Commodities Act.—The state chief of standards, James Sweeney, comes back at those who oppose the commodities act fixing standards of weight for st commodities, by saying that the demand for such an act was justified in the inspections made by sealers of weights and measures in various parts of the state last year. In 202,501 tests of scales, liquid and dry measures, milk jars, yard measures, weights and oil pumps 16 percent were found to be crooked. Of course, it is not charged that persons owning such measures were aware of the fact. Many of them were imposed upon and as a rule the inspectors found that where people were possessed of false measures or weights they were glad to be apprised of the fact.—Hamilton, Harrisburg, March 2.

NEW YORK LETTER

The Seeds Law.—It is proposed by a bill recently introduced in the legislature to amend the agricultural seeds law as it effects the sale of clover and grass seed, so that the proportion of foul or foreign seed that is permissible shall not exceed three percent by weight rather than by count, as the law now has it. Another bill would appropriate $40,000 for new buildings at the Cobleskill agricultural school.

Fruit Growers Elect.—The township fruit growers' association of Williamson, Wayne County, has elected the following officers: President, W. H. Wood; vice-president, H. M. DeRight; secretary, H. C. Pallister; treasurer, Anthony Lagner. This is one of the most important shipping centers for fruit and vegetables in the state and has grown from a place of no significance in this particular within three years, to one having a large cold storage plant, a basket factory, a canning factory and several warehouses. Over 2300 carloads of fruit and vegetables have been shipped the past year from the township of Williamson.

Co-operative Association.—The first co-operative market association under the recommendation of Governor Glynn was formed at Unadilla this week. The officers are C. O. Potter, president; S. A. Fisher, secretary and Arthur Rowell, treasurer. The organization is framed along the lines of a corporate company and shares are $100 each. Samuel L. Halbert was appointed sales agent. The association covers part of Otsego, Delaware and Chenango counties.

Land Bank Bills.—On March 2 two bills were introduced in the legislature to establish a system of rural credits, erected around the land bank idea. The first would establish a great co-operative bank to act as a sort of clearing house for a system of co-operative credits made up of all the loan and saving institutions of the state. The second would establish a stock bank with a capital of not less than $5,000,000. Either of the bills would carry out the Governor's idea of what the farmer should have to help him to easier credits.

County Highway Bill.—A bill has been introduced in the Assembly which would establish a county highway commission to consist of the county attorney, county engineer or highway superintendent and the chairman of the board of supervisors. It is given power to approve contracts for highway work and no money is to be paid out by state or county until the account is audited by the commission.

Milk Commission.—The sub-committees of the milk commission appointed by the governor have been holding sessions this week at Rochester, Watertown and New York City. At the latter meeting Dr. M. B. McMillan, representing the health department of the city said that recently a number of cases of typhoid fever were traced to milk shipped to the city and the shipper was not allowed to ship any more, but it was found that he had sold his milk up state, exposing others to the same danger. Another physician told the commission that one of the greatest evils confronting the people regarding impure milk was the fact that bad milk after having been rejected by the city authorities was sold to butter and cheese factories and disease germs reached the people just the same.

Cattle Bill Passed.—Senator Godfrey's bill providing that the state shall pay interest on money due farmers and others who were owners of diseased cattle that have been killed by state authority, passed the senate by a vote of 40 to 1. It will be remembered that the legislature appropriated last year $300,000 to pay farmers for stock killed by the state and senator Godfrey said that 75 percent of that amount had been paid into the treasury from the sale of carcasses.

The Legislative Rush.—March 27th is the date fixed for final adjournment of the Legislature. On one day this week 87 bills were introduced in the senate bringing the total up to 702 for the session. Under the Assembly rules no more bills can be introduced after March 1 unless by unanimous consent.

Health Campaign.—The Public Health committee of the state grange has already begun to lay plans for the work of the year. At a meeting of the committee last week with Dr. Biggs, head of the health department, the committee presented its ideas of what should be done to reduce the rural death rate. It asks that a rural sanitary inspector be appointed for each of the 20 sanitary districts of the state and the state department conduct a campaign of education thru the press and in other ways in order to arouse public opinion on the necessity of better rural sanitation and hygiene. Dr. Biggs assured the committee that the plan suggested would be carried out if funds permitted. There should be no trouble about funds in so important a matter as reducing the death rate in rural districts which now is more per thousand of inhabitants than in New York city. The able report made by the committee to the state grange at its recent meeting will be circulated by the state health department.

News Items.—A joint legislative hearing on the hydro-electric bill will be held on March 3. The threshermen have won their point on the use of traction engines for farm purposes on the state highways. Seymour Van Santvoord, of Troy, has been appointed to the public service commission which appointment receives general commendation. W. A. Mallery, of Columbia county, has been confirmed as fiscal supervisor of state charities, to succeed S. J. Tilden, deceased.—D.

MARYLAND NOTES

The State Grange Executive Committee has approved the plans of President H. J. Patterson for the erection of a permanent State Grange Home at College Park as a memorial to O. H. Kelly, one of the founders of the Grange. It is estimated the building will cost $15,000.

The 41st annual convention of Montgomery County farmers was recently held at Sandy Springs. The increase in taxes, and "what is the best solution of our county public school system;" the million dollar appropriation for the Maryland Agricultural College; and the high cost of road construction were some of the questions discussed.

The farmers' institutes of the State are better attended this winter than ever before, many farmers and their wives traveling many miles to attend. Dr. Richard S. Hill, the director, caters to the requirements of the respective sections. Men who have made marked success in the counties are secured as speakers, adding greatly to the local interest of the meetings.

The Castle Hill Orchard Company was recently organized at Snow Hill. The Company has 243 acres on which 18,000 apple trees are being planted. The trees will be planted far enough apart to alternate with peach trees as fillers. Intercropping the rows with truck crops is to be followed the first few years. Varieties to be planted are 7,800 Stayman Winesap; 2,800 York Imperial; 2,800 Gano and 4,000 Greenings, and Yellow Transparent, and Early Red.—G. O. B.

VALUABLE FREE CATALOGS

Waterproof Clothing.—Every farmer at some season of the year or in certain kinds of work has need of waterproof clothing. It saves health and money. The new catalog No. 411 recently issued by A. J. Tower Co., Boston, Mass., lists a full line of waterproof slickers, coats, fish suits, overalls, aprons, ponchos, hats, caps, etc., all of the famous Towers Fish Brand. The catalog will be sent free upon request to the above address if you say you are a reader of Pennsylvania Farmer.

Easy Monday.—This is the title of a neat folder being sent out by Dodge and Zuill, 5083 E. Water St., Syracuse, N. Y., describing their line of "Easy" washers, wringers, cleaners, etc. The booklet shows how these devices for the washroom have taken the drudgery out of wash day, and accompanying testimonials show they are saving work to thousands of farm women. A postal card request addressed to the above address brings the folder free.

The Saratoga Silo.—A neat 25-page catalog is now out describing the Saratoga Silo. Some of the distinctive features of this silo are the round, hinged door requiring no taking down, portable platform to be attached at any door, portable steel ladder and safety hoops and lugs. The catalog will be sent free upon request addressed to Saratoga Silo Mfg., Co., Box M, Saratoga Springs, N. Y.

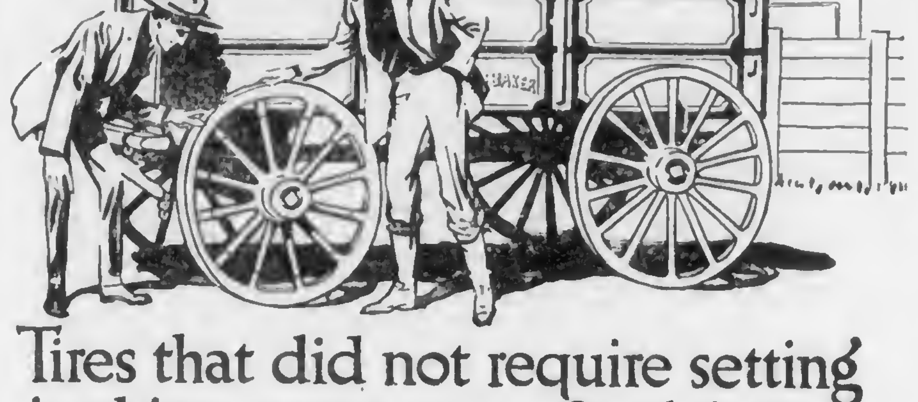
Haines Furniture.—The new Haines Furniture catalog contains many startling bargains in household furnishings including rockers, couches, bed room suits, beds, springs, and mattresses, dining room and office furniture, dishes, etc. The catalog is free upon request to the Linwood Haines Co., 99 Federal St., Camden, N. J.

Corn Contest.—The Bowker Fertilizer Co., will conduct a Better Quality Corn Contest this year. $500 are offered to the man, woman, boy or girl, who can raise 150 bushels of crib-dry shelled corn to the acre. If no one reaches this yield the money is divided into several prizes and awarded according to yield. Write the above company at 43 Chatham St., Boston Mass., for a copy of the rules and get into the spirit of making your acres earn their keep.

The Modern Cultivator.—Few lines of manufactures have shown greater progress in the last decade than the manufacture of agricultural implements. The evolution in farm machinery and the point of perfection reached in modern implements is shown in a most interesting and instructive 72-page booklet compiled by the S. L. Allen & Co., manufacturers of the famous Planet Jr., line of implements. Sixty farm and garden tools covering the whole range of cultivating needs, are here illustrated and described. The booklet is sent free upon request to S. L. Allen & Co., Box 1202E, Philadelphia, Pa.

Buying Paint.—Buying paint for your buildings is like buying clothes for yourself. You buy both to give protection and improve appearance. In the coat you want goods that will wear well and look well. In paint you want the same qualities. In both, the guarantee and character of the manufacturer back of the product are qualities of value. An advertisement in another column of this issue tells you how to get the Ingersoll Paint Book and save money.

Studebaker
WAGONS BUGGIES HARNESS



Tires that did not require setting in thirty years—on a Studebaker

AFTER thirty-six years of constant use Mr. William H. Horton, of Nineveh, N. Y., writes that his Studebaker farm wagon is as good as ever.

The wheels of Mr. Horton's wagon were run for thirty years without setting a tire. Mr. Horton writes:

"I have a Studebaker wagon purchased in 1877. The wagon now bears the original number and name of dealer; No. 33,435. Sold by Daniel Mann, Cobleskill. This wagon has had constant use since date of purchase and the wheels, were run 30 years without setting a tire. The wagon is in good condition today."

WHAT IS THE REASON FOR THIS?

The fact that Mr. Horton used his Studebaker wagon for thirty years without setting a tire means that the wheels were properly built. Its hubs, spokes and felloes were all made of the best materials.

Anyone could have bought them and built them into a wheel, but Studebaker not only build of the best, but they season their materials properly, and then combine these materials in a scientific manner so as to distribute the strain over the entire wheel and therein lies the reason why the Studebaker wagons run so easily and last so long.

The fact that the wheel material is properly seasoned, dipped in oil and built in the Studebaker way is the reason why Studebaker's tires stay on for thirty years and often times longer.

You will be making a good investment when you buy a Studebaker wagon, a Studebaker Buggy—or Studebaker Harness. They are the best you can buy—and outlast others.

Brooding Devices

PROF. A. L. CLARK, New Jersey Experiment Station

This is an all important subject at this time of the year. Many persons are for the first time embarking in chicken raising. Many who have had more or less experience are considering whether it might not be better to change their method or when enlarging their equipment are wondering what kind to get.

The brooding equipment is the most important investment in any poultry plant. This is the part of the business that is most often responsible for the failure of the plant. It has always been held that the replenishing of the stock was the most difficult branch of the business. It is the pitfall of the beginner and the stumbling block for the experienced.

Brooding Systems For Large Flocks

There has nothing yet ever superseded the long brooder house with hot water pipes running thru it to heat the hovers for large numbers of chickens in cold weather. Within the last few years great improvements have been made in brooding devices so that now it can hardly be said that these long houses are economical for less than 1500 or 2000 chicks. The best houses for such equipment are made with an even span roof 6 feet high at the plates and 10 feet at the ridge. Sixteen feet wide will give an alley way of two feet long one side with hover room three feet wide and runs in the house eleven feet long. If one remembers that fuel is costly and that the house and hovers must be kept warm in Winter weather, it will be seen that the extra cost for tight walls and care in building are advisable. Many brooder houses are built with double walls but after much experience with rats in old buildings of this kind I advise double boarding the walls on the outside with paper between. The roof should be of shingles as they offer more protection from the cold in Winter and from the extreme heat in Summer. The rafters should be braced across and then sheathed over on the under side about a foot above the plates. This will give a seven foot headroom and an air space in the peak. Every brooder house built for permanent use should have a concrete floor and be set upon a concrete foundation. Do not hesitate about concrete being cold or damp. If several inches of cinders are placed under the floor and the surface of the floor made six inches higher than the ground level outside there will be no danger. Of course the floor of the brooders should always be kept covered with sand and litter. Glass should be used plentifully along the front for light and an occasional muslin curtain will not be out of place.

In laying the pipes for overhead direct heating they should be about 6 inches above the floor at the end near the heater and rise to 12 inches a hundred feet away. It is best not to run pipes over a hundred feet long. Two-inch iron pipes are generally used and if six are laid, three to carry and three to return they should furnish enough heat. The return pipes should be laid alternately between the feed pipes. A space of a foot should be left between the back board of the hover and the first pipe and the pipes should be 4 inches between centers. In the middle between the first three and second three leave eight inches. This gives room to pick up dead chickens etc. The back board should be removable so as to render cleaning easy. In this way the litter and droppings can be swept right out into the alley way. If a common bran sack is ripped in half it will make two covers to nail on to two inch strips and so form frame coverings for the hovers. This burlap is the best material to use as it provides ventilation and still keeps in much of the heat. This burlap curtain should cover only the top surface of the pipes. The foot space between the first pipe and the back board should be covered by a wire screen. From the front and back edges of the frame short slit curtains ought to hang so as to provide against drafts. These can be made of oil cloth or regular awning trim can be secured all hemmed.

The partitions can be made every five feet and thus allow room for a hundred chickens in each apartment. A solid board should form the partition in the hover with one inch mesh wire between the runs. Such a brooder house can be built complete for from $1,500 to $2,000. The material will cost $1,000 to $1,500. Ship-lap yellow pine will answer very well for the first boarding and when covered with building paper, six inch N. C. Roofers will make a very good outer weather boarding.

For underneath hot water piping it is doubtful if one can install a system himself as cheaply as the manufacturers. There are several firms that make a specialty of making and putting up Mammoth brooding systems with underneath pipes. They have all the castings and parts made in large quantities and know just how to put them up cheaply. Whether there is much preference between overhead and underneath pipes in service and economy is doubtful. The overhead is the cheaper and perhaps a little more convenient.

Large Colony Brooders

For years people have been experimenting with large flocks in brooders. A number of years ago the New York State College of Agriculture brought out the gasoline colony brooder house. This has become a very common method in the East and has given the majority of its users excellent satisfaction. Complete directions come with burner parts for building and setting up. The brooder will hold 250 chickens. It works at its best in Spring weather. In very severe Winter weather it is often hard to keep the temperature up where it should be. High winds are apt to make trouble. The burners sometimes clog up from year to year. In warm Summer weather the house gets so hot that the chickens suffer. It is convenient in caring for the chickens altho the burner is so low that lighting is a nuisance. The cost is moderate and the fuel cost is reasonable. Within the last year or two several makes of coal stove colony brooders have appeared on the market. They are rather a simple contrivance and bid fair to become extremely popular. The three to five hundred size has been used a great deal and nearly everyone who has used them is loud in their praise. The fire does not keep as long as it might so that late night tending and early morning care are necessary. The larger sizes having capacity for up to 1500 have not been used so much and are yet somewhat in the experimental stage. If they turn out to be as efficient as they promise to be a saving will be secured both in building and brooding cost. For several years the progressive poultry raisers of the Petulume Valley district of California have been using with marked success a large colony brooder holding 1200 to 1500 chicks that is heated with crude oil. A brooder upon much this same style is being introduced in the East. Several such brooders are in use in Hammonton, N. J. The fuel cost with kerosene oil is relatively high altho if the brooders are filled to their full capacity it is not so much more than with some of the other kinds.

Brooders For Small Flocks

The demand for the small stationary lamp-heated brooders is very limited now. These used to be the only dependable kind for small flocks. In fact large plants were often equipped with numbers of them. Much the same style of hover was used in small outdoor colony houses and in long houses holding fifty or more. The adaptable hover as made by two or three enterprising firms superseded these to a considerable extent. These can be so easily transferred from one place to another that they have found a strong demand. When used in well protected places they are satisfactory but where the wick has to be turned high to keep up the heat there is danger from smoking. They should not be overcrowded. Most of them hold seventy-five better than over a hundred. The fireless craze has come to its end. For a person who wanted to raise a dozen or two chickens just for amusement it was an interesting way. Very good chickens can be raised where small flocks are kept and very careful attention is given them the first week or so.

How Shall We Decide

It largely resolves itself down to a few points. How many chickens do you intend to brood at one time? At what time of the year do you intend to begin? The first question will decide for you whether you want one of the mammoth systems or large colony brooders or whether you want one of the adaptable hovers. If over two hundred you will probably do best to choose one of the large colony methods. If you want to raise Winter broilers as a side line or a specialty perhaps the long pipe system would answer best for two thousand or more. For Spring brooding the colony houses will do just as effective work and will entail a much less expensive investment. A pretty good way is to have one or two of the large colony brooders and a couple of adaptable hovers. The hovers can be used in emergencies for small numbers where it would not be economical to run the larger ones.

To conclude, think well about the importance of having good brooding equipment. The old established firms can usually be depended upon to put out serviceable goods. The initial investment is not the thing that counts. Raising a large percentage of the chicks is what makes a method desirable. In building houses whether large or small make them tight. You can not afford to heat all outdoors. Think of the work you can save by arranging the interior rightly. Think of the ventilation which is so necessary for young stock. It is often better to copy after the plan of some experienced man who has made a success in the business than it is to make up some new arrangement of your own that has never been tried out.

MARCH BEE WORK

If the bee-keeper at this time has all the hives and supers prepared for the coming season as he should have, there is little that can be done that will make for success the coming season except reading and planning.

No business can be said to be well managed where there are small unnecessary leaks or wastes. The most common waste in bee-keeping is that of wax, which can be rendered from scraps of comb scraped from hives and frames and also rendered from combs no longer useful for breeding purposes. Great numbers of combs are now being used which contain so much drone comb as to cause the bee-keeper to lose in a year, thru the overproduction of drones, enough to replace all hives with frames with full sheets of foundation and thus insure nearly perfect combs. No hive should contain more than 30 square inches of drone comb unless it is a hive in which we are raising a choice strain of drones for mating purposes.

In cleaning hives and boxes the scrapings are often thrown away because they seem to be practically all propolis or bee glue, but there is a good percentage of recoverable wax in this refuse. Melt the whole thing in a vessel with plenty of water and allow to cool, when the propolis will be found at the bottom of the vessel and the wax on top.

Rendering wax, altho not very pleasant work, pays a good profit at this time, with good average wax selling at 34 cents wholesale. For best results a good press is a necessity, altho fair work can be done with an old cider or lard press provided there is an abundant supply of boiling water or steam. The old combs and refuse are thoroly melted but boiled little or not at all, as wax which has been much boiled is not soft and pliable but has a granular appearance. The press is heated by boiling water and the melted material is dipped together with about twice its volume of the hot water into a burlap bag in the press and the pressure applied, released, more boiling water is poured on the "cheese" and pressure is again applied. It is believed best results will be obtained by having a tight outside can to the press instead of the usual perforated one and pouring the wax and water from the top, so making it impossible for the "cheese" to reabsorb the wax. The secret of getting the maximum quantity of wax is in using an abundance of water and pressing in small quantities.

The use of acid in refining wax is unnecessary and often results in injury to the wax. If the wax is kept liquid for a long time the sediment will be practically all on the under side of the cake and can be scraped off when the cake will be ready for market. A fireless cooker or anything on that order is ideal for settling wax.

A common practice with bee-keepers, but a losing one, is trading beeswax at about 32 cents a pound for foundation at 55 cents to 60 cents a pound, a margin of at least 23 cents apound, when if shipped to a foundation factory to be made up a saving of at least 5 cents per pound is made after deducting transportation and making charges. This applies to quantities of 25 pounds or more but if one has only a small quantity two or more can club together and effect a considerable saving.

In bee-keeping as well as other business ventures it is the small things which count.—E. G. Carr, N. J. Deputy Bee Inspector.

TREATMENT FOR FROZEN COMBS

A very satisfactory plan for treating birds with frosted combs, devised by the Connecticut experiment station, is as follows:

"In case of frozen combs or wattles perhaps on of the best methods of procedure is to first get the frost out by smearing the affected part with vaseline and then manipulating with the fingers. Do not take the bird to a very warm room, and likewise protect the individual from severe cold. Then anoint the frozen parts once or twice a day with a mixture consisting of five tablespoons of vaseline, two tablespoons of glycerine and one tablespoonful of turpentine. A male bird whose comb and wattles have not been frosted too badly nor too often may later be used for breeding purposes with impunity."—D. T. H.

Which Tree Do You Want?

The slow-grower, with few and shallow roots and fruit of poor quality, or the vigorous, quick and steady producer of prime fruit?

DU PONT

Red Cross Dynamite

Blasted the hole in which the tree to the right was planted. The hole for the other tree was spade-dug. Both were two years old when photographed and excavated to show the root development.

How About Your Harvest?

A certain farmer found himself confronted with the same problem at every harvest—his yields seldom reached the mark they should. His profits were disappointing and, sometimes, distressingly small. He sought for the cause without success—until one day he read a

Cutaway (CLARK)

advertisement about Jim, the farmer whose land produced double that of his neighbor's, simply because he took a look ahead to the harvest when making the first preparation for planting. He followed the advice Jim gave his 50%-farmer neighbor and that very day wrote to us for a copy of "*The Soil and Intensive Tillage.*" In it he read about the chemical and physical properties of the soil, about how plants feed, and about intensive tillage. He learned that he could make much larger crops (often doubling them) from the same land, at proportionately smaller cost, by using CUTAWAY (CLARK) disk harrows. He got an entirely new idea about disk harrows and disk harrowing.

Do you know how much you lose where there are little hard ridges between the surface and the subsoil in your fields? Often the surface looks mellow and fine, and you are deceived. Do you know how much you lose every year because there is a clumpy strata between the seed-bed and the subsoil? You can stop these losses. CUTAWAY (CLARK) disk harrows pulverize all the soil to the full depth to which they run, and they are lighter draft than other harrows, size for size. There is a style and size for every farmer. In our catalog you will find illustrated and described Double Action Engine Harrows; Double Actions for horse power for both orchard and field work; Corn and Cotton Harrows; one-horse harrows for field, grove and garden; Bush and Bog Plows; Right Lap Plows; California Orchard Plows—in fact, the tool *you* need. Remember, our catalog "*The Soil and Intensive Tillage,*" is free for the asking. Write for it today.

Grange

McSPARRAN'S GRANGE NOTES

Free Canal Tolls

The question as to whether or not the coast trade vessels should be charged a toll in passing thru the Panama canal seems to be rather hard to decide. Congress at one time decided to grant them free toll and now is reconsidering the matter, or rather the attempt is being made to charge toll for these vessels the same as for others. This brings up again the subject of the government giving concessions to transportation companies.

It is a very doubtful proposition for the government to take the people's money and give it to a private corporation in order to get that corporation to do something for the benefit of the public at a future time. Large concessions of land and privileges were made to our transcontinental railroads to encourage their projection into the new West; and while these grants may have been the means of causing roads to be built where they otherwise would not have been built, yet when it came to the railroads making a return of these concessions to the people in the form of freight and passenger rates, they not only have been as grasping as other roads but are doing all they can to prevent their competitors, these coast-wise vessels from getting this much smaller concession from the government.

The general public which, as consumers, will pay these transportation charges, is concerned in the question in this way: Will the granting of this exemption from toll mean a lowering of the basis of rates for shipments both by water and land, or will it mean simply a gift from the government to certain of our vessels? We are rather inclined to think that unless some more effective method of controlling the pooling of rates is found than we have now that the latter will be found to be the true statement of the case. H. L. Pearsall, of Potter Co., Pa. in a letter to a Philadelphia daily hits the nail on the head when he says:

"And if these railroads, after receiving such large gifts from the government, still plunder the people with high freights and fares, why should we assume that vessels given free passage thru the canal will do any better? There is no reason to believe that free canal tolls will benefit any but the owners of the favored vessels.

"The transcontinental railroads are creatures of the government, passing for thousands of miles across the public domain, and if they are plundering the people it is because their creator, the government, permits them to do so. Our motto is, no more government aid to private monopoly in land grants, water, mineral or timber rights; no ship subsidy, no free canal. Govern the monopolies that now are and create no more."

The Grange of Pennsylvania has been strongly opposed to ship subsidy in any form and it looks to me as tho this were only subsidy in another form because there is no settled rate basis from which this exemption could be subtracted for the benefit of the people. Neither has there been any real physical valuation of these transportation properties by which a real basis of rates could be arrived at.

We do not pretend to have studied the technicalities of our treaties so that we can discuss the relation of our treaty with England to this subject, but it does seem strange that any treaty would be entered into by the officers of this great government so that when we spent $400,000,000 of our own money to dig a canal on our own land (for we bought the right of way) we should be compelled to ask Great Britain or any other country for the privilege of sending any or all of our own vessels thru that canal free of charge. If any such compact was made, the sooner it is broken, once and forever, the better. It is very proper to have friendly understandings with foreign nations. But these treaties should not only guarantee the right, but if necessary, compel each nation to tend to its own business.—John A. McSparran.

THREE MORE BATTLESHIPS

Few people realize the fact that 50 to 75 percent of the entire revenue of the United States is being expended for battle ships and preparations for war while peace prevails. What is going to bring this mad race of military expenditure to an end? One of the first factors will be the enormous cost. This problem is sure to be settled in the long run as an economic one. The nations of the earth cannot go on in this mad rush for naval expansion. The burden will become intolerable. No country can take up the sword without grave occasion, or it will have the condemnation of all the others. If any nation now unjustly attacks another it must be in the face of an opposition more potent than serried ranks of armed soldiers, or great squadrons of war ships. No nation is allowed to annex another country when it has gained a victory in war.

International Congresses have been held to prevent any nation from obtaining any great territorial accessions, and so it will be in the future. Nations are not allowed to acquire additional territory without the consent of the rest. There is concerted action among nations; a balance of power to be preserved so no acquisition shall be made by one without general approval. This doctrine was maintained when we had a weak navy, even when we had no navy; how much more will it be maintained in these days when every tendency is toward a community of interests among nations; when disturbance of the world's peace awakens universal disapprobation, and when the strong are not allowed to impose upon the weak, and war would hardly be tolerated between civilized nations.

A potent factor in doing away with the war monster is the increasing attention of civilized nations to the pursuit of industry and commerce. Those who are engaged in the industrial pursuits seek to prevent war just as a sanitary science guards against pestilence. With the growth of human intellect and the absorption of men in intellectual pursuits, and the increased influences of moral forces, war seems more and more appalling.

The familiar arguments of the modern war promoters is "prepare for war to preserve peace," and this great naval program is to show the world that we are going to protect our interests. Who is threatening our interests? In this great world where is there a sentiment in any nation that has one warlike note against the United States? The fundamental fallacy in all these arguments is the thought that in this day neither an individual nor a nation is safe unless he goes armed, while just the contrary is true.

The more we abstain from military armaments and everything that looks like aggression, the more our interests will be respected in the rest of the

"Better than leather
For all kinds of weather"

The High Cost of Leather Has Made Bootees Popular

There is more leather needed today than ever before. The makers of automobiles are worried about the decrease in the supply. They are paying fancy prices, and are taking the large share of the leather supply. That's why leather shoe manufacturers have been steadily raising the price of their products, and why men who work hard for their money are wearing comfortable **Hub-Mark Bootees.** Every pair represents a decided saving because they last longer and giver better service. They keep the feet warm, dry, and comfortable.

Hub-Mark Bootees are made from pure Gum Rubber and A1 Duck, with leather insoles. They are reinforced at every point where the wear and the strain comes. They have no seams that can rip. Their soles and uppers cannot split nor crack.

Note this:—Look for the **Hub-Mark** on all kinds and styles of rubber footwear for men, women, boys, and girls. You can rely on anything you buy from dealers who sell **Hub-Mark Bootees**—they are square dealers.

Let Me Tell You How the TEMPLE ENGINE Revolutionized Engine Building

—by radical improvements that make its service as superior to that of the "common herd" engine as the Thoroughbred is superior to the Scrub, without increasing the cost to you.

I cannot undertake to describe **this engine**—HERE. But **drop me a postal** and I will tell you how it **does away**—almost **altogether**—with ruinous VIBRATION and FRICTION—with excessive WEIGHT and BULK—with **many other features** that render ordinary engines so **costly, so short-lived, so inefficient** and so **cumbersome. In the meantime**—note in **sectional view** of the "TEMPLE," above, three of its radically "different" features, and **what these mean to** ENGINE USERS:

INVERTED CYLINDER—with HEAD on BASE—close to the ground—eliminating vibration, causing engine to run **quietly** and **smoothly**, delivering **maximum** power with **minimum** consumption of fuel (gasoline, kerosene, alcohol or distillate).

BELL-SHAPED WATER JACKET—(see letter A) flaring toward the base, giving **three times** the usual volume of **coolest water** where it's needed—around the explosion chamber, the **hottest** part of the cylinder.

SMALL, LIGHT, BASE—cutting out two-thirds of floor-space and BULK and one-half the WEIGHT of **other** engines—making it much lighter and easier to move from one job to another.

PROFITABLE ALL-AROUND SERVICE—The extraordinary lightness, **compactness** and **quiet** running of this **slow speed, heavy duty engine**, make it IDEAL for running Threshers, Grist Mills, Sawing Outfits, Shredders, Huskers, Sprayers, Pumps, and **all other** INDOOR and OUTDOOR machinery, requiring 2 H. P. to 50 H. P.

Just a penny—spent for **the postal you send me**—brings you ENGINE INFORMATION that will be worth **hundreds of dollars to you** in your season's work. Now "**take a chance**"—risk a CENT (for the postal)—and LEARN SOMETHING YOU DIDN'T KNOW BEFORE.

MUTILATED TEXT

Cream Cheese.—The dried pieces of cheese may be grated and mixed with rich cream, and seasoned with salt and pepper or paprika and left to stand and ripen for a day. The result is an excellent cream cheese which may be served with salad. Some cream may be used.—Mrs. J. J. O'Connell.

Toughening Glass.—To render lamp chimneys and other glass tough so it will not crack, place your chimneys, tumblers or other glassware which you desire to keep from cracking in a pot filled with cold water, add a little cooking salt, allow the mixture to boil well over a fire, and then cool slowly. Glass treated in this way is said not to crack even if exposed to very sudden changes of temperature. The process is simply one of annealing and the slower the process, especially the cooling portion of it, the more effective will be the work.

Prune Pastry.—Two heaping tablespoonfuls of lard, two heaping tablespoonfuls of butter, half a pound of flour, one teaspoonful of baking powder, water to mix, one-fourth of a pound of prunes, four apples, one strip of lemon peel, and two tablespoonfuls of brown sugar. Soak the apples and prunes together and then stew them with the sugar and lemon rind. When quite soft, take the stones from the prunes and break up the apples. Make a paste with the lard, butter, flour, baking powder and water. Line a pudding dish with it, put the mixture inside and cover with another piece of pastry, bake in a hot oven for half an hour.

PENNSYLVANIA FARMER PATTERNS.

Be sure to give the figures and letters of each pattern exactly as printed at the beginning of each description. We will not be responsible for correct filling of your order unless you do so. Also give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 214-18 S. 12th St., Philadelphia, Pa.

6368—Ladies' Shirt Waist.—Cut in sizes 34 to 42 inches, bust measure. Size 36 requires 2¼ yards of 36-inch material, ⅞ yard of 27-inch goods for collar. Price of pattern, 10 cents.

5960—Ladies' Apron.—Cut in sizes 32, 36, 40 and 44 inches, bust measure. Size 36 bust requires 5 yards of inch material and ¾ yard of 27-inch contrasting goods. Price, 10 cents.

4500—Children's Rompers.—Cut in sizes 2 to 8 years. Age 4 years requires 2⅛ yards of 36-inch material. Price, 10 cents.

5972—Girls' Dress.—Cut in sizes to 12 years. Age 8 years requires yards of 44-inch material. Price, cents.

6309—Ladies' Two Gored Skirt.—Cut in sizes 22 to 30 inches, waist measure. Size 24 requires 2⅜ yards of 44 or inch material. Price, 10 cents.

Bobby's First Long Pants

Drawn Expressly for Montgomery Ward & Company by Orson Lowell

It's a big day for Bobby—For now his first long pants have become a reality.

With a spirit of pleasurable anticipation he has awaited this package—this particular shipment from Montgomery Ward & Company. For Bobby is of a Ward family. A family that traded with Montgomery Ward & Company four decades ago.

And it was just as much of an epoch-making day for Bobbie's father when he received *his* first shipment from the house whose purpose is *to serve its patrons*, fairly and squarely.

For down through all these years, this policy has ever been maintained—this attitude of fairness never deviated from—this practice of giving a full dollar in value for a dollar in cash.

That's why this and thousands of other families have purchased their household supplies and luxuries from the house of Ward; that's why Moutgomery Ward & Company have grown, in forty years, from a small beginning to a glorious maturity.

Glance through the mammoth Montgomery Ward Catalogue today. Nothing that a home can need or heart can wish is missing.

As you turn the pages of this wonderful book, you can be assured that every representation of every article, by print and picture, is just as exact and true to type as the honesty of writer and genius of artist can make it

Have you this wonderful book in your home? This book whose mission is to truthfully represent the world's finest merchandise.

Your copy is waiting for you, *now*. Simply write or fill in the coupon, and this thousand-page book is yours without charge or obligation.

Markets

PHILADELPHIA PRODUCE

Philadelphia, Pa., March 2, 1914.

Desirable grades of butter were well cleaned up at good values. Egg receipts were moderate and the market ruled firm under a fair demand that kept supplies of desirable stock under pretty good control. Poultry ruled firm with demand equal to the offerings. Fruits and vegetable offerings were moderate with prices well sustained.

Butter.—Western creamery, 34c; extras, 32@32½c; firsts to seconds 26@30c; special prints, 38@41c; near-by prints, 32c.

Eggs.—Candled, 34@37c doz; extras, 32c. Current receipts at $8.85 per standards case.

Poultry.—Fowls, 16@17c; old roosters, 12@13c; pigeons, 30@32c pair.

Dressed Poultry.—Western fowls, 12@20c; roosters, 15c; turkeys, 21@26c; squabs $2@4.85 doz.

Vegetables.—White potatoes, Pa., 80c@$1 bu. Onions $3.50@3.65 per 100 lb bag. Peppers $1.75@2 per carrier. Eggplant $2.50@3.50 carrier. Lettuce $2@4 per hamper. Beets, new 5@8c bch. Sweet potatoes, 40@60c bas. String beans $2.00@4.00 hamper. Squash $2@2.50 per crate. Cucumbers, Florida $5@6 hamper. Celery, 60@75c per doz. stalks. Cabbage, new $1.75@2 ½-bbl crate. Cauliflower, $1.25@1.75 hamper.

Fruit.—Apples $4.00@6 bbl. Pineapples, per crate, $2@3.50. Pears, 50@75c basket. Grapes $4@7 keg; cranberries, $3.00@3.50 crt; lemons, $2@3.50 per box; grape fruit $2@4 per box; oranges, $2@3 per box.

Hay and Grain.—No. 3 hay, large bales, $18.00@18.50; No. 1 medium $18@18.50; no grade, $10.00@12.00. Clover mixed hay, light mixed at $17.50@18.00; straw No. 1 new straight rye, $16.50; No. 2 do., $15@15.50; No. 1 tangled rye straw new $12; No. 2 do., $11.00@11.50; No. 1 wheat straw, $10@10.50; No. 1 oat straw, $10.50@11; new shelled corn No. 2 yellow, 69½@70½c. Wheat No. 2 red, $1@1.00½; No. 1 Northern, $1.05@1.06; No. 2 white oats, 45@45½c; No. 3, white 46@46½c; Standard white 45½@46c.

Coffee.—Rio 7s 9⅛c; Santos 4s 11⅞c. Mild Coffee.—Cordova, 13@16½c.

Sugar.—Cut loaf, $5.10 cwt.; cubes, $4.35; powdered, $4.20; granulated, $4.10; standard granulated, $4.15; crystal A, $4.10.

Flour.—For 196 lbs. in wood, winter-clear, $3.85@4.10; do straight, $4.20@4.35; favorite brands, $5.00@5.25; rye flour, Pa., $3.50@3.60 per bbl.

Hides and Skins.—Steers, abattoir, 16¾@17¾c; do country, 15c. Cows, country, 15c. Bulls, abattoir, 14½c; do. country, 13c. Calf skins, Nos. 5 to 12 and up, $1.55@2.75; do. green 15c.

Provisions.—City beef, in sets, smoked and air dried, 31@31½c. Beef hams, $40@42. Pork family, $23@24. Hams, cured, 13⅝@14c; skinned 14@14⅞c; smoked 17@18c. Other hams, smoked, city cured, as to brand, 17@18c. Picnic shoulders, 10⅜@10⅞c; do smoked, 13@13½c. Bellies in pickle, 13¼@14¾c. Breakfast bacon, as to quality, 19@23c. Lard, refined, 11¼@11⅞c tcs; do in tubs, 11¾@12c; do kettle rendered, 11¼@11¾c. Tallow, prime city 7c; country, 7c; do. dark, 6c; do. cakes, 7¼c.

Philadelphia Retail.

Vegetables.—Onions, 20c ½-pk. Peppers, 35c doz. Eggplants, 15@25c apiece. Cabbage, 10c a head. Lettuce 2 to 3 hds for 25c. Beets new 10@15c bch. Swt potatoes 30 ½-pk. White potatoes, 20c ½-pk. String beans, 75c per bas. Tomatoes, hothouse, 85c small bas; cucumbers 10@15c apc. Celery 60c bch; squash 5 to 6 for 25c; cauliflower 20@35c apiece; mushrooms, 40@50c lb.

Fruit.—Grapes 30c lb. Apples 20c ¼-pk. Pineapples, 20@35c apiece. Cranberries, 20c qt; lemons 15@20c doz; grapefruit, 2 to 3 for 25c; Oranges, 35@75c doz.

YORK PRODUCE MARKET

York, Pa., March 2, 1914.

The extremely cold weather and the closed roads many places made the market conditions very uncertain. Some days there were but few farmers in town and other days the customers failed to turn out, hence prices were up and down. The principal feature is the sudden demand for potatoes. These have been very slow during the winter until the past two weeks. Prices range from 60 cents for small to $1.10 per bu. Butter and eggs firm.

Eggs.—26@29c.

Butter.—Country, 30@35c; separator, 35@38c. Milk, 6c per quart. Cream, 12c per pint.

Poultry.—Scarce. Hens 15@17c. Dressed poultry, 50@95c each.

Vegetables.—Potatoes 10@16c ½-pk; 60@$1.10 bu; cabbage 4@12c each; lettuce, 5@12c; beets, 3@5c bch; radishes, 5c bch; onions 5c bch., 10@16c per ½-pk; lima beans 14@16c qt; sweet potatoes, 12@15c per ½-pk; lard 14@16c lb; celery, 8@15c; peppers, 8@12c doz; turnips 10@12c per ½ pk, soup beans, 12c qt; sauer kraut, 8@10c qt, apple butter, 20@25c qt.

Fruit.—Apples, 15@35c ½-pk; pears, 10@25c per ½-pk; chestnuts, 10@15c qt; walnuts, 15c per ½-pk.

Retail Grain Market.—Wheat, $1.07 bu; corn, 82c; oats, 55c; rye, 77c; bran, $1.40 cwt.; middlings $1.50 cwt.

Wholesale Grain Market.—Wheat, 97c; corn, 69c; oats, 45c; rye, 67c.

NEW YORK PRODUCE

New York City, March 2, 1914.

Stormy weather has made the butter market rather irregular. Owing to the uncertainty as to supplies, values were little changed. The egg market labored under the same irregularity as the butter market. Little demand in poultry. Market nominal. In the fruit and vegetable markets values were unsettled.

Eggs.—State and near-by hennery whites, fine to fancy 33c; gathered whites, 32½@33c; fair to good 31½@32c; no grades, 30@31c; fresh gathered firsts to extras, 31½@32½c; seconds to thirds, 26@30½c; no grades 26@28c; mixed 30½@31½c.

Butter.—Creamery, firsts to extras, 28@32c; thirds to seconds, 22@27c; state dairy 20@31c; packing stock 16@19½c; process 20@23c.

Cheese.—Whole milk specials, 18@18½c; do, common to fancy, 14½@17¾c; skims 6@14¼c.

Dressed Poultry.—Turkeys, dry, 23@25c; chickens, 11@25c; fowls, 12@18c; old roosters, 14c; ducks 13@19c.

Live Poultry.—Prices unsettled.

Vegetables.—Cabbage, $20.00@28.00 ton. Green beans $3.50@4 bas. Carrots $1.25@2.25 bag. Cucumbers, $1@$2 doz. Lettuce $1.25@4.50 bas. Squash, $2.25@3 bbl. Celery, $1.50@5.00 per basket. Onions $3.00@3.50 100-lb bag. Tomatoes, $1.00@$3.00 carrier. Peppers $1.25@1.50 carrier. Beets, $3@4 per 100 bunches. Potatoes, $4.00@6.00 bbl. Sweet potatoes, 35c@$1 bas. Eggplants, $2@2.75 per bx. Cauliflower $1.25@1.75 bas.

Fruit.—Apples, $2.00@6.00 bbl. Cranberries $9@13.50 bbl. Pears 75c@$1.50 bbl.

Grain.—Wheat No. 2 red $1.01¼c; No. 1 Northern, $1.05½; corn, new No. 3 yellow 70⅞c; oats, standard white 45½@46c.

PHILADELPHIA LIVE STOCK

Philadelphia, Pa., March 2, 1914.

Lenten conditions produced a dull feeling thruout the market, while prices were well maintained. Ohio and Illinois cattle were on sale. Calves and cows realized former values.

	Beef Cattle	Sheep and Lambs	Hogs
Total for week	3,009	9,885	5,900
Previous week	2,828	10,636	5,457

Best steers	$8.90@9.00
Choice steers	8.60@8.80
Good	8.40@8.50
Medium steers	8.00@8.25
Common steers	7.50@8.00
Bulls	5.25@6.85
Fat cows	6.20@7.00
Medium cows	4.75@5.75
Thin cows	3.00@4.50

Veal calves steady

Best calves	$11.50@12.25
Good to choice do	10.50@11.00
Medium	7.50@8.00
Common do.	5.00@8.00

Sheep and Lambs.—Values showed no material change.

Choice wethers	$6.00@6.25
Good do.	5.25@6.00
Common to medium	3.50@5.00
Ewes, fat	5.25@5.75
Extra lambs	8.50@8.75
Good to choice do	8.25@8.50
Common to medium	6.50@8.00

Hogs.—The market was a trifle quiet but steady at the ruling rates. Western as to size and quality $12.50@12.75.

City Dressed Stock.—All choice and prime meats of every variety were steadily held, demand being moderate. Steers, 12@14c, heifers, 10½@13c; cows, 9@11c. Veal calves, 14@15c, country dressed calves, 14@15c; extra do., 15½c. Sheep, 9@11c; extra wethers, 12c. Spring lambs 13@14c. Hogs 12¾@13c.

PITTSBURGH LIVE STOCK

Pittsburgh, Pa., March 2, 1914.

Cattle.—With a supply of 85 loads compared with 125 loads the week before, the market ruled slow at steady to strong prices on the choice heavy and light grades while the medium grades were about steady. Heifers, fat cows and bulls were in light supply and with a good demand they sold higher. Fresh cows barely steady on the choice, while other grades and springers were slow sale at low prices. Today's cattle receipts were 115 head, and the market was steady on best but slow on others.

Good to choice	$8.80@9.10
Good 1,300-1,400 lb.	8.40@8.75
Medium to good 1,200-1,300 lb	8.10@8.35
Tidy 1,050-1,150 lb.	8.20@8.40
Fair to medium, 900-1,100 lb	7.40@7.75
Rough, half fat, 1,000-1,300	5.00@7.00
Common to good fat oxen	4.00@6.50
Common, 700-900 lb.	5.50@6.50
Common to good fat bulls	5.00@7.75
Common to good fat cows	4.00@6.50
Heifers	5.50@8.00
Bologna cows	3.50@4.25
Fresh cows and springers	25.00@90.00

Calves.—Veal calves have been in light supply all week and with good demand market closed 50c per cwt higher than last Monday's prices. Today's receipts were 300 head and the market ruled steady.

Heavy and thin calves	$5.50@7.50
Veal calves	8.50@12.50

Sheep and Lambs.—The supply of sheep and lambs during the week has been fair but with a good demand the market ruled active with a gain of 10 to 15 cents per cwt on choice grades of both sheep and lambs. Other grades steady. Today's receipts were 25 double-deck loads, bulk of the supply being lambs. With a light demand the market ruled slow and steady on sheep, but lower on lambs.

Prime wethers	$6.25@6.50
Good mixed	5.90@6.15
Fair mixed ewes and wethers	5.25@5.75
Culls to common	3.50@4.50
Spring lambs	5.50@8.00

Hogs.—The supply of hogs during the week was light and with a good demand the market ruled active and 5 to 10 cents per cwt. over Monday's prices, but the close for the week was bad, all the gain lost, and 10c per cwt. besides. Today's hog receipts were 50 double deck loads, and the market ruled steady.

Prime heavy	$9.05@
Prime medium weight	9.15@
Heavy mixed	9.10@
Best heavy Yorkers	9.15@
Light Yorkers	9.15@
Pigs	8.75@9.00
Common to good roughs	7.90@8.50
Stags	7.00@7.50

BUFFALO LIVE STOCK

Buffalo, N. Y., March 2, 1914.

Cattle.—The slow opening for the week and the approach of the Lenten season made a quiet trade of the week. On the close the market was only fair at unchanged prices. With a run of 3,750 head in the yards this morning, cattle continued slow.

Choice heavy steers	$8.75@9.00
Medium	8.25@8.75
Yearlings	8.00@8.50
Handy butchers	7.50@8.35
Good to choice fat cows	6.50@7.25
Good to choice heifers	7.50@8.00
Butcher bulls	6.00@7.50
Feeders	6.25@7.00
Stockers	5.00@6.25
Cows and springers	30.00@90.00

Calves.—The trade for the week was fair for choice veals. The opening basis was $12@13. On the close the market was active and the basis half a dollar lower.

Choice veals	$11.50@12.00
Lights and thin	6.00@8.75

Sheep and Lambs.—The market was easier thruout the week. Lambs sold easier. The trade in sheep was fair. Wethers were in good demand. On the close the market was active for lambs and 10 to 15c higher. The best lambs sold $8.25@8.50. Yearlings and sheep were in good demand and firm. Sheep and lamb receipts today totaled 18,000. The market was lower.

Choice lambs	$8.10@8.15
Yearlings	7.00@7.50
Wethers	6.00@6.25
Ewes	5.50@5.75
Sheep	5.75@6.00

Hogs.—The opening basis was lower and the demand fair. Medium and heavy were in good demand. On the close the market was steady and light weights easier. Heavy hogs sold generally at $9.25, and a few at $9.50. Some 14,000 hogs were on sale on a lower market today.

Heavies	$9.00@9.10
Mixed and medium	9.00@9.10
Yorkers	9.00@9.10
Light Yorkers	9.00@9.10
Pigs	9.00@9.10
Roughs	8.00@8.40
Stags	6.50@7.50

Horses.—With 450 head on sale, there was a fair demand for best teams at $650@700 while single workers brought $225@300.

PITTSBURGH HAY AND GRAIN MARKET

Pittsburgh, Pa., March 2, 1914.

Hay.—Receipts of the lower grades, this applying to No. 2 timothy as well as other grades, of which there is quite an abundance arriving, and the prices on same are slowly but surely working lower. Poorer than No. 2 hay shows an accumulation at the different terminals with no buyers; sales being effected only at concessions. Demand for strictly No. 1 timothy and No. 1 clover is good and being readily placed at quotations.

No. 1 timothy	$16.25@16.50
No. 2 timothy	14.00@15.00
No. 3 timothy	10.00@11.00
No. 1 light mixed	14.50@15.00
No. 1 clover mixed	13.75@14.25
No. 2 clover mixed	10.50@11.50
No. 1 clover	13.50@14.00
No. 2 clover	10.00@11.50

Ear Corn.—Receipts and demand about equal. Market steady and looking stronger.

New No. 2 yellow	69@69½c.
New No. 3 yellow	65½@67c.

Shell Corn.—Market continues exceptionally draggy for this season of the year.

New No. 2 yellow	70@70½c.
New yellow No. 3, natural	66@66½c.
New sample	64@65c.

Oats.—Market dull and draggy with little demand. Some inquiry for oats suitable for seeding purposes.

No. 2 white	43½@43¾c.
Standard oats	42¾@43c.
Standard No. 3 oats	41¾@42¼c.

Mill Feed.—Oat market bare of bran, with quite a good inquiry for same. Demand for middlings fair.

No. 2 white midds.	$27.00@27.50
No. 1 brown midds	26.00@26.50
W. W. Bran, coarse.	27.00@27.50
W. W. Bran, medium	26.00@26.50

NEW YORK MILK MARKET

New York City, March 2, 1914.

The milk market is over supplied. The market value is believed to lie between 3⅜@3⅝ cents a quart net for grade B to the producer in the 32-cent zone. The surplus was augmented by the failure of the railroads to get the milk into the city on Monday morning early enough for general delivery. The storm delayed all trains very badly. The dealers said the situation was worse than at any time since the famous blizzard of 1888. The Health Department on Saturday definitely ordered that those dealers who had failed to install pasteurizing machinery before March 1, should be prosecuted.

The receipts of milk and cream in 40-quart cans for the week ending February 28 were as follows:

Railroad	Milk	Cream
Erie	46,234	1,562
Susquehanna	9,849	481
West Shore	15,114	702
Lackawanna	52,750	1,325
N. Y. Central (long haul)	78,587	1,347
N. Y. Central (short haul)	11,835	88
Ontario	40,185	2,450
Lehigh Valley	36,249	731
Homer Ramsdell Line	.....	....
New Haven	7,770	140
Pennsylvania	3,250	450
Other sources	1,665	16
Totals	303,488	9,292

ELGIN BUTTER QUOTATION

Elgin, Ill., March 2, 1914.

The quotation committee of the Elgin Board of Trade this afternoon declared butter firm at 30c.

1913 RECORD Magnificent Crops in all Western Canada

All parts of the Provinces of Manitoba, Saskatchewan and Alberta, have produced wonderful yields of Wheat, Oats, Barley and Flax. Wheat graded from Contract to No. 1 Hard, weighed heavy and yielded from 20 to 45 bushels per acre; 22 bushels was about the total average. Mixed Farming may be considered fully as profitable an industry as grain raising. The excellent grasses full of nutrition, are the only food required either for beef or dairy purposes. In 1912 at Chicago, Western Canada carried off the Championship for beef steer. Good schools, markets convenient, climate excellent. For the homesteader, the man who wishes to farm extensively, or the investor, Canada offers the biggest opportunity of any place on the continent.

Apply for descriptive literature and reduced railway rates to Superintendent of Immigration, Ottawa, Canada, or to Canadian Government Agent.

$10,000.00 BACKS THIS DRILL

If this drill does not satisfy you in every way after 30 DAYS' FREE TRIAL ship it back at our expense and we will refund all your money, or forfeit $10,000 held in trust by our bankers to protect you. This is the best all round drill on the market—sows all kinds of seed, grain or fertilizers. Strong, durable, exact. High broad tires lighten pull. We also make a low down and plain seed drill. We sell direct from factory—save you $10 to $20 dealers' profits.

HERTZLER & ZOOK CO., Box 119, Belleville, Pa

Wasted Energy

Something must give way when you grind clothes on a washboard. It won't be the board. Money will replace the clothes wasted that way, but not your precious energy. That cannot be measured in dollars and cents. There is not a single compensating feature for the energy wasted on a washboard or any device that makes washing hard for you. The

Rubbing means wear and wear means waste, waste of fabric—MONEY—and the waste of priceless human energy. The

Syracuse "EASY" Washer

Cuts off this waste

You can prove it by 30 DAYS' TRIAL

The "EASY" utilizes air to force suds through the cloth. That means air and suds without friction, that's why it saves energy and fabric. Just remember it, "easy for the operator, harmless to the fabric;" yet forceful and efficient.

It's going to last too, because it's made of sg l—the tough-est kind of steel, galvanized. Will neither shrink swell, rust nor

eak. Unlike suds-soaked wooden tubs and washers, there is no retention of germs or filth, but is clean and sanitary.

Ask for our new folder "EASY MONDAY" describing our latest improved washer—the Model B. Ask about our Motor Washers and Vacuum Cleaners.

Winston of the Prairie

By HAROLD BINDLOSS

Copyrighted by Frederick A. Stokes Company.

CHAPTER XXIII (continued)

“Of course!” said the Sergeant gravely, tho he felt a little thrill of content as he saw the shot he had been by no means sure of, had told. “That man, however, had lost his horse in the river, and it was the one he got from you that took him out of the country. Now if we could show you knew what he had done, it might go as far as hanging somebody.”

The man was evidently not a confirmed law breaker, but merely one of the small farmers who were willing to pick up a few dollars by assisting the whisky-runners now and then, and he abandoned all resistance.

“Sergeant,” he said, “it was 'most a week before I knew, and if anybody had told me at the time, I'd have turned him out to freeze before I'd have let him have a horse of mine.”

“That wouldn't go very far if we brought the charge against you,” said Stimson grimly. “If you'd sent us word when you did know, we'd have had him.”

“Well,” said the man, “he was across the frontier by that time, and I don't know that most folks would have done it, if they'd had the warning the boys sent me.”

Stimson appeared to consider for almost a minute, and then gravely rapped his companion's arm.

“It seems to me that the sooner you and I have an understanding, the better it will be for you,” he said.

They were some time arriving at it, and the Sergeant's superiors might not have been pleased with all he promised during the discussion. Still, he was flying at higher game, and had to sacrifice a little, while he knew his man.

“We'll fix it up without you, as far as we can, but if we want you to give evidence that the man who lost his horse in the river was not farmer Winston, we'll know where to find you,” he said. “You'll have to take your chance of being tried with him if we find you're trying to get out of the country.”

It was half an hour later when the rest of the troopers arrived and Stimson had some talk with their officer aside.

“A little out of the usual course, isn't it?” said the latter. “I don't know that I'd have countenanced it, so to speak, off my own bat at all, but I had a tolerably plain hint that you were to use your own discretion over this affair. After all, one has to stretch a point or two occasionally.”

“Yes, sir,” said Stimson. “A good many now and then.”

The officer smiled a little and went back to the rest. “Two of you will ride after the other rascal,” he said. “Now, look here, my man, the first time my troopers, who'll call round quite frequently, don't find you about your homestead, you'll land yourself in a tolerably serious difficulty. In the meanwhile, I'm sorry we can't bring a charge of whisky-running against you, but another time be careful who you hire your wagon to.”

Then there was a rapid drumming of hoofs as two troopers went off at a gallop, while when the rest turned back towards the outpost Stimson rode with them quietly content.

CHAPTER XXIV

The Revelation

Winston's harvesting prospered as his sowing had done, for by day the bright sunshine shone down on standing wheat and lengthening rows of sheaves. It was in the bracing cold of sunrise the work began, and the first pale stars were out before the tired men and jaded horses dragged themselves home again. Not infrequently it happened that the men wore out the teams and machines, but there was no stoppage then, for fresh horses were led out from the corral or a new binder was ready. Every minute was worth a dollar, and Winston, who had apparently foreseen and provided for everything, wasted none.

Then, for wheat is seldom stacked in that country, as the days grew shorter and the evenings cool, the smoke of the big thrasher streaked the harvest field, and the wagons went jolting between humming separator and granary, until the latter was gorged to repletion and the wheat was stored within a willow framing beneath the chaff and straw that streamed from the chute of the great machine. Winston had around him the best men that dollars could hire, and toiled tirelessly with the grimy host in the whirling dust of the thrasher and amid the sheaves, wherever another pair of hands, or the quick decision that would save an hour's delay, was needed most.

As compared with the practice of insular Britain, there were not half enough of them, but wages are high in that country, and the crew of the thrasher paid by the bushel, while the rest had long worked for their own hand on the levels of Manitoba and in the bush of Ontario, and knew that the sooner their toil was over the sooner they would go home again with well-lined pockets. So, generously fed, splendid human muscle kept pace with clinking steel under a stress that is seldom borne outside the sun-bleached prairie at harvest time, and Winston forgot everything save the constant need for the utmost effort of body and brain. It was even of little import to him that prices moved steadily upward as he toiled.

At last it was finished, and only knee-high stubble covered his land and that of Maud Barrington, while, for he was one who could venture fearlessly and still know when he had risked enough, soon after it was thrashed out the wheat was sold. The harvesters went home with enough to maintain them thru the winter, and Winston, who spent two days counting his gain, wrote asking Graham to send him an accountant from Winnipeg. With him he spent a couple more days, and then, with an effort he was never to forget, prepared himself for the reckoning. It was time to fling off the mask before the eyes of all who had trusted him.

He had thought it over carefully, and his first decision had been to make the revelation to Colonel Barrington alone. That, however, would, he felt, be too simple, and his pride rebelled against anything that would stamp him as one who dare not face the men he had deceived. One by one they had tacitly offered him their friendship and then their esteem, until he knew that he was virtually leader at Silverdale, and it seemed fitting that he should admit the wrong he had done them, and bear the obloquy, before them all. For a while the thought of Maud Barrington restrained him, and then he brushed that aside. He had fancied with masculine blindness that what he felt for her had been well concealed, and that her attitude to him could be no more than kindly sympathy with one who was endeavoring to atone for a discreditable past. Her anger and astonishment would be hard to bear, but once more his pride prompted him, and he decided that she should at least see he had the courage to face the results of his wrong-doing. As it happened, he was given an opportunity when he was invited to the harvest celebration that was held each year at Silverdale.

It was a still, cool evening when every man of the community, and most of the women, gathered in the big dining-room of the Grange. The windows were shut now, for the chill of the early frost was on the prairie, and the great lamps burned steadily above the long tables. Cut glass, dainty china and silver gleamed beneath them amidst the ears of wheat that stood in clusters for sole and appropriate ornamentation. They merited the place of honor, for wheat had brought prosperity to every man at Silverdale who had had the faith to sow that year.

On either hand were rows of smiling faces, the men's burned and bronzed, the women's kissed into faintly warmer color by the sun, and white shoulders shone amidst the somberly covered ones, while here and there a diamond gleamed on a snowy neck. Barrington sat at the head of the longest table, with his niece and sister Dane and his oldest followers about him, and Winston at its foot, dressed very simply after the usual fashion of the prairie farmers. There were few in the company who had not noticed this, tho they did not as yet understand its purport.

Nothing happened during dinner, but Maud Barrington noticed that, altho some of his younger neighbors rallied him, Winston was grimly quiet. When it was over, Barrington rose, and the men who knew the care he had borne that year never paid him more willing homage than they did when he stood smiling down on them. As usual he was immaculate in dress, erect, and quietly commanding, but in spite of its smile his face seemed worn and there were thickening wrinkles which told of anxiety, about his eyes.

“Another year has gone, and we have met again to celebrate with gratefulness the fulfillment of the promise made when the world was young,” he said. “We do well to be thankful, but I think humility becomes us too. While we doubted the sun and the rain have been with us for a sign that, tho men grow faint-hearted and spare their toil, seed-time and harvest shall not fail.”

It was the first time Colonel Barrington had spoken in quite that strain, and when he paused a moment there was a curious stillness, for those who heard him noticed an unusual tremor in his voice. There was also a gravity that was not far removed from sadness in his face when he went on again, but the intentness of his retainers would have been greater had they known that two separate detachments of police troopers were then riding toward Silverdale.

“The year has brought its changes, and set its mark deeply on some of us,” he said. “We cannot recall it, or retrieve our blunders, but we can hope they will be forgiven us and endeavor to avoid them again. This is not the fashion in which I had meant to speak to you tonight, but after the bounty showered upon us I feel my responsibility. The law is unchangeable. The man who would have bread to eat or sell must toil for it, and I, in disregard of it, bade you hold your hand. Well, we have had our lesson, and we will be wiser another time, but I have felt that my usefulness as your leader is slipping away from me. This year has shown me that I am getting an old man.”

Amazing Prices on STEEL Shingles

The demand for Edwards "Reo" Steel Shingles has become so big that we now sell them from factory to user for less—actually LESS—than common wood shingles. And we pay all freight! LOOK INTO THIS MONEY-SAVING PROPOSITION BEFORE ROOFING YOUR BUILDINGS. SEND POSTAL TODAY AND GET FACTORY PRICES.

No Trick to Put Them On

You don't have to nail these steel shingles, like wood shingles, ONE AT A TIME. Put on as high as 100 at once, for they come in big sheets ready to nail on sheathing or old roof. It's ten times easier than putting on wood shingles. No extra materials to buy, no painting to do, no tools to borrow. Your hired man can do the job with a hammer.

Absolutely Rustproof

Please don't judge Edwards Steel Shingles by common galvanized iron roofing—the kind that rusts. We have invented a method that absolutely prevents rust from ever getting a foothold, as 100,000 delighted owners of Edwards Roofs have found out. It's the famous Edwards Tightcote Process applied to genuine Open Hearth Steel.

Protect Your Buildings from FIRE

Don't take chances of fire from defective chimneys, flying sparks and lightning. Roof your buildings with these Steel Shingles and make them safe. Remember nine out of every ten fires start with the roof. We specifically guarantee every Edwards Steel Shingle Roof against lightning. This Guaranty is backed by a $10,000 Cash Bond.

Cheaper Than Prepared-Paper Roofing

Edwards Steel Shingles cost less, far LESS, than prepared-paper or composition roofing. IF YOU FIGURE THE COST PER YEAR. And that's the right way to figure.

Mention Pennsylvania Farmer in every letter or card you send to our advertisers. It helps them and helps us.

Dane kicked the foot of a lad beside him, and glanced at the piano as he he stood up.

"Sir," he said simply, "altho we have differed about trifles and may do so again, we don't want a better one—and if we did we couldn't find him."

A chord from the piano rang thru the approving murmurs, and the company rose to their feet before the lad had beaten out the first bar of the jingling rhythm. Then the voices took it up, and the great hall shook to the rafters with the last "Nobody can deny."

Trite as it was, Barrington saw the darker flush in the bronzed faces, and there was a shade of warmer color in his own as he went on again.

"The things one feels the most are those one can least express, and I will not try to tell you how I value your confidence," he said. "Still, the fact remains that sooner or later I must let the reins fall into younger hands, and there is a man here who will, I fancy lead you farther than you would ever go with me. Times change, and he can teach you how those who would do the most for the Dominion need live today. He is also, and I am glad of it, one of us, for traditions do not wholly lose their force and we know that blood will tell. That this year has not ended in disaster irretrievable is due to our latest comrade, Lance Courthorne."

This time there were no musical honors or need of them, for a shout went up that called forth an answering rattle from the cedar paneling. It was flung back from table to table up and down the great room, and when the men sat down, flushed and breathless, their eyes still shining, the one they admitted had saved Silverdale rose up quietly at the foot of the table. The hand he laid on the snowy cloth shook a little, and the bronze that generally suffused it was less noticeable in his face. All who saw it felt that something unusual was coming, and Maud Barrington leaned forward a trifle, with a curious throbbing of her heart.

"Comrades! It is, I think, the last time you will hear the term from me," he said. "I am glad that we have made and won a good fight at Silverdale, because it may soften your warranted resentment when you think of me."

Every eye was turned upon him, and an expression of bewilderment crept into the faces, while a lad who sat next to him touched his arm reassuringly.

"You'll feel your feet in a moment, but that's a curious fashion of putting it," he said.

Winston turned to Barrington, and stood silent a moment. He saw Maud Barrington's face showing strained and intent, but less bewildered than the others, and that of her aunt, which seemed curiously impassive, and a little thrill ran thru him. It passed, and once more he saw only the leader of Silverdale.

"Sir," he said, "I did you a wrong when I came here, and with your convictions you would never tolerate me as your successor."

There was a rustle of fabric as some of the women moved, and a murmur of uncontrollable astonishment, while those who noticed it, remembered Barrington's gasp. It expressed absolute bewilderment, but in another moment he smiled.

"Sit down Lance," he said. "You need make no speeches. We expect better things from you."

Winston stood very still. "It was the simple truth I told you, sir," he said. "Don't make it too hard for me."

Just then there was a disturbance at the rear of the room, and a man, who shook off the grasp of one that followed him, came in. He moved forward with uneven steps, and then, resting his hand on a chair back faced about and looked at Winston. The dust was thick upon his clothes, but it was his face that seized and held attention. It was horribly pallid, save for the flush that showed in either cheek, and his half-closed eyes were dazed.

"I heard them cheering," he said. "Couldn't find you at your homestead. You should have sent the five hundred dollars. They would have saved you this."

The defective utterance would alone have attracted attention, and, with the man's attitude, was very significant, but it was equally evident to most of those who watched him that he was also struggling with some infirmity. Western hospitality has, however, no limit, and one of the younger men drew out a chair.

"Hadn't you beetter sit down, and if you want anything to eat we'll get it for you," he said. "Then you can tell us what your errand is."

The man made a gesture of negation, and pointed to Winston.

"I came to find a friend of mine. They told me at his homestead that he was here," he said.

There was an impressive silence, until Colonel Barrington glanced at Winston, who still stood quietly impassive at the foot of the table.

"You know our visitor?" he said. "The Grange is large enough to give a stranger shelter."

The man laughed. "Of course he does; it's my place he's living in."

Barrington turned again to Winston, and his face seemed to have grown a trifle stern.

"Who is this man?" he said.

Winston looked steadily in front of him vacantly noticing the rows of faces turned towards him under the big lamps. "If he had waited a few minutes longer, you would have known," he said. "He is Lance Courthorne."

This time the murmurs implied incredulity, but the man who stood swaying a little with his hand on the chair, and a smile in his half-closed eyes, made an ironical inclination.

"It's evident you don't believe it or wish to. Still, it's true," he said.

One of the men nearest him rose and quietly thrust him into the chair.

"Sit down in the meanwhile," he said dryly. "By and by, Colonel Barrington will talk to you."

Barrington thanked him with a gesture, and glanced at the rest. "One would have preferred to carry out this inquiry more privately," he said, very slowly, but with hoarse distinctness. "Still, you have already heard so much."

Dane nodded. "I fancy you are right, sir. Because we have known and respected the man who has, at least, done a good deal for us, it would be better that we should hear the rest."

Barrington made a little gesture of agreement, and once more fixed his eyes on Winston. "Then will you tell us who you are?"

"A struggling prairie farmer," said Winston quietly. "The son of an English country doctor who died in penury, and one who from your point of view could never have been entitled to more than courteous toleration from any of you."

He stopped, but, for the astonishment was passing, there was negation in the murmurs which followed, while somebody said, "Go on!"

Dane stood up. "I fancy our comrade is mistaken," he said. "Whatever he may have been, we recognize our debt to him. Still, I think he owes us a more complete explanation."

(To be continued.)

Veterinary

(Conducted by W. C. Fair, V. S.)

(Advice thru this department is free to our subscribers. Each communication should state history and symptoms of the case in full; also the name and address of writer. Initials only will be published. When reply by mail is requested, it becomes private practice and a fee of $1 must accompany the letter. This is one of the most valuable columns of the paper and we invite readers to make use of it. Clippings from this column, when properly preserved and classified, would make one of the most valuable medical symposiums a farmer-stockman could obtain.)

Dislocation of Patella.—I have a 7-year-old horse whose stifle joint slips out of place. When it is out he is unable to step, but drags toe until it slips into position. G. E. H., Moorestown, N. J.—Clip hair off stifle joint and apply 1 part powdered cantharides and 6 parts lard every week or 10 days.

Kidney Ailment.—I have a 10-year-old horse that must have kidney trouble. His water is very thick; his back is tender when pressed and he stands as if uncomfortable. He moves about in stall, changing feet and after being down a few hours is very stiff in hind parts. He is lead for exercise daily. I caught some of his urine, let it stand for three days and there was quite a sediment. A. B. G., Southhold, L. I., New York.—Give your horse 1 oz bicarbonate soda, 1 oz powdered charcoal, a dessert spoonful of salt and a teaspoonful of powdered nitrate of potash at a dose in feed, 2 or 3 times a day. He should be fed some roots.

Knuckling—Cracked Heels.—I have a pedigreed mare that is getting straight on fore fetlock joints. I would like to know what can be done for her. I have another horse that has scratches. F. E. W., Emilie, Pa.—Clip hair off and blister fetlock joints with 1 part cantharides and 8 parts lard every 10 days. Kindly understand that her pastern may be short and upright; if so hard work or fast driving will have a tendency to cause her to knuckle forward. She should be shod level. Dissolve ¼ lb. sugar of lead, 3 oz of sulphate of zinc, 3 oz of carbolic acid in a gallon of water and apply to sore heels, 2 or 3 times a day.

Wire Cut—Scar Tissue.—I have a young mare that cut her shin to bone on wire; this wound is situated midway between knee and ankle and the flesh seemed to be torn loose from bone at time of accident. The wound covered over and left a raw bunch in center about the size of a silver half-dollar, which refuses to heal. She is not lame, but I would like to have a cure. R. H., Salisbury, Md.—Apply tincture of iron to raw fungus once a day and as you perhaps know it is very difficult to reduce a bunch of this kind without making leg sore. You will obtain fairly good results by occasionally applying tincture of iodine, however, you must avoid blistering bunch.

Infected Udder.—I have a cow that commenced to milk hard and in a short time I found it almost impossible to draw milk from one quarter. I used a sharp instrument to open end of teat, but in a week this quarter swelled, became hard; then stringy milk and matter came out. Sometime ago two of the other quarters inflamed and are now in bad condition. What caused this trouble? What must I do to effect a cure? F. I. L., Genesee, Pa.—Three quarters of her udder are now infected. It is doubtful if these can ever be restored to their original condition. If you will apply 1 part iodine and 20 parts fresh lard to the diseased portions of bag every day or two, you will make her some better. Also give her 2 dr of potassium iodide at a dose in feed, 3 times a day. When you opened teat the instrument may have been infected, or it is possible that infection passed thru teat canal into quarter and then later, while milking her, infection was carried by hand from one quarter to the other two. Dairymen are frequently careless in this particular. I am inclined to believe that she will prove unprofitable for dairy purposes.

Rheumatism.—About a month ago two 5-months-old pigs commenced to cripple. First one became stiff and in four or five days another one moved sore. The whole trouble appears to be in their legs and it must hurt them to walk. They seldom get up without assistance. G. E., Laceyville, Pa.—Change their feed from corn to oats and oil meal, giving them some tankage or roots; besides, keep them dry and warm. Brush them twice a day, and give each one 10 grains sodium salicylate at a dose, 4 times a day.

The Safest Breech-Loading Gun Built!

12 and 16 Gauge Hammerless "Pump" Guns

Six Quick Shots!

The Marlin hammerless repeating shotgun is a fine-appearing, beautifully-balanced gun, without any objectionable humps or bumps; no holes on top for gas to blow out through or water to get in; can't freeze up with rain, snow or sleet; its solid steel breech (not a shell of wood) permits a thoroughly symmetrical gun without sacrificing strength or safety; **it is the safest breech-loading shotgun ever built.**

It is **Hammerless** with **Solid Steel Breech** (inside as well as out)—**Solid Top—Side Ejection —Matted Barrel** (which costs $4.00 extra on other guns)—**Press Button Cartridge Release**—(to remove loaded cartridges quickly from magazine without working through action) **Double Extractors—Take-Down Feature—Trigger and Hammer Safety.** Handles rapidly; guaranteed in shooting ability: price standard **Grade "A" 12-gauge gun, $22.60; 16-gauge, $24.00.**

BUSTED PRICES!

Our Great 1914 Offer!!

BANG!!

No Money Down

WIRE & FENCING PRICES **ROOFING PRICES**

LUMBER PRICES **BUILDING MATERIAL PRICES**

Here is the Greatest Sale ever advertised—the opportunity you have long sought for—a chance to buy staple lumber and building material—Roofing, Wire, Fencing, Furniture and Household Goods of every kind and description, in fact, Merchandise of every nature, at unheard of low prices.

We are determined that the Spring of 1914, will be the most successful in the history of this Great Company, and the Wise man will take early advantage of the great bargains shown in this advertisement.

You can order a complete carload of building material from us, including everything you need to construct and equip and we will ship it to you, without one cent cash in advance.

All we want to know is that the money will be paid us as soon as the material is received, unloaded and checked up.

Lumber Prices S-m-a-s-h-e-d

Yes, we mean smashed. Absolutely busted to pieces. That's our policy. We quote prices on lumber that will positively save you big money. If you will send your lumber bill we will send you a freight paid price that will mean a saving to you of from 30% to 50%. Every stick is absolutely first class, brand new and fully up-to-grade such as you would buy from any reputable house in the United States.

We have determined that the year of 1914 is going to be the Banner year in our great lumber department. We have on hand 20,000,000 feet of high-grade lumber suitable for the construction of Buildings, no matter for what purpose intended. Come to our great yards in Chicago and let us show you this stuff actually in stock. No other concern in the world has a more complete stock of everything needed to build, whether Lumber, Shingles, Structural Iron, Plumbing, Heating, Doors or anything else that you may need. Do you know that lumber is getting scarcer and scarcer every year? Yet our prices are lowest and will continue so until our stock is gone. WRITE TODAY.

CHICAGO HOUSE WRECKING CO.

Now operated under the name of

HARRIS BROTHERS COMPANY

For 22 years the CHICAGO HOUSE WRECKING COMPANY has been well and favorably known to the public. During all these years the four Harris Brothers have been the executive officers and owners and for that reason have finally decided to operate under the name of HARRIS BROTHERS COMPANY.

There is no change in our business, except that in the future the four Harris Brothers will advertise and sell their goods, heretofore advertised and sold under the name of the CHICAGO HOUSEWRECKING COMPANY, under the new name of HARRIS BROTHERS COMPANY.

Why We Are Called the Great Price Wreckers

Consider what becomes of the stock of goods, when a manufacturer or big retail merchant goes bankrupt or "busted" as the saying goes. It is estimated that about ten thousand merchants annually meet with business disaster—this is why our company exists. If the stocks are sufficiently large and the goods are new and desirable, they find their natural way to our great forty acre plant for distribution at a small added profit, to our thousands of customers, who in this way get the benefit of wonderful bargains. In many cases our prices do not even represent the original cost of production. We stand foremost in our line. We recognize no competition. That's why we are called "THE GREAT PRICE WRECKERS."

Our Binding Guarantee

We guarantee absolute and complete satisfaction. There is no half way about this guarantee. Every purchase you make from us will be exactly as represented and you will be satisfied in every way, or we will make such just amends as are within our power. We will take back any unsatisfactory article at our freight expense both ways and refund your purchase price. We refer as to our responsibility to the publisher of this or any other publication or any bank or express company and to the public at large.

We Sell Practically Everything

Our stock includes practically "everything under the sun." It's in truth, from a needle to a locomotive. No matter what your vocation, or what position in life you occupy, or what your business, or how great a merchant you are, you have use for us, and we have the goods that you can buy from us to a decided advantage. The quicker you learn to recognize this fact, the sooner you will be "putting money in your pocket."

Our stock includes Building Material, Lumber, Roofing, Sash, Doors, Millwork, Wire and Fencing, Hardware, Plumbing Material, Heating Apparatus and Supplies, Furniture, Household Goods, Rugs, Stoves and everything needed to furnish or equip your home, your club or hotel. It includes Groceries, Clothing, Dry Goods, Boots and Shoes, Furnishing Goods and every single article to clothe a man, woman or child. It includes Sporting Goods, Fishing Tackle, Hunting Outfits, Tents, Guns, Harness and Vehicles, Jewelry, Sewing Machines, Clocks; also structural iron needed in construction of buildings, bridges, etc. Machinery, gasoline, gas and electric power outfits. In fact you cannot think of a single manufactured article that we cannot supply you at a saving in price. Let us convince you—it means but little effort on your part to prove the truth of all we say. Write us today for our Catalogue and literature. Fill in the coupon shown below.

THE GREAT PRICE WRECKERS

A THOUSAND PAGES OF BARGAINS

Write us today for a copy of our Great Big Spring Price Wrecker now off the press. It is the most stupendous Book of Bargains ever produced. LETTERS FROM CUSTOMERS

$1,000.00 Saved

Everything arrived in good condition. I saved on the building; also heating plant and bathroom outfit about $1000.00 as this kind of lumber would be very dear here.
Signed (LEWIS YOUNG, Pennsylvania.

$700.00 Saved

I am perfectly satisfied. Don't be backward in referring to me, for you have done more than you agreed to. I saved $700.00 and also got better material, and a better house.
(Signed) JOHN J. DUNN, Ohio.

Satisfied With Furnace

The furnace I got from you is perfect in every way. I would not be without it one winter for double its price. If farmers only knew how easy it is to install it, they would not be without it.
(Signed) HENRY D. CHARTER, Canada.

Used 12 Years and In Good Condition

Some 10 or 12 years ago, I bought quite a bill of Black Corrugated Roofing from you, and only painted it twice since I laid it, and it is in just as good condition today, as the day it was laid. Please send me your catalog, as I expect to put up a barn next Spring and am looking for something for a roof as good as that bought from you last time.
(Signed) W. W. STODDARD Ohio.

Will Order More

Am pleased to say the roofing all here and in splendid shape. Allow me to congratulate you on prompt delivery. You will receive more orders from me.
(Signed) D. DUCELLO.

Recommends Our Paint

I have used your Premier Paint in this salt atmosphere for the past four years and find it better for this climate than any paint I can buy, no matter what the price. (Signed) W. A. WEIDE, Florida.

$13 BUYS COMPLETE BATHTUB

This is a white enameled, cast iron, one-piece, heavy roll rim bathtub; fitted with the latest style nickel-plated trimmings, including Fuller double bath cocks for hot and cold water, nickel-plated connected waste and overflow and nickel-plated supply pipes. The Purchase of Lime.

By Prof. JOHN H. VOORHEES,
New Jersey Experiment Station

Headle Dr T J
Rutgers College
814

It is no easy matter to buy all of the supplies eded on a one-hundred acre farm and at the same e have assurance that the purchases have been de efficiently and without error. A generation o it was much easier than it is today. At that e knowledge of scientific farming was much less d the markets were not so overcrowded.

Every successful farmer must pur- ase lime. Stop and think for a mo- ent of the choice of the various nds, the same kinds with different mes and the multitude of values l costs, not to mention the agricul- ral factors upon which its purchase pends. The ordinary burned lime lcium oxide, (CaO) is known as e, quicklime, caustic lime, stone- e, lump-lime, unslaked lime, etc., d there are any number of so- lled "prepared agricultural limes."

In order to understand lime and rchase it efficiently it is necessary know its source, its form or chemi- l composition, and since the advent the ground forms, the fineness of ision of each. Advancing explana ns of these points, lime occurs in ture as pure calcium limestone, cal- m-magnesium limestone, oyster ells, and shell marls. There are vast mations or deposits of pure calcium and calcium- gnesium limestone in Pennsylvania and neighbor- states, including New York, New Jersey, Dela- e and Maryland. Oyster shells are to be obtained the greater part at seacoast points, where oyster- is the chief occupation of the inhabitants, and r big cities where the oyster is used as food and the shells are a waste from easting-houses, [illegible] ants and hotels. The shell marls are not so gr[illegible] in importance because the number of deposits now being operated is small. This form of lime, however, is one of the best from an agricultural point of view because the deposits were laid down centuries ago and a large proportion of these substances is immediately usable in the soil without any grinding or burning. The marl deposits now being worked are limited to the coastal plain states. I know of one in New Jersey and I believe there is one in New York, one in Massachusetts, and one in Virginia.

MARL PIT IN SUSSEX CO., N. J. THIS MARL ANALYZES APPROXIMATELY 97 PERCENT CALCIUM CARBONATE, EQUIVALENT TO 54 PERCENT CALCIUM OXIDE OR ACTUAL LIME.

These sources of lime all occur in Nature as the [illegible] nate of lime or calcium carbonate. In its na- [illegible] it is not immediately available or usable [illegible] the purposes desired upon application to t[illegible] must be finely powdered or ground. The adve[illegible] powerful machinery for this purpose has been recent—within my own memory. Looking back, way back, into the days of our forefathers, they learned that the limestone rocks of the hills, as well as the oyster shells, changed upon the addition of heat. Use was made of this knowledge by building kilns and burning the limestone. We know now that the addition of this heat caused the liberation of a gas known in chemistry as carbonic acid gas, or carbon dioxide; and further that the heat caused a change in the form of the material; the resulting material being the oxide of lime, or calcium oxide. Because this oxide is an integral part of all forms of lime, it has been designated as a constant or basis upon which the content of actual lime in any form is determined. To this I will refer later.

The purest forms are usually sold as building material and the less pure to farmers as quick-lime, stone-lime, lump-lime, etc., for agricultural purposes. This form may, of course, be derived from the pure calcium limestone, calcium-magnesium limestone, and from oyster shells. Whatever the source, this burned lime has an affinity for water or air and will absorb either if either or both are brought into contact with it. To make this burned product fine, capable of even distribution and more

MARL READY FOR SPREADING ON FARM OF THOMAS INSLEE, SUSSEX CO., N. J. PUTTING LIME IN PITS IS NOT GOOD PRACTICE BUT HERE IT AIR DRIES, MAKING IT CAPABLE OF MORE EVEN DISTRIBUTION.

readily soluble, it has been the practice of the user to add water. This operation is called slaking. The amount of water needed is about one-third, by weight, so that the resulting product, water-slaked lime or hydrated lime, may be said to be quicklime diluted by combination with about one-third of its weight of water. The change which occurs is accompanied by marked physical changes; the lime swells in bulk, crumbles to a fine powder and generates much heat. The rapidity with which commercial lime slacks depends upon the amount of water used and the composition of the quick-lime. It is not a good practice to use water too freely because too much water or a sudden chilling of the partially slaked lime by cold water is liable to result in the production of a coarse, granular material in place of the desired fine powder.

As previously stated, the less pure forms are sold to the farmer. It is not wise to buy forms containing more than 10 percent of impurities because the slaking is slower and imperfect. Regarding the calcium-magnesium limes, I always feel like saying "when in doubt, don't", because they, too, slake imperfectly; and while it is known that magnesium will correct just as much and a little more acidity than calcium, yet the effects of magnesium in other ways have never been definitely worked out, even tho larger yields are sometimes secured.

The introduction of powerful machinery not so many years ago for crushing and pulverizing the original limestone rock and oyster shells has had its influence upon the market. It has heightened competition. It brought into operation a new method of making the lime of limestone available and capable of distribution. Two new forms of lime, ground limestone and ground oyster shell lime, both of the same chemical composition, and new methods of handling by shipper and farmer, were added to the original complications of buying and using this soil amendment. These are both in the form of carbonate of lime and the availability of any ground product desired from the original rock will depend under our conditions upon the fineness of division or the size of the particles.

Aside from the five kinds, burned limestone, burned oyster shells, ground limestone, ground oyster shell, and marl, many "prepared agricultural limes" have appeared in recent years. These the farmer should investigate as to price and actual lime content in comparison with other forms. It is my experience in two years' of purchasing for an agricultural co-operative organization that they are, except for a few, too costly. The manufacturers of some of these kinds of lime have capitalized the farmer's ignorance of chemistry and played on the shortage of farm labor to sell their products at prices far in excess of their actual value, everything considered. It is not my intention to mislead anyone to believe that these products or so-called "agricultural limes" are not just as good or that they are harmful in any way, but the price per pound of actual lime should be carefully compared with the price per pound of actual lime in other staple kinds. "Look before you leap," and think and figure before you buy.

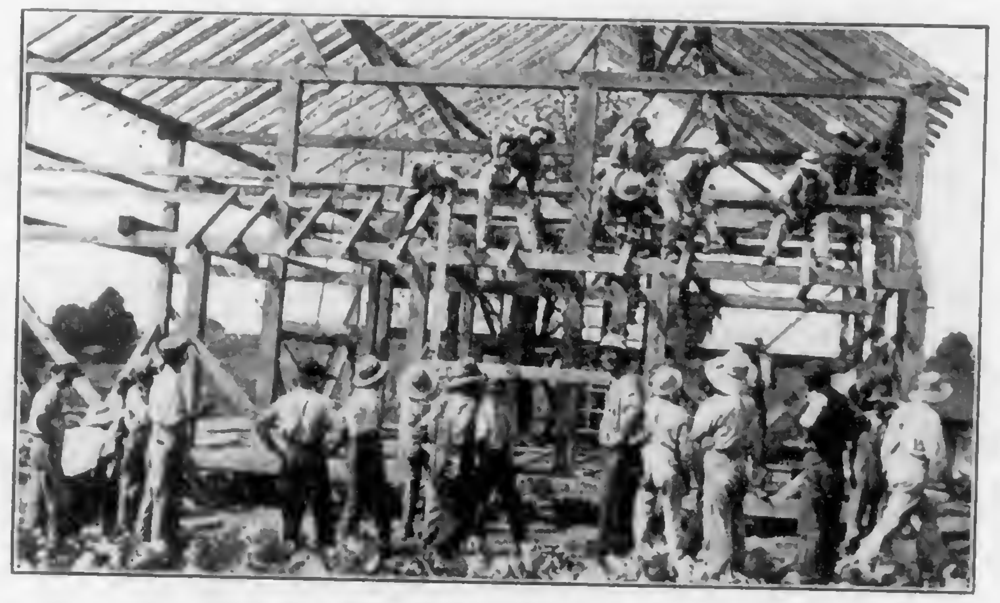
Assume that you have been offered several kinds of lime. For instance, ground limestone at $3.00 per ton delivered; lump-lime, quick-lime, or burned lime (which ever you wish to call it) at 14 cents per bushel, which, at 80 lbs. to the bushel is equivalent to $3.50 per ton; prepared hydrated lime, at $6.00 per ton, and ground burned lime—another "agricultural lime"—at $6.00 per ton, which are you going to buy? In the ground limestone there should be approximately 50 percent of actual lime, or 1,000 lbs. in one ton. That brings up the question of just what actual lime is. It is not easy to understand. It is really the part of lime which actually corrects acidity in the soil. The reason why there are different amounts of actual lime in different kinds of lime is because the actual lime—calcium oxide—is diluted either with water or with a gas known as carbon dioxide. Sometimes, as in the case of burned lime, it is in the form of calcium oxide and is actual lime except for the impurities which occur in all forms of lime used for agricultural purposes. To continue, the burned lime would contain 90 to 95 percent of actual lime, or approximately 1,800 lbs. in one ton; the prepared hydrated lime, 70 percent actual lime, or 1,400 lbs. in one ton and the ground burned lime 90 percent actual lime, or 1,800 lbs. in one ton. The amount of actual lime and cost per pound is always the first consideration. Perhaps the following table will help you to determine this factor.

Kind of Lime	Guarantee percent Actual Lime	Pounds Actual Lime in one ton	Quotation per ton Delivered	Relative Value Actual Lime
Burned Lime	90	1800	$3.50	$\frac{\$3.50}{1800}$ or 0.19
Ground Limestone	50	1000	3.00	$\frac{3.00}{1000}$ or 0.30
Hydrated	70	1400	6.00	$\frac{6.00}{1400}$ or 0.42
Ground Burned Lime .	90	1800	6.00	$\frac{6.00}{1800}$ or 0.33

METHOD OF CALCULATING RELATIVE VALUE OF ACTUAL LIME IN DIFFERENT FORMS.

This accomplishes one step. It shows that burned lime is the cheapest source of actual lime at the quotations given. The cost of handling and the fineness of division of the ground forms should be added to this table. These were discussed in my article of February 7th.

In closing, let me add that sometimes a two-cent stamp will save a dollar on every ton. My own experience as purchasing agent as mentioned has taught me the value of search. One quotation from one firm may be as good as ten, but on the other hand, the tenth quotation may save that dollar for you on every ton. Your agricultural paper and your Agricultural Experiment Station will help you in your search for a reliable source of lime or any other farm supply.



A LANCASTER COUNTY BARN RAISING.

THE BARN RAISIN'

No event in our rural life better illustrates the disposition of the farmers to get together and be of mutual help than the old barn raisings. At such a time every able bodied farmer for miles around leaves his work for a few appointed hours and drives to the scene of activities to shoulder his part of the burden and carry his share of lumber.

Sometime ago the owner of the barn shown in the illustration was kind enough to permit some bed clothing from a neighbor's who had just been burned out, to be stored in his barn, out of the path of a coming rain storm. Some live sparks lay hidden in the clothing, and within a few hours after the kindly act, the good Samaritan's barn was also reduced to ashes. The accompanying illustrations portray two stages of the rebuilding of the barn, on the farm of Benjamin D. Mellinger, Lancaster County. "Abe" Herr was master carpenter.—Dr. D. McCaskey.

FARM EXPERTS AGAIN

After reading the article in the Pennsylvania Farmer of February 21 entitled "Farm Experts and Expert Farmers," I am led to believe that a somewhat wrong impression is given of the duties of so-called County Agricultural Agents. The following points, taken from the last issue of the Farm Management Monthly, published at the Office of Farm Management, Washington, D. C., are apropos, and I feel will prove of interest to readers of the Pennsylvania Farmer in telling just what constitutes the work as outlined for County Agricultural agents.

County Agricultural Agents are sometimes referred to as "county advisers." This implies a misunderstanding of the real work of the agent. Advisory work is a part of the agents' duties, but it is a minor part. Farmers quite generally resent and refuse to support the county agent whose work is outlined to them primarily as that of an adviser. As we conceive of it, the county agent has about half a dozen principal functions:

1. He studies the agriculture of the county to learn what is being done and what is worth while agriculturally in each part of it. This study includes farm, financial and organization surveys.

2. He gives the results of his studies to farmers, not in the way of advice but as facts observed and conclusions drawn. This is done thru the local press, lectures, institutes, circulars, short courses and personal interviews.

3. Based on these local studies and the ascertained need of the county, clubs, associations and the like are organized and the individuals solicited to undertake definite lines of agricultural improvement on their own farms. Organizations are also formed for co-operative buying and marketing and the standardization of farm products.

4. He co-ordinates all existing agricultural agencies within the county so that all may work unitedly and efficiently.

5. He develops local leadership. The task of improving the agriculture of an entire county is so stupendous that the agent must be primarily an administrator. He must inspire and accept the help of voluntary assistants.

6. He acts as the connecting link between the scientists of the research institutions of the state and nation and the farmer, presenting the results of investigations in such a way that the farmer can use them, and calling the attention of scientists to the local agricultural problems of the county and soliciting their assistance.

7. He gives advice. This may relate to spraying, seed treatment, mixing fertilizers, combatting insect pests, cultural practices, or other miscellaneous matters which are the stock in trade of every well informed agent.

We place the giving of advice seventh on the list because in actually improving the agriculture of the county it is probably of least importance, altho in point of time it may be the first work undertaken.—C. F. Preston, County Agent, Chester County, Pa.

Farm Crop Notes

By E. P. KESTER

Counselor on Soils to the State Department of Agriculture.

Thru this department Mr. Kester will discuss queries from Pennsylvania Farmer readers on soils, field crops and general farm practice. Address all queries to Pennsylvania Farmer, Philadelphia, Pa.

Improving Run-down Land

Two letters received recently from two men widely separated tell the same story and ask similar questions. Both have recently bought run-down farms. Neither has money with which to make improvements. Running expenses, as well as a living, must be made from the farm. One of these men has worked on a farm all his life, while the other is a mechanic. The mutual concern is, how to increase productiveness most economically.

Duplicate situations can be found in every section of the country. Not only by beginners is this a pertinent question, but honest inquiry is being made by men who have been farming for years. Too often we see the pathetic situation where hard work has not brought even comfort and the necessities of life to the farmer and his family, yet with right methods of handling, the soil would have responded and at the same time increased its power to produce.

One promising characteristic of these inquirers is that they are starting new and are willing to learn. Many farmers feel that there is no hopefulness in their situation since their methods and practices have not brought them success. It would be interesting to follow the course of these two men for the next few years. The difference in their success will largely represent the difference in the inherent qualities of the men themselves, because "it's more in the man than in the land."

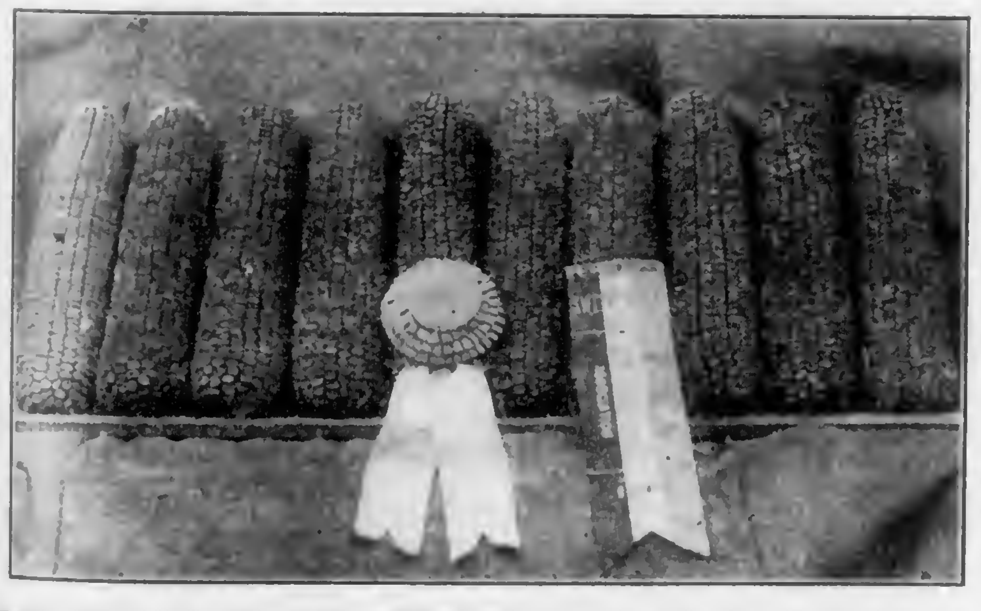
Success under such conditions is worth infinitely more to a community as an object lesson than are the Alladin-like creations of millionaire farmers whose developments, made possible by limitless money, more often dazzle and discourage than help the neighboring, practical farmers. It is possible that too little has been said or published on what we might call natural methods of soil improvement, and too much said, relatively, about percentages, pounds, elements, chemical combinations, etc. All these things are important and are a part of the study of soil improvement, but the over-emphasis has led many a farmer to think only in these terms and to guage his possibilities and hopes by his ability to buy foreign material to apply.

A great number of farmers are practically in the situation of these young men; they must make a living and improve the soil at the same time, with no capital or other income. That it can be done is proven by individual successes found in every part of the country. The secret of their success, if it may be called a secret, is invariably found in what may be stated in a single sentence: They have developed and maintained the right physical and mechanical condition of the soil.

I wish it were possible to sear that sentence into the minds of every farmer, in big letters. The soil must be considered as more than a repository for plant food brought from some other source. Even the so-called worn-out soils have great quantities of most elements of plant food in them. But it is "locked up." Nature will let man rob her for a while, then she turns the key on her stores of plant food. But she will hand the key over to the man who will treat her right and put the soil in the right physical condition, use a sane rotation, cultivate intelligently and thoroly, assist in taking care of her generous supply of moisture, and grow plants that will furnish her bosom with the life-giving element, nitrogen.

It is comparatively a slow process, but the results are worth the waiting. Agriculture is unattractive to much of the present-day impatient generation, mainly because Nature does not have a pay-day every two weeks. Natural processes can not be hurried, but he who works with them faithfully and intelligently learns one of the greatest lessons of life, patience. There is no short-cut, no royal road to success in restoring fertility, but there are shorter and longer ways. There is no magic wand that can be waved over the land with a "presto, change!", and make fatness spring up, like genii, from depleted soil.

The writer proposes to write a series of articles dealing with methods of handling the soil and the growing of crops that will improve its physical and mechanical condition and increase its productiveness. It is largely in this phase of the question of soil improvement that the poor man's hope lies.—R. P. K.



TEN EARS YELLOW DENT CORN. WINNER SWEEPSTAKES AT MARYLAND WEEK SHOW AND INTERSTATE CONTEST, 1913. Grown by A. B. Twining, Harford Co., Md.

VALUE OF BREEDING IN CORN

The 10 ears of corn here shown are of the Yellow Dent variety, grown the second year in the East from pure-bred seed from Illinois puchased in the spring of 1912. On account of selection and acclimation, it did much better in 1913 than in 1912, and I am told by experienced men that it should do still better this year. Some of the ears were in the sample of ten that won sweepstakes for the Eastern Zone at the National Corn Show at Dallas, Texas. We also had Champion single ear and Champion 10 ears white.

This corn was planted on an old alfalfa sod plowed last spring and fertilized with 400 lbs of 2-9-5 goods to the acre. The ground was hardly as well prepared as it should have been as the very stiff sod was hard to work up and in the pressure of spring work I did not give it as much time as it should have had. I believe in the old adage, "Work corn before you plant it." The seed was hill dropped with a corn planter in rows 3 feet 2 inches apart, and about 30 inches apart in the row, and thinned (when much too large) to two stalks to the hill. It was cultivated three times with a walking double worker (five times would have been better) and run thru once in the row with single cultivator when I sowed clover and alfalfa seed when corn was about ready to tassel. The corn is a medium early variety with ears ready for cutting in about 110 days from planting.

Owing to the fact that I am raising both white and yellow corn, and having them widely separated, I only had a small piece of yellow corn this year. The ground measured 3 2-3 acres and yeilded 85 bbls. as we measure corn here in Maryland (a barrel equalling 5 bushel of shelled corn) making 116 bushels per acre—the best crop I have ever raised. As to preference of white or yellow corn, it is still a question with me as to which I like the best; somewhat like the love-sick swain who said: "I could be happy with either one if the other wasn't there."

My white stock also came from Illinois about 8 years ago and is known as Boone County Special. On 11 acres of white corn last year, check planted 3 feet, 4 inches by 3 feet, 2 inches, the field averaged 18½ barrels (92½ bushels shelled corn) to the acre, but about three acres of this was a light sandy slope that did but poorly, owing to the dry spell we had during the season. I think, with all conditions equal, that one kind would do as well as the other. As to the feeding values, a chemical analysis I had made a few years ago showed that the white and the yellow varieties were about equal in content of protein and fat, and both were ahead of the mixed breeds.

I have not tried the ear-to-row method in breeding, but aim to pick all my seed that is to grow seed so that the whole field is a breeding plot and I do not believe that a more complicated method would give me any better results. As in our live stock, so in our corn, "Blood will tell."—A. B. Twining, Evergreen Farm, Harford Co., Md.

TRADE MARK Thomas A. Edison
EDISON PULVERIZED LIMESTONE
Nature's Crop Producer
Made from the purest Crystalline White Limestone obtainable.
Pulverized like flour; owing to its fineness of division, immediately available to plant life.
Not being Caustic, can be applied at any time without danger to plant life.
The best and cheapest form of Lime for all crops.
Especially recommended for Alfalfa.
Sustains fertility and increases productiveness of the soil.
Packed in 100 pound Bags, also in Bulk. For Sample, Booklet, Price, etc., address
Edison Portland Cement Co.
Stewartsville, N. J.

Potato Profits
depend largely on how the crop is planted. Every skipped hill is a loss in time, fertilizer and soil. Every double wastes valuable seed. It means $5 to $50 per acre extra profit if all hills are planted, one piece in each. That is why
IRON AGE 100 Per Cent Planters
often pay for themselves in one season on small acreage. They also plant straight, at right depth, 12 to 24 inches apart. New angle steel frame and steel seed hopper. With or without fertilizer distributor. Ask your dealer to show you this Planter and write us for booklet, "100 Per Cent Potato Planting" and copy of Iron Age Farm and Garden News.

PLANT BREEDING AND SEED SAVING BY FARMERS

STONY LAND MADE PROFITABLE BY ORCHARD PLANTING.

(Continued from last week.)

Nearly, if not all, vegetables and fruit plants, as well as our cereals and grasses, have been evolved from the wild or semi-wild plant. Louis De Vilmona evolved the carrot and parsnip from the wild one growing in fields and hedge rows. The strawberry of today was bred from the natural or semi-wild plant. The tomato, cabbage, turnips, beets and most of our grasses came thru the same course of procedure.

When the beet sugar industry first began it was found that the beet carried too small a percentage of sugar, only from 5 to 7 percent. It was found by selecting individual mother beets that carried a larger percentage of sugar than their fellows, the percentage of sugar might be increased. By following this practice generation after generation a breed has been evolved that now carries from 18 to over 20 percent of sugar. When the noted Frenchman began with the carrot and parsnip it was with the wild plant, selecting at first those plants that had vigor and a more fleshy root. Then, by careful selection generation after generation, those plants that showed tendencies along the line of larger root development, the carrot and parsnip of today were produced. Cabbage originally produced only leaves. Man, with his knowledge of breeding by selection, has wrought out the hard, solid, compact cabbage head that we enjoy today. One could continue illustrations along this line almost indefinitely, for practically everything we have came the same way or by hybridizing. But that is another story.

The thought may present itself that while all this is true and we now have such fine fruits, vegetables, cereals, grasses, etc., why bother our heads any more about it; let well enough alone. That, apparently, is just what we are doing. We forget or do not know that since all these various fruits, vegetables, etc., have come to us thru generations of careful work, that just as soon as this careful work ceases, the particular plant begins to go back to its natural state and condition, namely, the wild state. Hence, just as soon as seeds are gathered from anything and everything that grows, deterioration, low vitality and less vigor are sure to follow. The rule of "like begets like" holds just as true in plant breeding as it does among animals, poultry or even the human race. Nature has no opportunity among our cultivated plants to make her own selection; hence, it is not a case of the survival of the fittest among cultivated plants.

But what should the farmer do? It is needless to say "I am helpless. I know nothing about plant breeding." Every farmer knows something about plant breeding. Many a time you have observed a beautiful stalk of corn with one or possibly two ears on. It attracted your attention because it was better than most of what you had seen. Often the cabbage grower has found one or two, possibly half a dozen cabbage plants that produced larger, better-shaped or more compact heads or showed something that told him that if all his crop was like those few his yield would be greatly increased. This thing occurs daily among crops and farmers. Now why not, since we know that like begets like, select the best we have for seed. In the beginning of an operation of this kind there are some fundamental principles to be observed:

First, all plants produced from seeds are the result of two parents. Now if we could control the male parent the work would be much easier and far more satisfactory. But as this can not be done readily by the farmer we have to be content with a slower process thru control of the mother plants.

Second, in trying to maintain or improve any variety or strain of plants by selection the breeder should not have too many ideals in mind at one time. First form an ideal; know just what you are going to try to do and then conform rigidly to that. In other words, if a breeder is aiming for size of fruit, that should be his first consideration. If he is aiming for earliness, that should be the first attribute sought regardless of all others. If he is aiming for maximum yield or volume of crop, then that should be his first consideration.

The breeder should never attempt to breed for more than one important point at one time, because nature does not work in two divergent directions at the same time. For example, earliness and heavy yield do not go hand in hand. Neither does large size increase the volume of crop; we obtain one at the expense of the other.

Third, constitutional vigor in any plant is a prime factor, remembering always that the leaf surface is what makes for vigor. Leaf surface should be one of the breeder's considerations, and an important one it is. When we consider such crops as lettuce, cabbage, etc., remember that all nature is trying to do is to produce seed to perpetuate the species. She is not trying to produce something for humanity to eat or wear. In that effort, if a large cabbage head or a large well developed head of lettuce is produced, and that head is removed for use, you have taken away nature's storehouse of plant food; the very material that the plant made and stored away in that head to be used by that plant in its effort to produce seed. Hence, when seeds are grown from cabbage stalks that have had the heads removed, the seed of necessity must be weak and of low vitality.

If farmers would interest themselves along this line they would soon have a higher opinion of themselves and of agriculture in general. Furthermore, the gain in money value and satisfaction would be out of all proportion to the labor involved. The best method of procedure in the outset is, first, secure the best strain or variety of whatever plant you want to grow. Grow it the best you know how. When the crop is at its best, go into the field, first knowing just what your aim is as indicated elsewhere in this article. When you have found your ideal plant or plants, be sure you have taken the following into consideration: The whole plant as a unit. The shape of the plant; its amount of foliage and stem growth; where fruit is located on the plant, whether in a desirable or undesirable position; the shape of the fruit, quantity, quality and time of maturity; also health and constitutional vigor of the plant. A further examination should be made from interior appearance of the fruit and with such fruits and vegetables as carry succulence, flavor and interior qualities these should all be considered, eliminating all but the desirable. When this method is carried out religously, year after year, the breeder will soon see improvements.

After making the final selection, separate all small and light seeds from the lot. This may be accomplished, first, by floating off in clean water all that will float; second, blow out by wind all light seeds; third, screen out all small seeds. When all this is done we have left only the very best for our next crop, and those are none too good. It has been proven repeatedly that large, plump seeds of almost any plant produce a stronger plant; one that grows faster, matures its crop quicker and yields better than the same seeds of ordinary size.

The radish growers near our large cities found long ago that by planting only large, plump seeds they could mature one crop more during winter in their green houses than they could by using seeds of ordinary size. The lettuce plant has been so improved right here under my own observation by careful selection, as here indicated, that it will now head so uniformly that the whole crop can be harvested in less than one week, thus not only saving time but producing a far more uniform product with a higher commercial value. This topic is so broad the writer hardly knows where it ought to end, but perhaps enough has been said.—C. C. Hulsart, Monmouth Co., N. J.

HOT BEDS

There is usually one family at least in a community that has a hot bed. The crops of lettuce, radishes and other vegetables, as well as flowers, which they are able to enjoy as late as Christmas and in the early spring, are the enjoyment of all, yet this is often as far as it goes. The fact is, anyone that has a small piece of ground and can afford the expense of a small amount of glass and a few boards, can have a hot bed and run it successfully. Manure may usually be had for nothing.

The best location for a hot bed is on the south side of a building or of a tight board fence. The size of hot bed sash is commonly three by six feet.

After the size of the bed has been determined a frame or box without top or bottom is made of just the right size to admit of using the sash for a cover. The sash should slant to the

THIS year ten disk harrows will be sold where one was sold five years ago. Why? Because so many farmers have learned that the proper use of a disk harrow is the best guarantee of a successful crop.

Proper use of a disk harrow means the purchase of an I H C disk harrow because they are the ones built to do the best work. The frames are strong, to stand the strain of following the binder or of slicing meadows. The set levers keep the gangs to their work at even depth. The bearings are the most durable that can be put on a disk harrow.

The full line includes disk, peg tooth, and smoothing harrows, drills and cultivators. See this line before you buy. We send catalogues on request.

"The Disk Harrow," a book which illustrates and explains the proper preparation of a seed bed, and gives examples of the value of disking—32 pages of valuable information—is yours for four cents to cover postage and packing.

south, consequently the front of the box will be lower than the back. An eight-inch front and a twelve-inch back will be about right, tho many other forms are used. A hole is now dug where the bed is to be, of the same size as the frame, to hold the manure which furnishes the heat. The depth of the hole will depend upon the degree of cold that it is expected the growing plants will stand. Zero weather will require 30 inches of manure, while for late fall or early spring usually a depth of twelve inches will suffice. If a twelve-inch layer of manure is decided upon, the excavation should be eighteen inches deep; the extra six inches to be filled in with soil in which to grow plants.

The manure should be collected a few days before seeds are to be planted or plants are to be set out. Fresh horse manure which is mixed with one-third of fine straw is commonly used. This is placed in a pile to ferment, which it will begin to do in a few days if kept moist. When steam is given off. the pile is forked over, throwing the outside toward the center. After a few days the manure will become heated a second time, when it is ready to put in the bed.

In filling the beds put in a layer of manure at a time and press it down firmly with the feet. Care must be taken to see that each layer is spread evenly and packed thoroly. The frame is now placed so that the bottom will be a little below the surface of the ground and covered with the sash until the bed is heated thru. When this has been accomplished the surface of the manure should be made smooth and the six inches of fine, loamy soil filled in. The bed should be allowed some more time to warm the soil, when it will be ready for seeds and plants. In the meantime the frame should be well banked on the outside with the same heating material.

Such a bed should give off heat for five or six weeks if made in the early spring or late fall.

Covering of some kind must be provided for the beds and be put on before the sun gets low in the afternoon and then allowed to remain until 9 or 10 o'clock in the morning, depending upon the the weather.

Great pains must also be taken with the watering and ventilating. Water only during the middle of the day so that the surface soil and the plants may have time to dry before dark. Otherwise the dreaded damping off of the plants may be induced. Ventilation is required for the same purpose. Moreover, there is a large amount of injurious gases given off from the manure which must be allowed to escape. Even in the coldest weather ventilation should be provided, if only for a short time each day.

If such crops as lettuce, radishes, onions and spinach are started in March, tomato and cabbage plants may be started after these crops are off. Plants for the garden may be grown in this way which are superior to those ordinarily found upon the market.—W. Paddock, Colorado Agricultural College.

The Orchard Service.—State Zoologist Surface has instructed his orchard inspectors and demonstrators to begin the collection of data regarding orchards on the plan recently outlined in this paper, without delay. Already hundreds have offered information for the card index of orchards to be made at the Capitol and it is expected that much valuable data will be available before the end of the summer.

Quantity and Quality Characterize Crops Raised With

E. FRANK COE FERTILIZERS

1857 THE BUSINESS FARMERS' STANDARD FOR OVER FIFTY-FIVE YEARS 1914

Mr. L. S. Bean, of Aroostook County, Maine, specializes in Potatoes of Quality.

His entire crop is purchased for seed purposes by Messrs. Peter Henderson & Co., of New York, whose standard for seed potatoes is the highest.

The photograph shows Mr. Bean's men digging a field of Irish Cobblers that yielded 418 bushels per acre. On another field Mr. Bean's yield was 566½ bushels per acre, all raised with E. Frank Coe Fertilizers.

Mr. Bean's record with E. Frank Coe Fertilizers is as follows: In 1911, 10 tons; in 1912, 90 tons; in 1913, 150 tons. He expects to use more in 1914. Is there a thought here for you? If so, write us.

THE COE-MORTIMER COMPANY, 51 Chambers St., NEW YORK CITY

Poultry

FACTS ABOUT INCUBATORS

The hatching and rearing of poultry for egg production would be quite out of the question if it were not for modern incubators. No experienced person will attempt to raise fowls entirely for egg production and depend upon the hens for hatching the chicks. Not only are they poor setters, but it pays better to keep them on laying and use artificial means for hatching.

There are many good incubators on he market that will give excellent satisfaction when properly handled. It is best before investing extensively in any kind of incubator to understand the machine thoroly. If after trying a certain make of machine it has given good results, then additional machines of the same kind may be purchased.

There are two things that confront the prospective buyer of an incubator, first, that of the price. Too often the price governs the kind of incubator that is purchased, regardless of the make or reputation. I have in mind a man who bought several machines because they were low in price and after one season's use he offered these cheap machines for half the original cost.

The difference in price lies in the difference in quality of the machines and not in their popularity. A good incubator should be well constructed and built of good lumber. It should be of lasting qualities and economical of oil. The heat supply should be perfectly and easily adjusted. The regulator should be sensitive to sudden changes of temperature, which is very necessary to a good hatch.

The best results are generally secured when the incubator is run in the cellar or a partly submerged room. It is much easier to keep an even temperature in a room of this sort than it is in an upper room. We have our incubators in a room that has been partitioned off from the rest of the cellar. There should be no drafts in the room and yet plenty of ventilation and light, which two factors are very essential. They should drop down at the top to afford good ventilation.

The new machine will need no disinfecting but the old one should be thoroly disinfected with a ten percent solution of zenoleum or creoline. In some experiments either of these coal tar preparations have reduced the percentage of chicks troubled with white diarrhea. Prof. Graham of the Ontario Experiment Station says, "Use sulphonal to wash out the entire inside of the incubators previous to putting in the eggs. I find the percentage of livable chicks considerably increased". A five percent solution of carbolic acid is also good for disinfecting. Never use kerosene oil in the incubator for this purpose. The lamps should be started and the machine kept closed for twenty-four hours, then open them and allow them to air out thoroly. If this is not done the disinfectant may do more harm than good. The incubator should be free of any strong odor before it is used.

The incubator should be run without the eggs until it has been regulated and the operator is thoroly acquainted with the adjusting of the machine. The disc should be raised about a third of an inch up from the heater when the thermometer registers 101 to 101½ degrees. After it has been adjusted to run evenly the little bur at the top of the thermostat should not be moved again, the raising and lowering of the temperature being generally controlled by adjusting the wick. After the incubator is running rightly the trays can be filled, but the eggs should never be piled on top of each other. We have tried crowding them in at first by setting them with all the small ends down and putting as many as 300 eggs in a 240-egg machine but I do not think it pays after all. When we do that we cannot turn them until we test on the third day and I would rather turn them on the second day if possible.

At the end of the third day the white eggs may be tested, while it is necessary to let the brown eggs stay in a few days longer. The infertile eggs can be used for cooking purposes for they are just as good as ever.

A BUNCH OF FLUFFS.

As our cellar has a tendency to be very dry we always supply extra moisture by the use of sand trays. These trays cover the entire bottoms of the machine. They are galvanized iron and can be secured of a tinner. They are removed the 19th day and all the slides are closed until the hatch is about half off, when they are opened up again. After the hatch is all out, which should always be at the end of the 21st day, we sometimes give the little chicks some luke warm water to drink, hardening them off by bracing the incubator doors open so that the change, when they are removed to the brooder, will not be such a shock. We always leave the chicks in the incubator until they seem to be pretty hungry and chirp considerably; frequently until they are 72 hours old. There is plenty of nutriment in the little chicks' body to last them 3 or 4 days and it is folly to take them out of the incubators too early and attempt to make them eat.

The lamps should be cleaned after every hatch and the burners boiled and new wicks placed in them.

Finally, I would advise the purchase of an incubator that is large enough to bring out all the chicks desired in one or two hatches, in which case they will be nearly the same age and much easier to raise. Of course, the incubators will have to be moved out of the cellar when not in use, unless one has an exceptionally dry cellar. In order to make them convenient to handle and get thru doors we use 240 or 250 egg size machines.—C. C. McCurdy, Crawford Co., Pa.

POULTRY.

SHOEMAKER'S BOOK on POULTRY and Almanac for 1914 has 224 pages with many colored plates of fowls true to life. It tells all about chickens, their prices, their care, diseases and remedies. All about Incubators, their prices and their operation. All about poultry houses and how to build them. It's an encyclopedia of chickendom. You need it. Only 15c. C. C. SHOEMAKER, Box 1109 Freeport, Ill.

PEN-Y-BRYN FARM
AMBLER, Box P 36, PA.
Breeders of S. C. W. Leghorns, White Wyandottes, Imperial Pekin and White Indian Runner Ducks Eggs, Chicks, Ducklings, and White Leghorn Pullets for sale

GRANDVIEW FARM
Single Comb W. Leghorns
Best laying strain, vigorous stock. Eggs for hatching, $1.00 per 15; $3.00 per 50; $5.00 per 100. If 50 percent hatch is not secured they will be REPLACED AT HALF PRICE. Let us book your orders early. J. M. & C. C. McCURDY, Hartstown, Penna.

EGGS FOR HATCHING
From Kulps famous 242 egg strains. S. C White Leghorns, S. C. Rhode Island Reds, free range breeders, $1.50 per 15, $6.00 per hundred, day old chicks, $12.00 per hundred. Good Cockerels, $2 00 each. Improvement of Permanent Pastures.---No. I.

By JOHN H. REISNER, Cornell University.

A TYPICAL WEED-GROWN PASTURE. A PROLIFIC SOURCE OF WEED SEEDS AND A WASTE OF LAND.

Present Condition in Pasture Lands

Never has the interest in permanent pasture lands been as wide spread as at present. Never has there been greater need of interest and intelligent action in reclaiming or improving them. We are right in thinking that the present condition and methods for the successful improvement of our permanent pasture lands present one of the most important and serious problems in our farm management today.

In some sections the situation is acute. In practically every section, the pasture problem is present and being recognized as such. The following will serve as an illustration. Ten to twelve years ago the writer helped harvest the last hay crop from a field that had been in meadow and pasture—so far as it could be determined from the most authentic sources—for approximately 70 years. In this time the largest part of the field had never been plowed. A crop of hay—timothy and bluegrass—had been harvested annually, and after harvesting the meadow was used as a fall pasture. Suddenly it gave out, and since that time it has not only not produced a crop of hay, but has furnished scanty pasture for the dairy herd. In the past fifteen to twenty years the writer has observed the gradual deterioration of many once productive pasture lands. It seems to be regional rather than local in area and importance. Doubtless these same observations have been made by many others.

We are also coming to think along the lines of an old Flemish proverb which reads "No pasture, no cattle; no cattle, no manure; no manure, no crops;" meaning, of course, that good grass lands are the foundation of good agriculture. With the deterioration of our grass lands, both permanent and temporary, we are almost bound to suffer the impairment of the very foundation of our agriculture. This applies directly to Pennsylvania agriculture.

The problem is important from a second standpoint, that of actual land area. From the most reliable data available, approximately one-third of the improved farm land in Pennsylvania is in permanent or temporary grass, used for grazing purposes only. Further, the unimproved farm lands, whose area is equal to about one-third of the total lands in farms are used largely, if used at all, for grazing. A conservative estimate would be that from 30 to 40 percent of the total land area in Pennsylvania is now being used, or may be used for either temporary or permanent grazing purposes.

A third important consideration relative to the problem is that of markets, and market demands. Pennsylvania has easy access to all great Eastern markets, in many ways the greatest in the world. The market demands for perishable and bulky products can be met by production most profitably according to their nearness to the source of the demands. Milk and hay must be supplied by the area closest the markets. Both require grass lands. Good pastures and meadows become indispensible, and they are becoming more so with the increasing market demands for such bulky and perishable products. With the development and improvement of the dairy comes a more diversified and steadier money income, and a more diversified farm management in order to profitably use the by-products.

From the standpoints, then, of market supply and demand, of diversity of income, of the large area invested, and from the standpoint of permanency of our agriculture, the importance of our grass lands assumes a larger and more significant aspect.

Classification of Grass Lands

In this classification only grass lands are included that are used permanently for grazing and are never or seldom plowed up for the use of a cultivated crop before reseeding for pasture. They may therefore be classed (1) as improved farm lands not in crops nor in temporary pasture, (2) as farm lands unimproved and (3) all lands other than farm lands that are not improved but including woodlots. Under the first class come the natural meadows usually found where there is running water, generally the most desirable and may become the most valuable for grazing purposes. In addition there is much land of low fertility over-run with weeds and brush which, combined with location and topography, can no longer be cultivated profitably for crop production.

The unimproved farm lands include the wet, low, undrained and overflow lands; stony lands which can never be cultivated; hilly lands and steep slopes which, with stony land, have been deforested, much of which should be reforested; and brush lands. This class of lands, all of which is or may be grazed, seems to present the most difficulties for successful and profitable management.

The third class of lands, including woodlots, are essentially forest lands, and altho they are of considerable importance in certain sections of the state, the first two classes are of such greater importance that they should receive, for the present at least, our more serious consideration. When we have succeeded with them, then it will be time to look more carefully into the latter. Further, we must put our investment of time and money where it will bring the largest and surest returns.

Causes of Deterioration

An understanding of why and how these pasture lands have deteriorated is fundamental in understanding how they can be built up again, and in determining what methods can be used with surest chance of success. The first cause is probably the lack of appreciation of the value of these lands and what they needed or would need, and consequently their neglect. They have been more or less left to nature and the dairy herd, and no particular care given to them.

The second cause, and probably the most important, is grazing, either too early, too close or too late. Too early grazing, if the soil is still wet and heavy causes excessive packing and puddling of the soil, making plant growth extremely difficult if not seriously injuring root development. Further, plant growth is affected by having the young leaves eaten off before a sufficient amount of food is elaborated and stored in the plant for its own future use. Too close grazing may be accompanied with even more serious results. No organic matter at all can be returned, with consequent loss of humus to the soil. Evaporation is intensified, and if it is a region of high temperature positive injury may be done to the roots. The effects of too late grazing in tho fall are obvious. The conditions of wintering are made more difficult by the removal of the green matter which should be allowed to remain on the ground as a protective covering, and the plant can store less food with which to pass thru the winter.

A third cause for deterioration is the increase of weeds and brush. Generally, weeds do not crowd out the grass. When the grass gets thin, the weeds come in and when once started they are usually quick to make use of every opportunity to further increase. When the grass is out and the weeds come in, then follows brush in nature's rotation, and the result is usually a worthless pasture. The elimination of grass and the introduction of weeds is often due to lack of fertility in the soil. Some of the necessary plant food elements may be actually lacking, or there is lack of moisture and actively decaying humus in the soil to cause the solution of the minerals present but unavailable. This is quite often the case where the number of pasture plants is limited to one or two instead of to five or six. Competition for food is generally keener among the plants of the same species than between the plants of different species.

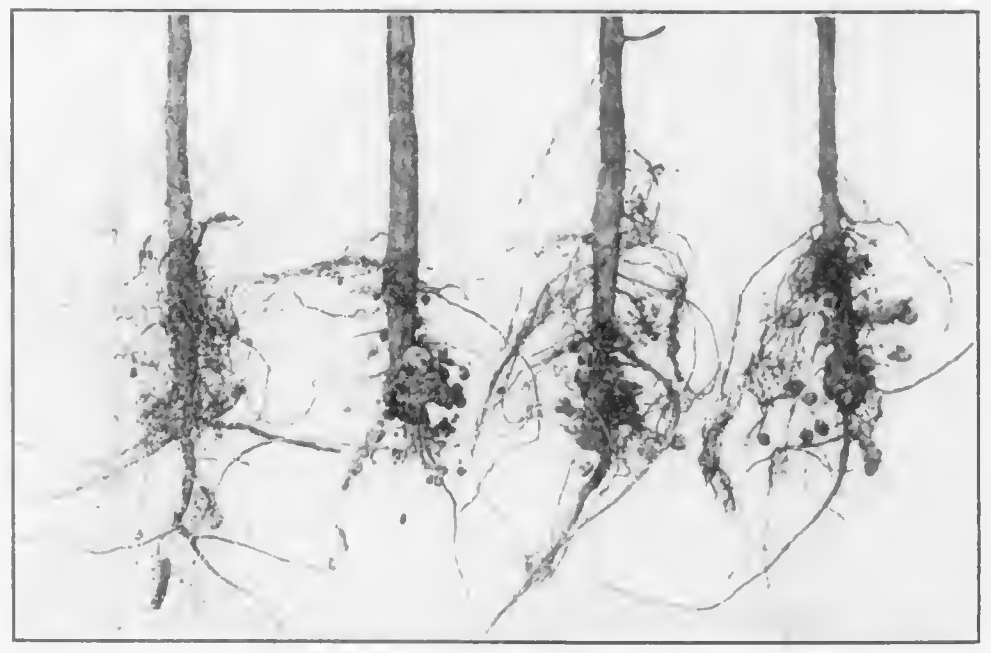
The last cause is lack of adaptation, first of the grass to its environment and second of the land for pasture purposes. Many pastures die out because the plants can not thrive under the given conditions of soil, moisture, fertility and exposure; or if the plants do not die out, those that survive may be such as are not desirable for grazing purposes. Further, many of the lands are not adapted to pasture at all. They are forest lands and should be reforested if they are ever to be of any value to their owners.

NOTE.—This is the first of a series of articles on this subject. The second article will appear in an early issue.—The Editors.

SOY BEANS AGAIN

Not so long ago the editor of a prominent farm journal told me that he had decided not to recommend the soy bean for use except with corn or other materials in the silo; that this was, to his mind, the best way in which to use this valuable protein supplier. Of course that would mean that the use of the plant would be confined to a comparatively negligible number of farms. But all farms need protein producers; and while it is probable that all farms need silos, as well, why confine the use of a valuable plant to those who have money and initiative enough to erect silos?

Moreover, there are a very great many farms that need the soy bean for another reason—the restoration of humus and nitrogen of which the soils have been depleted thru drawing too severely on the land without paying back the drafts. What particularly brought this matter to my attention at this time is a letter just received from a man who is regularly engaged in mercantile work in New York City, but who has a farm in the foot hills of the Catskill mountains, which he is trying to bring back to a state of fertility largely by the use of leguminous crops. I quote from this letter as follows:



NODULES ON ROOTS OF SOY BEANS GROWN FROM INOCULATED SEED.

"Owing to the delay in getting inoculating fluid, my beans got into the ground so late that they needed about one week or ten days more to ripen when frost came. Altho the piece of ground where they were tried was rather poor and the weather immediately and during the whole remaining season very dry, they grew fairly well. When killing frost came most of the beans were immature and green, with a few just ripening. Under the circumstances I decided to let them stand in the field with the idea of plowing them under in the spring, and re-seeding this plot with soy beans to get it well inoculated.

"On Washington's birthday I went to visit my farm and going thru the field found my soy beans sticking out their heads from beneath over a foot of snow. I picked off a few pods and to my surprise found that practically every seed had ripened and become black, proving that even tho the plants had long ago been killed by the severe weather the seeds continued to ripen. One row not inoculated was very much poorer than the rest."

This experience is one I have gone thru with repeatedly; and I happen to know that it has also been gone thru with by one of our experiment stations, in a deliberate test made to determine whether the soy bean had this power or not. But the curious fact, and one worth considering, is that some of the varieties, notably the one referred to above (Wilson), have the power to retain seed so that it can be harvested successfully in the spring, and the alternate freezes and thaws of winter do not apparently affect its power of germinating.

In my first experience of this sort, seed taken from above and below the snow line February 1, germinated over 97 percent; the experiment station test was not so high, because of a rain which froze on the pods and remained for some time. The first year we got caught by frost, (waiting for the ground to dry), we had about five acres that staid out all winter. In the early spring we turned our pigs loose, took them to the field once; and then, each morning, would let them out of the pen. It would have required a double-quick lens to have taken a moving picture of those shoats going for that soy bean field.

Is there any other crop that will lie out all winter and still furnish first-class seed or feed as you may desire? And why must we wait for silos to grow it?—Abram Bunn, Bedford Co., Pa.

ROUNDING OUT THE FEEDING SEASON

The old adage about "half your corn and half your hay still in the barn on Candlemas Day" is familiar to all. Doubtless this a pretty correct dividing line for the winter, yet I have often thought that while but half of the fodder may have been consumed, the quality has deteriorated so much that it is far less valuable. This is particularly true of corn fodder. Not only is it of less value in nutrients, but the cows do not eat it so readily, showing that it has lost much of its palatability. Oats and pea hay has also lost some of its value, as the mice have probably consumed more or less of the grain.

Silage seems to be the one food that does not decrease in value as the winter advances. Fortunate indeed is the farmer who finds his silo still holding a goodly supply for the March days. At this season the appetite of the cow seems to require something different, yet they never seem to tire of the silage, no matter how much they may pick over the other fodder. A good plan to follow is to feed the other things out in the early winter, reserving the bulk of the silage for the early spring days if the supply is limited.

Next in value to the silage comes the hay of legumes. Peas and oats, tho not as good as earlier, will still be relished by the cows better than the feed of timothy. Clover hay, properly cured, is a better fodder, and alfalfa, where that crop is raised, is one of the best. Leguminous hay seems to keep up the strength of the cows better than common hay. It is of necessity true that the cold of the winter will have done its work with the cattle to a certain extent and their vitality will have been taxed by the inaction. As the winter advances they need good food, and silage and legumes make the best.

Mangles are grown by many dairymen and at this season they may be fed with excellent results. A liberal quantity may be fed to the milkers daily with no harmful results. Rutabagas must be given with more care, else the milk may be tainted. Roots help to keep the digestive organs in fit condition, being especially valuable where the feed is largely of red top or timothy hay. They also increase the flow of milk to a considerable degree. In the spring they are in better condition than when dug, provided they have been kept from freezing.

Stock molasses is sometimes fed mixed with cut fodders. This adds considerably to the palatability of the food and doubtless helps the cows to assimulate the necessary amount of nourishment. Oil meal is fed, but care should be observed, else the butter may show the taint. Two or three pounds per day is about the limit for milking cows. The grain ration should be regulated by the other fodder available. Where common hay forms the principal item, more grain is necessary.—Charles H. Chesley.

Testing The Dairy Cow.—Circular 122 of the Ohio Experiment Station at Wooster, O., describes the following steps in milk testing. Secure a representative sample, measure out the required amount of milk with a 17.6 c.c. pipette and deliver it to the test bottle; add 17.5 c.c. sulphuric acid for whole milk, 20 c.c. for skim milk; mix gently but thoroly. Place in centrifuge and whirl at full speed for 5 or 6 minutes for whole milk and 7 or 8 for skim-milk. Add hot water to bring the fat up to the neck of the bottle to the 8 or 9 percent mark. Give final whirling at full speed for at least one minute. Read the test at 125 to 140 degrees Fahrenheit. Record the test and empty the bottle immediately; cleanse thoroly by shaking to remove sediment.

DAIRY CATTLE

HOLSTEINS

Three grandsons of King of the Pontiacs, one year old and ready for service. Individuality the very best. One is dark, two light colored. Sire is a son of King of the Pontiacs from a 25-lb. three-year-old, her dam a 22-lb daughter of Hengerveld De Kol and full sister to the dam of our 37-lb cow. Dams of these bulls all have official records and splendid backing.—Must be sold before February 23rd.

Send for pedigree and price.

STEVENS BROTHERS CO.,
Liverpool, N. Y.

WORLDS CHAMPIONS
Ayrshires Our cows made 23022 lbs. 4 per cent milk in one year. Our herd average is 11868 lbs.
Berkshires The large prolific kind. We won grand champion boar and sow at International.
Foundation stock for sale. The best is cheapest.
PENSHURST FARM, NARBERTH, PA.

HOLSTEINS
Heifer calves, high grades 7-8 Holsteins, $15 each, crated on cars Tully, 1 week old, express paid if 5 or more ordered at one time. Registered and high grade cows; also registered bulls. Branch address: Plumlyn Farm, Fairview Village, Pa.

Registered Jersey Cattle and Single Combed Buff Leghorn chickens. Eggs for hatching. $1 per 15. J. W. Reabuck, Rt 7, Danville, Pa.

Unadilla Silos Are Trustworthy

They preserve silage perfectly. Combine best construction, greatest durability and convenience. Easy to erect and keep air-tight. Write today for catalogue. Agents wanted. Address
UNADILLA SILO CO., Box P , Unadilla, N. Y

The Watch Tower of Prosperity

The INDIANA SILO is the Watch-tower that marks the advancing line of progress in agriculture. It stands like a beacon light to the farmers and points the way of safety to those whose course to independence is beset by crop failures and high price feed. The

INDIANA SILO

is the easiest silo to erect and keep in order. The mechanical features found only on the INDIANA SILO make it the best silo to be had. Dollar for dollar it gives the greatest services of all silos and if used according to our instructions it will last a lifetime. It increases production; it lessons labor and doubles profits. It is not an experiment. It is not sold on promises but on the strength of its own past performances.

More INDIANA SILOS are in use on American stock farms than of any other make.

The contents of an INDIANA SILO are never endangered as the INDIANA SILO never gives trouble while filled.

The INDIANA SILO is not affected by the settling or cracking of foundation; there is no danger of cracked or bursted walls. Wood is a non-conductor and no loss results through improper curing through lack of heat or absorption of the juices.

The present high price of feed stuff and of live stock makes it imperative that the farmers of America conserve the wealth which their acres produce.

Get ready to build a silo for 1914. We have a special EARLY BUYERS' Proposition which will be of interest. A new book by Benjamin Quod, "The Watch Tower of Prosperity," our new catalog and other literature will be mailed free upon request.

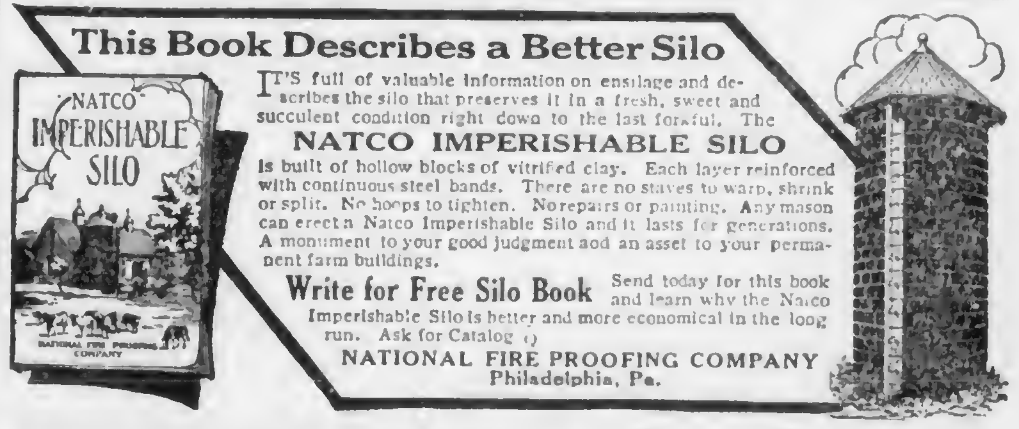
$15.95 AND UPWARD SENT ON TRIAL
AMERICAN CREAM SEPARATOR

Thousands In Use giving splendid satisfaction justifies your investigating our wonderful offer to furnish a brand new, well made, easy running, easily cleaned, perfect skimming separator for only $15.95. Skims one quart of milk a minute, warm or cold. Makes thick or thin cream. Different from this picture, which illustrates our low priced large capacity machines. The bowl is a sanitary marvel and embodies all our latest improvements.

Our Twenty-Year Guarantee Protects You

Our wonderfully low prices and high quality on all sizes and generous terms of trial will astonish you. Whether your dairy is large or small, or if you have an old separator of any make you wish to exchange, do not fail to get our great offer. Our richly illustrated catalog, sent free of charge on request, is the most complete, elaborate and expensive book on Cream Separators issued by any concern in the world. [illegible] Write today for our catalog and see for yourself what a big money saving proposition we will make you. Address,

AMERICAN SEPARATOR CO., Box 1062 Bainbridge, N. Y.



This Book Describes a Better Silo

IT'S full of valuable information on ensilage and describes the silo that preserves it in a fresh, sweet and succulent condition right down to the last forkful. The

NATCO IMPERISHABLE SILO

is built of hollow blocks of vitrified clay. Each layer reinforced with continuous steel bands. There are no staves to warp, shrink or split. No hoops to tighten. No repairs or painting. Any mason can erect a Natco Imperishable Silo and it lasts for generations. A monument to your good judgment and an asset to your permanent farm buildings.

Maryland College Bill

While the present situation of the Maryland Agricultural College may not be generally understood, several things stand out upon which there is full agreement. (1) Maryland Agricultural College has not been as strong a factor in development of the state's agricultural resources as it should have been. Like all land-grant colleges, it succumbed to the temptation to emphasize mechanic arts at the expense of agriculture. All forward-looking land-grant colleges have either reversed or are now reversing this policy. Dr. Patterson is very correctly urging that Maryland do the same thing with its college. He is undoubtedly right and his policy should have the loyal support of every farmer in the state. (2) The institution should be owned and controlled by the state. Founded in 1844 as a private corporation by public spirited citizens who acquired the property and erected the buildings by stock subscription, the title to the property is now vested in the stockholders and the state. Each owns a half interest in a property worth about $500,000. The state in the past made considerable appropriations to the college. It now holds an overdue mortgage of $15,000 against the stockholders' half interest. The institution is managed by a large and unwieldy board, composed of state officials acting as ex-officio members, state trustees, appointed by the Governor and the stockholder trustees. The burden of conducting the affairs of the college has very largely rested upon the shoulders of the stockholder trustees. This triplicate board lacks unity of purpose and unanimity of action. The destruction of the main college buildings by fire, brought the institution before the public. Its needs have been ably presented by Dr. H. J. Patterson, its President, and studied by a legislative committee appointed in 1912, as well as by the Country Life Commission and the City-Wide Congress, whose committee has recently held a number of conferences with other important city and state organizations. There is practical unanimity in the recommendations of these various bodies. The legislative committee of 1912 has presented its report to the legislature now in session, with three bills, providing: (1) For the taking over of the college by the state thru mortgage foreclosure proceedings; (2) granting the college a new charter, and (3) providing appropriations for rebuilding and maintenance as urged by Dr. Patterson. While certain amendments to these bills will probably be presented by the City-Wide Congress in conjunction with other organizations, there is practical agreement as to the main features of these bills. The most gratifying feature is the remarkable interest displayed by the leading civic organizations of Baltimore City in the rebuilding and reorganization of this institution. These organizations frankly admit and urge that the welfare and progress of the city is interdependent with the welfare and progress of the counties and agricultural interests of the state. The city representatives in the legislature appear minded to enact constructive and progressive legislation as needed by the college. The Governor of the state has the welfare of the college very much at heart. Under these circumstances it would be a calamity if the farmers of Maryland, for want of leadership or because of indifference to their own best interests, were to miss this unique opportunity to secure legislation thru united action on the part of city and country to promote the welfare of the state under direction of a new agricultural college. This is further emphasized by the fact that Baltimore City, which contains one-half of the population of Maryland, must in any event pay 70 percent of any appropriations made to the college. The State Grange has again and again urged this matter as well as the organization of a strong state board of agriculture. At its last meeting, it emphatically endorsed Dr. Patterson's plans for the college, whose trustees, by legislative enactment, were made a State Board of Agriculture without definition of their duties. Surely the farmers of Maryland ought to follow its lead in urging this matter upon the present legislature which adjourns early in April.

Organized Farm Labor

A recent issue of a popular magazine discusses the dangers of the extension of labor unions to include farm labor. The article points out the disastrous results to farmers of the enforcement of a uniform scale of wages, the eight-hour law, extra pay for overtime, etc., which are features of labor union control, and predicts that when these rules are enforced the farmer "will have a still harder time to make a fair return upon his investment." The writer might have gone further and predicted that with increased wages and decreased hours for laborers, the farmers would make no return upon investment, and would be compelled to curtail operations to do without hired labor. This result is so certain as to virtually preclude the invasion of the unions into the farm field. The union could not exist without members and there could be few farm laborers at the increased cost under a union scale. The writer makes the common error of classing farming with other lines of manufacture and industry. The manufacturer must keep his entire plant in operation in order to make return on investment. The farmer prefers to do so, but if conditions necessitate he can curtail operations to the capacity of his labor force, and if pressed he will certainly do so. Even now, without organization of farm labor, but with scarcity of proficient help, many farmers are limiting their work to labor capacity rather than acreage capacity. Should efforts be made to increase the demands on time and wages there will be further curtailment in operation and greatly increased and wide-spread concern in the production and cost of food products. Farming is an industry that could never operate under union regulations, and present conditions in farm labor make the prospect of organization a hopeless one.

Lime

A prominent agricultural authority in this state recently remarked that when one began to talk lime to the eastern farmers he had his hands full; that there was scarcely a question in farm practice in which there was such general and wide-spread interest. Since the publication of an article on "Lime and Soil Fertility" in our issue of February 7, we have had a very large number of queries on various phases of the purchase and the use of lime. The article on the first page of this issue by Prof. Voorhees is a discussion of the points most frequently asked about in the purchase of lime. This wide interest in this subject indicates two very healthy conditions: (1) That farmers are generally coming to recognize the need of lime in the maintenance and restoration of soil fertility, and (2) that the farmers are seeking information as to best and most economical forms of lime to purchase. The first is an indication of better agriculture and the second an indication of more intelligent buying. When a farmer buys seed wheat from his neighbor he is very apt to examine it carefully for weed seeds, cracked or light-weight grains and other impurities. He knows that the value of the wheat depends upon its freedom from impurities, and he accepts or rejects it and bases his price upon that condition. When it comes to the purchase of lime, however, the average farmer disregards this principle and buys upon trade name or upon the basis that lime is all lime. The article in this issue is intended to help those who would buy on this basis of quality as well as price.

STATE CAPITAL NEWS

State's Biggest Crop.—Reports compiled by the new bureau of statistics of the State Department of Agriculture on the production of hay, the State's most valuable crop, show an interesting variation in prices received for the three varieties of hay in different counties. The acreage in hay aggregates 3,141,000 from which in 1913 there was gathered a total crop of 4,146,000 tons, bringing in $61,775,000, a sum much in excess of that received for any other crop. Only one state exceeds Pennsylvania as a producer of hay and the immense sum paid for the Keystone State crop will probably surprise a good many people. The reports received show that every county in Pennsylvania raises clover and timothy hay, but that only 20 of the 67 raise alfalfa. Alfalfa brought an average of $17 per ton, the price ranging from $22 in Mifflin and Union counties to $14 in Dauphin, Tioga and Lackawanna. The average yield of alfalfa was 3 tons to the acre, half a dozen counties getting but 2 to the acre. Timothy hay brought an average price of $15 per ton, ranging from $10 in Crawford county to $19 in Cameron; Lancaster showing an average price of $15 and Huntingdon of $18. One and a half tons to the acre appeared to be the general average of production. On clover hay the prices ranged from $8 in Crawford to $18 in Cameron; Lancaster showing an average of $13. The average for the state was also $13. The production was about the same as that of timothy, one and a half tons. Judging from statements made in volunteer reports there will be a big acreage in hay again and State officials are encouraging the clearing of lands in sections which have been deforested or allowed to run down and the making of such properties into pasturage or preparing it for hay. The crop shows big values and there is a steady demand of which farms well located for transportation can take advantage.

Planting Trees.—The State Forestry department plans extensive planting of trees this year. To set out the 20,000,000 trees which Dr. J. T. Rothrock, the former chief of forestry, says Pennslyvania should put out, would cost about $140,000 to $145,000 per year, but it would be money well spent because of the conservation of water supply and the ultimate revenue from timber. When it is remembered that the income from the forest reserves of the state, now numbering over 1,000,000 acres goes into the state school fund this looks like good business. The school fund is to be allowed to accumulate against the day when Pennsylvania's great revenues from exploiting of the coal, oil, iron and stone and other natural resources are diminished. The fund is to be made up of estates which fall to the state and the income from forest lands, the whole being invested and the interest also invested. As the state raises millions of trees on its nurseries systematic replanting would seem like a matter to consider. The fact that over 100 applications have been made by people who want to take advantage of the auxiliary forest reserve law, by which the state will controll planting and cutting, receiving for benefit of county wherein reserve is located ten percent of the income from timber when cut, looks as tho business men saw something in conservation. It is to be hoped that the next legislature will allow an appropriation to be made for farm forestry which will be adequate.

Must Use Care.—The Public Service Commission has informed several railroad companies that their employees must use care in firing locomotives to avoid the showering of farm lands along railroads with cinders and sparks. A number of complaints have been made recently wherein it is charged that lands beside lines on which there is heavy freight traffic have been covered with cinders to the consequent detriment of the soil, to say nothing of danger from fires. It has also been suggested that it would be good business for railroads to exercise more supervision over the methods of firing engines because it would not only prevent damage to lands, but also result in checking of waste in reckless handling of fuel.

Must Post Rates.—In a short time notice is to be issued to all railroads, trolley lines, water, gas, electric and other companies, including toll roads and toll bridges that they must post their rates and file copies with the Public Service commission. Judging from complaints there is a lack of uniformity and the state plans to supervise. The state will also regulate use of meters of all kinds.

Snow Retards Demonstrations.—The heavy snows have held up the inauguration of a good bit of State demonstration work and it begins to look as tho the orchard demonstrators would be held back later than usual because of the prevailing snows and the bad road conditions which are sure to follow. Meanwhile they are actively corresponding with people in districts which can not be reached and are giving advice. The farm counsellors will start in April if the weather permits. Owing to the bad weather the division of farmers institutes has arranged for sessions to be held in counties where the regular sessions were prevented. The bee inspection work will not start for some weeks.

Snow Costs Money.—It is estimated at the Capitol that the cost of removing snow from main highways of the state system will run about $20,000, the statement being made that such work was demanded so that traffic could go on. The State has definitely refused to pay for clearing township highways, holding that such costs must be borne by the supervisors. This is the first time the question of cost of removing snow has arisen and it bids fair to be a vexing problem.

Rabies Prevalent.—Rabies is reported by State Live Stock Sanitary Board authorities to be prevalent to an unusual degree this winter, there being half a dozen quarantines in boroughs and adjoining districts. In some sections farmers have hunted down the dogs because of danger to cattle.

Fertilizer Inspection.—The division of fertilizer control is planning an inspection service this year that will be the most rigid of any to date and will start soon, the object being to get as many samples as possible in the season when purchases are being made by farmers. The state officials are planning to go as far back into the manufacture as the law will permit and to thoroly investigate complaints as to the constituents of some brands. During the winter a large amount of information has been gathered about the manner in which people have been victimized, the investigations being carried on in a number of places without any blowing of horns over it. This will be used to supplement the work this spring.

Heavy Loss In Game.—According to reports made by game wardens, this winter will show a heavy loss in game birds, especially quail, pheasants and wild turkeys, owing to the heavy snows which have prevented the birds from finding food. Probably thousands of quail will be destroyed and only a quick thaw will save many of those alive. The organized effort to feed the birds on the part of sportsmen's associations will probably be the means of preserving the birds in some sections, but in mountain districts, between the snows and large birds and animals, the chances are that but little hunting will be left.—Hamilton, Harrisburg, March 9.

NEW YORK LETTER

Testing Milk For Sediment.—Rochester, and possibly some other cities, has a system of testing milk for some of the grosser forms of evil that contaminate it by using the test for sediment. This dirt trap is simple and yet does the work. It consists of a cloth screen over the end of a metal container which holds a quart, and thru this screen the sample of milk is forced and of course if there is any sediment in it, it will be seen on the cloth. The local authorities have established a standard for the milk according to which the milk is considered clean, moderately dirty, dirty and excessively dirty. (Is not milk either clean or unclean and should it not be treated accordingly?) If a man brings only "moderately dirty" milk he is notified to improve it but if he brings "real dirty" milk he is told to keep it out of the city until he can do better. If he fails to regard this notice the officials send his shipments back tagged "condemned," and his name and the record goes into the "milk rogues' gallery" at the health bureau.

A Good Idea.—A bill has been introduced in the Assembly amending section 52 of the highway law providing that temporary obstructions on public highways, such as logs, trees, lumber, machinery and vehicles, must be removed within five days from notice or the town supervisor will have the right to remove them. The present law permits 30 days' notice. The bill also provides that all permanent obstructions such as telegraph and telephone poles and trolley poles and wires, shall be removed or reset within 30 day's notice or the town superintendent shall remove or reset them. Were the present law enforced it would improve appearances along many highways.

A Large Business.—According to recently printed reports the Borden's Condensed Milk company pays every year $215,000 on sanitary and veterinary inspection, uses 4,000 horses and 2,500 vehicles, employes 7,000 persons, operates 120 plants in 11 states, makes 300,000,000 cans of condensed milk yearly, uses the milk from 250,000 cows owned by 12,000 farmers and utilizes 581,395,350 quarts of milk every year.

Cauliflower Figures.—The next time you eat cauliflower reflect that the center of this industry is Riverhead, Long Island, N. Y., and then reflect again that the farmers of that vicinity sold over 400,000 packages last year at a net profit of $500,000. This is the report of the Long Island Cauliflower association made at its annual meeting. This association declared a dividend of 10 percent on a paid up capital of $6,000 and has a balance in its favor of over $25,000.

Active Farm Bureaus.—The Oneida County Farm Bureau, G. Wendell Bush, agriculturist in charge, has accomplished a good work the past year. Among its accomplishments was the organization of three cow testing associations with about 1,500 cows under test and the establishment of a reasonable price for lime. This, prior to the establishment of the Bureau, ranged from $4 to $7 per ton, but owing to the efforts of the Bureau the price was lowered to about $2.25 per ton in carload lots. The Bureau has also improved corn and potato seed by breeding and selecting and co-operative spraying for potato blight was undertaken in several fields; it has supplied exhibits of an educational nature, or assisted at three fairs in the county; secured about 25 farm hands for the farmers of the county thru the state department of agriculture; encouraged the growth of alfalfa where is does not grow naturally, and co-operated with the farmers in solving many problems of an individual nature. The Bureau has saved the farmers $2,000 in the cost of lime and made over $1,000 for two different farmers in the growing of apples. It cost about $3,000 to operate the Bureau during the 11 months prior to the report. The Onondaga county Farm Bureau has also interested itself in the improvement of the dairy herds. Last year it had 1,000 cows under test and this year it is proposed to increase the number by 2,500. This bureau is trying to establish a better standard of dent corn and about 75 acres will be devoted to tests and experiments for the up-breeding of a variety that may be taken as a standard for the county. This year more attention will be paid the co-operative work and to improving market conditions. These two Bureaus are reperesentative of the more than 20 now in active operation in the state and the work all are doing is most encouraging and efficient.—D.

MARYLAND NOTES

Local Option Agitation.—In the local option counties of the state, especially on the Eastern Shore, the people are now agitating the question of regulating the amount of how much each imbiber should be allowed to "import." It has been proposed by a member of the Eastern Shore Anti-Saloon League that the amount should be limited to one gallon a month. This, however, is in no sense prohibition, but a sort of individual license or regulation.

Farmers' Club Meets.—The Upper Cross Roads Farmers' Club recently met at the home of Mr. W. F. Scarff. The main discussion was on "Buying Seed Thru The Farmer's Produce Exchange." This plan was unanimously favored. The members have ordered several car loads of potatoes for seed from the North. It is concluded from experiments made at the Maryland Agricultural station that potatoes grown in Garrett Co., Md., are equal in every respect to those grown in any section.

Creamery A Success.—The Oakland creamery is thriving beyond all expectations, and the demand now for butter is greater than supply.

Rich Neck Club Meets.—At the last meeting of the Rich Neck Farmers' Club of Kent Co., a Produce Exchange was organized with W Irving Walker as president. The report of the treasurer of the Price Milk Cooling Station, recently started, showed that an average of $3,000 a month was being paid to farmers in the immediate territory. This is considered a pretty good showing for a section where heretofore little effort at dairy products had ever been made.

Tomato Growers' Protest.—Caroline County tomato growers are greatly incensed at the low price packers or canners are offering for the coming season's crop of tomatoes. So far no contracts have been signed. Not only are the canners offering less than last year by the ton, but are also talking of buying by the basket, instead of by the ton, and are to pay 12 cents per basket. Some farmers are talking of growing other crops, and if many should do this the canners would have something serious to thing about.

VALUABLE FREE CATALOGS

Bohon's "Blue Grass" Buggies.—Anyone contemplating the purchase of a buggy or harness this spring should investigate the factory-to-you offer made in the new catalog issued by the D. T. Bohon Co., 219 Main St., Harrodsburg, Ky The catalog is a beautifully printed and illustrated booklet of 150 pages. It shows and describes sigle buggies ranging in price from $46 to $100; double seated buggies from $50 to $120; spring wagons from $40 to $75; harness from $12 to $40 All goods are fully guaranteed and sold on a direct selling plan that will appeal to all purchasers. The catalog and full details will be sent free upon request to the above address.

Seeds and Implements.—The 1914 catalog of vegetables, grass and flower seeds issued by Ross Bros., 41 Front St., Worcester, Mass., is bigger, better and brighter than ever. It contains 120 pages descriptive of a full line of seeds for the farm, garden and lawn; also a line of farm and garden implements, including plows, harrows, drills, planters, weeders, cultivators, incubators, fencing, feed cookers, grinders, spray outfits, wagons, etc. This is one of the largest agricultural department stores in New England and has an established reputation for reliability and quality of goods. The catalog will be sent upon request to the above address.

Guaranteed Roofing.—Are you buying roofing or fencing this spring? If so, you will be interested in the new catalogues of the American Iron Roofing Co., Station 20, Middletown, O. These catalogs describe the famous ingot iron fencing and roofing. American ingot iron is guaranteed to be 99.84 percent pure, giving a lasting, rust resisting product that fills the need in both roofing and fencing. The catalogs are free upon request to the above address.

Sowing Fertilizers.—The problem of applying fertilizers in accurate quantities has long been an important one with farmers. The Stevens Broadcast Fertilizer Sower solves the problem. This implement will immediately appeal to farmers because of its strong construction and simplicity of operation. It has no springs or gears in the box, but will distribute any quantity desired, from 200 pounds up to 8 tons per acre. A new circular giving full description will be sent free to any reader writing to Belcher and Taylor Agricultural Tool Co., Box 20, Chicopee Falls, Mass.

If the average Farmer is as shrewd a merchant as he is said to be—and we *know* he is—the fact explains why so many Mitchell cars are in *daily use on the farm.*

It is because the Mitchell is a sturdy and lasting proposition and may be maintained with maximum economy that the farmer finds it suited to his needs. When he buys it he realizes that he has made an investment which *pays big dividends in efficiency.*

The car that does the most work, lasts the longest and can be kept up with the least expense for repairs, is *the car that the Business Farmer needs* and this we declare to be the Mitchell because years of experience have *proved* it definitely.

The purpose of this advertisement is to request you Business Farmers to go at once to the nearest Mitchell dealer, examine the car carefully, take a ride in it and *drive it yourself* so as to get the *personal feel* and the *personal touch.* If it proves its merit it is the car you want. That's the *only way* to *buy* an automobile and the only real way to *sell* one.

Equipment of All the Mitchell Models That is Included in the List Prices:

Electric self-starter and generator—electric lights—electric horn—electric magnetic exploring lamp—speedometer—Tungsten valves—mohair top and dust cover—Jiffy quick-action side curtains—quick-action rain vision wind-shield—demountable rims with one extra—double extra tire carriers—Bair bow holders license plate bracket—pump, jack and complete set of tools.

Live Stock

THE FOREIGN FAD

The adage, "Distance lends enchantment to the view" has many applications. The notion that things from a distance are better has been a most expensive one for the American people. It has had just enough of a basis in truth to give the notion dominance. The value of the introduction of the improved breeds of live stock from Europe into this country can never be estimated but it does not follow that this country is benefited by the continued importation of the same breeds.

If the improved breeds of foreign countries will not maintain their high degree of excellence in this country and transmit it to offspring they are not what we want. From the importance we attach to the fact that an animal is imported we seem to think that European countries continue to produce better individuals than we can in this country. I do not share this belief. I see no justification for the continual stream of money we are sending abroad for more individuals of breeds already well established in this country. But our fad for foreign things is not confined to live stock from across the sea. It extends to manufactured products and products of the soil. Merchants make capital of this fad and insist that many articles are imported as an argument for their superiority.

TWO VALUABLE FARM TEAMS

A few days ago I visited a Swiss cheese factory where a native Swiss was in charge. I bought some of the cheese at 18 cents a pound. A few days later I bought some of my grocer at 28 cents a pound. At my protest that the spring in price was too great he insisted that he was selling cheese made in Switzerland. English cloth and French styles attract us!

The delusion of distance is not confined to "across the sea;" it holds within our own continent. There is an enormous waste in transporting breeding stock, farm seeds and implements long distances. I would not be understood as discouraging the introduction of improved stock and seeds. There is opportunity for many men to improve their financial condition by introducing better stock and better farm crops. But the improved stock and seed they should have are just as apt to be in their own township as a hundred or a thousand miles away. The truth that a "Prophet is not without honor save in his own country" applies to the promoter of improvement in animal and plant life as well as in morals. Our attitude in this matter is a fallacy we ought to overcome.

What every man should do is to set about systematically improving by selection for breeding what he has. This applies to his animals and his crops. He may take a long step in advance by buying his foundation from a neighbor who started improvement some years in advance. Since not all men will select their own farm seeds there will always be an opening in every community for some one to produce good breeding stock and good farm seeds for their neighbors. The patronizing of such home industries is to be encouraged. It would be a great advantage to a community to settle upon some one breed of dairy or beef cattle, of hogs; one variety of corn, wheat and oats. The imagination that plays such a large part in child life in populating the woods and the dark lingers with us into mature years, and the Easterners who want to grow better corn send to Indiana for seed; the Hoosier sends to Illinois and the Sucker sends to Iowa. We send to Maine or Minnesota for potatoes, and to Canada for oats. This practice is not only wasteful on account of the cost of transportation but in many instances is wrong because acclimated plants do better than those transplanted from a different environment.—H. P. M.

OUTBREAK OF GLANDERS CHECKED

Something over a year ago a carload of 26 horses was shipped from a western state into Columbia County, Pa., for public sale. These horses then were all in an apparently healthy condition and thus were sold to various farmers and horsemen thruout that community. In a short time, however, several of these horses began to show syptoms of glanders, a dangerous infectious disease, thereby jeopardizing the health of hundreds of other horses in neighboring counties, as each horse in the car was undoubtedly a source of infection. Glanders is communicable to man and, as in horses, the disease is fatal.

Following the development of these cases, the agents of the State Livestock Sanitary Board began to make a thoro investigation. By the tracing of all animals in this shipment, by testing of these and in addition all exposed animals with mallein, an efficient dingnostic agent, and by an examination of blood samples collected from the horses and submitted to the Board's laboratory, nearly all of the 26, besides other horses, in all 33, were found to be infected with glanders. All diseased animals were destroyed and thoro disinfection was carried out in all stablos and on all premises where these animals were found and thus the horse owners of that community were relieved from any further loss.

By THE COUNTRY PARSON.

Our School Problem

At the International Congress of School Hygiene, held at Buffalo, N. Y., last August, 2,000 physicians, scientists and educators from nearly every civilized country in the world came together to discuss the school question from the viewpoint of public health. This is unquestionably a most important matter, and it is eminently proper that it should be discussed by our doctors, who are more and more coming to realize that the preservation of health rather than the cure of disease is or should be their chief concern. That they should, therefore, begin with the child is but natural, for the foundation of most chronic diseases is laid in childhood. School house construction with an adequate and economical solution of its many problems will doubtless be studied by our architects. This raises what I believe to be a perfectly legitimate question: Is there any side of this ever-present problem which may with profit to the community be discussed by the church under leadership of its ministers?

I am not now thinking of morals. Since the church refuses and must refuse to recognize any system of morals which lacks a religious foundation, and since the teaching of religion, with wisdom and right, is excluded from the State's plan of public education, it is apparent that the church cannot urge the teaching of any system of morality thru our public schools. All it can ask is that nothing be taught contrary to the system of morals, whose inculcation it clieves to be its peculiar province and duty.

Is its attitude toward the great question of public education then to be purely negative? Is there no service its ministers may render akin to that of this Congress of School Hygiene? Or must we leave this matter of public education to the architect, the physician, the educator, and, let us add, to the politician? As being the man to whom we entrust tho management of public business, it finally comes back to the politician. All this talk about keeping our schools out of politics is arrant nonsense. We cannot keep them out, if we will. Nor is it desirable that we should. Politics or public policy has to do with the administration of public business. Whatever progress has been made toward its administration for the public good has been made by putting things into politics rather than taking them out.

I therefore have no patience with this idea that certain things must be kept out of politics and put into the hands of self-perpetuating boards. You may thereby secure greater temporary efficiency, but you are bound to lose public interest and get into a rut. This is as true of public education as it is of a municipal water supply, of an art gallery as of a university. It all comes back to the question: Can the people be trusted? There will always be two answers, just as there will always be classes of men, conservatives and progressives. It is perhaps well that there should be, for they counterbalance and compensate each other.

I need not say that my sympathies are with the people who are trying to go ahead rather than with the people who are trying to hold back. I, therefore, believe that the more things you put into politics the worse it will be for the selfseeking politician and the better for the people. I read that out of Guizot's "History of Civilization in Europe." I am, therefore not a bit sorry that the progressive cities of St. Louis and Detroit have put their art galleries into politics by making them municipal institutions.

The motto of every politician I have ever known (and I have known quite a number) is "Give the people what they want." Of course, we know that this laudable desire is not inspired by any sincere affection for the people. The politician aims to give the people what they want, because he well knows that he cannot long maintain himself in power if he openly defies public opinion, which is the one thing he really respects and fears. Over against that, he is a most arrant coward. It is, therefore, of supreme moment, especially in this all-important matter of public education, that the people should want the right thing and know what they want.

Education, which was once almost exclusively in the hands of the Church, has been largely taken over by the State. We have come to realize that the teaching of arithmatic and spelling is nowhere enjoined upon the Church, even as the teaching of Christian doctrine and morality is not the function of the State. This, however, cannot possibly mean that the Church is not concerned with public education. Its members are citizens of the State. Its children are pupils of the State's schools. While its direct efforts in their behalf are confined to the teaching of religion and morals, it cannot, without injury to them and itself forget that their so-called secular training is a matter of grave concern to both Church and State.

It would therefore appear that the organization and plan of study of our public schools are matters in which all citizens and especially those citizens who are members of the Church are most vitally interested. If our physicians, in order to mould and direct public opinion, can meet to discuss school hygiene; if our architects can meet to discuss school architecture, and render a public service by doing so, then I fail to see any sound reason why I should not meet with the Jewish Rabbi and the Catholic priest of my community to discuss public education—provided, of course, that we agree at the off-start to confine our discussion to public education as we understand it in this country. If we, thru such discussion find out what we want, our respective congregations will be apt to find out what they want and the community will very probably find out what it wants. The politician, I think, will then be in something of a hurry to find out what he wants.

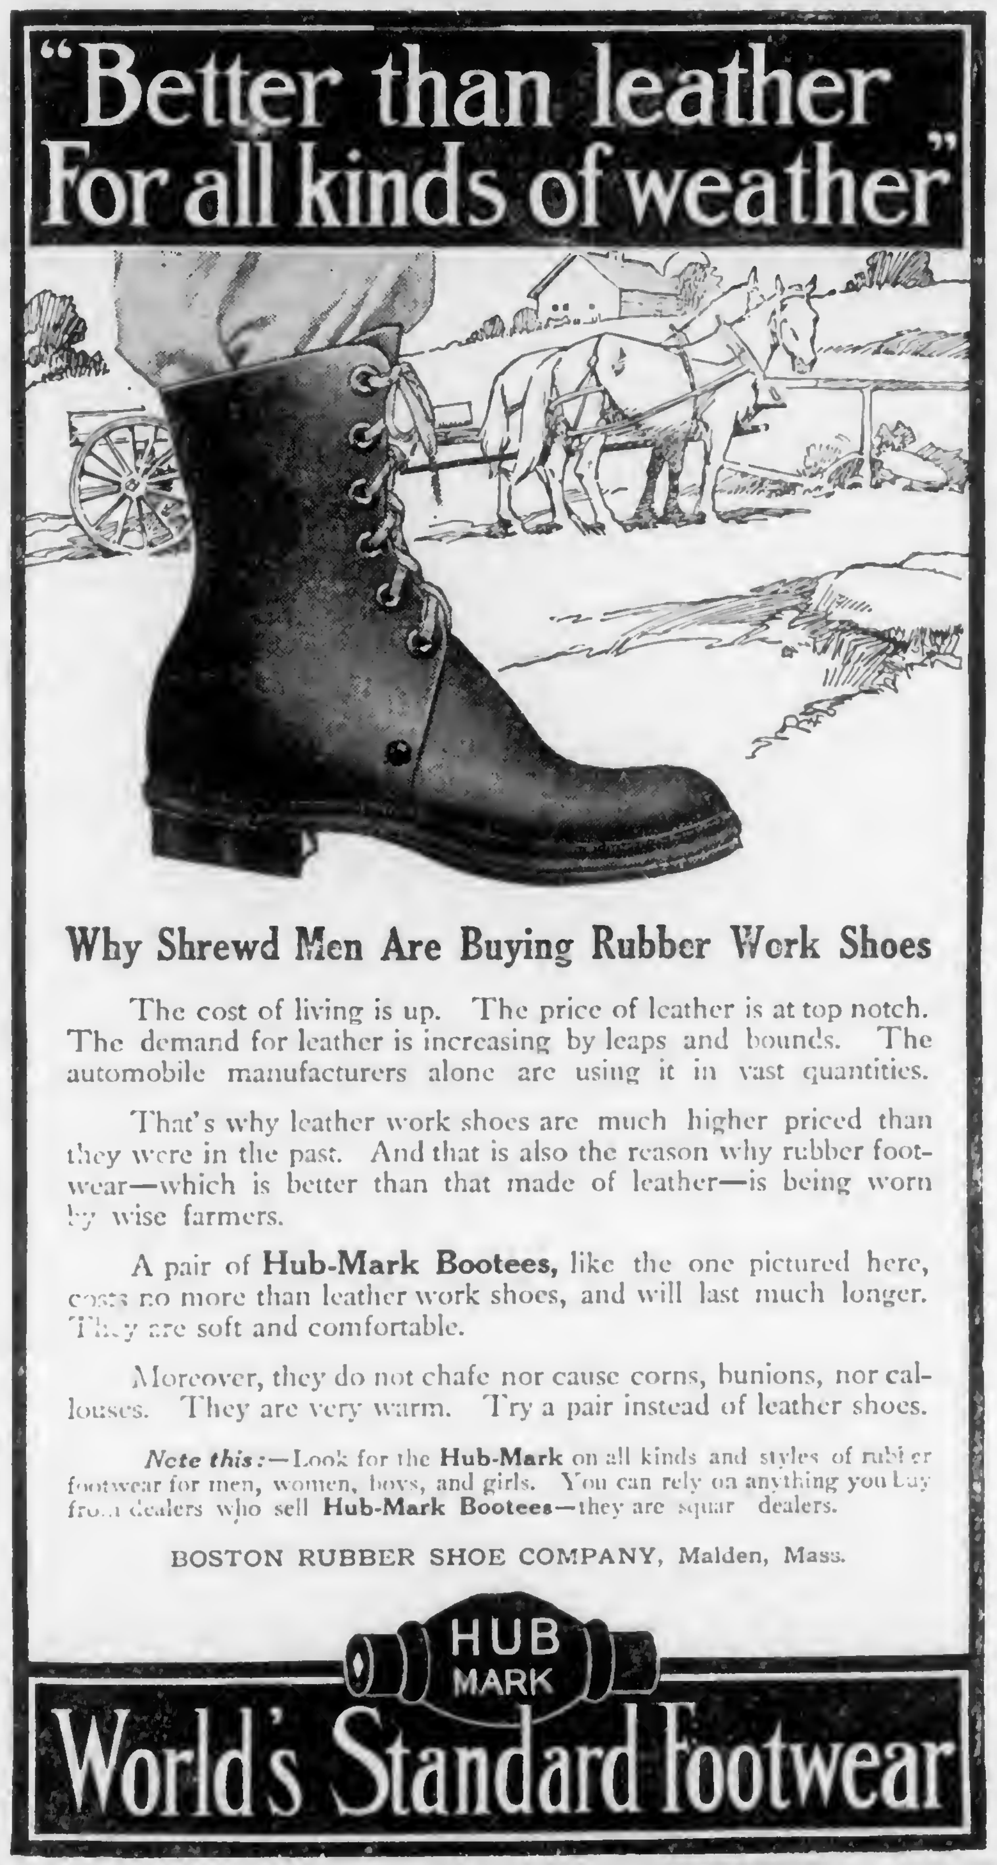
That we want something is very apparant. We are told that the day of the little red school-house is past. There is a quite general feeling of dissatisfaction with our city schools. That the great majority of their pupils, who leave school before their fourteenth year, are most imperfectly prepared for their future vocation is admitted. That the whole plan of study should be arranged as if every one of the 20,000,000 children in our schools were going to high school and college—a goal reached by a comparatively small number, is felt to be a mistake.

Efforts are being made to introduce vocational training, which in our city schools usually means hemstitching for the girls and a little woodwork for the boys. In our rural schools it has hitherto meant the organization of corn clubs. These are no doubt very helpful things, but none of them are fundamental. They are merely attachments stuck on a poorly-designed machine. Vocational training (and all training should be vocational) means more. Would there then be anything amiss in our coming together to ask ourselves what we really want in the way of secular education for our children? Or must we leave that to our educational experts, who, when unsupported by intelligent public sentiment over against our politicians, are usually very helpless people?

GRANGE PUBLICITY

I want to express my admiration of the timely article in Pennsylvania Farmer of January 31, from the pen of John McSparran on "Publicity at the National Grange;" also your comments on the same in your editorial columns. These facts are news to the rank and file of the members of the grange and smack very much of machine politics. They strike at the very foundation of the principles and purposes of the order. I believe with Brother McSparran that the granges could do no better work for the good of the order than to present the facts to every member in the order. Why should we not know and have access to these proceedings? Turn on the light. No gang rule.—G. L. Goodhart, Center Co., Pa.

"For the land's sake, use Bowker's Fertilizers; they enrich the earth and those who till it."—Adv.



"Better than leather For all kinds of weather"

Why Shrewd Men Are Buying Rubber Work Shoes

The cost of living is up. The price of leather is at top notch. The demand for leather is increasing by leaps and bounds. The automobile manufacturers alone are using it in vast quantities.

That's why leather work shoes are much higher priced than they were in the past. And that is also the reason why rubber footwear—which is better than that made of leather—is being worn by wise farmers.

A pair of **Hub-Mark Bootees,** like the one pictured here, costs no more than leather work shoes, and will last much longer. They are soft and comfortable.

Moreover, they do not chafe nor cause corns, bunions, nor callouses. They are very warm. Try a pair instead of leather shoes.

Note this:—Look for the **Hub-Mark** on all kinds and styles of rubber footwear for men, women, boys, and girls. You can rely on anything you buy from dealers who sell **Hub-Mark Bootees**—they are square dealers.

BOSTON RUBBER SHOE COMPANY, Malden, Mass.

HUB MARK
World's Standard Footwear

Horses, Mules & Cows Should be CLIPPED

They are healthier and give better service. When the heavy coat that holds the wet sweat and dirt is removed, they are more easily kept clean, look better, get more good from their feed and are better in every way. Horses and mules take on new life and energy when clipped and naturally work better. Clipping the flanks and udders of cows prevents the dropping of filth into the milk. The best and most generally used clipper is the Stewart Ball-Bearing Clipping Machine, the only machine that can be used on horses, mules and cows without change. It turns easier, clips faster and closer and stays sharp longer than any other. Gears are all file hard and cut from solid steel bar. They are enclosed, protected and run in oil; little friction, little wear. Has six feet of new style easy running flexible shaft and the celebrated Stewart single tension clipping head, highest grade.

Price $7.50 Get one from your **dealer** or send us $2.00 and we will ship C. O. D. for balance. Your money and transportation charges returned if you are not satisfied.

THE STEWART BALL-BEARING CLIPPING MACHINE $7.50

It's Easy Action, High Speed

Get More Money for your wool. You not only scar and disfigure your sheep but lose a dollar on every six you shear the old way. Figure how much more money you'll get if you use a Stewart Shearing Machine. It's the most perfect hand operated shearing machine ever devised. Has ball bearings in every part where friction or wear occurs. Has a ball bearing shearing head of latest improved Stewart pattern. **Price** complete, including 4 combs and 4 cutters of the celebrated Stewart quality is $11.50 Get one from your dealer, or send $2.00 and we will ship C.O.D. for balance Money back if not satisfied.

Household

A SHAMROCK PARTY

Children love holidays, and their observance helps to make the home-life happy. While St. Patrick's Day may not inspire the same amount of interest as many other holidays, it offers possibilities that may make it an occasion of rejoicing to the little folks, especially those who have birthday anniversaries around about this date. The majority of country mothers are too busy to spend much time on frivolities, but while making their children happy in some simple form of home amusement, the mothers may really get relaxation themselves.

A shamrock party will afford both the children and grown-ups no end of pleasure, and it is not difficult to plan for. First of all, banish dishes if you would make the party a pleasure rather than a burden. For substitutes purchase as many white paperoid plates as will be required, allowing a few extra ones for the food. These are usually about ten cents a dozen. Paper napkins with a shamrock or some other St. Patrick's Day emblem may be bought for five cents a hundred. Add to this expenditure a few cents for some bright green "pin wheel" paper, and three sheets of bright green tissue paper.

SHAMROCK CHEESE FOR SHAMROCK PARTY DINNER.

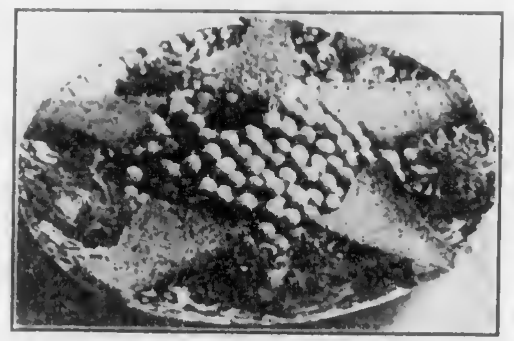
Cut two shamrock patterns from cardboard, making one 1½ inches, and the other ⅝ inch in diameter. Upon the back of the green paper outline the shamrocks, afterwards going over the same with a coat of mucilage. When dry the shamrocks are easily cut out and moistened into place. A large one may be pasted in the center of each napkin, if plain white napkins have been bought.

Lay the table or tables with white centerpieces over green paper, the latter cut out to fit the scalloped edges of the centerpiece. This color scheme is not obtrusive, and yet will give a hint of the accepted color scheme of green. A fern or some green plant on the centerpiece should furnish the main decoration. This should set on a plate covered with green tissue paper; the base may be surrounded with bunches of fruit and sprays of fresh parsley. Low bowls of pussy-willows, the latter of emerald hue in their new spring robes, will be just the thing for further ornamenting the table.

The little girl who assists in serving should wear a white frock with a green sash. An original feature may be a son of the Emerald Isle, his dark trousers banded with a stripe of green tissue paper. A sprig of green parsley in his tall hat will give it a jaunty air. This son of Erin may pass the Blarney stone to the guests for its customary kissing. Any stone of the cobble variety will serve for this purpose, but it should have a shamrock pasted on it, and should be carried on a green sateen or tissue paper pillow while conjuring the guests to perform the rite of kissing it.

The Refreshments

Shamrock Cheese.—Plain bread and butter sandwiches, cut as thin as the wafer, may be made altogether delectable if shamrock cheese (see illustration) is served with them. To make, mix with a bowlful of cottage cheese 1 teacupful of peacan or English walnuts chopped fine either in a bowl or run thru a meat chopper. Moisten with cream or a good mayonnaise, and season with salt and pepper, then set away in a cool place until it hardens. Decorate the top with pecan nuts laid in the shape of shamrocks, using a bit of water cress or parsley for the stems. Set the cheese on a paperoid plate, and garnish with cress or parsley.



PEAS a la ERIN, WITH "HARPS" OF TOAST.

Another pretty idea is to fill green peppers with the cheese, packing the pepper shells tightly. Set away for over night, if possible. When ready to serve, slice rather thin, leaving a rim of the green pepper around the cheese. Decorate each slice with three pecan nuts exactly as for shamrock cheese. One slice laid on each individual paperoid plate will be most attractive, as well as palatable, as the acrid tang of the pepper will give an appetizing flavor to the cheese.

Peas a la Erin.—If peas are to be served, they should be poured from the can into a strainer, after which pour over them 2 quarts of cold water. Drain and let stand exposed to the cold air 15 minutes. Melt 2½ tablespoonfuls of butter, add 1 tablespoonful of onion juice, and stir until yellow. Then add 1 tablespoonful of water and the drained peas. Cook until the peas are thoroly heated, and season with salt and pepper. Heap on the paperoid serving dish with toast harps (see illustration) as a decoration, and with parsley for a garnish. A little "nosegay" of parsley in the center of the mound will give a festive touch.

"BUTTERCUPS." ANGEL CAKE MOLDED IN SPOONS.

For dessert, nothing will be daintier or easier to make than "Buttercups". Mold very thin slices of angel cake in the bowls of dessert spoons, carefully trimming off the edges, cover with thin icing tinted yellow with the yolk of an egg. When the frosting has set, remove the cakes from the spoons and place the petals in the form of buttercups. Fill the center with coarse granulated sugar, tinted with a harmless green vegetable coloring. Serve the buttercups on individual plates.

One of the prettiest ideas I have ever seen at a St. Patrick's Day party was a candleboard. The latter was a circular board about eighteen inches in diameter. Candle holders were set all around the board in two tiers, leaving a place in the center for the cake—an angel food decorated with pecan nuts the same as on the Shamrock Cheese. A sprig of green myrtle garnished the cake. The candles were green.

Any one can make such a board, and it may be stained mahogany, oak or to match the dining room furniture. Candle holders may be purchased for a few cents. They are made of a cheap metal, perhaps tin, but when they are stained with lamp-black or gilded they are quite attractive. Many prefer the original color and use no stain. They are easily fastened into position on the board exactly as thumb tacks are used. Such a candleboard will serve not only for the St. Patrick Day festivities but for Christmas, birthday and wedding anniversaries, to say nothing of innumerable family occasions.

Candied orange peel makes a delicious aftermath. To make, cut peeling in quarters from the orange. Boil in clear water until the pulp is soft enough to pierce with a fork. Scrape off the white part without breaking the peel. Boil 1 cup of sugar and 1 of water until the syrup hardens in cold water, and the skin is clear. Drain dry and roll in sugar. Cut in thin strips with scissors. This bon-bon will be cheaper and by far more wholesome than the average candy.—Louise E. Dew.

EASILY MADE APPLE BUTTER

Apple butter is enjoying a great wave of popularity in our home this season. For many years I thought this appetizing "spread" must be made in large quantities in a kettle of great circumference; that the outside air, gypsy fire and huge wooden stirrer were absolutely necessary to produce its delicious flavor. But it came to be quite a burden to peel those quantities of apples, and there were sighs at not only going thru this heavy work of making apple butter but of eating it, so this part of the routine fall work was dropped. After a time we sold the kettle, feeling that its usefulness to us was passed.

It was last September that our boy, Robert, fresh from a neighbor's where he had caught a whiff of the spicy fragrance of apple butter, asked me to buy some. When I asked my neighbor to sell me a gallon of her newly made "ma'malade," she said I could have it for $1 a gallon. This being a higher price than I wished to pay, I determined to make a gallon myself.

My kettle was gone, and so was my ambition for twenty gallons, but surely there was no excellent reason for not making a smaller quantity in my preserving kettle. I peeled one peck of apples, cut them into rather small pieces, put then in a kettle with about 2 pints of water, put on the kettle lid and set them on the back part of a hot stove. At intervals I stirred the contents of the kettle vigorously, never letting them stick or scorch; it is quite unnecessary to stir all the time. (Cooking the butter in a glazed crock in the oven eliminates the necessity of stirring to prevent burning.—Editor.) When the fruit was tender and cooked, I used a potato masher to reduce it to a smooth pulp, then added 1 slightly rounded teaspoonful of cloves, 3 level teaspoonfuls of cinnamon, and 2 pounds granulated sugar. Then I cooked the mixture for three hours after the spices and sugar went in.

I packed the butter in two stone crocks for immediate use, having obtained about six quarts from one peck of apples, at an outlay of less than fifteen cents, which is surely more economical than paying $1 per gallon!

Should you desire to keep your apple butter for some time, seal it in air tight glass cans as you would canned fruit or preserves. But our quantity proved so delicious that very soon we "ate it all up."

It is such a speck of trouble to make that now every time we are seized with a desire for apple butter, we make a few quarts, often using thus the speckled apples picked from the fruit stored for winter. And it is such a saving of our preserves and jellies!

City folks have tremendous appetite for this farm product, and women could turn a good many apples into money by supplying this appetite.—Charlotte Marshall, Baltimore Co., Md.

IMPROVEMENTS IN KEROSENE LIGHTING

In artificial lighting there are two important factors to consider: (1) The cost per unit of light, and (2) the efficiency of the light. The old style kerosene lamp is the most inefficient, in that its yellow light is very far from daylight.

Up to a few years ago it was not considered possible to burn kerosene except in a wick lamp. And other forms of fuel were advocated which could be burned with the so-called incandescent mantle because by means of this mantle a light much more closely resembling diffused daylight could be obtained. With the introduction of the mantle lamp for kerosene, however, artificial lighting in the farm home can be made very efficient as the character of the light depends not on the fuel but on the character of the mantle which is used. The kerosene mantle lamp requires somewhat more care than the ordinary lamp. The mantles are fragile and tend to blacken if the wick is not kept properly trimmed. Portable mantle lamps have also been devised for the use of other fuels.

With the introduction of denatured alcohol a fairly cheap fuel for lighting has been made available. Alcohol is in some respects more desirable than kerosene in that there is less danger of fire because alcohol can be extinguished with water; there is less tendency to blackening of mantles; and possibly most desirable of all, the disagreeable odor of burning kerosene is done away with. At present, however, even denatured alcohol is much more costly than kerosene, and unless these secondary considerations just mentioned outweigh the difference in cost, kerosene should be used. The mantle lamps are more costly than the ordinary kerosene lamp, ranging up from $3.00, while the ordinary lamp can be bought for from 50 cents to $1.00. The character of the light from the two styles of lamps, however, can not be compared and where any amount of close work, such as reading or writing or sewing, is to be done by artificial light the light which is least harmful to the eyesight should receive first consideration.—R. M. West, Assistant Agricultural Chemist, University Farm, St. Paul.

AN ENGLISH WOMAN AND HER CHICKENS

One of the great drawing cards of the fifth annual show of the Maryland Poultry and Pigeon Association in Baltimore, was Miss Carey of England and her string of 40 birds. As I entered the Fifth Regiment Armory and began to look at the 4,000 picked birds exhibited there the first thing I heard was "I want to see the English woman and her chickens." This was from a fine, elderly woman who, if one may judge from appearances, did not know much about chickens except as she saw them in market. Then two young men stopped at a pen of White Orpingtons to which a blue ribbon was attached, saying "These are all right but I want to see the English Miss Carey and her Orpingtons." So I decided I'd better see Miss Carey and her exhibition birds myself. And I was not disappointed. Miss Carey, Buff and White Orpington specialist, and originator of the White Faverolle, proved to be an agreeable and interesting young woman. She was modest and unassuming and her head did not seem to be at all turned by the fact that her birds—cocks, cockerels and hens—have won first prizes in all the great poultry shows in England, the United States and South Africa, and that, too, after being in the business just seven years.

From experience I know that women can raise poultry successfully, but I was naturally interested to know why Miss Carey, a slender little woman of 28 or 30 years, apparently, should take up a business that requires both time and strength to carry on successfully. In reply to my query, Miss Carey said "It was just this way. I had been brought up without any special training for self-support, then all at once the money was gone and I had to do something to earn some more. I did not want to be a clerk or work in an office, so I decided to work for myself, and as I knew more about chickens than anything else I decided to raise chickens for breeding and exhibition. That is how I became an Orpington specialist. Then I began to breed the White Faverolles because I like to have something new to interest me. The Faverolles are such favorites in France both for table and egg-laying qualities that I became interested in introducing them in England, but they are so ugly being dull and dingy looking, that I knew they would not be popular in England and America, so I began to try to produce a white type, and you see the result."

And Miss Carey pointed to her pen. They certainly were fine specimens, much like the Orpingtons except that they have fluffy tufts of feathers beside their eyes and feathers on their legs like Cochins. Her Orpingtons were larger than any I have seen exhibited anywhere. When I commented on that and suggested that it was due perhaps to climatic conditions Miss Carey replied that in her opinion it was a question of care rather than of climate. She said that when the weather was bad, wet and cold, she kept her chickens in and let them take their exercise in the scratching pens. By giving them proper food and attention she could produce immense birds.—Mrs. Nevada Davis Hitchcock.

Cement To Mend China.—Take a very thick solution of gum arabic, and stir into it plaster of Paris until the mixture is of the proper consistency. Apply it with a brush to the broken edges of the chinaware and stick them together. In a few days it will be impossible to break the article in the same place. The whiteness of the cement makes it doubly desirable.

PENNSYLVANIA FARMER PATTERNS

Be sure to give the figures and letters of each pattern exactly as printed at the beginning of each description. We will not be responsible for correct filling of your orders unless you do so. Also give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 214 18 So. 12th St., Philadelphia, Pa.

6549—Girls' Dress.—Cut in sizes 2 to 8 years. Age 4 requires 3 yards of 36-inch material for the dress and bloomers and ¾ yard of 36-inch material for the underwaist. Price of pattern, 10 cents.

6105—Ladies' Apron.—Cut in sizes 34, 38 and 42 inches, bust measure. Size 38 requires 4⅜ yards of 36-inch material. Price, 10 cents.

6472—Ladies' Shirt-waist.—Cut in sizes 34 to 44 inches, bust measure. Size 36 requires 2 yards of 44-inch material. Price, 10 cents.

5863—Ladies' Two Piece Skirt.—Cut in sizes 22 to 30 inches, waist measure. Size 24 requires 3 yards of 36-inch material. Price, 10 cents.

4784—Girls' Dress.—Cut in sizes 6 to 12 years. Age 8 years requires 2¼ yards of 50-inch material. Price, 10 cents.

Winston of the Prairie

By HAROLD BINDLOSS

Copyrighted by Frederick A. Stokes Company.

CHAPTER XXIV (continued)

Then Maud Barrington, sitting where all could see her, signed imperiously to Alfreton, who was on his feet next moment, with Macdonald and more of the men following him.

"I," he said, with a little ring in his voice and a flush in his young face, "owe him everything, and I'm not the only one. This, it seems to me, is the time to acknowledge it."

Barrington checked him with a gesture. "Sit down all of you. Painful and embarrassing as it is, now we have gone so far, this affair must be elucidated. It would be better if you told us more."

Winston drew back a chair, and when Courthorne moved, the man who sat next to him laid a grasp on his arm. "You will oblige me by not making any remarks just now," he said dryly. "When Colonel Barrington wants to hear anything from you he will ask you."

"There is little more," said Winston. "I could see no hope in the old country, and came out to this one with one hundred pounds a distant connection lent me. That sum will not go very far anywhere, as I found when, after working for other men, I bought stock and took up Government land. To hear how I tried to do three men's work for six weary years, and at times went for months together half-fed, might not interest you, tho it has its bearing on what came after. The seasons were against me, and I had not the dollars to tide me over the time of drought and blizzard until a good one came. Still, tho my stock died, and I could scarcely haul in the little wheat the frost and hail left me, with my worn-out team, I held on, feeling that I could achieve prosperity if I once had the chances of other men."

He stopped a moment, and Macdonald poured out a glass of wine and passed it across to him in a fashion that made the significance of what he did evident.

"We know what kind of a struggle you made by what we have seen at Silverdale," he said.

Winston put the glass aside, and turned once more to Colonel Barrington.

"Still," he said, "until Courthorne crossed my path, I had done no wrong, and I was in dire need of the money that tempted me to take his offer. He made a bargain with me that I should ride his horse and personate him, that the police troopers might leave him unsuspected to lead his comrades running whisky, while they followed me. I kept my part of the bargain, and it cost me what I fancy I can never recover, unless the trial I shall shortly face will take the stain from me. While I passed for him your lawyer found me, and I had no choice between being condemned as a criminal for what Courthourne had in the meanwhile done, or continuing the deception. He had, as soon as I had left him, taken my horse and garments, so that if seen by the police they would charge me. I could not take your money, but, tho Courthorne was apparently drowned, I did wrong when I came to Silverdale. For a time the opportunities dazzled me; ambition drew me on, and I knew what I could do."

He stopped again, and once more there was a soft rustle of dresses, and a murmur, as those who listened gave inarticulate expression to their feelings. Moving a little, he looked steadily at Maud Barrington and her aunt, who sat close together.

"Then," he said, very slowly, "it was borne in upon me that I could not persist in deceiving you. Courthorne, I fancied, could not return to trouble me, but the confidence that little by little you placed in me rendered it out of the question. Still, I saw that I could save some at least at Silverdale from drifting to disaster and there was work for me here which would go a little way in reparation, and now that it is done I was about to bid you good-by, and ask you not to think too hardly of me."

There was a moment's intense silence until once more Dane rose up, and pointed to Courthorne sitting with half closed eyes, dusty, partly dazed by indulgence, and with the stamp of dissolute living on him, in his chair. Then he glanced at Winston's bronzed face, which showed quietly resolute at the bottom of the table.

"Whatever we would spare you and ourselves, sir we must face the truth," he said. "Which of these men was needed at Silverdale?"

Again the murmurs rose up, but Winston sat silent, his pulses throbbing with a curious exultation. He had seen the color creep into Maud Barrington's face, and her aunt's eyes, when he told her what had prompted him to leave Silverdale, and knew they understood him. Then, in the stillness that followed, the drumming of hoofs rose from the prairie. It grew louder, and when another sound became audible too, more than one of those who listened recognized the jingle of accoutrements. Courthorne rose unsteadily, and made for the door.

"I think," he said with a curious laugh, "I must be going. I don't know whether the troopers want me or your comrade."

A lad sprang to his feet, and as he ran to the door called "Stop him!"

In another moment Dane had caught his arm, and his voice rang thru the confusion as everybody turned or rose.

"Keep back all of you," he said. "Let him go!"

Courthorne was outside by this time, and only those who reached the door before Dane closed it heard a faint beat of hoofs as somebody rode quietly away beneath the bluff, while as the rest clustered together, wondering, a minute or two later, Corporal Payne, flecked with spume and covered with dust, came in. He raised his hand in salutation to Colonel Barrington, who sat very grim in face in his chair at the head of the table.

"I'm sorry, sir, but it's my duty to apprehend Lance Courthorne," he said.

"You have a warrant?" asked Barrington.

"Yes, sir," said the corporal.

There was intense silence for a moment. Then the Colonel's voice broke thru it very quietly.

"He is not here," he said.

Payne made a little depreciatory gesture. "We know he came here. It is my duty to warn you that proceedings will be taken against any one concealing or harboring him."

Barrington rose very stiffly, with a little gray tinge in his face, but words seemed to fail him, and Dane laid hand on the corporal's shoulder.

"Then," he said grimly, "don't exceed it. If you believe he's here, we will give you every opportunity of finding him."

Payne called to a comrade outside, who was, as it happened, new to the force, and they spent at least ten minutes questioning the servants and going up and down the house. Then as they glanced into the general's room again, the trooper looked deprecatingly at his officer.

"I fancied I heard somebody riding by the bluff just before we reached the house," he said.

Payne wheeled round with a flash in his eyes. "Then you have lost us our man. Out with you, and tell Jackson to try the bluff for a trail."

They had gone in another moment, and Winston still sat at the foot of the table and Barrington at the head, while the rest of the company were scattered, some wonderingly silent, tho others talked in whispers, about the room. As yet they felt only consternation and astonishment.

CHAPTER XXV

Courthorne Makes Reparation

The silence in the big room had grown oppressive, when Barrington raised his head and sat stiffly upright.

"What has happened has been a blow to me, and I am afraid I am scarcely equal to entertaining you tonight," he said. "I should, however, like Dane and Macdonald, and one or two of the older men to stay a while. There is still, I fancy, a good deal for us to do."

The others turned towards the door, but as they passed Winston, Miss Barrington turned and touched his shoulder. The man, looking up suddenly, saw her and her niece standing close beside her.

"Madam," he said hoarsely, tho it was Maud Barrington he glanced at, "the comedy is over. Well, I promised you an explanation, and now you have it you will try not to think too bitterly of me. I cannot ask you to forgive me."

The little white-haired lady pointed to the ears of wheat which stood gleaming ruddy bronze in front of him.

"That," she said, very quietly, "will make it easier."

Maud Barrington said nothing, but every one in the room saw her standing a moment beside the man, with a little flush on her face and no blame in her eyes. Then she passed on, but as it was the pause had been very significant, for it seemed that whatever the elders of the community might decide, the women, whose influence was supreme at Silverdale, had given the impostor absolution.

The girl could not analyze her feelings, but thru them all a vague relief was uppermost, for whatever he had been it was evident the man had done one wrong only, and daringly, and that was a good deal easier to forgive than several incidents in Courthorne's past would have been. Then she was conscious that Miss Barrington's eyes were upon her.

"Aunt," she said, with a little tremor in her voice, "it is almost bewildering. Still, one seemed to feel that what that man has done could never have been the work of Lance Courthorne."

Miss Barrington made no answer, but her face was very grave, and just then those nearest it drew back a little from the door. A trooper stood outside it, his carbine glinting in the light, and another was silhouetted against the sky, sitting motionless in his saddle further back on the prairie.

"The police are still here," said somebody.

One by one they passed out under the trooper's gaze, but there was the usual delay in harnessing and saddling, and the first vehicle had scarcely rolled away, when again the beat of hoofs and the jingle of steel came portentously out of the silence. Maud Barrington shivered a little as she heard it.

In the meanwhile, the few who remained had seated themselves about Colonel Barrington. When there was quietness again, he glanced at Winston, who still sat at the foot of the table.

"Have you anything more to tell us?" he asked. "These gentlemen are here to advise me if necessary."

"Yes," said Winston quietly. "I shall probably leave Silverdale before morning and have now to hand you a statement of my agreement with Courthorne and the result of my farming here, drawn up by a Winnipeg accountant. Here is also a document in which I have taken the liberty of making you and Dane my assigns. You will, as authorized by it, pay to Courthorne the sum due to him, and with your consent, which you have power to withhold, I purpose taking one thousand dollars only of the balance that remains to me. I have it here now, and in the meanwhile surrender it to you. Of the rest, you will make whatever use that appears desirable for the general benefit of Silverdale. Courthorne has absolutely no claim upon it."

He laid a wallet on the table, and Dane glanced at Colonel Barrington, who nodded when he returned it unopened.

"We will pass it without counting You accept the charge, sir?" he said.

"Yes," said Barrington gravely. "It seems it is forced on me. Well, we will glance thru the statement."

For at least ten minutes nobody spoke, and then Dane said, "There are prairie farmers who would consider what he is leaving behind him a competence."

"If this agreement, which was apparently verbal, is confirmed by Courthorne, the entire sum rightfully belongs to the man he made his tenant," said Barrington, and Macdonald smiled gravely as he glanced at Winston.

"I think we can accept the statement that it was made without question, sir," he said.

Winston shook his head. "I claim one thousand dollars as the fee of my services, and they should be worth that much, but I will take no more."

"Are we not progressing a little too rapidly, sir?" said Dane. "It seems to me we have yet to decide whether it is necessary that the man who has done so much for us should leave Silverdale."

Winston smiled a trifle grimly. "I think," he said, "that question will very shortly be answered for you."

Macdonald held his hand up, and a rapid thud of hoofs came faintly thru the silence.

"Troopers! They are coming here," he said.

"Yes," said Winston. "I fancy they will relieve you from any further difficulty."

Dane strode to one of the windows, and glanced at Colonel Barrington as he pulled back the catch. Winston, however, shook his head, and a little flush crept into Dane's bronzed face.

"Sorry. Of course you are right," he said. "It will be better that they should acquit you."

No one moved for a few more minutes, and then with a trooper behind him Sergeant Stimson came in, and laid his hand on Winston's shoulder.

"I have a warrant for your apprehension, farmer Winston," he said. "You probably know the charge against you."

"Yes," said Winston simply. "I hope to refute it. I will come with you."

He went out, and Barrington stared at the men about him. "I did not catch the name before. That was the man who shot the police trooper in Alberta!"

"No, sir," said Dane, very quietly. "Nothing would induce me to believe it of him!"

Barrington looked at him in bewilderment. "But he must have done—unless," he said, and ended with a little gasp. "Good Lord! There was the faint resemblance, and they changed horses—it is horrible."

Dane's eyes were very compassionate as he laid his hand gently on his leader's shoulder.

"Sir," he said, "you have our sympathy, and I am sorry that to offer it is all we can do. Now, I think we have stayed too long already."

They went out, and left Colonel Barrington sitting alone with a gray face at the head of the table.

It was a minute or two later when Winston swung himself into the saddle at the door of the Grange. All the vehicles had not left as yet, and there was a little murmur of sympathy when the troopers closed in about him. Still, before they rode away one of the men wheeled his horse aside, and Winston saw Maud Barrington standing bareheaded by his stirrup. The moonlight showed that her face was impassive but curiously pale.

"We could not let you go without a word, and you will come back to us with your innocence made clear," she said.

Her voice had a little ring in it that carried far, and her companions heard her. What Winston said they could not hear, and he did not remember it, but he swung his hat off, and those who saw the girl at his stirrup recognized with confusion that she alone had proclaimed her faith, while they had stood aside from him. Then the Sergeant raised his hand and the troopers rode forward with their prisoner.

In the meawhile, Courthorne was pressing south for the American frontier, and daylight was just creeping across the prairie when the pursuers, who had found his trail and the ranch he obtained a fresh horse at, had sight of him. There were three of them, riding wearily, grimed with dust, when a lonely mounted figure showed of a moment on the crest of a rise. In another minute it dipped into a hollow, and Corporal Payne smiled grimly.

"I think we have him now. The creek can't be far away, and he's west of the bridge," he said. "While we try to head him off you'll follow behind him, Hilton."

One trooper sent the spurs in, and, while the others swung off, rode straight on. Courthorne was at least a mile from them, but they were nearer the bridge, and Payne surmised that his jaded horse would fail him if he essayed to ford the creek and climb the farther side of the deep ravine it flowed thru. They saw nothing of him when they swept across the rise, for here and there a grove of willows stretched out across the prairie from the sinuous band of trees in front of them. These marked the river hollow, and Payne, knowing that the chase might be ended in a few more minutes, did not spare the spur. He also remembered, as he tightened his grip on the bridle, the white face of Trooper Shannon flecked with the drifting snow.

Tobacco That is Good For Your Nerves

TUXEDO actually *soothes* the nerves. It is just mild enough to keep your nervous system in poise, your muscles in tone. Unlike other tobaccos, Tuxedo *burns cool* and *slow*. There cannot be a speck of irritation in a pound of Tuxedo.

Great singers smoke Tuxedo just before a performance. Public speakers testify as to its soothing influence. Doctors recommend it to smokers whose throats are delicate.

Tuxedo
The Perfect Tobacco for Pipe and Cigarette

The secret of its superiority is the unique "Tuxedo Process" by which all the unpleasant features are eliminated from tobacco.

Another reason is that Tuxedo is made from the *best tobacco grown*—the choicest, mildest, mellowest leaves of the highest grade Burley tobacco.

Tuxedo is widely imitated—but no other manufacturer has succeeded in making a tobacco as good as Tuxedo.

Tuxedo will give you the greatest pleasure and satisfaction that money will buy.

YOU CAN BUY TUXEDO EVERYWHERE

Convenient pouch, *inner-lined* with moisture-proof paper 5c
Famous green tin, with gold lettering, curved to fit pocket 10c
In Glass Humidors, 50c and 90c

FREE Send us 2 cents in stamps for postage and we will mail you a souvenir tin of TUXEDO tobacco to any point in the United States. Address

THE AMERICAN TOBACCO COMPANY
Room 1202 111 Fifth Avenue New York

JOEL HILLMAN
proprietor "Harvey's" Washington, D. C.
"Tuxedo is a good, wholesome tobacco, with a mildness and fragrance all its own. It adds many degrees to my pipe pleasure."
Joel Hillman

L. S. BROWN
Gen. Agent of the Southern Railway at Washington
"Tuxedo has gained and maintained a high reputation for superiority. Its coolness, mildness, and genuine soothing qualities are unrivalled."
L S Brown

PHILIP R. GOODWIN
the illustrator
"There's zest and encouragement in every pipeful of Tuxedo. The sweetest, most soothing smoke I know."
Philip R. Goodwin

PHILADELPHIA LIVE STOCK

Philadelphia, Pa., Mar. 9, 1914.

Beef Cattle.—Conditions were of an unsatisfactory character. The recent storms kept supplies back and in consequence current offerings were light, mostly of western brands of cattle. Trade was by no means active, tho for all choice steers, values closed steady. Very little trade in cows and calves went at concessions.

	Beef Cattle	Sheep and Lambs	Hogs
Total for week	2,743	9,864	5,418
Previous week	3,009	9,885	5,900

Best steers	$8.90@9.00
Choice steers	8.60@8.80
Good	8.40@8.50
Medium steers	8.00@8.25
Common steers	7.50@7.80
Bulls	5.25@6.85
Fat cows	6.20@7.00
Medium cows	4.75@5.75
Thin cows	3.50@4.50

Veal calves steady.

Best calves	$11.00@11.50
Good to choice do	10.50@11.00
Medium	7.50@8.00
Common do	6.50@7.00

Sheep and Lambs.—The market was at a standstill and very disappointing. In some instances prices were barely steady.

Choice wethers	$6.00@6.25
Good do.	5.25@6.00
Common to medium	3.50@5.00
Ewes, fat	5.25@5.75
Extra lambs	8.25@8.50
Good to choice do	8.00@8.25
Common to medium	6.00@8.00

Hogs.—Trading was moderate, with the former rate limit predominating. Western as to size and quality $12.50@12.75.

City Dressed Stock.—All choice and prime meats of every variety closed firm under normal inquiry. Steers, 12@14c; heifers, 10½@13c; cows, 9@11c. Veal calves, 14@15c; country dressed calves, 14@15c; extra do., 15½c. Sheep,, 9@11c; extra wethers, 12c. Spring lambs 13@14c. Hogs 12¾@13c.

PITTSBURGH LIVE STOCK

Pittsburgh, Pa., March 9, 1914.

Cattle.—With a supply of 115 loads compared with a light supply of 85 the week before the market ruled slow and generally 15 to 20 cents per cwt. lower. The largest supply of light to medium weight cattle was on sale here that we have had for quite a while. Best heifers in light supply and sold about steady while the plain and medium grades were only steady. Cows in fair supply and sold about steady on all grades. Bulls fair supply and market about steady. Best fresh cows steady with springers slow sale. Supplies this morning totalled 110 cows. Best fat grades were steady to slow while others were easier.

Good to choice	$8.75@9.00
Good 1,300-1,400 lb	8.40@8.65
Medium to good 1,200-1,300 lb	8.10@8.30
Tidy 1,050-1,150 lb.	8.10@8.35
Fair to medium, 900-1,100 lb	7.40@7.90
Rough, half-fat, 1,000-1,300 lb.	5.00@7.00
Common to good fat oxen	4.00@6.50
Common to good fat bulls	5.00@7.75
Common to good fat cows	4.25@6.50
Heifers	5.50@8.00
Fresh cows and springers	25.00@90.00

Calves.—Veal calves in fair supply and prices ruled lower, the close being $1 per cwt. lower than Monday's prices. Some 600 head were on sale. The market was steady.

Heavy and thin calves	$5.00@7.00
Veal calves	8.00@11.50

Sheep and Lambs.—The supply of sheep and lambs has been fair, and with only a fair demand the market ruled slow and lower, the close on sheep and lambs being 25 cents per cwt. lower. The demand today for sheep was fair. Choice lambs were higher while other grades of sheep and lambs were steady.

Prime wethers	$6.10@6.25
Good mixed	5.75@6.00
Fair mixed ewes and wethers	5.00@5.50
Culls to common	3.00@4.50
Spring lambs	5.00@8.00

Hogs.—The supply of hogs during the week has been light and with only a fair demand, owing to the easier prices at western points, the market ruled slow and the close was about 10 cents per cwt. lower than Monday's prices. Pigs very hard sale at low prices. Forty double-deck loads were on sale this morning. Heavies, mediums and handy grades were 5@10 cents lower while others were steady.

Prime heavy	$9.10@
Prime medium weights	9.10@
Heavy mixed	9.10@
Best heavy Yorkers	9.10@
Light Yorkers	8.90@
Pigs	8.50@8.60
Common to good roughs	7.75@8.25
Stags	7.00@7.25

NEW YORK LIVE STOCK

New York City, March 9, 1914.

Beef Cattle.—Receipts for week 3,000 head. Market irregular.

Steers	$6.50@9.50
Bulls	5.50@8.00
Cows	4.00@7.00
Dressed beef	12@14c.

Calf receipts 4200 head. Market steady.

Choice	$9.00@13.25
Culls	7.00@8.50

Dressed Calves higher. Dressed veals, 15@19½c.

Sheep and lamb receipts 10,000 head. Market steady.

Sheep	$4.50@6.00
Culls	6.25@7.00
Spring lambs	6.75@8.10

Hog receipts 8,800 head. Market steady. Choice, $9.15@9.30; roughs, $8.00@8.25.

BUFFALO LIVE STOCK

Buffalo, N. Y., March 9, 1914.

Cattle.—The week opened with a slow trade and lower basis as usual for the fore part of Lent. The close was about steady with a moderate demand. On today's market, cattle showed a 10@15c advance on all grades. Some 3,000 head were on sale.

Choice heavy steers	$8.75@9.10
Medium	8.25@8.85
Yearlings	8.00@8.50
Handy butchers	8.00@8.35
Good to choice fat cows	6.75@7.10
Good to choice heifers	7.00@7.85
Butcher bulls	7.00@7.50
Feeders	5.75@7.00
Stockers	5.00@6.25
Cows and springers	30.00@90.00

Calves.—The large supply at the opening of the week and the lower basis had a depressing effect on the week's business. The opening basis was $11@11.50 for the best veals and on the close the market was higher with a good demand and light supply. Basis $12@13. With 1,000 on sale today, best calves brought $12@12.25

Choice veals	$12.00@12.25
Lights and thin	6.00@8.75

Sheep and Lambs.—The sheep and lamb market was about in the same shape at the week's opening as the balance of the trade—slower and lower. Choice lambs opened the week on the basis of $8@8.15, and sheep, $5.75@6.25. The week closed with lower prices and a light demand from all quarters. With 12,000 head on hand this morning, sheep and lambs were steady at last week's prices.

Choice lambs	$7.85@8.00
Yearlings	7.00@7.25
Wethers	6.25@6.50
Ewes	5.50@6.00
Sheep	6.00@6.25

Hogs.—The liberal receipts Monday and the moderate trade at lower basis helped to make a slow market for the balance of the week. The opening basis on Yorkers was $9@9.10; mediums, $9.05@9.10. On the close the trade was fairly active and 10@15 cents higher on the best grades. Yorkers closed $9@9.10; pigs slow, $9@9.05. Common grades higher on the best grades. Receipts this morning numbered 14,000 and the loss at the end of the week was regained. On the strong market, heavies, mixed, mediums and yorkers sold well.

Heavies	$9.05@9.10
Mixed and medium	9.05@9.10
Yorkers	9.05@9.10
Light Yorkers	9.05@9.10
Pigs	8.75@8.90
Roughs	8.15@8.40
Stags	6.25@7.25

Horses.—With 600 head on sale, there was a fair trade for best workers. Best pairs brought $650@700; medium, $500@600.

NEW YORK MILK MARKET

New York City, March 9, 1914.

The milk market last week was demoralized by the snow storm of Sunday March 1. Farmers were unable to get their milk to the station for two or three days. The milk trains were badly delayed and in some cases brought belated supplies representing two or three days' production. The result was, among other thing, that several railroads failed to report their receipts for the week. This makes it impossible to publish the usual weekly table of receipts. It also makes it impossible to state the actual condition of the market as regards supply and demand, altho, probably the former exceeds the latter.

ELGIN EUTTER QUOTATION

Eligin, Ill., March 9, 1914.

The quotation committee of the Elgin Board of Trade this afternoon declared butter steady at 27 cents.

PITTSBURGH HAY AND GRAIN MARKET

Pittsburgh, Pa., March 9, 1914.

Hay.—Market improving slightly on the better grades. This is on account of the light receipts during the week. Lower grades dull and difficult to place.

No. 1 timothy	$16.50@17.00
No. 2 timothy	14.00@15.50
No. 3 timothy	10.00@12.00
No. 1 light mixed	14.50@15.00
No. 1 clover mixed	14.00@14.50
No. 2 clover mixed	10.00@12.00
No. 1 clover	14.00@14.50
No. 2 clover	10.00@12.00

Ear Corn.—There has been quite a free movement in ear corn during the week. Demand sufficient to care for arrivals.

New No. 2 yellow	68½@69½c.
New No. 3 yellow	65½@67c.

Shell Corn.—Shell corn shows little improvement, market somewhat dull.

New No. 2 yellow	70 @70½c.
New yellow No. 3, natural	66 @66½c.
New sample	64 @65c.

Oats.—Oat market firm and has shown surprising strength during the last few days. Prices higher.

No. 2 white	43¼@44c.
Standard oats	43@43½c.
Standard No. 3 oats	42@42½c.

Mill Feed.—Little better demand for mill feed on account of heavy winter weather.

No. 2 white midds	$27.50@28.00
No. 1 brown midds	26.00@26.50
W. W. Bran, coarse,	27.50@28.00
W. W. Bran, medium	27.00@27.50

There's a Good Profit in Growing Corn like This

The gardener who is able to market his sweet corn and vegetables a little earlier than other truck growers will obtain better prices and a larger profit from his crops. To produce these results, your soil needs an application of a fertilizer especially adapted to its needs for growing thrifty and healthy vegetables and garden products.

Early Crop Odorless Fertilizer

contains just the right plant food elements in a soluble and immediately available form for rapid growth and quick maturity of sweet corn, early tomatoes, berries and other early fruits and vegetables. It is the most convenient and economical fertilizer you can use for this purpose. There's no waste of valuable plant food by leaching as the special fiber base holds the nitrogen, phosphoric acid, potash and lime in the soil where the plant can readily assimilate just the nourishment it requires throughout the growing season.

Early Crop Odorless Fertilizer enables you to produce bigger and better crops and to mature them from one to three weeks earlier than if you used ordinary fertilizers. 100 lbs. of this special fertilizer will produce better results than 200 lbs. of ordinary brands. You may store Early Crop Odorless any length of time without it deteriorating. Sold direct to users in any quantity—no middlemen handle Consumers Brands.

Write today for interesting book on "Soil Fertilization"—it's a regular text book on this subject. We send it free.

CONSUMERS FERTILIZER CO. 303 Longacre Building NEW YORK CITY

"Country Gentleman" Sweet Corn—grown by Consumers Fertilizer Company with Early Crop Odorless Fertilizer, on their Experimental Farm at Farmingdale, N. J., on light sandy loam soil.

GET MY BIG FREE BOOK OF Buggy Bargains

I am proud of it! I think it's the best book ever issued. I want you to have it, even if you don't think you will buy a buggy this year. It tells the story—how my buggies are built, how they are tested in ways no "store buggy" can stand, shows lots of photographs of the work in the factory, illustrates finished "jobs" in colors, tells how to select your own choice as to style, color, upholstering, etc.; best of all, it proves that when you buy a BOHON "BLUE GRASS" BUGGY

YOU SAVE $25 TO $50

You see I sell you direct from my factory—no dealer, agent or salesman to draw profits or expenses. It's all explained in this book, together with my 30-day free road trial offer, backed by a legal $30,000 guarantee bond, etc. So just send for the book—a postal will do. DO IT TODAY.

35 BUSHELS PER ACRE was the yield of WHEAT

160 ACRE FARMS IN WESTERN CANADA FREE

on many farms in Western Canada in 1913, some yields being reported as high as 50 bushels per acre. As high as 100 bushels were recorded in some districts for oats, 50 bushels for barley and from 10 to 20 bushels for flax.

J. Keye arrived in the country 5 years ago from Denmark, with very little means. He homesteaded, worked hard is now the owner of 320 acres of land. In 1913 had a crop of 200 acres which will realize him about $4,000. His wheat weighed 68 lbs. to the bushel and averaged over 35 bushels to the acre.

Thousands of similar instances might be related of the homesteaders in Manitoba, Saskatchewan and Alberta.

The crop of 1913 was an abundant one everywhere in Western Canada.

MEAD CYCLE CO. Dept. S-319 CHICAGO

Veterinary

(Conducted by W. C. Fair, V. S.)

(Advice thru this department is free to our subscribers. Each communication should state history and symptoms of the case in full; also the name and address of writer. Initials only will be published. When reply by mail is requested, it becames private practice and a fee of $1 must accompany the letter. This is one of the most valuable columns of the paper and we invite readers to make use of it. Clippings from this column, when properly preserved and classified, would make one of the most valuable medical symposiums a farmer-stockman could obtain.)

Amaurosis—Glass Eye.—I have a 10 year-old horse that appears to have gone blind. I first noticed it about two months ago, just after a heavy snow had fallen. There is no growth, discolorment nor soreness of any kind, but the pupils of his eyes are enlarged more so than formerly. Is there any help for him? V. M., Clarks Summit, Pa.—This horse suffers from paralysis of the optic nerves, but he suffers no pain and their is total loss of vision. The causes of this ailment are tumors and other diseases of the brain, implicating the optic nerve. It may occur from an overloaded stomach, or from hemorrhage. I am inclined to believe it the result of brain hemorrhage in your horse. Unless you know what caused it and secure a removal of the cause, it is very doubtful about the restoration of vision. Give 1 dr ground nux vomica and 1 dr potassium iodide at a dose in feed, 3 times a day for 3 of 4 weeks. If you drive him and there is snow on the ground, cover eyes with a green veil.

Depraved Appetite—Tape Worm.—I have a dog that is very thin, eats well, bowels and kidneys seem to act all right, but he has a craving for filth. He eats pieces of wood, paper, rags and many filthy things that he comes in contact with. He did not shed his old coat last spring and I would like to know what will help him. A. W. L., Lafayette, N. J.—For every pound that your dog weighs, give him 1 grain of powdered kamala at a dose, every day or two for 2 or 3 days. If he is wormy, or has a tapeworm, this medicine will perhaps relieve him. Then give him 10 or 15 grains bicarbonate soda, 1 grain of quinine and one-sixtieth of a grain of strychnine at a dose in feed, 3 times a day.

Eczema—Garget—I have a mule which seems to have been over-heated and I am unable to keep her from rubbing hair off; besides, she has little ambition and I am inclined to believe that she has impure blood. I also have a heifer that had caked udder before calving. I applied nearly everything I could think of, but she showed no improvement. She gives very little milk from one teat. H. C. H., Nottingham, Pa.—Give your mule a dessert spoonful of hypo-sulphite of soda at a dose, 3 times a day; also dissolve 6 oz in 1 gal. of water and apply to itchy parts, twice a day. Dust on some finely powdered sulphur in her coat occasionally. Give your heifer a dessert spoonful powdered nitrate of potash at a dose in feed, 2 or 3 times a day and apply 1 part fluid extract of phytolacca and 2 parts olive oil to caked part of udder, twice a day.

Navicular Lameness.—I have a horse that shows considerable soreness in one front foot. I believe he suffers pain on account of raising foot off ground every few minutes. His urine is quite thick and brown colored. Pinching him over kidneys does not seem to make him flinch. J. G. W., Pennsburg, Pa.—Give your horse 1 dr. ground nux vomica, a teaspoonful powdered nitrate of potash and a tablespoonful bicarbonate of soda at a dose in feed, 3 times a day. Clip hair off pastern and apply 1 part powdered cantharides and 6 parts fresh lard to coronet, every 10 days. If the hoof is dry and contracted, apply lanolin daily.

Impure Blood.—We have a mare that has been troubled with lice and got very much out of condition before we discovered it. We have succeeded in killing the lice but altho we give her plenty of good feed she does not lay on flesh. She has several sores on body, but none of them appear to heal. We think her blood is out of condition. She has a good appetite and her teeth are in good order. E. T., West Deptford, N. J.—Give your mare 1 dr. fluid extract nux vomica, a dessert spoonful of Donovan's solution and a teaspoonful of salt at a dose in feed, 3 times a day, and apply 1 part iodoform and 9 parts boracic acid to sores, once or twice a day.

The question is:
not "How little can I pay for roofing?";
but "How little will it cost me?"

You may pay little and get roofing that soon cracks, crumbles, and leaks; but it *costs less* in the end to use roofing of natural asphalt, which stays waterproof.

Genasco
THE TRINIDAD-LAKE-ASPHALT
Ready Roofing

has the natural oils of Trinidad Lake asphalt sealed in it. They give Genasco life and vigor to resist sun, rain, wind, heat, cold, alkalis, and acids.

It stays weather-proof and saves repair-expense.

Get Genasco and you get the satisfactory answer to your roofing question. The Good Roof Guide Book and samples are free on request. Ask your dealer for Genasco smooth or mineral surface; several weights. Look for the trademark. THE KANT-LEAK KLEET waterproofs seams without cement and prevents nail-leaks.

The Barber Asphalt Paving Company
Largest producers in the world of asphalt and ready roofing.

NATIONAL FIRE PROOFING COMPANY, Fulton Building, PITTSBURGH, PA.

These Seven Cows

May All Be Kept For One Year On

the product of one acre of land. It's hardly believable. And keeping seven cows for a whole year on one acre goes a long way towards reducing the cost of milk. Eureka Corn produced in one year, on one acre, 70 tons and 800 pounds. Figuring at the rate of 50 pounds of ensilage per day, which is a very liberal allowance, this amount will feed seven cows for one year, with enough left over for 261 feeds. This enormous crop won our $50.00 gold prize for the heaviest yield. We believe this record cannot be broken by any other corn, but we believe Eureka will beat its own record this coming year.

We offer $100.00 in Gold to the First Party Breaking our Present Record in 1914

We believe our crop of Eureka Corn for 1914 planting will germinate better than 98 percent. Eureka Corn was introduced by us about 25 years ago. It is a white, smooth dent corn, grows the tallest, usually from 16 to 20 feet, has the most leaves and is short jointed. If planted thin, it will yield two and three ears to the stalk. Planting Eureka Corn is as good as an insurance policy to any farmer. It grows where other kinds fail and the yield is tremendous. Last season Eureka Corn was planted in 45 states and the returns were exceedingly gratifying. We do not ask you to take our word for this, but refer you to any of the well-known farmers whose names are printed below.

Eureka Corn

Grows Tallest—Has Most Leaves—Greatest Number of Ears

You do not need to plant your whole farm when you can fill a 200-ton silo from 4 or 6 acres with Eureka. The best money you can spend on the farm is for good seed. Poor seed is dear at any price. Good seed is always worth what you pay for it. We're selling Eureka at last year's prices. Good seed is going to be very scarce and much higher before the planting season is over. Ask yourself what corn is worth per bushel, that will produce 70 tons and 800 pounds. We are not asking you to experiment, we are only asking you to buy seed corn that has been proven by thousands of successful farmers to be the best that money can buy.

Read What Some of Our Customers Say:

Bridgeport, N. J., Nov. 3, 1913.
Ross Bros. Co., Worcester, Mass.

Gentlemen:—Last spring I bought of you 1-2 bu. Eureka Seed Corn and to say that I was pleased with the results is putting it very mildly. It yielded about 3 or 4 times as much fodder as the ordinary seed which I planted next to it. I shall be more than pleased to recommend it to anyone who inquires about it. I expect to plant more of it next year and you may look for an order from me. Yours truly,
Signed, WM. H. BENNETT.

East Millstone, N. J., Dec. 22, 1913.
Ross Brothers Company, Worcester, Mass.

Gentlemen:—I have used Eureka ensilage corn for the past three seasons, and will say that it is the finest ensilage corn that grows. It withstands drought, grows taller and gives a greater yield of ensilage than any other variety of corn.
Yours very truly,
Signed, THOMAS H. METTLER.

New Hamburg, N. Y.
Ross Bros. Co., Worcester, Mass.

Gentlemen:—In reply to your inquiry about the Eureka Seed Corn will say that there is nothing else like it for fodder. It grows a larger and better stalk and will grow anywhere. The party who filled our silo thought that our corn beat anything that he had seen and wanted me to get him some of the seed for next year. Yours truly,
Signed, J. W. CROWELL.

Do not buy any corn without this trade mark

We refer you to any of these well-known planters: Bedford Farmers Co-op. Assn., Bedford Hills, N. Y.; Altoona Nursery Co., Altoona, Pa.; Locust Hill Dairy, Midway, Pa.; Hadley Dairy Farm, New Brunswick, N. J.; High Lawn Farm, Red Hook, N. Y.; Brooklands Farm, Poughkeepsie, N. Y.; H. C. Brill, Stewartsville, N. J.; Wm. H. Bennett, Bridgeport, N. J.; B. F. Mead, Warren, Pa.; Geo. H. Taylor, New Milford, Pa.

Sheffield World's Prize Flint Corn

still holds the record for the heaviest yield of flint corn, 123.8 bushels of crib dry corn from one acre. If you grow corn for grain, plant Sheffield. No other flint corn equals it. It can be planted later and will mature earlier than any other kind. It will produce more good ears, well filled out, than any other variety. Look out for your stock of flint corn before it is too late. There is a lot of poor corn on the market. Our stock of Sheffield has been tested and will germinate nearly 100 percent.

SEED OATS

It pays to buy the best, whether you wish to cut for green feed, for fodder, or ripen for grain. Anyone of the several kinds we offer will produce enough more feed to many times over pay for any difference in price. This has been proved by actual test and we are confident that in the stover alone you will get enough more feed to more than pay the difference in the price of the seed. You also get heavier and plumper heads filled with grain that will produce milk at a lower cost than almost any kind of green feed. All we ask is a trial.

LONG'S WHITE TARTAR

Reports from all sections show that this is an extremely productive variety. It is very early, of remarkably vigorous constitution and is suitable for all soils. The straw is long and stout and not liable to lodge or twist. The heads are from 8 1-2 to 10 inches in length and grain is of the largest size and remarkably plump and heavy, with thin hull. In its combination of desirable features, extreme earliness, great production of heavy, plump grain and long stout straw, the Long's White Tartar is not surpassed by any of the popular varieties. It is a one-sided oat, the grain all growing on one side, and each head will have from 50 to 80 long, plump grains. Price, pk. 35c., bus. $1.25, 2 bus. $2.40, 10 bus. $11.00, 20 bus. $20.00, bags included.

CANADIAN CLUSTER OATS

It has no equal as an oat to sow for green fodder. It produces an abundance of long, stiff straw with broad leaves. It is not as liable to rust as many other varieties and stands up well, while many other varieties will lodge. It will produce more feed with light fertilizing than any other kind, but will respond readily to a liberal supply of either commercial fertilizer or stable manure. The grain is large and plump and usually weighs about 40 lbs. to a measured bushel. Price, pk. 35c, bus. $1.25, 2 bus. $2.40, 10 bus. $11.00, 20 bus. $20.00, bags included.

CAUTION: Don't accept of any yellow dent or white horsetooth corn as Eureka. We received several letters last year from parties who were unable to get their Eureka from us and claimed that they had received from other dealers corn marked Eureka, which was entirely different from the genuine. Eureka corn, shelled, is always shipped in our trade-marked burlap bags, and ear corn is shipped in rat-proof crates holding 70 pounds. Either buy direct of us or some of our agents who have the genuine. Write at once for catalogue and quotations.

Prevention of Poultry Diseases.

By Prof. M. C. KILPATRICK,
Pennsylvania State College.

Judging from the tone of the many letters received by those engaged in poultry work in the agricultural colleges and at the experiment stations, the subject of poultry diseases and their treatment is always of interest to the average poultryman. The wise poultryman is more interested in methods of disease prevention than in methods of treatment, as he realizes the importance of keeping his flock in good physical condition, free from all disease, if it is to be a profitable proposition.

Disease is any departure from a normal state of health. Diseases are of two general classes, infectious and non-infectious. Practically all of the important diseases of poultry are infectious. These infectious diseases have their origin in organisms which are taken into the body of the fowl thru the genital-urinary tracts, thru bites of insects, thru inhalation and, particularly with the food and water. They spread from one fowl to another by contact or may be carried on the clothing of the poultryman or on implements used in caring for the flock. They escape from infected individuals thru all ordinary discharges and may be picked up by other fowls when feeding or drinking.

Disease breeding organisms are found to a greater or lesser extent in every poultry yard depending very largely upon the care with which it is kept. Fowls are being constantly exposed to disease. Because there is no indication of disease in the flock it does not follow that the disease germs are not present or that there is no danger of infection. The organisms may have lost their virulency or may not exist in sufficient numbers to make an appreciable impression upon the flock. Any circumstance which presents conditions favorable to their development will very likely be followed by an outbreak of disease.

Fowls of the same flock may be exposed to infection at the same time and under the same circumstances. One may die from the disease in a very short time and another may not contract the disease at all. This is due to the fact that one fowl is constitutionally strong and thus able to resist the attack of the disease organism and the other is not.

It is evident that liability to disease is dependent upon two factors—the virulence of the organism and the constitutional vigor of the fowl. The fowl of low vitality has very little chance of escaping the disease when exposed to virulent organisms. The problem of the general poultryman is to reduce the liability to disease. This may be accomplished by reducing the virulence of the organism and increasing the constitutional vigor of the fowl. There are, then, two fundamental factors involved in the maintenance of good health in poultry. These are constitutional vigor of the fowl and poultry sanitation and hygiene.

The subject of constitutional vigor has been discussed in a previous issue. It is not out of place, however, to refer to it again as there is no other one factor so important in poultry breeding. It is of great importance in its relation to disease. If the poultryman would only select his stock each year with particular reference to constitutional vigor, a large percentage of the great annual loss due to disease would be eliminated.

The second step in the process of disease prevention is to pay attention to the laws of sanitation and hygiene. It is only when this is done that constitutional vigor can be maintained and disease prevented.

The poultry house must be kept clean. It should be thoroly disinfected several times each year. Everything inside of the house, roosts, nests, dropping boards, etc., should be portable and easily removed. The floor should be of concrete or smooth boards. A dirt floor cannot be kept clean without great expense. To clean a house properly, everything inside should be removed. All the litter should be taken out and carted away. The ceiling, walls and floor should be thoroly swept with a stiff broom. Any droppings that adhere to the floor or wood work should be scraped off. The interior of the house should be thoroly washed using a hose if possible. After the house is dry, it should be thoroly sprayed with 3 percent cresol or creolin preparation, using a spray pump that will drive the disinfectant into every crack and corner of the house.

If a poultry house is to be kept in a sanitary condition it must have plenty of sunlight and fresh air. The house should be well ventilated without drafts and the sun should strike every part of the interior of the house at some period during the day. About one square foot of glass window should be provided for each 12 to 15 square feet of floor surface. Large openings in the front of the house should furnish the ventilation. These openings should be fitted with muslin-covered frames for use in cold weather. There should be one square foot of muslin covered opening for each 10 to 12 square feet of floor area.

The floor should be covered with clean dry litter. Filthy, damp or dusty litter is always dangerous. Replace the litter whenever it becomes damp or dirty. Avoid dampness in the poultry house, as fowls will not thrive in damp quarters. The dropping boards should be cleaned two or three times a week.

The land on which the fowls run must be kept

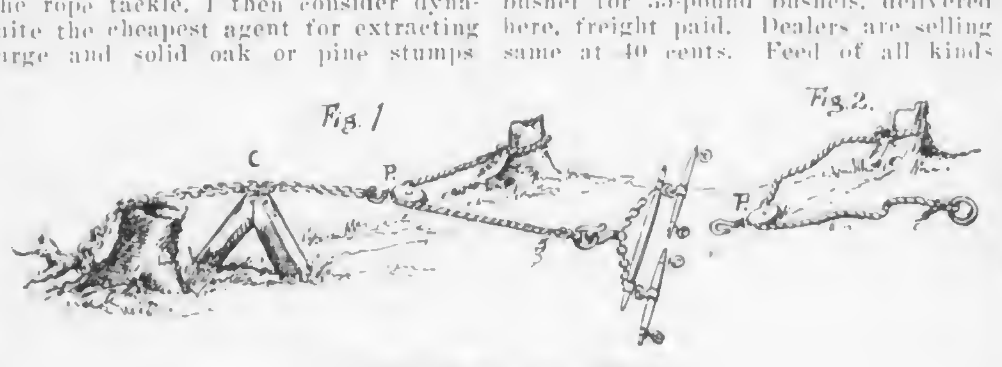
BRADLEY BROTHERS BB MAKANDA, ILL.

METHODS OF STUMPING NEW LAND

Where land is cheap it is often more economical to seed the clearing down to a mixture of clovers and grasses in the wheat or rye, whichever is used as the first grain crop. Then we would allow the grass sod to remain 5 to 7 years for hand mowing or pasture, during which time the stumps ripen very rapidly. We first go into the stump field with a good span of horses and two inch ropes, one about 50 feet long, the other 75 to 80 feet. We use two strong pulley blocks and a strong chain. In these we have an outfit that is light and can be operated very rapidly, as many stumps are pulled from one anchor stump. Two men work to the best advantage, one spending his entire time releasing and hitching.

The illustration shows ropes No. 1 and No. 2. No. 1 is attached to the stump. One end of rope is tied to an anchor stump while the other end is tied to a heavy ring for convenience in hitching the double tree. The rope passes thru pulley at P, where the chain is hooked. Now if the team gives a pull on the stump a glance will decide whether more power is needed. If so, we simply unhook the team at the first rope ring and step the horses up to ring on No. 2. We hook pulley (P) of No. 2 in the ring just abandoned by the team. Now we have increased the surge or power from 4 to 8 horses, and have also rendered the jerk on the team more elastic. C is simply a pole crutch over which the chain may pass to effect an upward lift on a stump or post, as we sometimes use it to lift fence posts. Rope and block No. 2 is kept near-by to supplement power quickly as needed, and requires less handling than a long rope and double block as sometimes used. In this way extra rope and slack are only to handle as needed.

After the field is gone over with the rope tackle, I then consider dynamite the cheapest agent for extracting large and solid oak or pine stumps of which we have many. When these are extracted whole by the use of a powerful machine, the expense of punching off the adhering clay is often very great, and then we have trouble to pile and burn the whole stump, while blasted fragments are easy to collect and burn readily. The average cost of blowing these larger stumps is about 23 cents each, or $40 or $45 per acre if the ropes or tackle was skillfully used and also if the man using dynamite understands his job. We find men who at a glance measure the force required for a stump of certain character, and they are able to center their shots very cleverly.—D. H. Watts, Clearfield Co., Pa.



HITCHES FOR PULLING STUMPS.

PURCHASE OF FERTILIZERS

At this season of the year many farmers are making contracts for fertilizer and in many cases I fear these contracts are made on meagre information. Commercial fertilizers are a great help in maintaining or restoring fertility to our soils, but we do not always get what we buy and pay for. There are many subterfuges in the composition of these manures from sludge acid to hoofs, hair and horns. There are also actual shortages in which the content of a given element represented on the printed analysis is not found in the material.

There is also wide range of prices on the same brand of goods that cannot altogether be accounted for by the difference of location relative to freight rates. Again, there is a large waste that is found in the making of the contract itself. The manufacturer naturally urges the complete fertilizer upon the customer, no doubt on account of the fact that the complete goods are the highest priced goods and therefore most likely carry the larger per ton profit. But in very many cases the purchase of nitrogen is a very unnecessary as well as expensive proceeding. In certain crops no doubt it is necessary, but where a farmer makes and utilizes a goodly amount of barnyard manure, and grows in the routine all the vegetable matter to plow down he can in justice to the regular crops he will have little need to buy nitrogen to keep up the soil fertility. There is no deception in the kind of material furnished by a crop of clover, for instance, and it has the added advantage in that it helps to keep the soil loose and open and in condition to receive the cheapest and best of all fertilizers, sunlight and moisture. When such a farmer is persuaded to buy a complete fertilizer, when a combination of phosphoric acid and potash is all he needs, a real waste is made.

In our opinion there is no better way to avoid waste and losses than to write to the Department of Agriculture of your state and ask for "The Tabulated Analysis" sent free on request. When it comes, make a close, comparative study of the different makes and prices. This official document is one that an agent cannot talk against. The samples are taken from the different station platforms from goods consigned to an actual purchaser, taken by an agent of the state without the knowledge of the manufacturer, and analyzed by the states' chemists. You will find among other things that the goods of some factories have lots of stars to them (indicating shortage) and other firms have almost none. You will see the range of selling prices in connection with commercial value. This book should be studied especially by purchasing agents of Granges before they close their contract for the fertilizers for their Grange. Many dollars in price as well as in value can often be saved by a consistent use of this avenue of information.—John A. McSparran, Lancaster Co., Pa.

LAWRENCE COUNTY NOTES

Corn is not keeping well, owing to the premature killing by frosts early in September. Farmers are importing ear corn from Ohio and paying 36 cents a bushel for 35-pound bushels, delivered here, freight paid. Dealers are selling same at 40 cents. Feed of all kinds is scarce on the farms and on all the dairy farms concentrates are bought in large quantities. The manurial products from these concentrates help to preserve the fertility of our glaciated farms, but at the expense of the farms in the southern and western states whence the concentrates come, such as cottonseed, oil meal, bran, corn and oats.

The regular rotation here is corn, oats, wheat, clover and timothy hay, pasture one year, then corn, etc., again. Agricultural writers claim that this rotation will exhaust the soil, and as our production is gradually decreasing, they are no doubt correct. Dr. Thorne, of Ohio, advises to grow soy beans instead of oats and to plow down the second growth of clover the winter of the fourth year, then begin with corn again, thus having two legume crops in every four year rotation. Some change in the rotation may eventually have to be adopted, for the old one of five years is no longer profitable here in general farming. Consequently most farmers, rather than change the practice of centuries, are adopting some side line, such as fruit production, truck crops, dairying, poultry, etc. All are forced to use "complete" fertilizers, the cheap ones, such as 1-8-4, being the most popular. But lately a few are adopting the plan of buying the chemicals, nitrate of soda, acid phosphate and muriate of potash, and mixing these at home.

Our New Wilmington grange is buying two carloads of chemicals this year at wholesale, and this will make a large saving in cost for the members. Our seed corn and clover seed are also to be bought in the same way, as neither one of these is grown here in sufficient quantity. The general scarcity of apples thru the country has made the price the highest ever known here, apples now commanding $6 a barrel, wholesale, or 6 cents a pound to the consumer. The nation-wide frosts in May were responsible for the great shortage—a condition not likely to occur again for a generation. The San Jose scale is gradually spreading here, and those who do not use the dormant season spraying are losing their orchards. Our roads are the old fashioned mud roads; the King drag is not much used. State aid has been but little sought here in road building. The bridges swept away in the floods about a year ago have never been replaced.—J. C. M. Johnston.

PRATT'S HAND-BOOK for FRUIT GROWERS

There will NEVER be enough number one apples—ALWAYS too many cider apples. Don't waste your time and your trees growing inferior grades. Use "Scalecide" the one sure spray for San Jose scale, and produce number one fruit. "Scalecide" is 100% efficient against scale and has marked fungicidal properties. Used by best orchardists the world over. Endorsed by Experiment Stations. Our SERVICE DEPARTMENT furnishes everything for the orchard. Write today to Dept. A for new booklet—"Pratt's Handbook for Fruit Growers" and "Scalecide the Tree Saver." Both free.

Farm Crop Notes

By
R. P. KESTER
Counselor on Soils to the State Department of Agriculture.

Thru this department Mr. Kester will discuss queries from Pennsylvania Farmer readers on soils, field crops and general farm practice. Address all queries to Pennsylvania Farmer, Philadelphia, Pa.

NATURAL METHODS OF SOIL IMPROVEMENT

I. Tillage—Plowing

After the farmer realizes that a correct mechanical or physical condition of the soil is quite as important to best crop production as is the chemical content, he will begin to study and apply the best methods of tilling his land, as the first step in the process of improvement.

Plowing is the first step in the cultivation of the soil, and should be rightly done, since a poor job can not be entirely corrected by any kind of after cultivation. The objects of plowing are to loosen, sub-divide and aerate the soil particles; turn under sod or other organic material that would interfere with cultivation and to turn to the surface plant food that has leached downward. The more nearly the plow performs the operation of turning the soil as it is turned by the spade in the hands of a good old German gardener, the better. In fact, spading seems to be the ideal way of performing this operation. A good plow cuts loose its furrow, lifts up the slice, breaks apart the particles, causing them to move upon each other, then rolls them off against the preceeding furrow slice, a well pulverized strip of soil.

What the plowman looks back upon with pride, and considers a beautiful job, is very often the poorest kind of plowing. This is the case when the furrow slice is turned completely over and remains intact, as you would turn over a board. The shape of the mold board, the width and depth of the furrow, must be right in order to do good plowing. Instead of turning the slice over flat, it should be turned against the preceeding slice. If a jointer is used, it should not be set so deep as to roll the sod into the bottom of the furrow, but only deep enough to leave a completely "raw" edge to the furrow slice when set over against the other.

Gradually increasing the depth of plowing is one way of increasing the productiveness of the soil. There is no question but that the majority of farmers plow too shallow a furrow. Where plowing has been the practice for years, and always at the same depth, an artificial hard-pan, almost impervious to water, is often found. This is especially true in soils having clay sub-soil. The tramping of the horses, the dragging of the plow sole, and the walking of the man on the moist furrow-bottom year after year has so packed the clay as to produce the hard-pan effect. Heavy rains will wash the soil that is in this condition, and on the other hand, it will dry out much more quickly because the water can not sink into the sub-soil.

Deeper plowing will also bring to the surface plant food that has leached beyond the reach of most plant roots. With the exception of humus and nitrogen, the elements of plant food increase in quantities as we go downward for a few feet. True, they are usually in a more or less insoluble condition but when turned up and exposed to freezing, and to the influence of the sun and air, they become available. Soil should not be plowed at the same depth two years in succession. It should vary with each crop in the rotation. If potatoes is one of the crops, let the depth be the greatest for this crop.

Generally speaking, fall plowing should be deep. This gives time for the soil to settle before planting, and also turns up the sub-soil where the freezing and thawing can pulverize it. Whether fall-plowing is a good practice or not is a never-ending question for debate. While there are some disadvantages and some loss, the advantages and gains usually outweigh the losses, so that it may be set down as an economical thing to do. This applies especially to sod land. There is little nitrogen converted into a leachable form after cold weather begins. It is work that can often be done when there is nothing else to do and the time gained is valuable when the rush of spring work begins.

In some places, it is customary to plow corn stubbles in the fall in order to sow oats early. Of course, the ideal way is to sow a cover crop in corn and plow in spring. This saves much loss, but where cover crops are not used there is probably not much more loss in plowing stubbles than when left without a cover crop.

Harrowing and Cultivation next week.—R. P. K.

VOLUNTEER ROAD BUILDING

In almost every community we may hear people complaining of waste in road money. There are likewise complaints of poor roads. But neither complaint brings better roads or larger or better applied funds. A few farmers of Gloucester County, New Jersey, in the vicinity of Pitman recently got together for some constructive volunteer work. The number included J. P. Kincaid, A. S. Densten, J. B. Warren, W. B. Fisher and A. Thies, Jr. They secured the promise of the mayor of Pitman and the road committee of the borough to provide gravel and all the shovelers needed if the farmers would provide the teams to grade and gravel a stretch of road about one mile in length which connected a rich agricultural community with a stone road.

The farmers, or team committee as they were called made a canvass and in less than one day had secured 32 teams to start work, all team work to be donated free. Work was started at once. The road is 16 feet wide and is dressed with a covering from 8 to 12 inches deep of good clay gravel. The work was completed in 8½ days, with an average of 16 teams on the job per day. On one day there were 21 teams on the job.

We believe that if farmers and businessmen in and about all rural towns would get together in this way we would soon have roads that all might be proud of. We found very few farmers who were not willing to donate the use of their teams in this way. Their teams were idle and they readily appreciated that in helping in such a community undertaking they were merely helping themselves. We all appreciate that good roads are essential in the building of a prosperous community.—James Kincaid, Gloucester Co., N. J.

NODULES ON COWPEAS

C. B., Atco, N. J., writes: "I sowed a field of cow peas last year. They were inoculated, manured, and made a good growth, but did not show any nodules on the roots. The ground is very light and sandy. Will some one kindly tell me why there was no nodule development?"

The failure of the cowpeas to develop nodules may have been due to two causes. First, the inoculating material may have been inactive, or dead, so that the cultures failed to develop. Second, the presence of barnyard manure may have supplied the necessary nitrogen for the peas so that they were not obliged to secure it from the air. It is a well-known fact that in the presence of considerable quantities of nitrogenous fertilizers, cowpeas and other legumes will put on few if any tubercles or nodules.—A. E. G.

TREATING OATS FOR SMUT

Kindly tell us how to give the formaldehyde treatment for smut in oats.—H. J. M., New Castle, Pa.

The formalin treatment is effective and about the easiest to use for oats. Make a solution of one pint of 40-per-cent formaldehyde to 40 gallons of water. Sprinkle the oats while shoveling them over on the floor. It will require about a gallon of the solution to thoroly treat one bushel of oats. They should be left in a pile for 3 or 4 hours, then be spread out and dried quickly by repeated shoveling over.

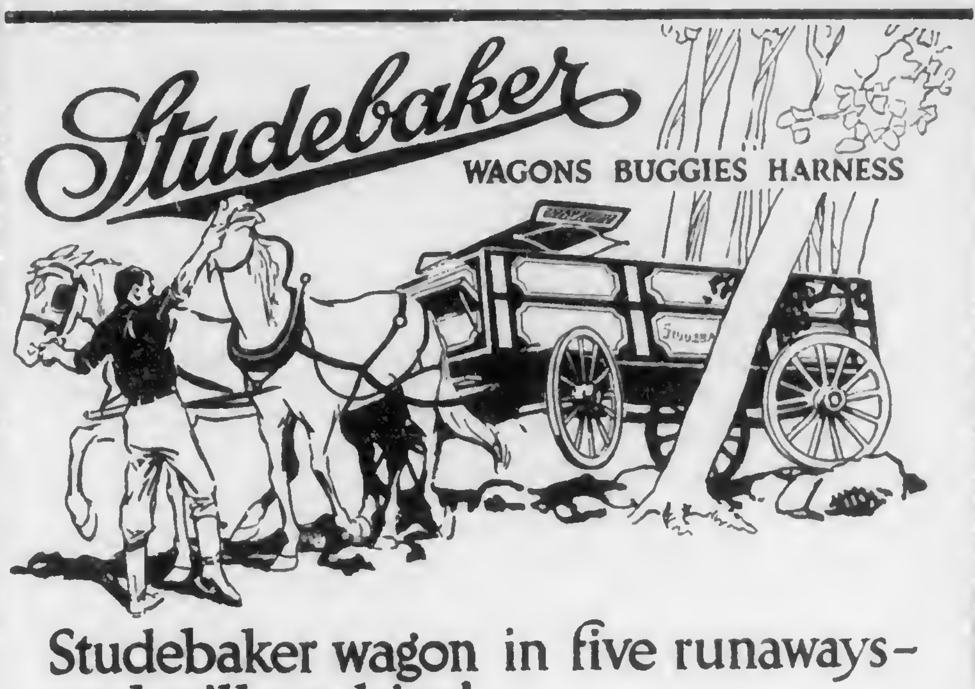
Studebaker
WAGONS BUGGIES HARNESS



Studebaker wagon in five runaways—and still working

Mr. Andrew Kittleson, of Litchfield, Minn., bought a Studebaker Wagon in 1869. He is proud of his Studebaker, and his letter describing its long life of usefulness is so interesting that it would be difficult to write a better advertisement. Here is Mr. Kittleson's letter:

"I bought my Studebaker in November, 1869, at Litchfield from Flynn Brothers, and it has been continually used on my farm ever since. This wagon has given me perfect satisfaction. Never was there a lighter running wagon and it has been of no expense to me. It has hauled thousands of bushels of grain to market, over mighty poor roads.

"My Studebaker has been through five runaways. On one occasion the team ran half a mile and into some oak trees where horses and wagon hung until help came. Another time my team ran into a stone pile. One horse was killed but the wagon was uninjured. It seems to stand all it can get.

"When I built my home I loaded 5000 pounds of sand into my Studebaker. The carpenters were surprised that the wagon could stand such a big load. I am using this wagon at the present time and expect to use it for many years to come."

A 45 YEAR TEST IS PROOF ENOUGH

Don't let anyone sell you a farm wagon, at any price, with the claim that it is just as good as a Studebaker.

You can buy Studebaker Buggies and Harness that will give the same satisfaction.

SPRAYING EQUIPMENT

We have, fortunately, passed the stage when growers ask whether they must spray, for that is now an assured fact. The important point is, how and with what shall the spraying be done? We so frequently see spraying done with either the wrong material or the wrong machine that there seems a place for a discussion of these questions.

The manufacturer of spraying machines has so developed his business that there is at hand a device for every sort of work, and no one will be efficient to the highest degree unless used in the place for which it was intended.

First of all, in answer to the often asked question as to whether the hand or power outfits are most serviceable, the reply must be governed by the work to be done. If the spraying is to be in an orchard, the hand machines will be most economical for the first six or seven years in the case of the apple, pear or cherry. For peaches, and plums, this time will be reduced to about four or five years. In other words, the hand machines will do good work in young orchards and to use the heavier and more powerful outfits is only to waste time and money. For potatoes, cabbage, tomatoes, bush fruits etc., the hand pumps are always the machines to use, and never at any time in such plantations will it pay to use the power sprayers.

FITTING GROUND FOR INTER-CROPPING RHUBARB IN YOUNG ORCHARD.
Buttonwood Farm, N. J.

Hand pumps are made in a large variety of patterns and styles, but they all operate in the same general way. They are mounted on barrels and operated by a lever. The buyer of such a pump has a choice of two types of barrel pumps; the first being the single-acting machine mounted on the top of the barrel, and the second, the double-acting pump mounted on skids and connected to the tank by means of an intake hose. The former will develop a pressure of about 90 to 100 pounds and is most serviceable in spraying small crops and bush fruits and trees during the first or second years. This same type of pump is often geared to the hind wheels of the cart and thus converted into the traction sprayer in which form it is even better adapted to the spraying of potatoes and cabbage. This type of pump, however, is never intended to be used in orchards which have passed their third or fourth years, since not enough power is developed to do efficient work.

The second type of pump mentioned is superior in every way for small orchard spraying since it will develop a constant pressure of 125 pounds or more and is less tiring to the operator. This type then is the one intended for use in the home orchard and in commercial planting where the trees are not over 8 or 10 feet in height.

While all of the pumps made by the standard spray concerns are good there is a great difference in them. The working parts should all be of brass in order to withstand the action of the lime and sulphur and the valves should all be of either the ball or poppet type. Exposed valves are a great convenience in cleaning and will save many minutes in this operation.

Power machines are of two general types and are designed for use in spraying tall ornamental trees and commercial orchards in which the trees have reached a bearing age. In such places no other outfit will do the best work. The first type is that which is fitted with a gasolene engine and a pump, and the second is operated by compressed air. In either case the machinery should be of the best materials and construction and the outfit equipped with a tower so the taller trees may be conveniently sprayed. A power sprayer should develop at least 150 pounds pressure and should not be operated at any less, since it requires this amount to completely break up the material into the fine mist which is wanted.

Probably the most essential point of a sprayer is the nozzle and here is where so many are weak. There are three types of nozzles, all of which are used in modern spraying; the Bordeaux, Vermorel and the disc nozzles. The first has only one place in orchard spraying and that is in the codling moth spray when the object is to develop a driving spray into the calyx cups of the blossoms rather than a fine mist to cover the entire tree. The nozzle makes a fan-shaped stream, and for the ordinary treatments will not give great satisfaction. The Vermorel breaks the material up finer but has the disadvantage of clogging more often and, for general orchard spraying is less efficient. The disc type is fitted with a disc thru which the material passes after it has been whorled in the whorl chamber. There are generally two discs provided with such nozzles, one with a small opening and the other with a larger one. The former is the one to be used in ordinary orchard spraying and for small crop work, while the larger one is designed for ornamental work on tall trees. The small disc is most efficient when used at a distance of about 8 feet from the object. This is very important, since if used at a closer distance only a portion of the object will be thoroly covered and when used at a greater distance there is less control over the direction of the spray. The larger nozzles send the material in a coarse stream for a distance of about 20 feet or more depending on the pressure used, at which point it breaks into finer particles. Hence such nozzles should not be used closer than 20 or more feet, or until the stream breaks. The finer the hole in the disc, the finer will be the spray and the closer the object will have to be to be thoroly covered.

In order to get good results in spraying, it is essential to use the proper machine for the particular work, to use the most efficient nozzles and to hold the nozzle at the correct distance from the object sprayed. This latter is largely a matter of experiment, depending upon the style of nozzle used.—L. Wayne Arny, Cornell University.

CARE OF GRAPES

The season for dormant pruning will soon be past. Investigate and study the vine or vines at once. The purpose of pruning is to encourage maximum production of fruit, to retain full vigor of vine and to aid the annual formation of fruit spurs. Incidentally light and air are admitted, fungus diseases lessened and thoro spraying facilitated.

The grower must realize that each vigorous bud left will produce from one to four clusters of grapes. He must take into account the vine as it is and the location, soil and variety. Many skilled growers cut back to one bud and very few leave more than two buds to the shoot, which practice insures fine fruit and vigorous growth of vine for subsequent crops. It should be remembered that old wood never bears again, that fruit shoots of this year are the source of shoots next year. This brings us to the point that old arbors or even vines on posts become too much encumbered by old or foundation wood which should occasionally be removed and new arms trained out to become a part of the frame work. Where vines on arbor or trellis have become matted thru neglect it is best to release them, reshape them on the ground and then tie them up again. The error of carrying too much wood is far more common than too severe pruning.

Periodical spraying with bordeaux 5-5-50 to which 3 lbs. of arsenate of lead has been added is essential to success. The first application should be made when the new shoots are 6 to 8 inches in length. Continue at intervals of two weeks until the berries are the size of buck shot. The spray formula as above is a strong fungicide which should eliminate black rot and mildew. The arsenate of lead is an effective insecticide. If leaf hoppers are at work it will be necessary to direct the spray with plenty of force on the underside of leaves as much as possible. The work of spraying will be facilitated if a stock solution of the copper sulphate (Blue stone) is made up in a separate vessel, each gallon of water carrying 2 pounds of the blue stone in solution and likewise water and lime in solution. When filling the spray barrel all materials should be strained thru a strainer of 25 to 30 meshes to the inch.

We find that good cultivation from May until August with cutaway and tooth harrow keeps down the weeds and conserves moisture, always insuring a better crop. This tillage should become shallow towards the end of the season as then the roots are nearer the surface.

Fertilizer may be applied as seems best. No uniform formula can be outlined for all soils and ages of vines but on reaching bearing age we would use 200 pounds of muriate of potash per acre and double that amount of basic slag. The slag contains phosphoric acid in a cheap carrier and some lime, which will be of service in getting a cover crop on the vineyard when organic material is needed. Stable manure when available is excellent on soils where a normal growth of vine is difficult to obtain. The following grape varieties are fine for home supply or local market: Miller's Early, Moore's Early, Niagara, Delaware, Worden, Concord.—D. H. Watts, Delaware Co., Pa.

FERTILIZATION IN THE ORCHARD

If the ground has been put in good shape previously to planting and is rich and well filled with humus, little fertilizer is needed in the orchard until the trees are of bearing age. If the young apple trees do not make a proper growth, nitrate of soda at the rate of about one ounce per tree will bring them along, or if a complete fertilizer is desired, mix 1 oz. nitrate soda, 8 to 12 oz. basic slag and 6 to 8 oz. of a low grade sulphate and apply around each tree as early in the season as possible. A fork full or two of well rotted stable manure is very good to bring the tree along, but care should be taken to keep it away from the tree for a distance of six inches all around.

Keep the trees growing rapidly until they begin to bear; then they should be checked somewhat and their energy directed to producing fruit.

Peaches are much faster growing than apples and rarely require anything but plenty of cultivation until bearing time is reached. Pears should be grown very slowly, because of the blight, which will be pretty sure to prove disastrous, otherwise. Plums grow very rapidly and do not need any special precaution as they are not subject to blight. After they have begun to bear, cut back severely annually. Cherries should not be forced along rapidly because they are apt to split apart and spoil the trees. This applies especially to the sweet varieties.—H. G. Fasset, Wyoming Co., Pa.

REMOVABLE PANELS FOR A GARDEN FENCE

There are many old garden fences that will have to be repaired this spring and many other new ones built. The first thing to consider is the convenience of having the end panels of the fence arranged in such a way that they may be taken down quickly so that in plowing the garden the horses will have plenty of room to turn outside. Until we solved this important problem we always had to use the spade. If we plowed, we never could plow up close to the fence and this also had to be spaded up. A great many people would use the horse and plow in the garden if it were not for the fact that in a small garden as much is destroyed in turning as is made by the plowing itself.

If the garden is made longer one way than the other, it may be plowed the long way and by having the end panels arranged so that they may be lifted out the horses may be turned in the road, lot, pasture or whatever the garden adjoins, and there will be no more weedy fence rows surrounding the garden. A garden 10 rods long and 5 or 6 rods wide is a very nice size. Our largest garden is 12 by 5 rods, and the small one 8 by 6 rods. The fencing used is woven wire chicken and hog proof, and the ends are arranged so that the panels may be taken out at any time. No possible amount of hoeing or hand plowing will accomplish what can be done with the horse, and these removable panels solve the difficulty very satisfactorily for us. Another thing that would help wonderfully in keeping the garden clean would be to change the old method of setting such things as sage, rhubarb and horseradish along the garden fence. We have solved this problem by setting these permanent plants in rows in the middle of our largest garden, and in this way we are able to farm up close to these plants and they are much more easily kept clean from weeds. We can also plow up close to the sides of the fence now without danger from plowing up some valuable garden plant. We plant a row of pole beans around the fence and utilize it for a support. Peas may also be planted in this manner with excellent results and one will not have to bother driving poles in the ground for them to climb upon, as the fence answers this purpose. — H. W. Swope, Montour Co., Pa.

INSECT POISONS

Dr. Thomas J. Headlee, State Entomologist of New Jersey, in a recent address on insect poisons, recommended arsenate of lead as the best all around poison for insects that chew vegetation, and can thus be attacked thru the stomach. He thinks it better than paris green for potato bugs, because paris green, while much cheaper, and really effective, will not stay on the plant, and if put on too thick it will burn the potato vine. Arsenate of lead mixed with soap will stay on cabbage leaves, and is about the only poison that will. Cranberry growers use it, and use a special mixture to make it stick on the cranberry leaf. Arsenate of lead powder and sulphur, blown on the peach will prevent all peach scabs. It is also the only effective remedy against the ear-worm in corn.

The use of arsenate of zinc was deprecated due to the fact that it is in a trial state and no one knows just what it will do, while arsenate of lead has been well tested out. Arsenic poisons, according to Dr. Headlee will not kill lice on cabbage, squashes, canteloupes, etc., or any other pest that sucks the juice of a plant instead of eating it. For these other poisons are necessary. Kerosene will do it, but it is bad on most plants. Various forms of mixing kerosene and water, by aid of soap, have been tried more or less successfully but kerosene when used often on peach trees is bad for them, and is apt to kill vegetables like cucumbers and melons. Soap and water will also kill lice without the kerosene. The best mixture, however, is nicotine sulphate, made from the stems and refuse of tobacco plants. A standard variety of this is made and when mixed with soap and water is the best remedy for juice sucking pests. By the use of soap, the nicotine becomes much more effective, and ten times as much water can be used in the solution with an equally good effect.

For general spraying Dr. Headlee favors what he calls a "three way" mixture which will kill insects, lice and fungi. This may be made by mixing the nicotine sulphate with Bordeaux mixture, with paris green or with sulphate of lead.

The remedy advocated for the control of the ear worm, which attacks 92 per cent of the ears of sweet corn, is to keep the tip of the ear, where the silk

Crops One to Three Weeks Earlier

The growing demand for early garden produce brings *prices that you should take advantage of.* The real difference between early and late crops is in the fertilizer. Most fertilizers require warmth and moisture for a considerable length of time before they become soluble plant foods—that's just where

Consumers Brands
EARLY CROP ODORLESS FERTILIZER

is superior to all others—it is immediately soluble. At the same time it does not leach or wash away in the soil, for it is mixed with pulp fiber.

Quicker Growth and Earlier Maturity are the results of the use of this fertilizer, for it contains twice the available plant food, in a more soluble form, than any other fertilizers. We've proven this and our customers have proven it—so have the Experiment Stations.

We can tell you of many advantages of Early Crop Odorless Fertilizer not possessed by other fertilizers—of how *it repels insects,* can be applied by hand or drill, *has no offensive odor,* is equally effective *whether the season be wet or dry.* We won't attempt it here, however.

Send for catalog and particulars. Don't neglect this for one day—it's a matter of early crops and big profits for you.

We sell only direct to the Consumer

Gaar-Scott Separator, 13 H-P engine and water wagon, all in A1 condition. Run six months. Price $1000—must sell. C. A. DEI LCASTER, Rt. 1, Lowellville, O.

comes out and falls over, dusted with a powdered sulphate of lead, mixed with sulphur, lime or wheat flour. This has to be put on as soon as the silk appears and kept there till the silk drys up, to be effective, and replaced as rains wash it off. This is too costly an operation for field corn, but will do for garden corn or for the truck patch, and the higher price received for the perfect ears will pay for the labor.—D. T. Hendrickson, Monmouth Co., N. J.

GROWING ASPARAGUS

Every one wants asparagus, and few know how easy it is to get it. I see people sending to the nurseries and buying two year old roots, imagining that these will give them asparagus sooner. If you plant roots, always plant one-year old ones, as they do better than two-year old ones. But it is not at all necessary to plant roots. In fact, you can get asparagus sooner from seed sown where the bed is to stay than by planting roots. Make furrows a foot deep and 4 feet apart and fill them half full of old rotten manure. On this spread a liberal dressing of a commercial fertilizer strong in phosphoric acid and potash, a 2-8-10, in fact. Cover with two inches of soil and sow the seed in a continuous row. Then when a good stand is assured thin out to 2 feet apart and cultivate wel during the summer, gradually filling the earth to the plants as they grow until level. Twice during the summer apply along side the rows some nitrate of soda to urge a rapid growth. The next spring you can cut some shoots of fair size, more than a year before you could from roots planted, and thereafter, if the plants are well manured every fall, and clean cultivated, the shoots will increase in size. The sowing of the seed can be done either in late fall or early spring. Fat shoots of asparagus is simply a matter of high feeding.—W. F. Massey, Wicomico County, Md.

APPLE QUESTIONS

Your recent excellent articles on the "The Apple of Tomorrow," leaves a very good taste in the mouth. Will you please ask the author to make a few things more definite? What are the "varieties that blossom at the same time" and does the whole list given, from Akin to Yellow Newtown, blossom at the same time? Again, which variety is "a heavy maker of pollen?" Which varieties are self-sterile and which are self-pollenizers? Also what are synonyms for his apple, "Sweet Paradise," as I cannot find that name in any of my works on fruit culture?

By writing to the Director of U. S. Experiment Station, Corvallis, Oregon, asking for bulletin on pollination of the apple, you will have most of your questions answered. A bulletin may also be had for the asking, by writing to the Director of the Experiment Station at Geneva, N. Y., for a bulletin on the blossoming period of apples and other fruits. Further information as to the blossoming period, as well as to the self-sterile, self-fertile and vigorously pollinating varieties of apples may be had by writing to Prof. H. P. Gould, Pomologist, Bureau of Plant Industry, Washington.

Two-thirds of the varieties of apples are self-sterile; and even the self fertile varieties make better fruit if cross pollinated. Of the heavy pollinators York Imperial and Wagener are in the list; and we are retaining some York in our best orchards, for the purpose of pollination.

The Sweet Paradise apple is also called Winter Paradise. I used the term Sweet as more descriptive.—Abram Bunn, Bedford Co., Pa.

The Vegetable Garden.—This is the title of Bulletin No. 171 of the Purdue Experiment Station, Lafayette, Ind., which discusses arrangement, planting and care of the home vegetable garden. The garden problems of those who live in the town have been considered, as well as the problems of the farmer. The plans presented and the recommendations made may be modified to suit both town and country conditions.

Peach Leaf Curl.—Circular No. 29 of the New Jersey Experiment Station, New Brunswick, N. J., under the above heading describes the characteristics of the fungus in question and its control.

Double your Potato Crop.

Sprayed potatoes yielded an average gain of 66 bu. per acre or 50% more than unsprayed potatoes. Experiments carried on for 20 years proved that. Let us send you pamphlet giving details about these experiments. It proves our statement and our catalog will tell you of the thorough work done with

Deming Spray Pumps Spray 4 Rows At One Time

The Deming Field Sprayer, shown alongside, is the handiest thing ever devised for spraying potatoes, strawberry beds, small nursery stock, cotton fields, etc. Easily and quickly attached to any wagon, sprays four rows at one time. Nozzle holders are adjustable. Ask your dealer or write us if he cannot supply you.

Poultry

PREVENTION OF POULTRY DISEASES

(Continued from page 1.)

clean. On the farm this can best be done by using portable colony houses and moving the fowls to a new location each year or by providing two large fields in connection with permanent houses that may be used alternately, growing crops in one while the other is used for pasturing the poultry. If small yards must be used, plow them up frequently and sow oats, rape or some other quick growing seed. Use lime liberally.

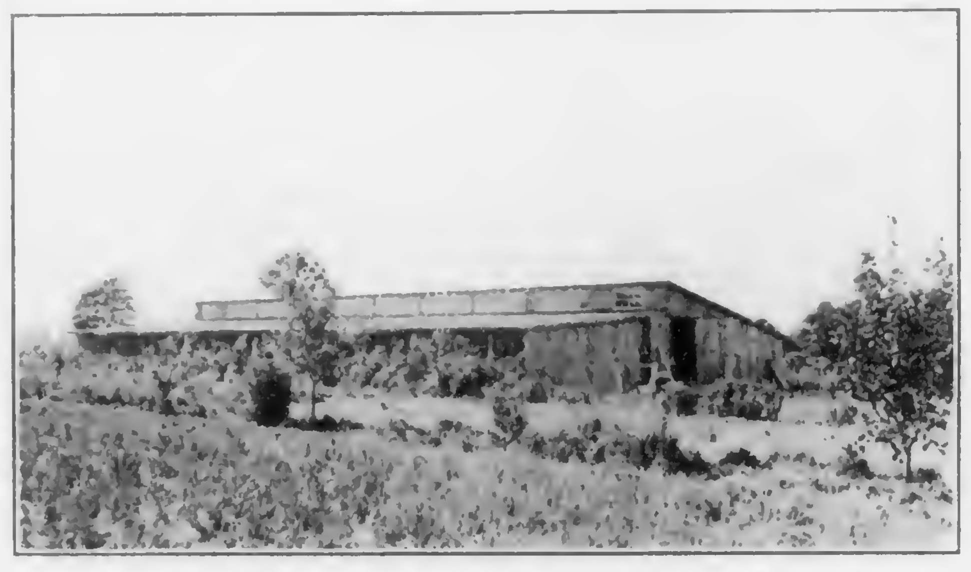
Close attention must be paid to the feeding. Never use any material in the ration that is not clean and wholesome. If wet mashes are used, see that the feed troughs are thoroly cleaned after each feeding. Avoid overfeeding. Successful feeding means heavy feeding but the feeder should be constantly on guard against digestive disorders. Provide plenty of succulent green feed. Under normal conditions, fresh air, sunlight and a liberal supply of green feed are the only tonics or medicines needed for fowls.

The supply of drinking water for the fowls should be clean and fresh. Disease is more rapidly spread thru the water than in any other way. A roup infected fowl may communicate the disease to fifty or more other fowls in a few hours if all drink from the same fountain. The water pans should be washed every day and thoroly scalded once a week. Disinfect the water with permanganate, using enough to make it a wine color.

If sickness appears in the flock, establish a rigid quarantine. Whether you intend to treat a fowl or kill it, no matter how simple the symtoms of disease may appear, remove it from the flock as soon as possible. It will generally be found advisable to kill all fowls that show any symptoms of an infectious disease. The treatment of poultry diseases is not often advisable because the value of the fowl is relatively small and the cured chicken is always a menace to the flock, since it may be a chronic carrier of the disease without showing any symptoms.

All dead fowls should be burned. If burning is not possible, bury them deep enough that the decaying carcass will not be dug up by dogs or uncovered by fowls.

The majority of poultry diseases are so easily prevented that their appearance in a flock is evidence of carelessness and neglect on the part of the poultryman in charge. Every poultryman, if he is to make his work a profitable proposition, should endeavor to prevent the appearance of any disease in his flock. This may be accomplished if only fowls that are constitutionally strong are allowed in the breeding pen and this constitutional vigor maintained thru constant selection and by paying close attention to the observance of a few simple rules of sanitation and hygiene.



CENTRAL POULTRY HOUSE, 48 x 120 FEET, AT WOODBINE FARM, CRAWFORD CO., PA.

POULTRY HOUSE AT WOODBINE FARM

In the summer of 1912 we built the large poultry house shown in the illustration, size 48 by 120 ft., capacity 2000 White Leghorn hens. There is a driveway thru the center and perches are arranged along the north side of the drive-way. The house faces the south, has a natural ground floor and has concrete foundation all the way around; which foundation is four inches thick and one foot above the surface of the ground. The building cost of the house was approximately $450. All material was purchased and labor employed, the hauling and miscellaneous work being done by farm laborers.

The object in building this large house was to test out some ideas which are the outgrowth of many years of successful poultry work. The house is not satisfactory as originally built and will be re-arranged inside. The building is located near the center of the farm and the birds have free range, as have all the 2,500 hens at Woodbine Farm. Many persons are astonished that we can give the birds free range and grow farm crops in close proximity to the poultry buildings yet as a matter of fact we do this year after year. A crop of wheat was grown on one side of this building and a crop of corn is growing on the other side. It all depends on knowing how to feed and handle the fowls wisely.—J. T. Campbell, Crawford Co., Pa.

EXPERIMENTS IN INCUBATION

Under natural conditions eggs not promptly incubated are warmed daily by contact with the body of the hen. In order to determine whether or not this preliminary warming has any effect on the vigor of the embryo, 2 tests were made recently by the Pennsylvania Station with incubator hatched chicks. In the first test the percentage of chicks hatched from all the eggs was as follows: Not warmed, 52 percent; warmed 1 hour daily, 63.4 percent; warmed 2 hours daily, 47.2 percent. In the second test the results were as follows: Not warmed, 20 percent; warmed 30 minutes daily, 20.4 percent; warmed 1 hour daily, 29.6 percent. From these results it is thought that there is some advantage to be gained from warming the eggs which are to be held for periods longer than 10 to 12 days before the regular period of incubation begins.

The effect of placing eggs in different positions in the incubator was also tested. No serious disadvantage resulted from standing the eggs on ends for 3 days, but eggs laid flat and turned twice daily gave better results than those kept in any other position. There was a distinct disadvantage in leaving eggs flat without turning. Eggs which had been held at different periods from 10 to 30 days were incubated, and the results indicated that there was little loss in the hatchability of eggs kept for from 16 to 18 days before setting.

Handling Brood Hens.—In an address at the recent "Get-together" dinner of the Essex county poultry association, of New Jersey, Charles D. Cleveland, secretary of the Madison Equare garden show, in explaining the art of handling brooding hens, dissected his "colony-coop" method. Taking a yard of 175 setting hens, the number is separated into three groups or pens. The setting hen is placed on the eggs and shut in a coop with only the head protruding thru slats. Every two days, the speaker asserted, was an excellent interval to adopt in allowing each hen fifteen minutes' recreation from the coop. Boxes are placed on top of each other when insufficient space is allowed in the yard. Mr. Cleveland advocated milk instead of beef scrap for the feeding of chickens.—D. T. H.

Improvement of Permanent Pastures.---No. II.

By JOHN H. REISNER, Cornell University.

Essential Qualities of Pasture

Every good pasture should possess certain essential qualities, and the best pasture would be one that contained them all in right proportions. First, there should be a quick growth in spring so that green pasture for the dairy herd may be early available; also to hasten the drying out of the soil so that cattle can be run on it without injury to it. Second, there should be a large production of green matter. Cattle should be able to satisfy themselves without having to graze ten to twelve hours each day and cover the distance of the meadow several times in doing it. Third, the grasses must be palatable, nutritious and digestible. This may appear axiomatic, but it is not. There is wide differences in the palatability of our different pasture grasses. Some are much better than others, and only the best should be used. Fourth, there should be a continuous supply of pasture thruout the season. It is difficult to get any one grass that will give this condition. The meadow should therefore contain grasses which have different habits of growth; that is, come on at different times during the summer, so that a supply of green pasture may be available at all times. This is an extremely desirable quality, and which few of our meadows possess. Finally, the turf should be such as will resist injury from tramping and close grazing. These five qualities combine to make up our ideal pasture.

GOOD NATURAL PASTURE LAND OVERGROWN WITH BRUSH.
Kentucky Bluegrass is indigenous to this region and would transform the plot to good pasture.

Methods of Improvement

How to improve the pastures that we are now using and have at hand is the real problem with which we are chiefly concerned. The classification of these lands already given indicated the diversity of the methods needed to meet such diverse conditions. For the most part then we shall be compelled to be content with the consideration of principles and methods, rather than make specific recommendations. These must needs be largely determined by conditions of seeding, soil and surface features and the results desired.

Immediate Improvements

These improvements are usually preliminary but are essential to further care, and will be discussed first. They are usually the least expensive and practically always show marked results. The first is to rid the pasture of all weeds, brush and trees which are not to be used for shade trees. This can be done by grubbing, firing or pasturing with goats. Excellent grazing lands can be made to produce which otherwise are only a burden to the farmer. The practice of pasturing with goats to clean up the weeds, brush and to kill the stripling trees can be profitably managed. They not only save the cost of labor, but are an increasing source of income themselves. I have seen hundreds of acres of pasture land reclaimed in this way and with profit to the farmer.

Another method of improvement which should be practiced much more than it is is mowing the pasture, first to cut down the weeds before they go to seed, and secondly to get rid of the over-ripe grass. Very often the weeds can be controlled in this way except those that reproduce by means of underground stems. In this case continuous grubbing is the only sure method of eradication. Mowing the ripe or dry grass not only rids the pasture of food that the cattle will not eat in most cases, but invigorates a new growth of green leaves at a time when otherwise there would be little good grass. It is not an unusual sight to see whole meadows "gone to seed," with the consequent deterioration if not an almost total loss of the area for grazing purposes. More general mowing of the pasture lands when mowing is needed would result in more available pasture during harvest time or shortly after when there is often a lack of green grazing.

The next method to be considered is drainage. This of course applies to low, wet, swampy and poorly drained lands. Undertiling is perhaps the most satisfactory method, but it is expensive and the results to be obtained may not warrant the expenditure of money. Open drains are not wholly desirable in grazing lands, but they may often be used to good advantage in reclaiming these lands. One thing should be noted in reference to these lands, that when drained and consequently aerated, they can be made the most valuable pasture lands of all. These soils usually contain large amounts of organic matter and nitrogen, causing luxuriant green growth.

The fourth of these temporary or immediate improvements is management and care in grazing. Grass lands, as already stated, should not be grazed too early, too close or too late. One week of too early grazing may injure the pasture for the rest of the summer. The demand for green feed is usually great at this time of year, and the tendency is to begin to use the grazing lands as early as possible. It is a dangerous practice. The land should be dried out enough so that tramping will not cause puddling of the soil, or too great packing. This not only destroys much grass, but injures the roots as well, with a consequent injury to the pasture as a whole. Further, the plant should be given a chance to manufacture and elaborate food both for present and future use. Early grazing prevents this, and leaves the plant in less vigorous condition. Too close grazing has the same effect on the vigor of the plant as too early grazing, but in addition may cause a loss of organic matter that would otherwise be added to the soil, an increase in evaporation, and, if the temperatures are high, a positive injury to the roots. Close grazing and lack of good vigorous green growth are usually associated with the dry summer periods.

While it is quite impossible to forestall the effects of dry hot weather in summer, we can prevent injury to the grass seeding by not allowing too close grazing. We must manage our grass lands with the future in mind rather than that they should afford a scant sufficiency of pasture for a few weeks when green feed is scarce. Late pasturing is injurious when it causes unfavorable condition for wintering. Top dressing of manure is so seldom applied, or in fact anything else that would act as a protective covering during the winter months. For permanent pasture grasses, nature will supply this necessary protection in the form of green material, but when we rob the lands of even this by late grazing, we make the conditions of maintenance by so much the more difficult for the plants.

In addition to the management and care in grazing, these lands should be rotated. By grazing but one-half the pasture, the other half is given a rest and chance to get a new start. There is no injury from tramping. Plant growth can go on unhindered. Production of green matter is stimulated. Thus the two pastures can be used in rotation, more green feed being supplied to the cattle and more easily accessible. Much in the way of permanent improvement can be done by careful management in grazing and by proper rotation of the pasture lands.

Adding Fertility to the Land

Improvement may not be possible without the addition of outside source of fertility. The land may be so depleted of mineral plant food that plants can no longer grow. The land may lack organic matter in an actively decaying condition, so that the mineral elements are too slowly soluble. If low lying and with poor drainage, or lacking lime the soil may be acid, and occupied with weeds or by plants that do not have a high pasturage value. It will be necessary then to correct these conditions before the improvement we are looking for is possible. Nitrogen can be added by growing clovers, either red, alsike or white. Every pasture should contain some clovers. White is perrenial and few good pastures are without it. Red and alsike must be sowed at least every two years. Alsike clover grows on wetter and more acid lands than red, so that on poor soils it is best to sow them in mixtures rather than alone.

The next way to add fertility is one that may be objected to by some on the ground that it lessens the quality of the pasturage, or at least the cattle show a preference aginst it. This is by the application of barn yard manure. Probably nothing can be added to the grazing lands that will improve them and the grasses grown on them as the application of barnyard manure. Not only are the manurial food elements, nitrogen, potash and phosphoric acid returned to the soil, but there is a direct addition of organic matter, the effects of which in the process of its decomposition with the soil will be evident for a long time. Such a method may be particularly valuable for treating hill tops on which the sod is running out.

The third suggestion in this connection is the addition of lime, which affects the fertility indirectly, chiefly by correcting acidity, improving physical conditions and by releasing plant food. The application of this method and the one following will receive further consideration later on.

The last method and the one which should be resorted to last of all and not without some assurance of its success, is the direct application of commercial fertilizers, either complete or incomplete. Nitrate of soda stimulates plant growth but is expensive. The increased yield in green feed must more than offset the cost of the application. The application of nitrogen, phosphoric acid and potash in a complete fertilizer may be the most profitable depending on soil conditions. We should remember that mineral fertilizers should be a last resort, and not until drainage, lime and manures had failed.

SAME KIND OF SOIL AS IN THE ILLUSTRATION ON OPPOSITE PAGE BUT CLEARED AND SEEDED TO BLUEGRASS.

ACCURACY OF MILK TESTS

Need of Regulation of Equipment and Testing

Is there any law in Pennsylvania that compells people who have charge of the testing in creameries and shipping stations to be licensed? If not, why shouldn't there be? A law of this kind would bring about more accurate and reliable tests of milk, which would not only protect the producer, but the creamery as well. Too much can not be said about this testing business. For example, I have had the milk from one of my cows tested at four different places and get tests ranging from 3.25 to 4.30. Is this dishonesty, ignorance or what? It seems to me that the farmers suffer more than necessary by these methods. Why should this go on? Who is at fault?—C. D., Schwenksville, Pa.

There is no law in Pennsylvania at the present time that requires that testers of milk and cream have a license. There should be such a law. Many of the states of the Middle West have, for a number of years, required that men who buy milk and cream on the butter fat basis must have a license; must pass an examination showing that they are competent to make such tests. The states of Minnesota and Iowa have learned by experience that this law is a good one. At the last session of the Indiana legislature a similar law was passed. Nearly all of the New England states have, for many years, had a law that required that all glass-ware used in Babcock test determinations be first sent to the Experiment Station to be tested. In Connecticut the first year that this law was in effect most of the glass-ware was condemned; the second year only 1 percent was found to be inaccurate, while the third year no inaccurate glass-ware was found. In Maine when this law went into effect, in a single lot of 60 test bottles 33 were found to be inaccurate, the error being from 3/10 to 1 percent. The importance, therefore, of having glass-ware tested is obvious.

It is also claimed by many that because of our neighboring states having such a law the best glass-ware goes to them, while the inaccurate glass-ware is sent to Pennsylvania where there is no law with reference to glassware. There are, however, a few companies that do guarantee their glass-ware to be accurate.

To answer your question as to whether or not a variation of 3.25 to 4.5 in test of milk from a single cow is "dishonesty, ignorance, or what," I must say that on different days the same cow may vary as much as 1 or even 2 percent. Excitement, the cow being in heat, and many other conditions may cause the fat content to vary, but if samples taken carefully from the same milk vary as much as 1 percent it shows that your glass-ware is inaccurate, or the test has not been properly made. It is possible to have samples check within 1/10 of 1 percent if they are properly handled, but it must be kept in mind that fat in milk is not in solution but suspension, and it is a very easy matter to take samples from the same milk and get different percentages of fat in them.

A law requiring the testing of glass-ware, and requiring that all users of the Babcock test have a certificate of proficiency for such work is desirable from the standpoint of the producer as well as the handler of milk. The writer has advocated this for a number of years.—Prof. C. W. Larson, State College, Pa.

DE LAVAL Cream Separators are not the mail order or agricultural implement kind

THERE ARE SEVERAL KINDS OF cream separators, but De Laval Cream Separators are of a kind that puts them in a class by themselves.

DE LAVAL CREAM SEPARATORS are made by the best engineers, with the best equipment, from the best materials, by the best workmen, and in the best shops of the kind in the world, all devoted solely to the production of the best cream separator.

THEY ARE NOT THE KIND OF SEPARATORS mail order houses contract for wherever they can be made cheapest, nor the kind that agricultural implement concerns manufacture along with corn shellers, plows, mowers, reapers, threshers, gasoline engines, cow milkers and the like, none of which begins to compare in mechanical quality or refinement with what the cream separator should be.

DE LAVAL CREAM SEPARATORS are the kind 98 per cent of the creameries use, where any loss in quantity or lack in quality of product means business ruin, as it always has ultimately to every creamery that did not replace an inferior separator with a De Laval.

PRECISELY THE SAME KIND OF DIFFERENCES exist in farm as in factory separators and precisely the same reasons apply to the use of cream separators on the farm as in the creamery, though they may not make or break the farmer as they do the creameryman where the farmer has other crops and products upon which to rely.

THE DIFFERENCES BETWEEN DE Laval and the mail order and agricultural implement kind of cream separators are fully set forth and made plain in a De Laval catalog to be had for the asking, while the machines themselves best tell their own story placed side by side, and that every De Laval local agent is glad to afford any prospective buyer the opportunity to do.

If you don't know the nearest De Laval agent, simply address the nearest main office as below.

LISTEN! Read This Twice

For five months starting February first I am going to make my New Special Proposition to every dairyman in this country on the New Genuine Galloway Sanitary Cream Separator. It's a combination offer. Its equal has never been made in the history of this country. I not only save you dealer's, jobber's and catalog house profits but I sell you a better machine and give you a bonus as well to try it, which shows my faith in my separator, my proposition and my plan. No such offer as I make on the class of separator I sell has ever been made.

The New Galloway Sanitary Cream Separator is made so good in my factory that I will send it anywhere in the United States without an expert to any inexperienced user for a ninety day free trial to test against any make or kind that even sells for twice as much and will let the user be judge, because it's the most modern—the most sanitary—the most scientific—the cleanest skimmer—the most beautiful in design of any cream separator made today and I have seen them all. Write me and I will tell you how to make money in the dairy business when the pastures are dried up in summer. I did it on my own farm and know. Get my proposition now. It's so good that no dairyman who owns two or a hundred cows can afford to be without it. All I ask you to do is to first get my proposition before you decide to purchase any cream separator of any make, kind or at any price. Just drop me a postal. Address

Travel 20,000 miles, look over every factory in the United States and all of the foreign countries—you won't find its superior at any price. Made in our own factory from finest materials on best automatic machinery, by skilled workmen, in tremendous quantities, all parts alike, interchangeable, and standard and sold to you for less money than dealers and jobbers can buy machines not as good in carload lots for spot cash.

Feed Ensilage This Summer When Pastures Get Low

To secure the maximum results, stock should be fed green feed all the year round. Its succulence produces rapid growth and a heavy flow of milk. No other feed equals ensilage in succulence. It is as valuable and economical to feed in summer as in winter. It pays, then, to fill a silo for summer feeding. You will keep ensilage succulent and palatable all-the-year-round as the day the corn was cut, if you have a

Natco Imperishable Silo
(Patented)

Built of non-porous vitrified-clay hollow blocks; its glazed surface excludes air and moisture. The two dead air spaces protect contents from heat and cold. Each layer of blocks is reinforced by continuous steel bands.

Weather Proof—Decay Proof—Vermin Proof—Fireproof

The Natco Imperishable Silo will last for generations—any mason can erect it—never needs painting—walls will not warp or shrink—no hoops to tighten—no continual repair bills—the first cost is practically the only cost. The Natco Imperishable Silo has a survival value unequalled.

FREE SILO BOOK. Full of information about ensilage and summer feeding. Describes completely the Natco Imperishable Silo. Write today. Ask for catalog Q.

International Special Dairy Feed

GAINED TWO QUARTS EACH DAILY

Mr. H. L. Gardner of Otisville, N. Y., has written us as follows:

"During the past two months I have fed three tons of International Special Dairy Feed to twenty head of cows along with ship feed and Gluten, using about six pounds of International Special Dairy Feed daily for each cow. By the use of this ration, my cows produced two quarts of milk more per day than when they were fed a mixture of Gluten and ship feed. I could not get your feed afterwards and fed dried Brewer's Grains in its place and my cows dropped one-half can per day."

International Special Dairy Feed is also extensively used as an entire grain ration and used in this manner will produce more milk at less cost than can be obtained from any other method of feeding.

Ask your dealer for International Special Dairy Feed. If he don't keep it for sale, then send us your dealer's name and address—we will arrange to supply you. C-5

Pennsylvania Hay Crop

Statistics from the State Department of Agriculture on hay production and prices, published in these columns last week, give some interesting figures on the state's greatest crop. For many years agricultural authorities have discouraged hay production from the standpoint of effect upon soil fertility. This has been particularly true in the case of timothy, which, because of its meagre root system and slight return of humus to the soil, proves a heavy drain on soil fertility in a series of years. Clover is not objected to because of its power to store up nitrogen in the soil and because, from its dying out the second year, it is not grown continuously on a single field as timothy often is. But even with clover the advice is frequently given to feed it on the farm or turn it back to the soil in some other way. In many communities the practice of selling hay of any kind has come to be regarded as wasteful and contrary to best farm practice. But in this, as in many other cases, the best general farm theories are subject to exceptions. The many large cities of the east create a demand and establish a price for hay which make hay production profitable; and the figures show that the farmers of Pennsylvania are taking advantage of these prices and have made hay the state's biggest crop. It is estimated that the acreage last year reached a total of 3,141,000, from which there was produced a total of 4,146,000 tons, bringing in $61,775,000. From the estimates given it appears that alfalfa has a wide margin on timothy and clover in gross returns per acre. The average price per ton of alfalfa for the state was $17 and the average yield was 3 tons per acre, giving an average gross return of $51 per acre. But while all of the 67 counties of the state raised clover and timothy, only 20 counties raised alfalfa. Timothy is credited with an average yield of one and one-half tons per acre, and the average price for the state was $15 per ton, making an average gross return of $22.50. The state average price for clover was $13 per ton and the average yield, one and one-half tons per acre, making the average gross return $19.50 per acre. When the cost of production is considered, particularly where farm labor is scarce and high priced, these gross profits indicate that hay must continue to be one of our leading crops. The problem is to so manage the farm rotation as to permit of hay production and still conserve soil fertility. Those who are growing clovers and alfalfa will have no worries on this score and those who are growing timothy are getting the desired results with short rotations in which timothy is always seeded with clover and the seeding standing only two years.

Berkshire Association

Every breeder of Berkshire swine in this state will be interested in the work of the newly organized Berkshire Breeders' Association. This association promises much for the development of the breed in this state and thruout the East, as it is starting with a strong staff of officials that is entirely free from entangling alliances with sets or classes of breeders, with sections and with individuals. The officers appreciate the needs of a strong breed association and the need of working toward a well-balanced general development of the breed among the actual, practicing farmers in all parts of the state. A particularly gratifying move is their determination to encourage the development of the utility or pork-barrel qualities of the breed rather than the fancy show points. Many breeds of farm live stock have suffered thru the exaggerated importance placed upon show-ring features. So far as the farmer is concerned, the value of the animal in any class or breed is determined solely upon the market value of itself or its products. He will use a breed only so long as the market quality makes it profitable for him to do so. As the farmer trade forms the backbone of the breed's existence, the breeders who permit themselves to lose sight of utility in their race for fancy points soon find their stock losing in popularity and depreciating in value. The Berkshire association is starting its work with the purpose of making the breed the best for all by making it the best for the farmer in the production of pork under eastern farm conditions. In this as in all of its efforts it deserves the support and co-operation of every Berkshire breeder of the state. The breed is already a popular one, there being more Berkshires registered with the national association from Pennsylvania in the past year than from any other state in the union. The state association is now prepared to push its organization and get down to constructive work in every county in the state. The brief note on page 14 of this issue outlines plans for solid constructive work that should appeal to all Berkshire men.

Milk Testing Equipment

Every dairy reader who sells milk or cream on the butter fat basis will be interested in the query and reply on page 9 of this issue. The query asks a number of questions which have no doubt occurred to many dairymen at different times. The reply reveals a condition that ought to have the attention of every farmer. The government and the various states exercise the most careful supervision of standards of weights and measures by which most products are bought and sold. The Babcock test is a standard by which hundreds of thousands of dollars worth of butter fat is bought and sold every year, and the equipment used in this test is not standardized and there is no specific legislation affecting it. The figures presented by Professor Larson showing that 55 percent of the glass ware investigated at certain times have been found to be inaccurate reveal a startling condition of affairs which affects every dairyman and every creamery. Farmers spend large sums of money and give great effort to increase production of butter fat by single pounds per cow. They spend money in the purchase of the most efficient separators and other equipment to conserve every particle of butter fat produced. Yet, after this care and expense, the standard of measurement by which this commodity is sold is liable to and even known to permit variations which may work serious injustice to either the buyer or seller, or both. There is no good reason to believe that the inaccuracies in the equipment favor the creameries or the purchasers more often than the sellers; but as the purchase of the equipment and its operation is in the hands of the creameries, there is at least a possibility of their selecting such equipment as will insure them against loss. The fact also that some states bar inaccurate equipment from use within their borders increases the probability of defective equipment being sent to states where there is no effort at control. This is a matter which should be fully discussed by dairymen. We shall be glad to hear from readers who have had further observations on this subject.

STATE CAPITAL NEWS

Demonstration Work. — Pennsylvania's orchard demonstration work is to be resumed next week in twenty counties under direction of the state zoologist, to be kept going until the trees bloom. The work has been retarded by the snows. Information will be given farmers and fruit growers as to what to expect from trees nipped by frosts. Sample infested twigs are to be passed upon at the demonstration orchards. The experts have been specially instructed concerning frost.

Beef Production.—Considerable attention has been given to the subject of beef production due to the recent bulletin on the subject. In some counties farmers have written that available land is not sufficiently large to raise cattle on an extensive scale; and in other sections it is claimed that calves and milk offer quicker returns than the raising of steers. However, the fact that beef production will bring down the cost of meat is being realized and there is a disposition to return to the plan of raising several steers a year for market. The state has offered to give advice on pasture lands and cattle raising and bulletins on the subject will be prepared. One of the first steps toward creation of pasture lands is the fencing in of and giving them proper attention.

Rabies.—The most extensive outbreaks of rabies known in recent years have been reported to the State Live Stock Sanitary Board in the last few weeks and two large quarantines have been put into effect, one in Delaware and Chester counties and the other in the vicinity of Lewisburg. Another is in force at Bloomsburg. These outbreaks have been traced to an unusually large number of infected dogs, which have bitten cattle and dogs and caused no end of trouble. The quarantine requires that all dogs in the districts be muzzled or penned up for 100 days, dogs at large to be shot on sight. In rural districts the farmers have given valuable help in running down wild dogs.

Cattle Dealer Fined.—State authorities are proceeding vigorously against cattle dealers violating the quarantine laws on cattle. A man who bought 8 diseased cows in Maryland and shipped them into this State has been indicted. Had these cows been used for milking or sold as food the danger of infection would have been widespread. This is the fifth arrest in a few months.

Coal, Meters, and Telephones.—The new Public Service Commission has had a large amount of business in the form of complaints, which will govern cases thruout the whole state. A wholesale overhauling of charges for hauling coal in the eastern end of the state is in prospect and attention is being given to a general set of rules to govern all kinds of meters, requiring companies to adopt standards and tests. Telephone rates are being investigated but the process is a slow one.

Barn Fires.—The state Fire Marshal says that while many barn fires are due to incendiaries, fire hazards can be lessened by cleaning up accumulated rubbish. Watching wires and prohibiting smoking are equally important as well as general carelessness.

Compliments On Report.—The Department of Agriculture has been receiving commendation on the plans of its crop report for this year, worked out with a view to securing accurate information. Printed pamphlets will be ready in a few weeks. Meanwhile steps to secure early reports for 1914 are being taken.

May Revise Gypsy Bill.—There are signs that the anti-gypsy bill which received so much attention a few years ago in the legislature may be revived at the next session due to complaints about gypsy bands. Last fall a number of thefts were reported and spring may bring more of these. The plan of the last bill was to require each band to take out a license, altho that was more a form than anything else, the main object being to get lists and descriptions of members of each band.

Institutes End.—The close of the farmers' institutes was marked by large attendance, and efforts are now being made to get reliable figures about the number of people attending the sessions. It is believed the record will be large, in spite of weather conditions.

Seed Inspection Work.—As an indication of the way in which grass seed dealers are seeking to avoid arrest for selling seeds not in accord with the new state standard, 250 applications have been made for analyses by such firms. All these applications have come in within two months. Public sampling will begin in April.

Fish Bulletin.—The Pennsylvania Department of Fisheries has received for distribution Bulletin No. 10, "What an Acre of Water Will Do," intended for the encouragement of fish raising by the farmer.—Hamilton, Harrisburg, March 16, 1914.

NEW JERSEY FARM NEWS

Damage From Snow Storms.—The recent heavy snow storms did thousands of dollars of damage to the farming sections of the State. Unable to get to the creameries and milk stations, many dairymen were compelled to throw away their accumulation of milk. Others made their milk into butter which found ready sale in near-by towns later on. Wild game of all kinds suffered from the severe weather. Local game wardens, shooting clubs and farmers, cleared away the snow at points in the fields and woodlands and scattered grain for the birds.

Road Notes.—There is great agitation over the state on the matter of road construction. The present roads have become so smooth that it is necessary to have a horse sharpened in order that he may travel upon them. State Road Commissioner Stevens favors roads with a hard strip in the centre for motor cars and earth on the two sides for horses, the earth to be hardened with crushed stone. With this type of road when the frost is coming out of the ground the earth gets soft and the traffic has to use the middle of the road. Suitable surfaces for motor traffic, in order to afford good footing for horses, must be kept low in crown and grade; but this involves considerable expense. Many roads have become practically impassable for horses, since the recent storms. These roads had been laid after due inspection of material and were considered at the time the best that could be made. Those who have the building of roadways in charge will probably let the present roadbed remain as it is, and cover the surface with some material that will make a firm footing for horses. A war is waging between the State road department and the taxpayers' associations of Sussex county. The former insists that all the grades in the new roads now in process of construction shall be 5 percent grades, while the latter declare that the topography of the county is such that to obtain a maximum of 5 percent on many of the roads increases the cost from 10 to 25 percent. A 7 percent grade has been requested and the request has been refused. It is now stated that the county will proceed with 7 percent grades, finding such to be cheaper than to construct 5 percent grades with State aid.

Farm Demonstration.—Prof. William B. Duryee, Jr., of Freehold, a graduate of the State agricultural college, has been appointed farm demonstrator for Monmouth county. Numerous petitions to the State farm superintendent, asking for a demonstrator for Union county have been received but the appointment has been deferred, altho the need of such a demonstrator is not denied.

Seed Analyses.—Many Burlington county farmers have been sending samples of all the seed they buy for spring planting to the state experiment station at New Brunswick, for analysis as to germinating qualities, freshness and standard of purity. The system of seed testing inaugurated by the state agricultural department is expected to save the farmers of that county alone close to $50,000. The state agrees to make the test free of charge and will publish lists of all dealers whose products fail to attain the proposed standard. Some farmers are also having analyses of fertilizers made as well. Farm Demonstrator H. W. Gilbertson, of Sussex county, has warned the farmers to get facts before buying fertilizers, feeds, lime, seeds and farm implements.

Poultry Notes.—Because of the high rent asked for the City Guard Armory at Easton, Pa., the Poultry Association of Easton and Phillipsburg is considering the advisability of holding its next annual exhibit at Phillipsburg. Last year the local association was instrumental in having a bill introduced in the Pennsylvania Legislature granting free use of armories for poultry exhibits but the bill failed to pass.

Miscellaneous Notes.—Miss Harriett Bradner, a graduate of an agricultural college, has been appointed farm superintendent of the New Jersey reformatory for women at Clinton. Delegates from many states attended the convention of the federation of Jewish Farmers of America at the Baron de Hirsch agricultural school at Vineland. For twenty years the school has been giving instruction in agriculture to Jewish youths and many of its graduates have taken up farming in South Jersey, acquiring considerable property. The Plainfield show was the first outdoor exhibition of the season in the vicinity of New York, and its passing will leave a void in the summer circuit. The Cape May county fair association has reelected the following officers for the ensuing year: President, Oliver Bright; secretary, J. S. Douglass; treasurer, A. C. Hildreth.—D. T. Hendrickson.

NEW YORK LETTER

Lights On Vehicles.—The Wilson bill providing for the carrying of lights on all vehicles on the highways except such as are propelled by hand has passed the legislature and been signed by the Governor. Its essential provisions are as follows: Every vehicle while upon a public highway or bridge shall display a light or lights visible from the front as a white light and from the rear as a red light, from one hour after sunset to one before sunrise. The law does not apply to hand propelled vehicles nor to any vehicle while upon any lighted street or highway if the street lights are maintained at a distance of not more than 500 feet apart or to a vehicle designed principally for the transportation of hay or straw while loaded with such commodities. But permission so to do must be obtained of the state commission of highways. The penalty for the violation of this statute is a $5 fine for each violation, to be recovered by the town or village in which such violation occurs.

Co-operative Association Organized. —The Dutchess county Co-operative association has just been organized at Poughkeepsie, among market gardeners for the purpose of selling produce direct to consumers. The ultimate plan is to have a city-owned market place for the use of all small truck farmers. Herbert G. Cottam is president and F. H. Lacy, of the Farm Bureau, is secretary.

State Fair Premium Money.—The state fair commission has $4,000 more at its disposal for agricultural premiums than last year. The premium list is being revised to comply with the increase in premiums. The appropriation for the racing features of the fair amount to $50,000 this year.

Motor Licenses.—A bill recently introduced to require every person driving an auto to have a license, opposed by all automobile associations in the state was lost in the committee of the Assembly.

Sunday School Corn Growing Contest. —The Saratoga County Sunday School Union will conduct a corn growing contest for boys who are members of rural Sunday Schools.

"Spotting" Fruit Cars.—The shippers of western New York are against the proposed charge for "spotting" cars costing 50 cents to $2 per car which they claim amounts to an increase of freight rates by so much. The matter is before the Interstate Commerce Commission. New York is said to be the largest fruit producing state in the Union, shipments of green apples grown here amounting to 25,000 to 30,000 cars a year, and of peach shipments from 3,500 to 5,000 cars.

More Milk Commissioners.—Governor Glynn has added more names to the state milk commission, as follows: F. W. Sessions, of Utica; Dr. Robert S. Breed, of the Geneva station; Dr. F. E. Fronesack, of Buffalo; Dr. S. G. Goldwater, of the health commission of New York City; Dr. L. R. Williams, deputy state commissioner of health; Stephen G. Williams, chairman of the New York milk committee and Charles E. North, secretary of the national commision on milk standards.

Capitol Notes.—The appropriation bill passed the Assembly March 12. It carries a total of $31,000,000 and withdraws all appropriations for the Efficiency and Economy and fire marshal departments. In this way the Republican Assembly hopes to get rid of these departments. The labor compensation bill has passed. The bill provides that no more than three of the commissioners shall be of the same political faith. There is talk of an extra session should the appropriation bill fail to pass the senate as it comes from the Assembly.

COUNTY NOTES

Harford Co., Md., (N.E.) March 7.—Warmer, after five weeks of severe winter weather. Live stock looking well. Many public sales, where live stock of all kinds are selling very high. Cows bringing $60 to $125; mules $300 to $450 pair. Hogs very high and scarce; brood sows with pigs bringing $50 to $75. The ground has been covered with snow for five weeks which looks well for a good crop of wheat and grass.—D. G. Harry.

Perry Co., Pa., (C) March 9.— Mild weather with plenty of snow. Stock is in medium condition. Sales are in progress, with stock bringing good prices. Winter wheat was covered since Christmas with snow, with scarcely any frost in the ground. Work is at a standstill. Most everybody is attending sales, to see what can be bought at a bargain.—S. B. Swartz.

York Co., Pa., (S.E.) March 10.—Cold weather with considerable snow. Beef cattle continue high in price. Horses selling for $175, to $275 per head; Potatoes, 80c bu; wheat, 95c bu; corn, 69c bu; apples, $1.50 to $2.00 bu; butter, 28 to 40c lb; eggs, 28 to 30c; tobacco, 8 to 10c lb. Farmers about finished stripping tobacco. Many now attending sales and getting ready for spring work.—Clarence D. Emig.

Chester Co., Pa., (S.E.) March 6.—Heavy snows and blizzard weather. Hogs, $11.50 cwt. Milk cows scarce and high. Wheat and grass well protected by snows. Eggs, 30c; hay, $15; straw, $8. Good horses high. Pigs are not numerous. Young heifers are high. Farm work in good condition and indicates a prosperous year. About 6 inches of snow on ground now.—Hayes C. Taylor.

Montour Co., Pa., (C) March 5.—Weather changing to warmer following extreme conditions, as low as 16 degrees below. Prices high. Beef, dressed 10 and 12c. Hogs, 11c; live 10c; chickens, 12@13c; butter, 38c; eggs, 35c; potatoes, 85c; corn, 70c; wheat, 92c; hay, $16; oats, 50c. Odd jobs being done. Caring for stock and opening roads. Wheat under snow. Severe weather on wheat just before last snowfall. —Benj. L. Diehl.

Bedford Co., Pa., (S.C.) March 9.—Cold and stormy, with considerable snow. Horses and cattle not in much demand and prices are lower. Wheat 90c bu; corn, 75c bu; hay baled, $15 ton. Winter grain has been covered with snow most of the winter, with very little frozen ground. Fruit prospects good, except peaches, which are badly frozen.—N. F. Richards.

Greene Co., Pa., March 13.—Weather has been very cold and blustery. Live stock scarce and very little changing hands. Horses about $25 cheaper than last year at this time. Cattle selling from 6 to 7½c lb; hogs, 8c; sheep, 5¼c; eggs, 30c doz; butter 30c lb. No plowing done since February 3. Farmers are waiting patiently for the ground to get into condition for the plow. Little work being done at present owing to the snow.—C. E. Addleman.

VALUABLE FREE CATALOGS

Keep Animals Healthy. — Condition is the surest preventive of disease. Stomach and intestinal worms are the greatest menace to condition in farm live stock. It is stated on good authority that 90 percent of sickness among farm animals is due to worms. It is in the destruction of worms that Sal-Vet has its greatest value. The advertisement on page 20 of this issue tells what it is and what it will do. Note the free trial offer and guarantee.

How To Grow Potatoes.—Few crops pay the careful farmer a larger profit than potatoes. But good potato yields require right methods of planting, cultivating and spraying. Good methods double the yield at slight additional labor and expense. A booklet entitled Manual of Successful Potato Culture will be sent free upon request addressed to B. G. Pratt Co., 50 Church St., New York City.

Does the Fertilizer You Buy Enrich Your Soil for Future Use?

If it does not, you are not buying the right kind of fertilizer READING BONE FERTILIZERS, being made up from ANIMAL BONE, BLOOD and TANKAGE, not only nourish the crop to which they are applied but enrich the soil for future use and bring the farm on which they are used up to a high degree of fertility. This is the reason why constant users of Reading Bone Fertilizers grow prize winning crops.

500 Bushels of Potatoes
100 Bushels of Oats, and
160 Bushels of Corn

to the acre were grown by users of Reading Bone Fertilizers. Made up by a Company composed of ONE HUNDRED GOOD PENNSYLVANIA GERMAN FARMERS.

In justice to yourself and your family it is your duty to buy the best fertilizer and it will pay you to buy Reading Bone goods. THE PROFIT ON THE FARM IS IN THE SURPLUS BUSHELS.

READING BONE FERTILIZER CO., READING, PA.

Write us for prices and terms, or consult our nearest agent. P.S. Goods endorsed by the Honorable William T. Creasy, Master of the Pennsylvania State Grange after a thorough investigation into the merits of various makes of Fertilizer offered for sale in the State of Pennsylvania.

This Little Girl Had A Spinal Deformity

Little Miss Taylor had Potts Disease, a progressive, destructive disease of the spinal column, usually tubercular, and often accompanied by paralysis. The trouble in this case had been in existence three years when her mother, Mrs. W. S. Taylor, R. F. D. No. 2, Clinton, Ind., brought the child to this Sanitarium, Feb. 22, 1910. At that time, because of the disease and deformity of the spine, the child's head was forced forward—her chin in contact with her chest.

This picture, recently taken, shows her condition and appearance at this time. Write Mrs. Taylor. *In treatment of this case plaster paris was not used.* The

L. C. McLain Orthopedic Sanitarium

is a private institution, devoted exclusively to the treatment of crippled and deformed conditions, especially of children and young adults.

Write us freely regarding Club Feet, Spinal Diseases or Deformities, Infantile Paralysis, Hip Disease, Bow Legs, Knock Knees, Wry Neck, etc. We will send you descriptive literature and advise you fully. Ex-patients as references everywhere.

JOHN DEERE TWO WAY PLOW

The Sulky with the Steel Frame and Patent Auto Foot Frame Shift

The John Deere Two-Way Plow will work equally well on hillsides and level land. It is well balanced, easy to operate, light draft and efficient,—built in the East for Eastern conditions.

It is the only two-way plow that has the Patent Auto Foot Frame Shift, which insures accurate and uniform width of cut. It will do the highest grade work for the longest time with the least possible effort and expense.

These Are Some of the Reasons:

1. All Steel and Malleable Frame—Steel Arch: Light, Strong and Durable—Rigid Connections—Permanent Alignments.
2. Patent Auto Foot Frame Shift: Slight foot pressure swings frame and accurately locates plow bottom.
3. Long Malleable Beam Clamps: No collars or set screws. Beam bolted rigidly to bracket, which extends to each bail arm. Cut always uniform.
4. Automatic Shifting Hitch: Positive and Automatic. Clevis cannot fail to move to position.
5. Automatic Horse Lift: Operator's foot releases latch. Pull of team raises bottom. Hand lever also provided.
6. Adjustable Jointers: Jointers clamped to beam. May be set forward or back or tipped at varying angles.
7. Wide Tread: Prevents tipping on hillsides and permits use of wide or narrow bottoms.
8. Chilled, Full Steel and Combination Bottoms: All styles made expressly for Eastern conditions.
9. Removable Shin Piece: Insures keen cutting edge—easily renewed—prolongs life of moldboard.

Write for John Deere Two-Way Book, handsomely illustrated in colors—and secure full information—free.

A COSTLY BOOK FREE
"Better Farm Implements and How to Use Them," has 169 large pages crowded with ideas that will make you money. It cost a large sum to produce. It is yours for the asking.

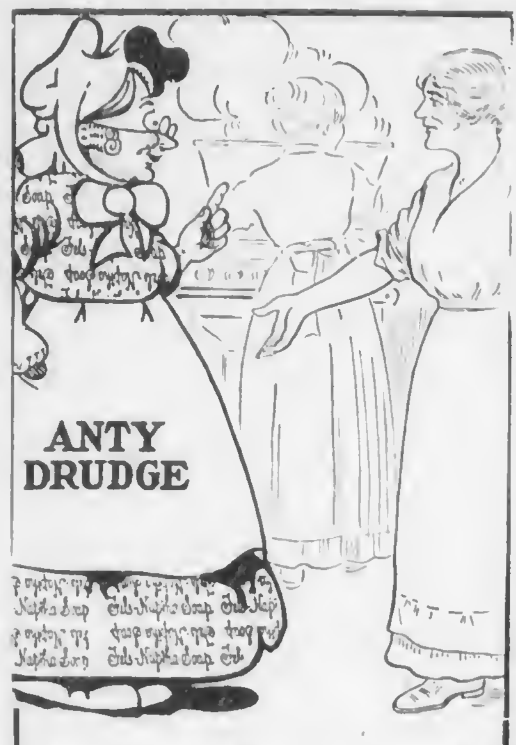
JOHN DEERE, MOLINE, ILLINOIS



Mrs. Disagree—"Anty Drudge, what's this nonsense you told Mary about not boiling clothes? The idea of these young things telling their mothers how to wash! I settled her!"

Anty Drudge—"Well, you can't settle *me*, because I'm old enough to have some sense—so's Mary, for that matter. She's a sight more sensible than her mother about some things! I told her about Fels Naptha Soap and how easy it makes work."

Don't boil your clothes. Don't waste time and strength rubbing up and down on a washboard.

Use Fels-Naptha Soap and cool or lukewarm water. Soak the clothes for 30 minutes while you do your choirs. Then rub lightly, rinse and hang on the line. They'll be sweeter, whiter and cleaner than ever before, with less than half the bother, and in less than half the time.

Fels-Naptha does *all* your housework just as easily and well.

Better buy it by the box or carton. Directions are on the red and green wrapper.

Fels & Co., Philadelphia.

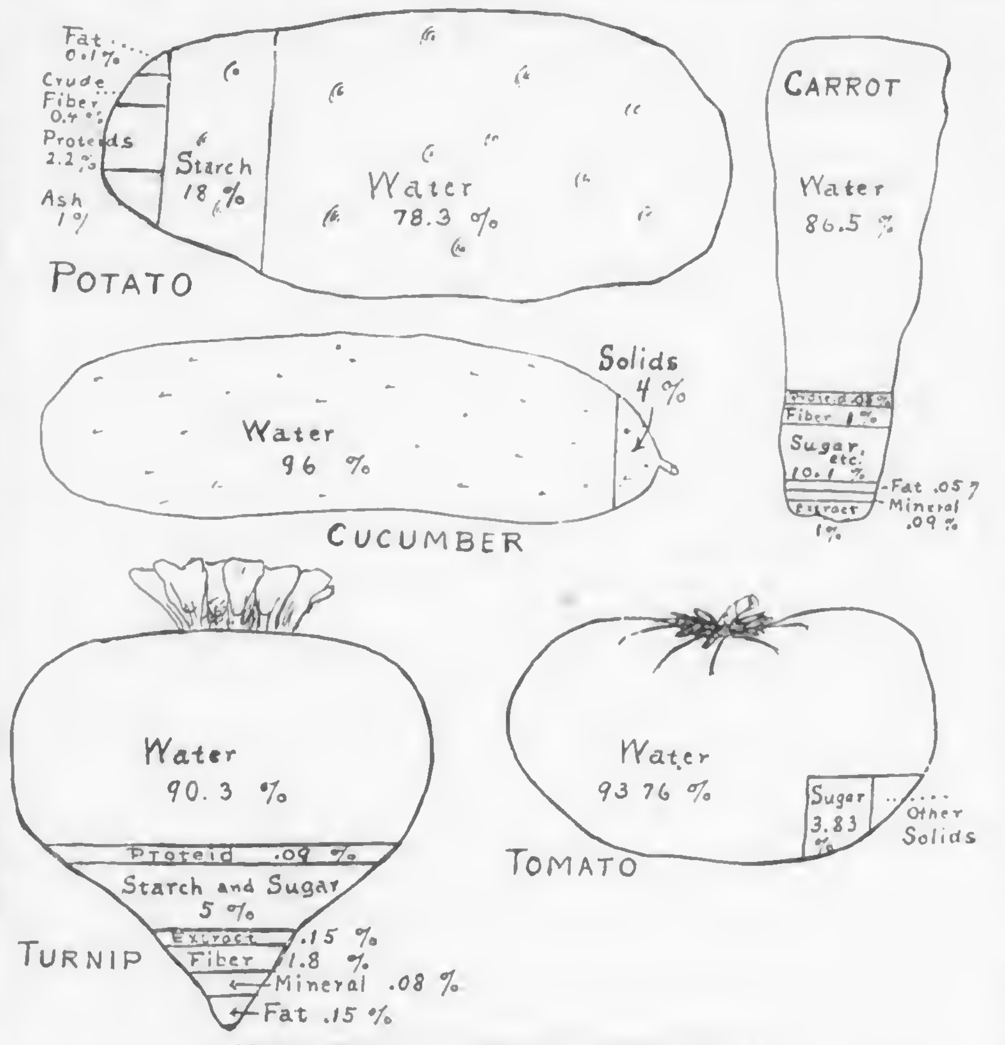
Facts About Foods.

By Mrs. C. W. FOULK.

Vegetables

Vegetables do and should furnish a large part of our food. They furnish salts and acids which are necessary to the body; they supply water; they give bulk to the food, which aids in digestion; and some vegetables furnish a large amount of nourishment, mainly in the form of starches and sugars.

Vegetables may be divided into two classes: First, the so-called "flavor" vegetables, those eaten largely because of their pleasing taste, such as asparagus, lettuce, radishes, spinach and cucumbers. While these vegetables are largely water and woody fiber and contain but little actual nourishment, they are nevertheless valuable foods because of the bulk they give and also because of the acids and salts which they contain. The second class or "nutritive" vegetables are used for their actual food value; they furnish sugars and starches, which are energy producers. In the case of beans and peas they contain protein or muscle builder. Among the nutritive vegetables are potatoes, sweet potatoes, peas, beans, beets carrots and parsnips.



COMPOSITION OF DIFFERENT TABLE VEGETABLES.

Fallacy of All-Vegetable Diet

An entirely vegetable diet is not a perfect diet, first because vegetables do not contain enough of the muscle forming materials (proteids). Peas, beans and lentils do contain a considerable amount of protein, but the amount so furnished is not sufficient. Another reason why a vegetable diet is not perfect is that vegetables contain so large an amount of water and woody tissue that in order to get sufficient nourishment the bulk would be too great. In Ireland where peasants live largely upon potatoes, many of them have the walls of the stomach and intestines permanently distended due to the large amount of food they must eat to satisfy their heat, energy and repair needs. This condition is so common that it has given rise to the name, "potato belly." Some strict vegetarians claim to be properly nourished on an entirely vegetable diet, but even in cases where they apparently seem to thrive on this one-sided fare, they are often found to lack resistence to disease, and break down under prolonged mental or physical strain. Most of the so-called vegetarians, however, use milk, eggs and cheese, which furnish the necessary protein to keep a well-balanced ration and repair worn-out muscle tissues.

The Potato

The potato, because of its keeping qualities, its good flavor, and the amount of nourishment it affords is the most popular vegetable. While the potato appears to be a very solid vegetable, it is in reality over three-fourths water. However, the potato contains about 16 percent of starch, which when compared with other vegetables, shows the potato to be one, if not the most nutritious of vegetables. Like the cereals it is an energy and heat producer, and if eaten in large quantities tends to produce fat. The potato will not produce muscle because of the very slight amount of protein which it contains. A potato in which the starch grains are well matured and are evenly distributed will, when thoroly cooked, be mealy and not soggy.

To Cook Potatoes.—A mealy potato is more easily digested than a damp and soggy one. Sometimes this sogginess is due not to the potato but the way in which it is cooked. When potatoes are boiled, they should be thoroly drained, then dried on the stove before serving. When baking potatoes, the surface of the potato should not be cut before placing in the oven because this allows the water in the potato to escape in the form of steam, and the potato, being a starchy food, needs the water to soften the starch grains. Just before removing from the oven, each potato should be stuck with a fork to break the jacket so as to allow the steam to escape, otherwise when the potato begins to cook the steam will condense and form water again, making the potatoes damp and soggy. Young or new potatoes are less easily digested than ripened matured ones, due to the starch being immature. Very old potatoes, especially those that have sprouted, are not so digestible or nutritious as those that have just been stored away for the reason that much of the starch and other nutrients have gone to develop the sprouts.

Sweet Potatoes.—The sweet potato has much the same composition that the white potato has, except that in the sweet potato there is more sugar and less starch. As sugar and starch have the same nutritive value, the sweet potato is much the same in food value as the Irish potato. The sweet potato contains a much larger amount of woody tissue or cellulose; this wood may often be seen in strings near the ends of the sweet potato. This cellulose makes the sweet potato rather more difficult to digest.

Beets, Carrots, Parsnips, Turnips

Beets and carrots contain a relatively large amount of nourishment, and are much alike in their food value as they contain about 8 to 12 percent of sugar.

The parsnip also contains sugar, but not so large an amount as beets or carrots. It has a large amount of woody material, particularly in the core. Parsnips should be avoided by persons with a tendency to gas in the stomach and bowels.

Turnips have less nourishment in them than either carrots or parsnips. They should be avoided by the sick, but are suitable food for people working in the fields, because they give bulk and keep off the feeling of hunger between meals.

Peas and Beans

Peas and beans contain larger amounts of muscle furnishing material than other vegetables; they also contain a large amount of starch. Young string or wax beans are as a rule easily digested but they contain less food material than the old beans. Beans, especially dried beans, have a tendency to produce gas in the digestive tract and are often constipating. For those who live active lives and who can digest them, baked beans furnish a cheap form of muscle-building and energy-producing food.

Onions, Cabbage, Cauliflower.

Onions contain some nourishment but are eaten largely for their flavor and bulk. The gas or odor which onions and cabbage give off during cooking is the same as that developed in rotten eggs, and it is for this reason that the odor from boiling cabbage or onions is so unpleasant. If these vegetables are cooked uncovered the gas will escape as it is generated and the ordor will be less apparent in the kitchen, but if cooked covered whenever the lid is removed the gas comes out in concentrated form making a very strong and disagreeable smell. When cooked with the lids on the kettles this gas is re-absorbed into the vegetables affecting their palatability and to some extent their digestibility. Cabbage should not be cooked too long, when done it should retain its fresh greenish white color; if it has turned pink or red while cooking it is less digestible. Raw cabbage is more easily digested and more nutritious.

Cauliflower has much the same nutritive value as cabbage, differing chiefly in mechanical structure.

The Salad Vegetables

Lettuce, greens of all kinds, asparagus, celery, cucumbers, etc are eaten largely for their flavor; they are also useful by reason of their laxative effect. The tomato is another vegetable that has but little value as food except for acid and salts. When eaten raw the tomato is refreshing because it is slightly acid; it is easily digested.

Some vegetables, for example, spinach, tomatoes and most green vegetables, are laxative on account of their chemical composition. Some like the cucumber will cause bowel movements because of the seeds, while corn has the same effect because of the large amount of indigestible cellulose in the skin of the kernels. In contrast, beans, peas and turnips may cause constipation.

Cooking and Serving Vegetables

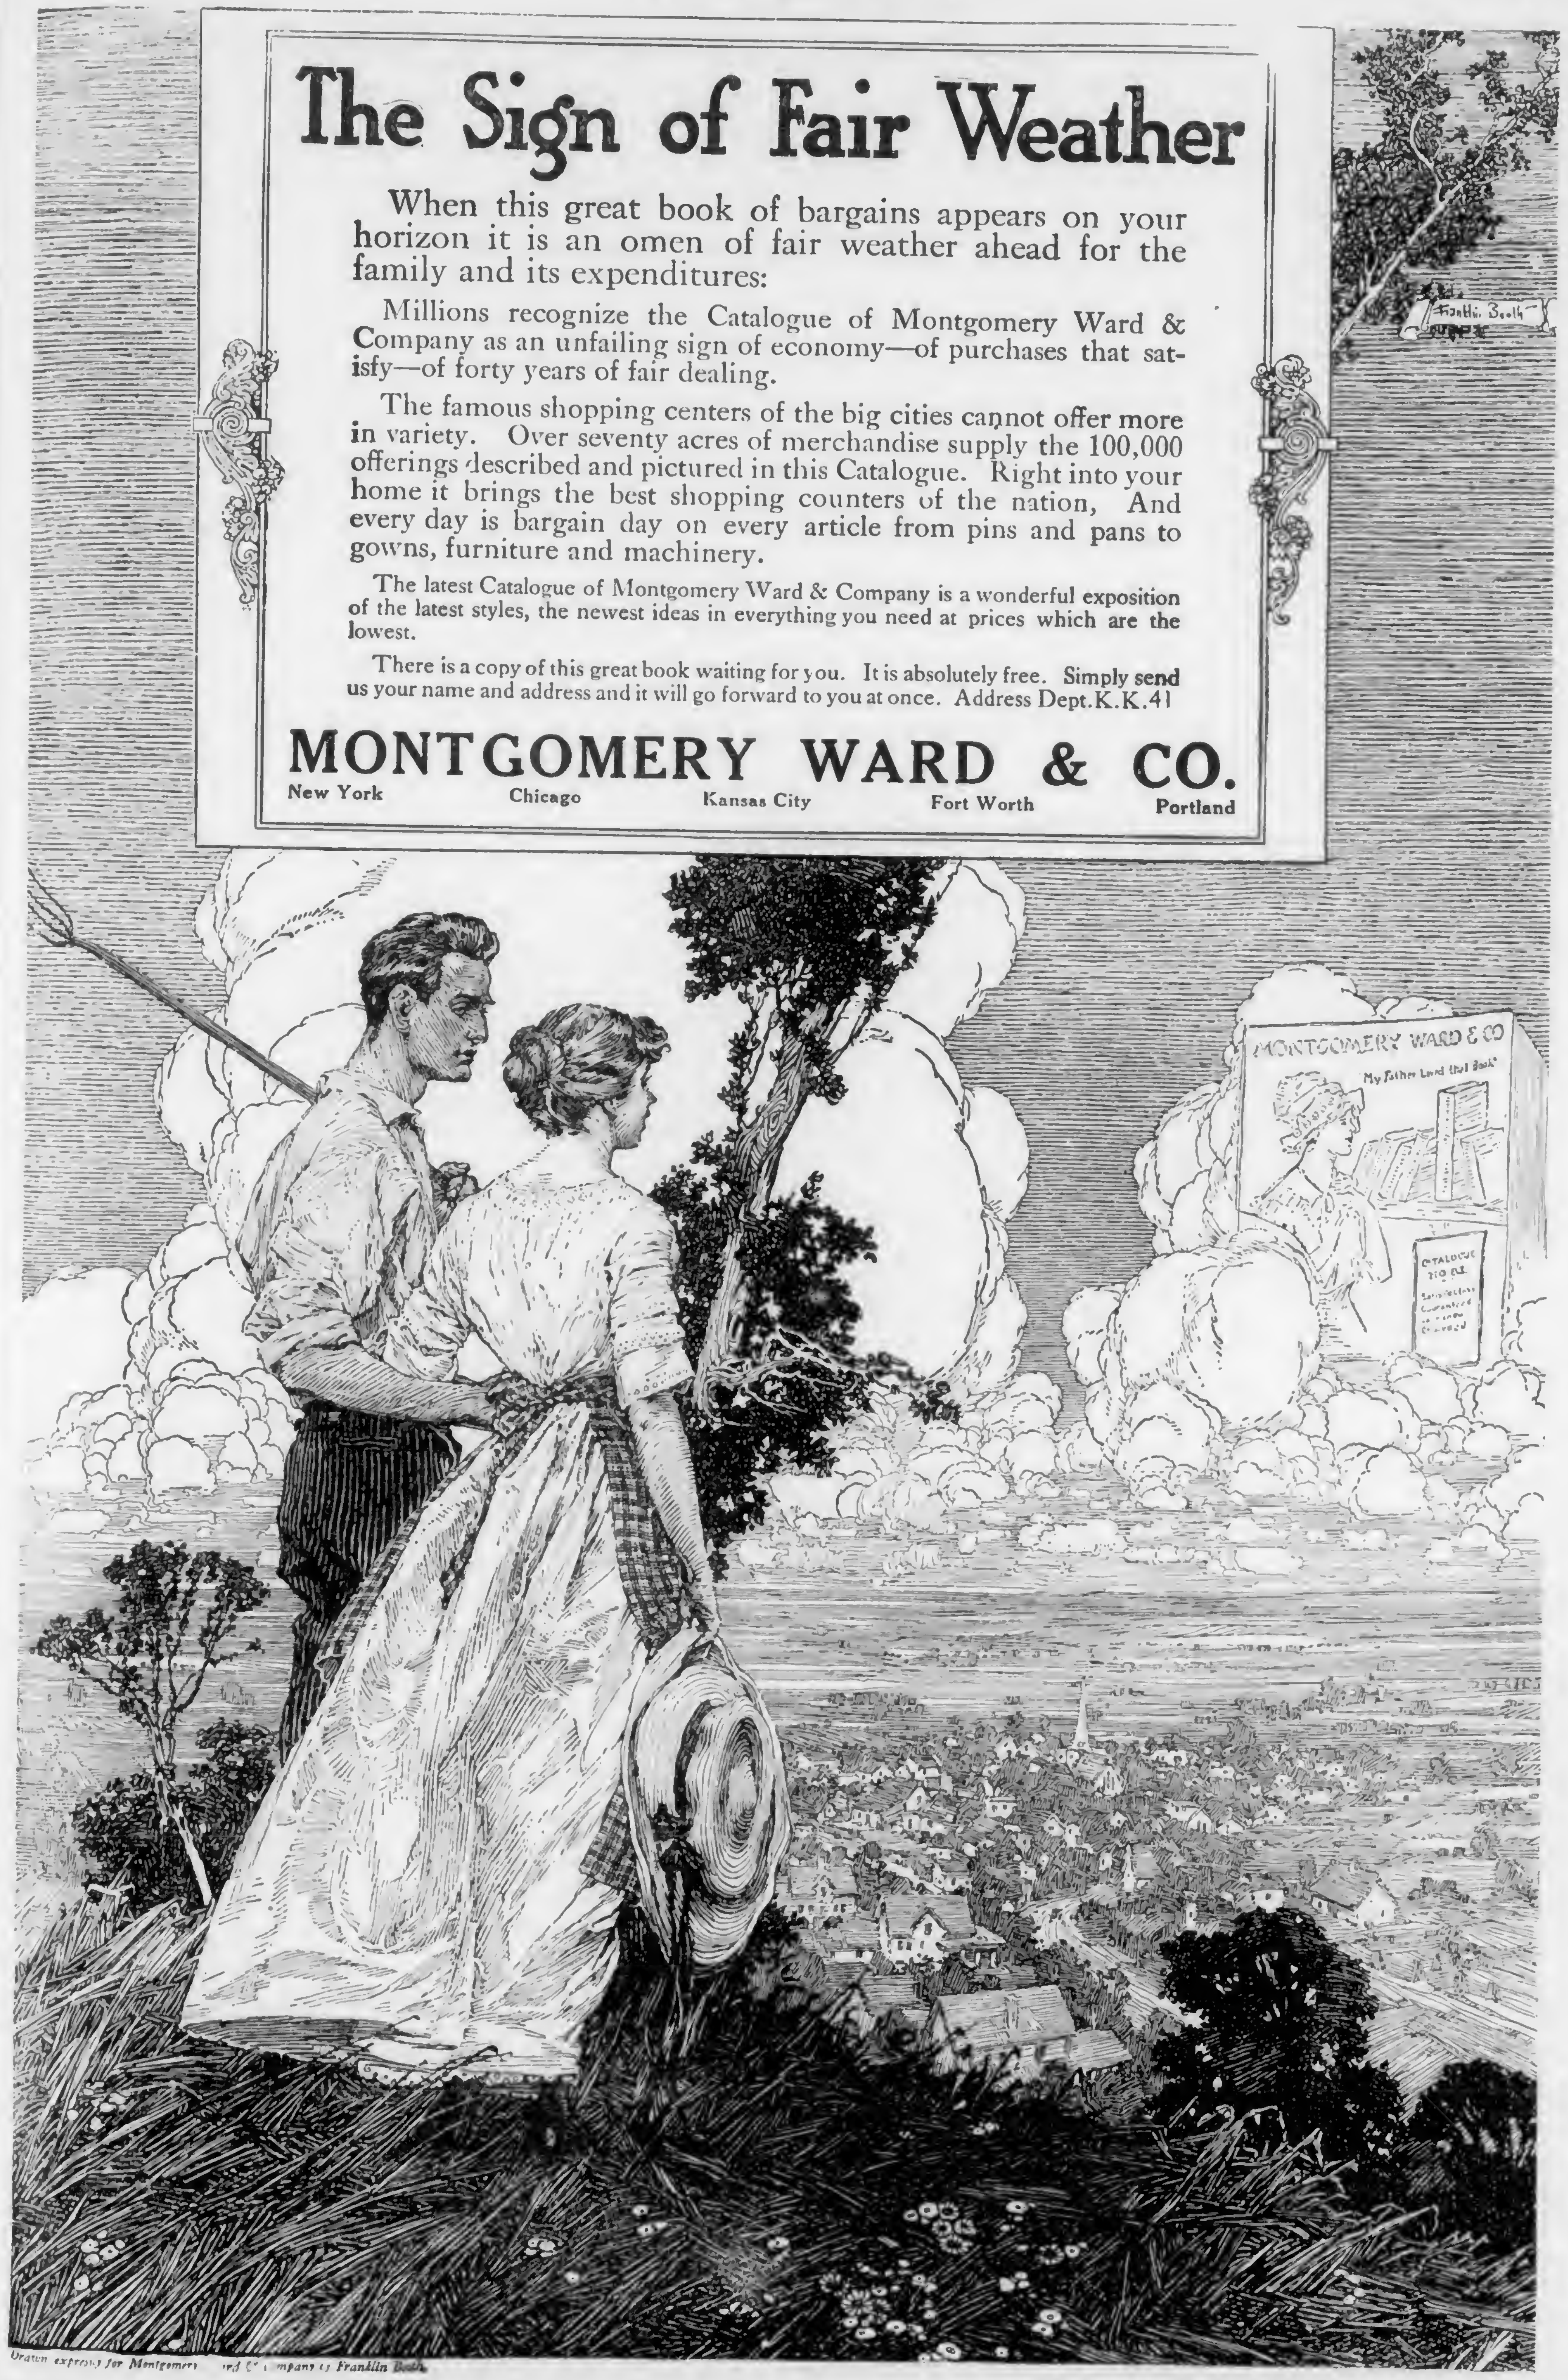
In general the simplest methods of serving vegetables are the best. All vegetables should be cooked while fresh; if for any reason they are wilted they should be soaked in cold water to restore the water content. Vegetables in heads, such as cauliflower and cabbage, should be soaked with their heads down in salted water containing a few drops of vinegar to remove possible insects that may be concealed therein.

Put all vegetables on to cook in boiling water. Salt may be added at the first except in case of peas and beans, which are hardened by salt, and it should therefore be added to these at the last. Cook all vegetables uncovered to keep their color and flavor.

Time Table For Cooking Vegetables

Asparagus	20 to 30 min.
Beans (string)	30 min. to 2½ hrs. (according to age.)
Beans (lima or shell	1 to 1½ hrs.
Beets (young)	45 min.
Beets (old)	3 to 4 hrs.
Cabbage (young)	25 to 30 min.
Cabbage (old)	45 min. to 1 hr.
Cauliflower	20 to 25 min.
Corn	10 to 20 min.
Onions	45 min. to 1 hr.
Oyster Plant (salsify)	45 min. to 1 hr.
Parsnips	30 to 45 min.
Peas (young)	20 to 30 min.
Peas (old)	1 hr.
Potatoes (boiled)	20 to 30 min
Potatoes ((baked)	45 min.
Sweet Potatoes (boiled	15 to 25 min.
Sweet Potatoes (baked)	30 to 40 min.
Tomatoes (stewed)	15 to 20 min.
Turnips (summer varieties)	30 min.
Turnips (winter var)	45 min to 1 hr.

Buttered Parsnips.—Boil the parsnips until tender, scrape off the skin. Slice quite thin, lengthwise. Melt some butter in a saucepan and season with salt and pepper to taste, put in the parsnips and fry until a delicate brown. Remove to a dish and pour the butter over them; sprinkle with chopped parsely over the top.



The Sign of Fair Weather

When this great book of bargains appears on your horizon it is an omen of fair weather ahead for the family and its expenditures:

Millions recognize the Catalogue of Montgomery Ward & Company as an unfailing sign of economy—of purchases that satisfy—of forty years of fair dealing.

The famous shopping centers of the big cities cannot offer more in variety. Over seventy acres of merchandise supply the 100,000 offerings described and pictured in this Catalogue. Right into your home it brings the best shopping counters of the nation, And every day is bargain day on every article from pins and pans to gowns, furniture and machinery.

The latest Catalogue of Montgomery Ward & Company is a wonderful exposition of the latest styles, the newest ideas in everything you need at prices which are the lowest.

There is a copy of this great book waiting for you. It is absolutely free. Simply send us your name and address and it will go forward to you at once. Address Dept.K.K.41

PENNSYLVANIA BERKSHIRE BREEDERS' ASSOCIATION

The Pennsylvania Berkshire Breeders' Association was organized during the recent session of the Berkshire Breeders' Congress at York, Pa. Officers were elected and preparations made for the development of a vigorous organization and state-wide development work. At a recent meeting of the executive committee plans were laid for the extension of the association to include Berkshire breeders in every part of the state. The secretary was empowered to appoint a breeder in each county as a member of the advisory committee to secure new members in their respective counties, aid the state secretary in arranging for public sales, representing the association at county fairs, etc.

Considerable attention will be given to public sales of Berkshires and to fair exhibits. It was definitely decided to hold a public sale next August or early in September at the stables of the Fortside Inn, Whitemarsh, Pa., for which all members will be invited to consign bred sows and gilts as well as sow shoats. The aim of the Association at this sale as well as in other sales to be held, is to be to offer utility rather than fancy stock; good material for the general farmer at reasonable prices rather than record animals at fancy prices.

It was further decided to supplement prizes at county and other fairs so far as possible. Special cups and gold and silver medals will be offered at the Allentown fair and the Devon Cattle Show; also medals at county fairs thruout the state on conditions to be arranged later.

The committee will welcome the cooperation of Berkshire breeders and admirers in all parts of the state. It has entered upon a vigorous campaign and should have the support of all Berkshire men. For further information address Secretary, D. Buckley, Broad Axe, Pa.

THE FARM DOG

On page 166 of Pennsylvania Farmer, E. P., of Beaver Co., Pa., under the title "The Costly Cur" says many good things on the dog question, however, he is rather extreme, when he says: "The best farm dog I know of is a dead dog." He fails to distinguish between the worthless sheep killer and the well-bred, trained and useful dog. He regards them all as bad. It can not be successfully disputed that there are real good, useful dogs that are worth money to their owners.

I went to one of our leading sheep growers and dealers to purchase a sheep for breeding purposes. The sheep were not very gentle and could not be caught easily, so he called his trained dog and showed him the sheep that he desired caught. The dog singled out that sheep and put it in a corner not ten feet from where we stood.

Only a little more than a year ago a turkey dealer here gathered up a drove of 400 turkeys that he was driving on foot to the railroad. He, with two helpers and a trained dog, was keeping the 400 turkeys herded together and traveling along the road. I watched them and the dog was doing nearly all of the work. The dog seemed to understand every word of his master and every turkey that showed a disposition to leave the drove was quickly turned back to the drove again. I have seen this dog driving cattle and he understands his business almost perfectly. I have seen numbers of just such dogs and it is unfair to class such dogs with the worthless curs.

It is true that the common ill-bred dog can not be trained to be useful, and it would be useless to undertake such a thing. But there are breeds of dogs that are bred and trained to do work, and such dogs are valuable. The well-bred trained dog as a rule is not the dog that does the sheep killing. The great trouble is that there are so many dogs that are not bred to any purpose; they are not trained to be useful and, in fact, the owners have no use for them. The idle, half-starved dog as a rule is the one that does mischief.—A. J. Legg, Nicholas County, W. Va.

NEW STOCK JUDGING PAVILION AT STATE COLLEGE

The Pennsylvania State College is erecting a new pavilion in which to judge stock. The excavating has been started on the far side of the road, just to the northeast of the Agricultural Building. By beginning the actual work of construction early in the spring, it is hoped that the building will be completed by September. This will relieve the crowded conditions which at present hamper the work of the Department of Animal Husbandry, and cause congestion in other departments. The new stock judging arena, which is to be 32 feet wide and 100 feet long, will seat 750 people. Canvas curtains will be so arranged as to make possible the division of the space into three rooms.

Besides the arena, the building will include several class rooms, facilities for preparing animals for exhibition, and a modern abattoir. When completed, the entire structure will consist of a single story built in the form of an oval, 142 feet long and 64 feet wide. It will be made of red brick, finished inside with tile and plaster. The building complete will cost $30,000.—Rush P. Marshall.

CATTLE FEEDING CONVENTION

The first Cattle Feeders' Convention ever held in Pennsylvania will occur at State College, Pennsylvania, April 3, 1914. At that time the steer feeding experiment for the year will be closed. Sixty head of West Virginia cattle have been fed this year. These have been divided into five lots and fed different rations. Some interesting results are being obtained that should be of immense value to Pennsylvania feeders. The results will be presented at this meeting. It will also afford an opportunity to see the cattle and note their condition before they are sold. A competent commission man from Pittsburgh stock yards has been secured to value the cattle in the lots on the day of the convention. A program has been arranged at which the different phases of cattle feeding and marketing will be discussed. This meeting should be of particular interest to cattle feeders in Pennsylvania as it is in direct line with one of their live stock problems. Every cattle feeder in Pennsylvania should make an effort to attend this meeting.

Holstein Sale.—At a two-day's sale held recently at the Liverpool pavilion near Syracuse, 214 head of Holstein-Friesians brought $62,445 or an average of $292 each. The highest price paid for a single animal was $1,750 tho several sold around the $1,500 mark.

How I Envy Man.

TAKE OFF THE HORSE'S COAT ALSO

Do you go at the spring work with your overcoat on? Of course you don't—Coats are a burden—you even roll up your shirt sleeves. Then how can you expect the horses to show proper energy under the hot sun with the same heavy coats on that they have worn all winter and which hold the wet sweat and dirt? Clip them before the work begins with a

Stewart Ball-Bearing Clipping Machine

They will get all the nourishment from their feed—be healthier and look better. They will dry off quickly, be more easily cleaned and feel better generally—that means work better. The Stewart Machine is not an expense—but a highly profitable investment. It turns easily, does more and closer work than any other machine—can't get out of order. Gears all file hard and cut from solid steel bar—protected and run in oil. Includes 6 feet new style easy running flexible shaft and celebrated Stewart's Single-Tension Clipping Head. The only machine that can be used without change for horses, mules and cows. You can make money clipping your neighbors' horses while yours will do better work. Each machine guaranteed. If it doesn't give perfect satisfaction, return it and get your money back. Complete from your dealer at $7.50 If he can't supply you send $2 and and we will ship one C.O.D. for balance.

Get More Wool from your sheep, longer, better wool that will bring you from 15c to 20c more from each sheep. Your flock will feel better and look better also. The Stewart No. 9 Ball Bearing Shearing Machine will more than pay for itself the first season. Any boy can run it all day without tiring. All joints ball bearing with ball bearing shearing head. The equipment includes four sets of knives fully guaranteed. Price . . $11.50 If your dealer hasn't it, send $2.00 and pay balance C. O. D.

160 ACRE FARMS IN WESTERN CANADA FREE

400,000 Settlers a Year

Immigration figures show that the population of Canada increased during 1913, by the addition of 400,000 new settlers from the United States and Europe. Most of these have gone on farms in Manitoba, Saskatchewan and Alberta.

Lord William Percy, an English Nobleman says:

"The possibilities and opportunities offered by the Canadian West are so infinitely greater than those which exist in England, that it seems absurd to think that people should be impeded from coming to the country where they can most easily and certainly improve their position."

New districts are being opened up, which will make accessible a great number of homesteads in districts especially adapted to mixed farming and grain raising.

For illustrated literature and reduced railway rates, apply to Superintendent of Immigration, Ottawa, Canada, or to the Canadian Government Agent.

F. A. Harrison, 210 N. Third St.
Harrisburg, Pa.

Potato Profits depend largely on how the crop is planted. Every skipped hill is a loss in time, fertilizer and soil. Every double wastes valuable seed. It means $5 to $50 per acre extra profit if all hills are planted, one piece in each. That is why

IRON AGE 100 Per Cent Planters often pay for themselves in one season on small acreage. They also plant straight, at right depth, 12 to 24 inches apart. New angle steel frame and steel seed hopper. With or without fertilizer distributor. Ask your dealer to show you this Planter and write us for booklet, "100 Per Cent Potato Planting" and copy of Iron Age Farm and Garden News.

Winston of the Prairie

By HAROLD BINDLOSS

Copyrighted by Frederick A. Stokes Company.

CHAPTER XXV (Concluded)

The bluff that rose steadily higher came back to them, willow and straggling birch flashed by, and at last Payne drew bridle where a rutted trail wound down between the trees to the bridge in the hollow. A swift glance showed him that a mounted man could scarcely make his way between them, and he smiled dryly as he signed to his companion.

"Back your horse clear of the trail," he said, and there was a rattle as he flung his carbine across the saddle. "With Hilton behind him, he'll ride straight into our hands."

He wheeled his horse in among the birches, and then sat still, with fingers that quivered a little on the carbine-stock, until a faint drumming rose from the prairie.

"He's coming!" said the trooper. "Hilton's hanging on to him."

Payne made no answer, and the sound that rang more loudly every moment thru the grayness of the early daylight was not pleasant to hear. Man's vitality is near its lowest about that hour, and the troopers had ridden furiously the long night thru, while one of them, who knew Lance Courthorne, surmised that there was grim work before him. Still, tho he shivered as a little chilly wind shook the birch twigs, he set his lips, and once more remembered the comrade who had ridden far and kept many a lonely vigil with him.

Then a mounted man appeared in the space between the trees. His horse was jaded, and he rode loosely, swaying once or twice in his saddle, but he came straight on, and there was a jingle and rattle as the troopers swung out into the trail. The man saw them, for he glanced over his shoulder, as if at the rider who appeared behind, and then sent the spurs in again.

"Pull him up," cried Corporal Payne, and his voice was a little strained. "Stop right where you are before we fire on you!"

The man must have seen the carbines for he raised himself a trifle, and Payne saw his face under the flapping hat. It was drawn and gray ,but there was no sign of yielding or consternation in the half-closed eyes. Then he lurched in his saddle as from exhaustion or weariness, and straightened himself again with both hands on the bridle. Payne saw his heels move and the spurs drip red, and slid his left hand further along the carbine stock. The trail was steep and narrow. A horseman could scarcely turn in it, and the stranger was coming on at a gallop.

"He will have it," said the trooper hoarsely. "If he rides one of us down he may get away."

"We have got to stop him," said Corporal Payne.

Once more the swaying man straightened himself, flung his head back, and with a little breathless laugh drove his horse furiously at Payne. He was very close now, and his face showed livid under the smearing dust, but his lips were drawn up in a little bitter smile as he rode straight upon the leveled carbines. Payne, at least, understood it, and the absence of flung-up hand or cry. Courthorne's inborn instincts were strong to the end.

There was a hoarse shout from the trooper, and no answer, and a carbine flashed. Then Courthorne loosed the bridle, reeled sideways from the saddle, rolled half round with one foot in the stirrup and his head upon the ground, and was left behind, while the riderless horse and pursuer swept past the two men who, avoiding them by a hairsbreadth, sat motionless a moment in the thin drifting smoke.

Then Corporal Payne swung himself down, and while the trooper followed, stooped over the man who lay, a limp huddled object, in the trail. He blinked up at them out of eyes that were almost closed.

"I think you have done for me," he said.

Payne glanced at his comrade. "Push on to the settlement," he said. "They've a doctor there. Bring him and Harland the magistrate out."

The trooper seemed glad to mount and ride away, and Payne once more bent over the wounded man.

"Very sorry," he said. "Still, you see, you left me no other means of stopping you. Now, is there anything I can do for you?"

A little wry smile crept into Courthorne's face. "Don't worry," he said. "I had no wish to wait for the jury, and you can't get an injury that's inside me."

He said nothing more, and it seemed a very long while to Corperal Payne, and Trooper Hilton, who rejoined him, before a wagon with two men in it beside the trooper came jolting up the trail. They got out, and one of them who was busy with Courthorne for some minutes nodded to Payne.

"Any time in the next twelve hours. He may last that long," he said. "Nobody's going to worry him now, but I'll see if I can revive him a little when we get him to Adamson's. It can't be more than a league away."

They lifted Courthorne, who appeared insensible, into the wagon, and Payne signed to Trooper Hilton. "Take my horse, and tell Colonel Barrington. Let him understand there's no time to lose. Then you can bring Stimson."

The tired lad hoisted himself into his saddle, and groaned a little as he rode away, but he did his errand, and late that night Barrington and Dane drove up to a lonely homestead. A man led them into a room where a limp figure was lying on a bed.

"Been kind of sleeping most of the day, but the doctor has given him something that has awakened him," he said.

Barrington returned Payne's greeting, and sat down with Dane close beside him, while, when the wounded man raised his head, the doctor spoke softly to the magistrate from the settlement a league or two away.

"I fancy he can talk to you, but you had better be quick if you wish to ask him, anything," he said.

Courthorne seemed to have heard him, for he smiled a little as he glanced at Barrington. "I'm afraid it will hurt you to hear what I have to tell this gentleman," he said. "Now, I want you to listen carefully, and every word put down. Doctor, a little more brandy."

Barrington apparently would have spoken, but, while the doctor held a glass to the bloodless lips, the magistrate, who took up a strip of paper, signed to him.

"We'll have it in due form. Give him that book, doctor," he said. "Now, repeat after me, and then we'll take your testimony."

It was done, and a flicker of irony showed in Courthorne's half-closed eyes.

"You feel more sure of me after that?" he said, in a voice that was very faint and strained. "Still, you see, I could gain nothing by deviating from the truth now. Well, I shot Trooper Shannon. You'll have the date in the warrant. Don't know if it will seem strange to you, but I forget it. I borrowed farmer Winston's horse and rifle without his knowledge, tho I had paid him a trifle to personate me and draw the troopers off the whisky-runners. That was Winston's only complicity. The troopers, who fancied they were chasing him, followed me until my horse which I was riding went thru the ice, but Winston was in Montana at the time, and did not know that I was alive until a very little while ago. Now, you can straighten that up and read it out to me."

The magistrate's pen scratched noisily in the stillness of the room, but, before he had finished, Sergeant Stimson, hot and dusty, came in. Then he raised his hand, and for a while his voice rose and fell monotonously until Courthorne nodded.

"That's all right," he said. "I'll sign."

The doctor raised him a trifle, and moistened his lips with brandy as he gave him the pen. It scratched for a moment or two, and then fell from his relaxing fingers, while the man who took the paper wrote across the foot of it, and then would have handed it to Colonel Barrington, but that Dane quietly laid his hand upon it.

"No," he said. "If you want another witness take me."

Barrington thanked him with a gesture, and Courthorne, looking round saw Stimson.

"You have been very patient, Sergeant, and it's rough on you that the one man you can lay your hands upon is slipping away from you," he said. "You'll see by my deposition that Winston thought me as dead as the rest of you did."

Stimson nodded to the magistrate. "I heard what was read, and it is confirmed by the facts I have picked up," he said.

Then Courthorne turned to Barrington. "I sympathize with you, sir," he said. "That must be horribly mortifying, but, you see, Winston once stopped my horse backing over a bridge into a gully when just to hold his hand would have rid him of me. You will not grudge me the one good turn I have probably done any man when I shall assuredly not have the chance of doing another."

Barrington winced a little, for he recognized the irony in the failing voice, but he rose and moved towards the bed.

"Lance," he said, a trifle hoarsely, "it is not that which makes what has happened horrible to me, and I am only glad that you have righted this man. Your father had many claims on me, and things might have gone differently if, when you came out to Canada, I had done my duty by his son."

Courthorne smiled a little, but without bitterness. "It would have made no difference, sir, and, after all, I led the life that suited me. By and by you will be grateful to me. I sent you a man who will bring prosperity to Silverdale."

Then he turned to Stimson, and his voice sank almost beyond hearing as he said, "Sergeant, remember, Winston fancied I was dead."

He moved his head a trifle, and the doctor stooping over him signed to the rest, who went out except Barrington.

It was some hours later, and very cold, when Barrington came softly into the room where Dane lay half-asleep in a big chair. The latter glanced at him with a question in his eyes, and the Colonel nodded very gravely.

"Yes," he said. "He has slipped out of the troopers' hands and beyond our reproaches—but I think the last thing he did will count for a little."

CHAPTER XXVI

Winston Rides Away

The first of the snow was driving across the prairie before a bitter wind when Maud Barrington stood by a window of the Grange looking out into the night. The double casements rattled, the curtains behind her moved with the icy draughts, until, growing weary of watching the white flakes whirl past, she drew them to and walked slowly towards a mirror. Then a faint tinge of pink crept into her cheek, and a softness that became her into her eyes. They, however, grew critical as she smoothed back a tress of lustrous hair a trifle from her forehead, straightened the laces at neck and wrist, and shook into more flowing lines the long black dress. Maud Barrington was not unduly vain, but it was some time before she seemed contented, and one would have surmised that she desired to appear her best that night.

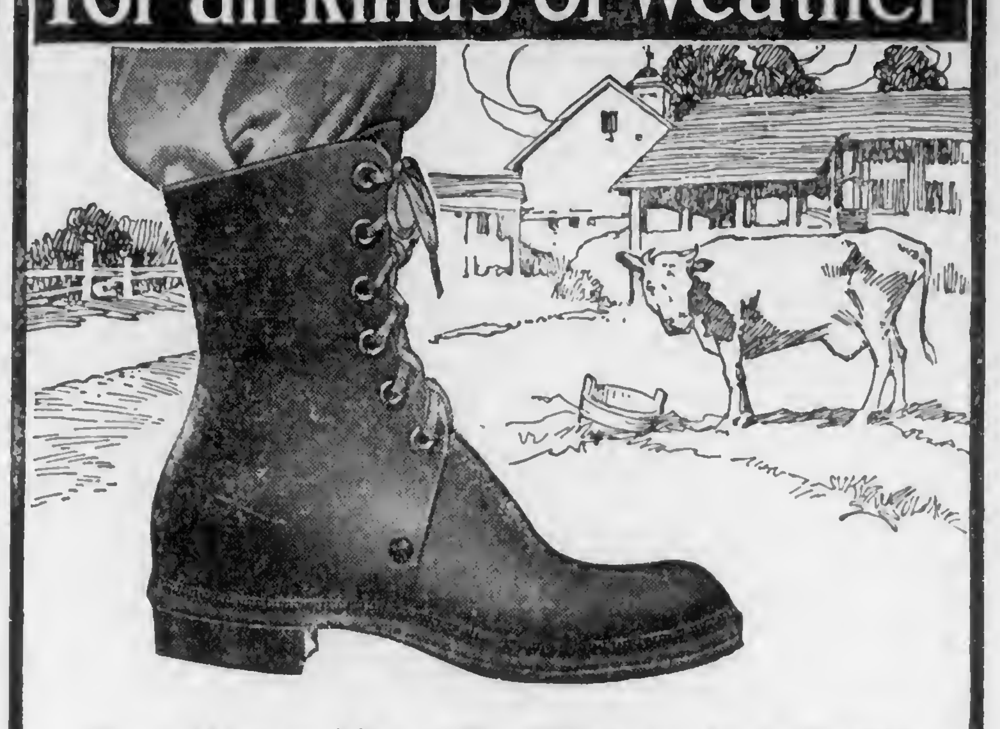
The result was beyond cavil in its artistic simplicity, for the girl, knowing the significance that trifles have at times, had laid aside every adornment that might hint at wealth, and the somber draperies alone emphasized the polished whiteness of her face and neck. Still, and she did not know whether she was pleased or otherwise at this, the mirror had shown the stamp which revealed itself even in passive pose and poise of head. It was her birthright, and would not be disguised.

Then she drew a low chair towards the stove, and once more the faint color crept into her face as she took up a note. It was laconic, and requested permission to call at the Grange, but Maud Barrington was not deceived, and recognized the consideration each word had cost the man who wrote it. Afterwards she glanced at her watch, raised it with a little gesture of impatience to make sure it had not stopped, and sat still, listening to the moaning of the wind, until the door opened and Miss Barrington came in. She glanced at her niece, who felt that her eyes noticed each detail of her somewhat unusual dress, but said nothing until the younger woman turned to her.

"They would scarcely come to-night, aunt," she said.

Miss Barrington, listening a moment, heard the wind that whirled the snow about the lonely building, but smiled incredulously.

(To be continued.)



"Better than leather For all kinds of weather"

You Won't Have To "Break In" These Money-Saving Shoes

You dread to put on new shoes. Why not escape the suffering, the aches, and the pains of new leather shoes.

Wear **Hub-Mark Bootees.** They are made from pure rubber and pliable duck with staunch, leather insoles. You will find them warm, and easy on your feet from the very beginning. These comfortable bootees are not stiff. Yet they are tough enough to always wear longer than the best leather work shoes.

Leather is getting dearer all the time. The automobile makers are taking the choicest of it away from the shoe men. That's why shrewd men are buying **Hub-Mark Bootees** with the knowledge that they spend less for their footwear, and get better value.

Note this:—Look for the **Hub-Mark** on all kinds and styles of rubber footwear for men, women, boys, and girls. You can rely on anything you buy from dealers who sell **Hub-Mark Bootees**—they are square dealers.

Amazing Prices on STEEL Shingles

The demand for Edwards "Reo" Steel Shingles has become so big that we now sell them from factory to user for less—actually LESS—than common wood shingles. And we pay all freight! LOOK INTO THIS MONEY-SAVING PROPOSITION BEFORE ROOFING YOUR BUILDINGS. SEND POSTAL TODAY AND GET FACTORY PRICES.

No Trick to Put Them On

You don't have to nail these steel shingles, like wood shingles, ONE AT A TIME. Put on as high as 100 at once, for they come in big sheets ready to nail on sheathing or old roof. It's ten times easier than putting on wood shingles. No extra materials to buy, no painting to do, no tools to borrow. Your hired man can do the job with a hammer.

Absolutely Rustproof

Please don't judge Edwards Steel Shingles by common galvanized iron roofing—the kind that rusts. We have invented a method that absolutely prevents rust from ever getting a foothold, as 100,000 delighted owners of Edwards Roofs have found out. It's the famous Edwards Tightcote Process applied to genuine Open Hearth Steel.

Protect Your Buildings from *FIRE*

Don't take chances of fire from defective chimneys, flying sparks and lightning. Roof your buildings with these Steel Shingles and make them safe. Remember nine out of every ten fires start with the roof. We specifically guarantee every Edwards Steel Shingle Roof against lightning. This Guaranty is backed by a $10,000 Cash Bond.

Cheaper Than Prepared-Paper Roofing

Edwards Steel Shingles cost less, far LESS, than prepared paper or composition roofing, IF YOU FIGURE THE COST PER YEAR. And that's the right way to figure

Markets

PHILADELPHIA PRODUCE

Philadelphia, Pa., March 16, 1914.

Supplies of fancy butter goods were well cleaned up, while offerings of lower grades were only moderate. Receipts exceeded requirements in the egg market and some dealers were obliged to clean up surplus stock on concessions. The demand for poultry was sufficient to absorb receipts. Offerings of desirable stock of fruit and vegetables were only moderate, and values ruled steady.

Butter.—Western creamery, 32c; extras, 30c; firsts to seconds, 24@28c; special prints, 36@39c; near-by prints 33c.

Eggs.—Candled 30@39c doz; extras, 33c. Current receipts at $9.30 per standard case.

Poultry.—Fowls, 17@18c; old roosters, 12@13c; pigeons, 30@32c pair.

Dressed Poultry.—Western fowls 12@18½c; roosters, 15c; turkeys, 20@26c; squabs $2@4.85 doz.

Vegetables.—White potatoes, Pa., 75@90c bu. Onions $3@3.50 per 100-lb bag. Peppers $1.50@1.75 per carrier. Eggplant $2@3.50 carrier. Lettuce $2@4 per hamper. Beets, $2 per bbl. Sweet potatoes 45@55c bas. String beans $3@4.50 hamper Squash $2@2.50 per crate. Cucumbers, Florida $4@5 hamper. Celery 50@75c per doz. stalks. Cabbage, new $1.75@2.25 ½-bbl. crate. Cauliflower $1.75@2 per ½-bbl. crate.

Fruit.—Apples $4@6.50 bbl. Pineapples, per crt, $2.50@3.50. Pears, 50@80c basket. Grapes $5@7 per keg; cranberries, $3@3.50 crt; lemons, $2.50@3.50 box; grape fruit $2@3.50 per box; oranges, $2@3 per box.

Hay and Grain.—No. 3 hay, large bales, $18.50@19.00; No. 1 medium $18@18.50 no grade, $10.00@12.00. Clover mixed hay, light mixed at $17.50@18.00; straw No. 1 new straight rye, $16.50; No. 2 do., $15@15.50; No. 1 tangled rye straw new $12; No. 2 do., $11.00@11.50; No. 1 wheat straw, $10@10.50; No. 1 oat straw, $10.50@11; new shelled corn No. 2 yellow 71½@72½c. Wheat No. 2 red, $1@1.00½; No. 1 Northern, $1.05@1.06; No. 2 white oats, 45@45½c; No. 3, white 46@46½c; Standard white 45½@46c.

Coffee.—Rio 7s 9c; Santos 4s 11¾c. Mild Coffee.—Cordova, 13@16½c.

Sugar.—Cut loaf, $5 10 cwt; cubes, $4.15; powdered, $4.00; granulated, , $3.90; standard granulated, 3.95; crystal A, $3.90.

Flour.—For 196 lbs. in wood, winter-clear, $3.85@4.10; do straight, $4.35@4.50; favorite brands, $5.00@5.25; rye flour, Pa., $3.50@3.60 per bbl.

Hides and Skins.—Steers, abattoir, 16¾@17¾c; do country, 15c. Cows, country, 15c. Bulls, abattoir, 14½c; do. country, 13c. Calf skins, Nos. 5 to 12 and up, $1.55@2.75; do green, 14@15c.

Provisions.—City beef, in sets, smoked and air dried, 31@31½c. Beef hams, $40@42. Pork family, $23@24. Hams, cured, 13⅝@14c; skinned 14@14⅞c; smoked 17@18c. Other hams, smoked, city cured, as to brand, 17@18c. Picnic shoulders, 10⅜@10⅞c; do smoked, 13@13½c. Bellies in pickle, 13½@14¾c. Breakfast bacon, as to quality, 19@23c. Lard, refined, 11¼@11⅞c tcs; do in tubs, 11⅜@12c; do kettle rendered, 11¼@11¾c. Tallow, prime city 7c; country, 7c; do. dark, 6c; do. cakes, 7¼c.

Philadelphia Retail.

Vegetables.—Onions 15c ½-pk. Peppers, 3 for 10c. Eggplants 10@25c apiece. Cabbage, 5@10c a head. Lettuce 10@25c. Beets new 30c bch. Sweet potatoes 20c ¼-pk. White potatoes, 75c basket. String beans 20c quart. Tomatoes, hothouse 6 for 25c; cucumbers 10@15c apc. Celery 3 stalks for 25c. Squash 10@15c apc; cauliflower 25@35c apc; mushrooms, 40c lb.

Fruit.—Grapes 35c lb. Apples 15@25c ¼-pk. Pineapples 25@30c apiece. Cranberries 20c quart; lemons 15c doz; grapefruit, 2 and 3 for 25c; Oranges, 25@50c doz.

NEW YORK PRODUCE

New York City, March 16, 1914.

The tone is barely steady on fancy fresh creamery butter and weaker on all the lower grades. The egg market shows heavy declines, the supply being more than ample for demands. Trading in poultry continues very slow and while there is little warrant for changes in quotations top figures are high. Fruits and vegetables show little change.

Eggs.—State and near-by hennery whites, fine to fancy 27c; gathered whites 32½@33c; fair to good 25@26c; fresh gathered firsts to extras 24½@26c; seconds to thirds, 23@24c; no grades 23c; mixed 25@25½c.

Butter.—Creamery firsts to extras, 25½@28c; thirds to seconds, 20@25c; state dairy 19@27c; packing stock 14@17½c; process 18½@22c.

Cheese.—Whole milk specials, 18¾@19c; do, common to fancy, 15@18½c; skims 5@14¾c.

Dressed Poultry.—Turkeys, dry, 23@25c; chickens, 14@25c; fowls, 12@18c; old roosters, 14c; ducks 13@19c

Live Poultry.—Prices unsettled

Vegetables.—Cabbage, $25.00@30.00 ton. Green beans $2@4.50 bas. Carrots $2.25@2.50 bag. Cucumbers $1@1.50 doz. Lettuce $1 25@4.50 bas. Squash, $3@3.50 bbl. Celery $3.00@4.50 standard case. Onions $2 25@3.00 100-lb bag. Tomatoes, $1.00@3.50 carrier; peppers $1.50@2.00 carrier. Beets, $3.00@5.00 per 100 bunches. Potatoes $1.50@6.50 bbl. Sweet potatoes, 35c@$1 bas. Eggplants, $2@3 per box. Cauliflower $1.25@1.75 bas.

Fruit.—Apples, $2.00@6.00 bbl. Cranberries $9@15 bbl. Pears 75c@$1.50 basket.

Grain.—Wheat No. 2 red $1.00@1.00½; No. 1 Northern, $1.05@1.06; corn, new No. 3 yellow 72½@73½c; oats, standard white 45½@46c.

YORK PRODUCE MARKET

York, Pa., March 16, 1914.

The markets were poorly attended during the week and sales were light. Demand was poor. Eggs dropped several cents. Butter is firm.

Eggs.—27@30c.

Butter.—Country, 30@35c; separator, 35@38c. Milk, 6c per quart. Cream, 12c per pint.

Poultry.—Scarce. Hens 15@16c. Dressed poultry, 50@90c each.

Vegetables.—Potatoes 10@16c ½-pk; 50c@1.00 bu; cabbage 3@10c each; lettuce, 10@12c; beets, 5c bch; radishes, 5c bch; onions 5c bch., 15@18c per ½-pk; lima beans 14@16c qt; sweet potatoes, 12@15c per ½-pk; lard 14@16c lb; celery, 10@12c; peppers, 8@12c doz; turnips 10@12c ½ pk; soup beans, 10@12c qt; sauer kraut 8c qt; apple butter, 22@25c qt.

Fruit.—Apples, 20@35c ½-pk; pears, 15@25c per ½-pk; chestnuts, 12@15c qt; walnuts, 15c per ½-pk.

Retail Grain Market.—Wheat, $1.07 bu., corn, 82c; oats, 55c; rye, 77c; bran, $1.50 cwt; middlings, $1.60 cwt.

Wholesale Grain Market.—Wheat, 97c; corn, 69c; oats, 45c; rye, 67c.

WILMINGTON PRODUCE.

Wilmington, Del., Mar. 16, 1914.

Butter.—Print butter, 38@45c lb. Creamery roll, 35 @ 45c.

Poultry.—Chickens, dressed, 18 @ 25c; ducks, 18@20c.

Eggs.—35@40c doz.

Vegetables.—Potatoes 10@12c ¼-pk. Cabbage, new 4c up. Sweet potatoes 45@50c bas. Onions, 10@12c ¼-pk. Eggplants, 10c each. Peppers, 10@15c doz. Parsley, 1@5c bch. Lettuce, 8@10c bch. Beets, 5@8c bch. Cauliflower, 10@20c each.

Fruit.—Apples, 10@25c ¼-pk. Pinapples, 20@25c apc. Grapes, 10@15c lb; 20@25c bas. Oranges, California, 25@30c doz. Florida, 35@50c doz. Bananas, 10@15c doz. Pears, 10@15c ¼-pk. Cranberries, 10@15c quart. Quinces, 20@25c ¼-pk. Grape fruit, 7@10c each.

PHILADELPHIA LIVE STOCK

Philadelphia, Pa., Mar. 16, 1914.

Beef Cattle.—Supplies were light and so was demand, altho prices were a shade firmer. Offerings were mostly of Ohio, Virginia, Western and near-by stock. Cows sold slowly and the top calf values ruled easier.

	Beef Cattle	Sheep and Lambs	Hogs
Total for week	2,285	5,873	5,650
Previous week	2,743	9,864	5,418

Best steers	8.70@8.80
Choice steers	8.50@8.60
Good	8.30@8.40
Medium steers	8.10@8.25
Common steers	7.75@8.00
Bulls	5.00@6.70
Fat cows	6.15@6.75
Medium cows	4.75@5.75
Thin cows	3.25@4.00

Veal calves steady

Best calves	$11.00@11.50
Good to choice do	10.50@11.00
Medium	7.50@8.00
Commou do	6.50@7.00

Sheep and Lambs.—The market continues at a standstill, with current rates nominally steady. Holdings were limited but more than ample.

Choice wethers	$6.00@6.25
Good do.	5.25@5.75
Common to medium	3.50@5.00
Ewes, fat	5.25@5.75
Extra lambs	8.25@8.50
Good to choice do	8.00@8.25
Common to medium	6.00@8.00

Hogs.—Conditions were steady with arrivals under satisfactory control. Westerns as to size and quality $12.50@12.75.

City Dressed Stock.—All choice and prime meats of every variety commanded full prices, trade being moderate. Steers, 12@14c; heifers, 10½@13c; cows, 9@11c. Veal calves, 14@15c; country dressed calves. 14@15c; extra do., 15½c. Sheep, 9@11c; extra wethers, 12c. Spring lambs 13@14c. Hogs 12¾@13c.

PITTSBURGH LIVE STOCK

Pittsburgh, Pa., March 16, 1914.

Cattle.—With a supply of 110 loads compared with 115 loads the week before, the market ruled slow with prices about steady on the fat cattle of all weights, while the light cattle and the cattle on the plain and coarse order were a little easier. Bulls were in liberal supply and sold easier. Best heifers steady while cows were steady on all grades. Best fresh cows steady; other grades and springers slow. Today's supply totaled 90 loads. The market ruled slow at prices barely steady with last week's close. Bulls, fat cows and heifers sold steady.

Good to choice	$8.75@9.00
Good 1,300-1,400 lb	8.40@8.65
Medium to good 1,200-1,300 lb	8.10@8.30
Tidy 1,050-1,150 lb.	8.10@8.35
Fair to medium, 900-1,100 lb	7.40@7.90
Rough, half-fat, 1,000-1,300 lb.	5.00@7.00
Common, 700 to 900 lbs.	5.50@6.50
Rough, half-fat	5.00@7.00
Common to good fat oxen	4.00@6.50
Common to good fat bulls	5.00@7.75
Common to good fat cows	4.25@6.50
Heifers	5.50@8.00
Bologna cows	3.75@4.35
Fresh cows and springer	25.00@85.00

Calves.—Veal calves in fair supply and the close for the week was a little lower than Monday's prices. Today's receipts were 550 head, and the market ruled 50 cents lower.

Heavy and thin calves	$5.00@7.00
Veal calves	7.50@10.50

Sheep and Lambs.—The demand for choice sheep was good and market ruled steady to strong while on lamb grades the market has ruled about steady, the demand being not quite so good as a week ago. Today's receipts were 20 double-deck loads. With a fair demand the market ruled fairly active on choice sheep, but other grades were easier. Lambs sold a shade lower. Two loads of choice yearling wethers sold at $7.

Prime wethers	$6.10@6.25
Good mixed	5.75@6.00
Fair mixed ewes and wethers	5.00@5.50
Culls to common	3.00@4.50
Prime lambs	5.50@8.10

Hogs. — The supply during the week has been fair but demand during the early part of week was light and market ruled about steady, but with a better demand the last of week the market closed about 15 cents per cwt. higher; pigs still very slow sale. Today's receipts were 40 double-decked loads. The market ruled 10 cents lower than last week's close.

Prime heavy	$9.20@
Prime medium weights	9.20@
Heavy mixed	9.20@
Best heavy Yorkers	9.20@
Light Yorkers	9.10@
Pigs	8.00@9.00
Common to good roughs	7.75@8.25
Stags	7.00@7.25

BALTIMORE LIVE STOCK

Baltimore, Md., March 16, 1914.

Cattle.—Receipts for the week 3,424 head against 2,013 last week.

Steers	$6.25@8.35
Heifers	5.50@7.00
Cows	3.00@5.75
Bulls	5.25@7.00
Fresh cows	35.00@75.00

Sheep and lamb receipts for the week were 2,596 head against 2,791 last week. Fair supply; market steady.

Sheep	$3.75@6.25
Lambs	5.50@8.50

Hog receipts for the week were 11,876 head against 16,143 last week.

Light western	$9.40@9.45
Heavy to medium	9.40@9.50
Near-by	9.20@9.40
Pigs	8.75@9.10

Calves.—Receipts for the week were 399 head, against 367 head last week. Liberal supply, market lower at $6.10@10.25.

BUFFALO LIVE STOCK

Buffalo, N. Y., March 16, 1914.

Cattle.—The market opened with a good demand and higher prices and the feeling was maintained thruout the week on choice. The demand for light butcher steers was good. On the close the market was slow and 10@15 cents lower. Further declines of 10@15c took place on a slow market today. Receipts totaled 3,750.

Choice heavy steers	$8.65@9.00
Medium	8.25@8.75
Yearlings	8.00@8.50
Handy butchers	7.50@8.50
Good to choice fat cows	6.50@7.25
Good to choice heifers	7.50@8.00
Butcher bulls	6.00@7.50
Feeders	6.25@7.25
Stockers	5.00@6.25
Cows and springers	30.00@93.00

Calves. — With liberal receipts for the opening, the market for the week was slow. The opening basis was $11.50@12. The week's close was slow, demand being light. With 1,000 head on sale this morning, further declines took place.

Choice veals	$10.00@10.50
Lights and thin	6.00@8.75

Sheep and Lambs.—The opening supply was about 12,000 head and the demand good; choice lambs were about 10c higher. Heavy sheep ruled slow to lower. On the week's close the market was about a quarter lower. The demand for yearlings was light. Heavy sheep were slow. Sheep and lambs shared in the decline this morning. There were 12,000 head on sale.

Choice lambs	$8.00@8.10
Yearlings	7.00@7.15
Wethers	6.25@6.50
Ewes	5.50@6.00
Sheep	5.75@6.00

Hogs.—The market on the opening was active and 10@15 cents higher. The demand for Yorkers was good and the basis was $9.10. Heavy hogs were also firmer, $9.05@9.10. On the week's close the trade was fairly active, and prices 5@10 cents higher. Yorkers ruled stronger. Pigs were slow. The better grades advanced. Roughs and state hogs were in fair request. Receipts of 14,400 this morning brought a generally lower market.

Heavies	$9.20@9.25
Mixed and medium	9.20@9.25
Yorkers	9.20@9.25
Light Yorkers	9.20@9.25
Pigs	8.85@9.10
Roughs	8.10@8.25
Stags	6.25@7.00

Horses.—The supply was light tho there was an excellent demand for good workers. Drivers were about steady with the supply light.—S.

NEW YORK LIVE STOCK

New York City, March 16, 1914.

Bef Cattle.—Receipts for week 3,100 head. Market lower.

Steers	$6.50@9.35
Bulls	6.00@7.65
Cows	3.50@6.25
Dressed beef	12@13½c.

Calf receipts 4,500 head, Market lower.

Choice	$9.00@13.25
Culls	7.00@8.50

Dressed calves lower. Dressed veals, 13@17½c.

Sheep and lamb receipts 8,000 head. Market steady.

Sheep	$4.00@6.00
Culls	4.00@4.25
Spring lambs	7.00@8.25

Hog receipts 6,900 head. Market steady. Choice, $9.10@9.40; roughs, 8.15@8.35.

PITTSBURGH HAY AND GRAIN MARKET

Pittsburgh, Pa., March 16, 1914.

Hay.—The receipts of hay have eased up considerably during the week. Billings in transit are also running light. Market for good hay beginning to look much stronger. Clover and mixed hay are in strong demand and readily selling at top prices. Poor hay, also threshed, is difficult to dispose of.

No. 1 timothy	$16.75@17.25
No. 2 timothy	14.50@15.50
No. 3 timothy	11.00@12.00
No. 1 light mixed	15.00@15.50
No. 1 clover mixed	14.50@15.00
No. 2 clover mixed	11.00@12.00
No. 1 clover	14.00@14.50
No. 2 clover	10.00@12.00

Straw.—Receipts of straw are somewhat free, but there is an excellent demand which readily takes care of all arrivals at top figures.

No. 1 Oats	$9.00@9.25
No. 2 Oats	8.75@9.00
No 1 Wheat	8.75@9.00
No. 2 Wheat	8.50@8.75
No. 1 Rye	9.25@9.50
No. 2 Rye	8.50@9.00

Ear Corn.—Demand has eased up for ear corn. Receipts more than equal demands. Market quiet.

New No. 2 yellow	69@69½c.
New No. 3 yellow	65½@67c.

Shell Corn.—Demand for shell corn slow. Receipts equal to demands. Market dull.

New No. 2 yellow	70½@71c.
New yellow No. 3, natural	66 @66¼c
New sample	64 @65c

Oats.—Demand for oats is good, but buyers will not stand for any advances. There seems to be considerable oats in the elevators still to be marketed, which has a bearish tendency upon prices.

No. 2 white	43¼@43½c.
Standard oats	42½@43c.
Standard No. 3 oats	41½@42c.

Millfeed.—Not much life to middlings.

No. 2 white midds	$27.50@28.00
No. 1 brown midds	26.00@26.50
W. W. Bran, coarse,	27.50@28.00
W. W. Bran, medium	27.00@27.50

ELGIN BUTTER QUOTATION

Elgin, Ill., March 16, 1914.

The quotation committee of the Elgin Board of Trade this afternoon declared butter weak at 26½ cents.

NEW YORK MILK MARKET

New York City, March 16, 1914.

There is a surplus in the market. The value in the 26-cent zone for Grade B is considered to be 3½ cents a quart. The Borden rates for the coming six month, Grade B, have been announced. They are per hundred pounds in the 26-cent zone as follows: April, $1.40; May, $1.15; June, $1.10; July, $1.25; August, $1.40; September, $1.50. Two premiums of ten cents each are offered; one for milk from dairies scoring 68 points; one for milk containing 3.8 percent butter fat. While, of course, the number receiving premiums varies from month to month, it may be said in a general way that about half of the milk from the short-haul districts and about 65 percent from the long-haul zones, earns these premiums. The rates for the corresponding months last year were 10 cents a hundred higher in April and May, the same in June, 10 cents higher in July and 5 cents higher in August and September.

The receipts of milk and cream in 40-quart cans for the week ending March 14, were as follows:

Railroad	Milk	Cream
Erie	46,251	986
Susquehanna	7,980	260
West Shore	15,476	623
Lackawanna	57,110	1,490
N. Y. Central (long haul)	81,794	1,631
N. Y. Central (short haul)	11,870	88
Ontario	43,981	2,802
Lehigh Valley	32,486	1,050
Homer Ramsdell Line	.....	....
New Haven	7,990	140
Pennsylvania	4,015	196
Other sources	1,668	18
Totals	310,621	9,284

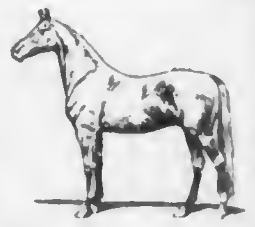
TOBACCO MARKET

Tobacco buyers who have steadfastly held that growers are asking too much for their tobacco, are now under the impression that the approach of "settlement day" (April 1.) will compel the sale of many crops at reduced prices and it is their hope that a long desired landslide in prices will follow. Of course such things have happened but conditions are changing and if the grower will but employ the opportunities that are now being presented he may soon be in position not alone to avoid such contingencies but also to see the end of the speculative career of those who are now seeking to take undue advantage.

At a meeting of the Lancaster County Tobacco Growers Association reports indicated that about one-half of the 1913 crop has been sold. At East Lampeter one-half sold at $8@$9; East Petersburg, three fourth; Lititz, one-half at $7; Millersville very little sold; Rawlinsville, less than one-half at $8@$9.50; Maytown, $8@$9.50; Washington Borough, considerable Havana at $12@$15; Intercourse, 60 to 70 percent of crop at $6.50@$8; West Lampeter, one-half at $8@$10.50; Rohrerstown, none sold; Ephrata, little sold; West Lampeter, ten crops sold at $7.50@$9.50. It was reported from many sections that prices were lower and demand slow. At the same meeting the recently organized Seedleaf Association was discussed at length. The general agreement seemed neither to oppose or favor the new organization until it has had time to show what it will do. It was well remarked that the methods of the organization are clean and plausible. A committee was appointed to make an investigation and report at next meeting. In regard to the new crop it was found that many growers will plant Havana. The majority will raise seedleaf and some both. The matter of reducing the acreage was discussed. A representative of the experiment station announced that the station would test tobacco seed for growers.

The Seedleaf Association announced that 25,000 to 30,000 pounds of tobacco have been delivered at the warehouse of the organization. This was "bonded" at $5@$9 per cwt. The attitude of local banks with reference to the warehouse certificates issued for this tobacco was quite varied, some being inclined to refuse them. It is a noteworthy fact that very few of these certificates have been offered to banks.—H. E. Tweed, March 16, 1914.

Book of Reasons For Engine Buyers.—Every prospective engine purchaser should secure catalogues now being issued by The Temple Engine and Pump Co., before buying. These catalogues list and describe engines for every use and give letters from users of engines giving just the information the purchaser wants. The catalogues are mailed free upon request mailed to The Temple Engine and Pump Co., 2134 So. 54th Ave., Chicago, Ill.



SAVE-THE-HORSE
Trade-Mark, Registered

REGARDLESS of price or any other reason Save-the-Horse is the cheapest remedy known. It goes through and through both bone and tissue—it works inside, not outside. And Produces a Cure That Withstands Every Test. No Scar or Loss of Hair. Horse can work as usual.

Why We Can Make a Contract to Cure.
Greenwood, Ind., March 10, 1913
Troy Chemical Co., Binghampton, N. Y. I have cured the horse of bone spavin. I also recommended it to a neighbor who cured a bone spavin. Frank Stevens.

Druggists everywhere sell Save-the-Horse WITH CONTRACT, or we send by Parcel Post or Express paid.

OR write and we will send our—BOOK—Sample Contract and Advice—ALL FREE to (Horse Owners and Managers—Only). Address

Let Me Tell You How the TEMPLE ENGINE Revolutionized Engine Building

—by radical improvements that make its service as superior to that of the "common herd" engine as the Thoroughbred is superior to the Scrub, without increasing the cost to you.

I cannot undertake to describe this engine—HERE. But drop me a postal and I will tell you how it does away—almost altogether—with ruinous VIBRATION and FRICTION —with excessive WEIGHT and BULK—with many other features that render ordinary engines so costly, so short-lived, so inefficient and so cumbersome. In the meantime—note in sectional view of the "TEMPLE," above, three of its radically "different" features, and what these mean to ENGINE USERS:

INVERTED CYLINDER—with HEAD on BASE—close to the ground—eliminating vibration, causing engine to run quietly and smoothly, delivering maximum power with minimum consumption of fuel (gasoline, kerosene, alcohol or distillate).

BELL-SHAPED WATER JACKET—(see letter A) flaring toward the base, giving three times the usual volume of coolest water where it's needed—around the explosion chamber, the hottest part of the cylinder.

SMALL, LIGHT, BASE—cutting out two-thirds of floor-space and BULK and one-half the WEIGHT of other engines—making it much lighter and easier to move from one job to another.

PROFITABLE ALL-AROUND SERVICE—The extraordinary lightness, compactness and quiet running of this slow speed, heavy duty engine, make it IDEAL for running Threshers, Grist Mills, Sawing Outfits, Shredders, Huskers, Sprayers, Pumps, and all other INDOOR and OUTDOOR machinery, requiring 2 H. P. to 50 H. P.

Just a penny—spent for the postal you send me—brings you ENGINE INFORMATION that will be worth hundreds of dollars to you in your season's work. Now "take a chance"—risk a CENT for the postal—and LEARN SOMETHING YOU DIDN'T KNOW BEFORE.

HORSE LAME? Use KINDIG'S Famous OINTMENT. A sure cure for bone, bog, and blood spavin, ringbone, curb, soft bunches splint, etc. 50 cents, post paid. E. Kindig, Jr., Remedy Co., 4825 Woodland Ave., Phila.

Veterinary

(Conducted by W. C. Fair, V. S.)

(Advice thru this department is free to our subscribers. Each communication should state history and symptoms of the case in full; also the name and address of writer. Initials only will be published. We cannot make reply by mail. This is one of the most valuable columns of the paper and we invite readers to make use of it. Clippings from this column, when properly preserved and classified, would make one of the most valuable medical symposiums a farmer-stockman could obtain.)

Everted Uterus.—Soon after three of my ewes lambed their wombs came out and two of them died soon after; the third also died, but not so soon. Upon opening them I failed to find any cause for their trouble. I feed crushed oats for grain ration and oat and pea straw for roughage. A. S., High Bridge, N. J.—The principal cause of eversion is weakness and undue straining at time of delivery. Your ewes may not have had enough exercise this winter or their bowels may have been constipated at time of lambing. If you have other ewes due to lamb soon, increase their grain ration, exercise them more, salt them well, which will increase their thirst and have a tendency to open their bowels. When uterus comes out, it should be washed clean with a one-to 5,000 solution of bichloride of mercury and tepid water; put back into place carefully, then put in two stitches into external opening and apply a surcingle around body at flank to prevent straining.

Nasal Catarrh—Sore Throat.—I have four pigs, 4 months old, that have been sick for some time. They cough and sneeze most of the time, but show it most when eating. Their nostrils appear to be partially closed, causing them to breathe thru mouth. L. N. S., Centerville, Pa.—Your pigs should be kept in a dry, warm comfortable place. Give each of them 10 grains powdered sulphate iron, 2 grains of quinine and ⅛ teaspoonful of cooking soda at a dose, 3 times a day. Dip their noses in a solution of salt and water; a tablespoonful of salt to ½ gallon of clean boiled water, twice a day.

Brain Hemorrhage—Loss of Vision—Paralysis—Deafness—I have a 14-year old mare that went blind and deaf suddenly at night. She was apparently all right in the evening and in the morning I found her in above condition. Her eyes appeared bright, only lids drooped a little, holds her head to left side of the manger and low down, resting head on manger part of time. She eats what I give her, but does not grind hay very well and she appears to be unable to move tongue. She appears stupid and acts dumb. Her ears lop down. I feed her 2 quarts of oats each feed, 3 times a day. She has clover, timothy and straw for roughage. This mare is due to foal in June and I would like to know if she can be cured? O. S., Harmony, Pa.—Your mare has either met with an injury, has some brain hemorrhage or else there is a watery effusion in brain causing nerve pressure which gives rise to deafness, loss of vision and partial paralysis of throat, tongue and lips. Give her 1 dr. fluid extract nux vomica, 1 dr potassium iodide and ½ oz. fluid extract of cinchona at a dose, 3 or 4 times a day. You need not be disappointed if she does not recover. to use a remedy which will not interfere could be removed. What should I apply. I need his work; therefore I prefer

Rheumatism.—We have a cow that him no lameness. I have been told they has shown some soreness or lameness for the past six weeks, but is not al- in weather from hot to cold she is most ways lame. Whenever we have a change crippled but she shows no symptoms of of camphor dissolved in a pint of gasoline. Make this application twice a day and beware of fire in handling gasoline.

Windgalls.—I bought a road horse last fall that was troubled with windgalls on all four legs, but they caused spots, apply iodine and camphor, 1 oz. twice a day. If you can locate sore her 2 dr. sodium salicylate at a dose, a dose in feed 3 times a day; also give spoonful powdered nitrate of potash at nor, Pa.—Give each cow a dessert- has met with an accident. M. T., Elgin- [illegible] before that she with his usefulness. M. J. B., Jamestown, N. Y.—If I owned your horse and he was doing good road work every day, I should leave him alone. If treated at all apply 1 part iodine and 10 parts fresh lard, 3 times a week. I found applications of glycerine to act fairly well on cases of this kind, but remember chronic solidified windgalls cannot be reduced entirely.

Blast Tree Holes; Get Better Roots

To grow fast and bear early, trees must have vigorous roots. "Both apple and peach trees planted in blasted holes developed deeper and stronger root systems than those in spade-dug holes," the N. J. Experiment Station found. "Soil around spade-dug trees was hard; around blasted trees it was loose for yards." Plant your fruit trees in holes made with

Atlas Farm Powder
THE SAFEST EXPLOSIVE

and they will grow faster and bear earlier than spade-set trees. Just punch a hole, charge it, light a fuse and the work is *done!* Be careful to get Atlas Farm Powder, made especially for agricultural use, and sold by dealers near you.

Atlas is the easy, quick and economical explosive for use in planting trees, blasting stumps, digging ditches, and doing many other kinds of farm work. Use it to break up the subsoil in your fields and get bigger crops.

"I am sure "Sal Vet" is what you claim. I have a horse that was constantly troubled with colic and worms; he has not been sick since I fed "Sal Vet."—Levi S. Peiffer, Notary Public, Fredericksburg, Pa.

"I am feeding my hogs "Sal Vet" every day, and they are doing finely on it. There is quite a lot of hog cholera around here but my hogs are thrifty and in good health, and I want to keep them so."—S. I. Steinminger, Rt. 1, New Columbia, Pa.

"'Sal Vet' is doing fine work for my hogs. Before feeding it I had lost 38 head of hogs, but since feeding it, I have not lost a single one, and they are looking better than they ever did."—T. C. Corl, Bellefonte, Pa.

"I thought my pigs were all healthy and free from worms, and wanting to keep them so, I sent for "Sal Vet." However, after feeding it a while, one of my sows that was due to farrow in about four weeks, showed signs of worms. These were soon expelled and she came thru with a nice litter of pigs. The rest of my herd all looked a great deal better and picked up, and I have seen no sign of worms since."—Will S. Loflin, Rt. 3, Box 6, Kingsley, Pa.

"One of my young horses would not eat until I gave him "Sal Vet." It not only restored his appetite, but expelled more than a peck of worms from him, and he no longer looks like the skeleton that he did before. I can recommend "Sal Vet" to do more than you claim for it."—Sam'l F. Moyer, Stouchsburg, Pa.

I'll Feed Your Stock 60 Days Before You Pay

I'll Stop Your Losses From Worms Or No Pay

I'll Prove It On Your Own Stock

I don't ask you to pay me one single cent until you have fed SAL-VET for 60 days and seen with your own eyes it's wonderful merit. I don't ask you to send me a penny **until I prove to you, on your own stock,** the great value of SAL-VET as a worm destroyer and conditioner. I have shipped tons and tons of SAL-VET to readers of this paper who have accepted my "no money down" offer. I want an opportunity **to show you** who have not yet accepted it, that it pays, and **pays big** to feed SAL-VET regularly to all your farm stock — Hogs, Horses, Sheep or Cattle. You have nothing to risk — everything to gain.

The Great Worm Destroyer

TRADE MARK

SAL VET

REG. U.S. PAT. OFF.

The Great Live Stock Conditioner

makes all animals **thrive better, look better,** destroys and expels intestinal and stomach worms which prey on the digestive tract, **robbing** your animals of vitality and strength and keeping them in an unthrifty, unprofitable condition. SAL-VET will put them in condition to get more good out of their feed—makes them thrive faster — stops your losses from worms, makes stock sleek in coat, vigorous in action, and far better able to resist diseases. Millions of dollars are lost every year by stock raisers who do not keep their animals worm-free, healthy, and in a condition to get all the benefits of the rations fed.

Don't Send a Cent—Just the Coupon

Tell me how many head of stock you have and I'll ship you enough SAL-VET to feed them 60 days. You simply pay the freight on arrival—feed it as directed. At the end of two months report results. If SAL-VET has not done all I claim, I'll cancel the charge — you won't owe me a single penny. Send the coupon today and begin action against worm pests—the greatest enemy you have to contend with in raising stock.

"I am as strong for SAL-VET as ever. Almost every one, in these parts, has lost hogs, but mine are still doing finely, thanks to SAL-VET." Dick Crookham, Lacey, Ia.

"SAL-VET has been a great help to my hogs as none have died since I fed it, although previous to its use, I had a number of losses. T. J. Reed, Rt. No. 1, Hutton Valley, Mo.

"Hog cholera has swept this part of the country, but for the first time in years, my own hogs escaped. I have been feeding SAL-VET and now I would not be without it for double the price."
Thomas Fitzgerald,
Rt. No. 2, Connersville, Ind.

"I took some of my poorest and weakest pigs, shut them up in a lot by themselves, and fed them SAL-VET in order to make a test. I found SAL-VET all you claim. These pigs are now good, strong, healthy shotes, weighing 125 to 150 pounds. I shall always feed SAL-VET the year 'round."
W. A. Kearn, Rt. No. 1, Tampico, Ills.

"Your SAL-VET is certainly all to the good, and you may always count on me to be a booster.

When the SAL-VET arrived, our hogs were either all sold or dead with cholera. There were five little runts alive, which were considered as good as dead, but, thanks to SAL-VET they are the best looking hogs of their age in the neighborhood. My one regret is that we did not get SAL-VET sooner, as I feel that we could have saved the whole bunch."
LeRoy A. Barrett, Oswego, Ills.

"When the SAL-VET arrived my hogs were sick, and up to that time, I had lost sixteen pigs, all under twenty pounds. After the balance of the pigs had access to SAL-VET, they came through all right, and some of them now weigh 525 pounds, which I consider pretty good. I am talking SAL-VET to every man I meet, as I honestly believe it is the one conditioner and preventitive to feed to hogs the year 'round." Ben E. Woitte,
Prop. North Grove Farm,
Rt. No. 1, Milbank, S. D.

"When we butchered our hogs, we found them entirely free from worms, although before we began feeding SAL-VET, one hog in particular seemed badly out of condition and was coarse and rough. When we butchered him, he was the smoothest and fattest hog in the bunch."
F. H. Durflinger,
Rt. No. 8, Van Wert, Ohio.

Look For This Label on all SAL-VET packages. Don't be deceived by imitations.

Don't buy "Sal" this or "Sal" that; get the original genuine SAL-VET.

PRICES 40 lbs., $2.25; 100 lbs., $5; 200 lbs., $9; 300 lbs., $13; 500 lbs., $21.12. No orders filled for less than 40 lbs. on this 60 day trial offer. Never sold in bulk; only in Trade-Marked Sal-Vet packages. Shipments for 60 days' trial are based on 1 lb. of Sal-Vet for each sheep or hog, and 4 lbs. for each horse or head of cattle, as near as we can come without breaking regular sized packages.

Purchase and Mixing of Fertilizers.

By SHELDON W. FUNK,
State Farm Adviser on Horticulture,
Berks Co., Pa.

The economical buying and intelligent use of commercial fertilizers is a subject that the ordinary farmer knows less about than almost any other on the farm. It is not a hard problem to solve, and yet it may mean the saving or losing of quite a large sum of money and disappointment in wasted effort in a very short period of time.

We know that in a complete fertilizer we buy the three elements of fertility; namely, nitrogen, phosphoric acid and potash; no others. Ordinarily these are the only three elements in our soils of which the available portion ever becomes exhausted. Instead of buying fertilizers according to the analysis, or the content of one or more of these elements, as they should always be bought, a great many farmers buy them according to the name or the price of the brand. For potatoes they buy what the manufacturers choose to call a "potato brand;" for corn, a "corn brand," regardless of what they contain. They are bought in this way, regardless of the fact that strictly speaking, there is no such thing as a potato fertilizer or a corn fertilizer. We have all observed that different soils, or even different fields in the same type of soil, require a different fertilizer to meet actual requirements.

Again, the content of a potato fertilizer, for instance, will depend almost altogether upon the firm which is manufacturing the goods. I know some firms that manufacture what they call a potato fertilizer that carries but 1 percent of ammonia, while others carry as much as 5 percent; both being labeled as a potato brand. These two brands have the same name but are entirely different, and the one will cost from $10 to $15 more than the other. The first brand would do fairly well for potatoes on some limestone soils, while the second brand would give too much top growth on the same soil. Change over onto an ironstone soil and results would likely be the reverse. So we can readily see that if we wish to buy fertilizers economically we must buy strictly by analysis and not by the brand name.

Naturally, the farmer is blamed for not buying these fertilizers according to analysis, but in my opinion much of the blame belongs to the manufacturer, who, if instead of putting six or eight different terms upon a sack of complete fertilizer would only put on the content of nitrogen, available phosphoric acid and actual potash, the only things which are found therein, many more farmers would be buying their goods entirely by analysis. Not only would the farmer be benefited by such a change but the manufacturer as well, because the farmers would secure better results and therefore would purchase a larger amount of material.

I have said that different soils as well as different crops require different fertilizers. Therefore no one can tell you the best fertilizer to be used for a particular crop on your soil unless he knows your soil conditions thoroly. Usually we know our soil better than any other person, so if we would use commercial fertilizers economically we must learn to buy the smallest amount of the different elements that will give us the largest returns for our money. To do this, will we send a sample of our soil away and have it analyzed? No, the plant does that for us. My plants tell me how much and what kind of fertilizers will enable them to make their finest growth; this is the best and only way in which we can settle that problem satisfactorily. In other words, we must experiment with different fertilizers on different crops, right on our own farm and until we do this we are working at a disadvantage.

PLOWING TOUGH SWAMP SOD ON MEADOW ISLAND FARMS, N. J. SEE ARTICLE PAGE 2.

We do not know as definitely as we would like the exact duties of each particular element, but we do know in a general way that nitrogen promotes wood and leaf growth. It gives to the plant that dark luxuriant green color which is always found in a healthy plant. Therefore if our trees or plants are not making a rapid growth and the leaves have a yellowish tint to them, we know that nitrogen is lacking. On the other hand, if we are getting too much wood and leaf growth, we must cut down on our nitrogen and increase the phosphoric acid and potash content of our soil. In the same way we have learned that phosphoric acid helps toward the building up of the seed or grain part of the plant; and when our soil produces great large corn stalks with small ears, an application of phosphoric acid usually gives a material increase in corn. The main duty of potash seems to be to give rigidity to the stalk, to make it stronger and better able to carry its load of fruit or grain.

PULLING HEAVY DOUBLE-ACTION DISC HARROW WITH TRACTOR
on Meadow Island Farms, Warren County, N. J.

Taken as a whole, the soils of Pennsylvania seem to be most deficient in phosphoric acid, while some of us are using more potash than is necessary. In my case I remember when we used 10 percent potash for potatoes. We gradually learned that 6 percent was sufficient, making a saving of about $4 per ton. Following this problem a little farther, we found that oftentimes we could not get the analysis we wished to have, because the manufacturers did not mix it. And then after investigating matters still farther we found that we could save a little money by mixing our own goods. The result was that in the first year, we mixed a fertilizer for $25 per ton that the manufacturer declared he would be losing money upon if he sold it under $39 per ton. Now I do not wish to convey the impression that you can save $14 on every ton, but I do believe that ordinarily you can make a very nice profit by home mixing, and make it during the winter months or on rainy days, when there is very little work to be done.

Many manufacturers have told me that I cannot mix the ingredients by hand nearly so well as they can with their improved machinery. I will not dispute that part, but I can mix them well enough for all practical purposes. The plant tells the tale with me every time, and so long as I can secure better and finer plants for less money, where I use my own mixed goods, just so long will I mix my own fertilizers. A great many farmers have an idea that mixing fertilizers is quite a problem. We find it is quite a simple operation. Any person who can do a little figuring will have no trouble.

The first thing necessary is to understand the different ingredients and what they carry. We have three different forms of nitrogen, representing the different stages of decay or availability. There is organic nitrogen, the kind we have in dried blood or tankage, which is neither soluble in water nor immediately available to the plant; nitrogen in the form of ammonia which is soluble but not immediately available, as sulphate of ammonia for instance; and nitrogen in the form of a nitrate, as nitrate of soda, which is both soluble and immediately available. Since nitrate of soda is supposed to last in the soil only about six weeks, where you are carrying more than [illegible] percent of nitrogen in your fertilizer it is always advisable to take at least ½ or 3-5 of it from the organic state and the remainder from the nitrate of soda. In this way your nitrogen is gradually becoming available thru the entire season. The best dried blood carries about 13 percent nitrogen; tankage from 5 percent to 8 percent of nitrogen and from 8 percent to 4 percent phosphoric acid, while nitrate of soda carries 15 percent nitrogen.

In choosing phosphatic materials we want the cheapest and best carrier of available phosphoric acid. This is usually the acid rock which analyzes 14 to 16 percent phosphoric acid, depending upon the grade you buy. Bone meal is an excellent source of phosphoric acid but is more expensive. Basic slag is also an excellent source and carries about 18 percent phosphoric acid and 35 percent of lime, but for general purposes I prefer the acid rock.

In potash, use the muriate for all crops excepting tobacco and sugar beets, where the sulphate is the better. Both forms carry about 50 percent actual potash. There are a great many other carriers that I might mention but these are the standard goods, also the most economical and will make a nice dry mixture.

If we wish to mix a fertilizer containing 4 percent of nitrogen, 9 percent of phosphoric acid and 6 percent of potash, we would use the following ingredients: To secure 4 percent nitrogen we would need 80 lbs in a ton. Taking ¼ of it from nitrate of soda and ¾ from dried blood we would have 133 pounds of nitrate of soda and 460 pounds of dried blood. (Oftentimes the term ammonia is used instead of nitrogen. The difference is that only about 4-5 of the ammonia is nitrogen, hence the above mixture would equal 5 percent ammonia.) A content of 9 percent of phosphoric acid would mean 180 pounds to the ton, or 1,125 pounds of 16 percent acid rock. Goods to carry 7 percent potash would require 140 pounds of actual potash to the ton, or 280 pounds of 50 percent muriate. Totaling these four ingredients we have 1998 pounds of fertilizer with no filler or make weight. On the other hand, if we were mixing a low grade material, as a 1-8-6 for instance, it would only contain 1,375 pounds of the same ingredients, and the fertilizer manufacturer would put in 625 pounds of make-weight, either in the form of sand or coal ashes or in the form of lower grade ingredients, to bring the weight up to a ton. This is not necessary when you home-mix, because if your mixture does not total a ton you simply apply less to the acre. However, in buying ready-mixed fertilizers you can readily see that it never pays to buy a low grade mixture. Far better, buy a high-grade fertilizer and apply less to the acre than pay freight together with the time and trouble of handling 500 or 600 pounds of material which does not benefit you a particle.

To mix your material, place the different ingredients in layers on top of each other, either on the barn floor or on a hard ground floor, (a little ground will do no harm). Let one man use a shovel and the other a rake, mixing it the same as you would concrete. Shovel and rake the pile about twice and run thru a sand screen to remove the lumps, after which you are ready to place it back into the bags. There are a few don'ts in the fertilizer business which it is well to remember as follows:

1. Don't mix lime or any carrier of lime with any material containing organic nitrogen or it will tend to drive off the nitrogen in the form of ammonia gas. For the same reason never mix lime or wood ashes with manure.

2. Don't mix lime or any carriers of lime with acid rock or it will change the available phosphoric acid to the insoluble state.

3. Don't take more than 1-3 of your material from what is known as the "salts" (nitrate of soda and muriate of potash) or your fertilizer will tend to become hard if allowed to stand for any length of time.

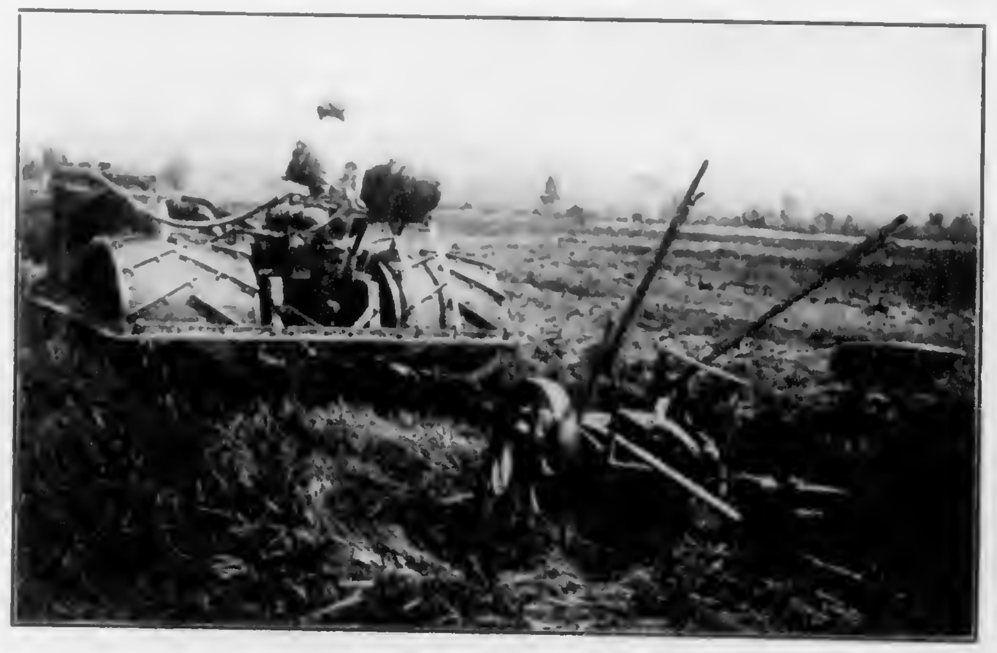
4. Don't use commercial fertilizers simply to increase next year's crops; but with the main idea of increasing the vegetable matter in your soil. Decaying vegetable matter, or humus, is after all the foundation of all agriculture, and when you and I have a sufficient amount of that humus stored up in our soils we will have no use for the commercial fertilizers.

Follow these instructions, buy your raw materials from the manufacturers, always according to analysis, pay cash and you will not only save money but you will gain a lot of practical knowledge along the line of commercial fertilizers.

Farming With Heavy Traction Power

By HARRY HUBBARD, Mgr. Meadow Island Farms, N. J.

Owing to high cost of labor and difficulty of obtaining same, many farmers are looking for machinery to take the place of the old method of using horses and drivers. This problem has been solved in part on the large level farms of the Central West by using tractors, either steam or gasoline. These outfits were all right where fields were large and regular in shape, but were not satisfactory for the man with a small irregularly shaped field, on a small farm. Owing to the demands of the man with the small farm for a tractor suitable for his use a number of companies have put small tractors on the market. The writer has used one of these tractors, the past year on a farm in Warren Co., N. J.



PLOWING WITH DEEP TILLING MACHINES.

Our tractor is unlike the usual type in that it has three large broad rollers in place of the narrow wheels generally used on tractors. It has a 3-cylinder, 2-cycle motor, water cooled, and is equipped with transmission and differential the same as many automobiles and motor trucks. It is rated at 30 horse power, developing 4 to 6 horse power at the draw, or 8 horse power under favorable conditions. It has three speeds forward and one reverse. I have not been in position to give this tractor a good trial under favorable conditions, but have tried it out well under unfavorable conditions as the work I have done was on low land, that had not been plowed for 15 to 20 years, and had grown up in willows and bogs. The tractor did not give any trouble under these conditions, but we could not get the plows that would work well in this tough, boggy sod.

From the work done under these conditions I am convinced that where land had been plowed and cultivated in the usual manner the tractor could plow 10 to 12 acres per day, at a cost of from 50 cents to 75 cents per acre, including the cost of one man at $2 per day and one man or boy at $1.50 per day. For disking and harrowing this tractor is ideal. The large broad rollers crush lumps or clods, leaving the surface smooth for disk or harrow. I have used our tractor to draw a large double-action harrow with 28 disks as shown in cut on page 1. I can draw this disk on plowed ground at the rate of 4 to 6 miles per hour, set at an angle that would tire 4 large horses in one-half day. I figure that the cost of disking is greatly reduced, and that the tractor has many advantages over horses as at that season it is generally warm and dusty and the usual number of horses can not do this heavy work fast enough to get crops in on time. With a tractor you can rush the work and when it is done you do not have extra idle horses to feed and care for. Heat and dust do not cause you to slow up with work with a tractor as it does with horses.

I have also used this tractor to remove large stones, and move small buildings from place to place. It is ideal for this work as you can go very slow or stop just where you wish to. While I have not used this tractor to draw grain drill, mower, binder, etc., it is my intention to do so the coming season. There is a large amount of bog muck land on this farm, from which I intend to remove the bogs with bog cutting machine drawn by the tractor. It is almost impossible to use horses on this soft land for this purpose.

As to cost of operation of tractor compared with horses, I have been able to do as much with our tractor as I could have done with four to six horses, and do it much cheaper. It does not take as many men, goes faster and the cost of oil and gasoline are not as great as feed for horses. On rainy days we do not have the six horses to feed. The tractor is very simple in operation and can be worked by any one who can handle other farm machinery or an automobile. Owing to broad rollers and low construction it is impossible to tip it over. I have used the tractor for the following purposes, for which I find it very satisfactory: Plowing with three-bottom plow, three furrows 14 inches each. Plowing with deep tilling machine. Disking with double action disks. Harrowing, pulling grubs, removing stones, as a land roller, hauling heavy logs and moving small buildings. I have also used it as stationary power for sawing wood, cutting stalks, etc. The repairs for tractor since purchased in July, 1913, have only been 50 cents, and these were for breakage caused by accident.

Farm Crop Notes

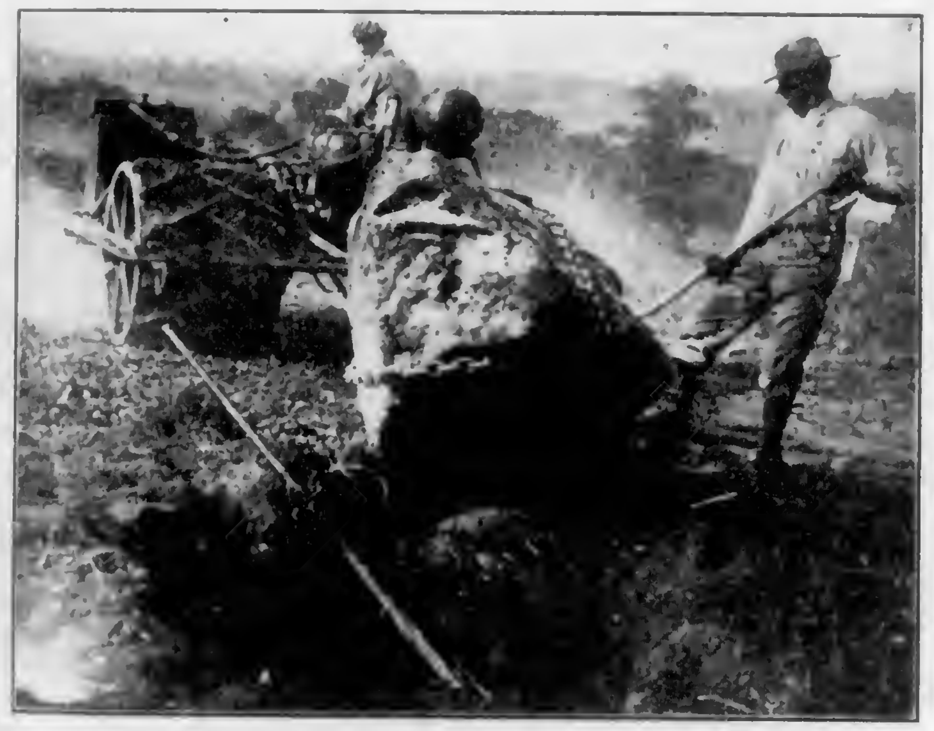
By R. P. KESTER
Counselor on Soils to the State Department of Agriculture.

Thru this department Mr. Kester will discuss queries from Pennsylvania Farmer readers on soils, field crops and general farm practice. Address all queries to Pennsylvania Farmer, Philadelphia, Pa.

NATURAL METHODS OF SOIL IMPROVEMENT.—II.

Tillage (Continued)

One operation in tillage, one which logically comes before plowing, is that of disking the sod. This is especially helpful if the sod is heavy or if the plowing is to be deep. When the sod is chopped up to the depth of three or four inches by a disk or cut-away harrow and turned over at the proper angle by the plow, the subsequent cultivation mixes the sod with the soil, increasing its water-holding capacity, and promoting a more rapid decay and a better distribution of organic nitrogen.



PULLING OUT HEAVY BOULDERS WITH FARM TRACTOR, MEADOW ISLAND FARMS, N. J.

After plowing, the next work of tilling is harrowing. Simple as this operation is, it is one that is too frequently ineffectually and improperly done. When the soil is in just the right condition for plowing, it is also in the best condition to harrow. Spring or summer plowing should be followed closely by the harrow. Evaporation is very rapid from the newly turned furrow during the hot windy days of spring and summer, and the soil is dried out, furrow deep, in a very short time unless the plowed ground is harrowed at once after plowing. It is usually safest to harrow after each half day's plowing. Land that has been plowed in fall or winter should be harrowed the first day that it is dry enough to harrow in the spring. By so doing we stop the rapid evaporation of the moisture—can it up, as it were—for use in a possible dry spell to come. Not only does harrowing as suggested help to retain moisture, but the soil pulverizes better and more easily at this time than is possible after it becomes dry and baked.

Soil must be well pulverized to be in best condition for plant growth. A little root can no more make use of a clod than it can make use of a stone. While air is necessary in the soil, large air spaces are detrimental to root development, and they necessarily exist when the soil is cloddy. Reducing clods and pulverizing the soil by rolling and rubbing is costly, and less effective than harrowing when the furrow is freshly turned, or, when fall plowed land is first dry enough.

Intensive cultivation is one means of increasing the solubility of plant food, hence, of increasing production. Cultivation has been called the "poor man's manure," altho it alone does not add anything to the soil. Only a small part of the land under cultivation recieves sufficient cultivation for best results. Inability to give it is frequently charged to lack of time and sufficient labor. This is probably true, but the wise thing would be to farm less acreage. A full crop from five acres is better and more satisfactory than a half a crop on ten acres. Under present conditions the average farm is twice too large to farm properly, yet the farmer feels that he must try to spread over all of it.

A little boy was once given a hen and privilege to set her. One day he came in and announced that he had set old Biddy. "That's good," said his mother, pleased that Johnny was taking an interest in it, "and how many eggs did you give her?" "I gave her thirty eggs," said Johnny. "Why, Johnny, she can't properly cover thirty eggs." "I know she can't,' said Johnny, "but I like to see the old fool spread herself."

The ideal seed-bed is well pulverized, firm beneath and loose on top. Frequent harrowing, and possibly rolling or rubbing is the way to produce it. He who plants a crop on loose, cloddy, poorly prepared soil, invites failure, no matter how much he may spend for fertilizer.

"How much cultivation should be given?" is frequently asked. I will answer it as a stone mason once answered me when I asked him how many stone to draw for a wall. "Haul until you think you have enough, and then haul as many more," he said.

I know of a crop of corn being raised on a poor, run-down field in the following way: No manure or fertilizer was used because none was available. The field was plowed in the fall, about 2 inches deeper than ever before. It was harrowed as soon as dry enough in the spring. It was harrowed seven times before planting and three times with a light spike tooth harrow after planting, and cultivated six times during the summer, making 16 times in all. The result was a good crop of corn on a field where a previous crop of corn, grown with the usual amount of cultivation, was not harvested because there was practically nothing to harvest.

Another incident in mind is that of a man beginning at fifty years of age with nothing and succeeding. He bought twenty-five acres of run-down land on time, built necessary buildings and went into fruit raising. Small fruits and tree fruits were raised. "Intensive cultivation" was his motto. Early and late, the season thru, you would see him out in the field with old Charley hitched to the harrow or cultivator. He grew fine fruit and berries, and died at the age of seventy-five, after developing and paying for a nice comfortable little home. But he had naturally two necessary qualifications; he loved nature and he was not afraid of work.

One thing should be noted in connection with this instance, this man's place would be in better shape today if he had, in connection with his intensive cultivation, sowed catch crops and cover crops to add humus and plant food, and prevent leaching and washing.

Cultivation should leave the ground as level as possible. For this purpose a demand should be made for a seven-tooth, one-horse cultivator instead of the implement with five teeth, now in general use. A two-horse sulky cultivator is better for having eight teeth than six teeth. The first harrowing is best done by a spring tooth harrow. After two or three harrowings with this implement, a light fifty or sixty-tooth harrow does good work.

Next week, water and soil moisture. —R. P. K.

BEWARE OF SECOND HAND POTATO SACKS

The Department of Agriculture has issued a special caution to potato growers against the use of any second-hand British or European potato sacks unless sacks have been thoroly sterilized since they have contained or come in contact with foreign potatoes. This warning is due to evidence thru recent inspections of the presence of a number of the most serious potato diseases among importations of that staple from Europe, including late blight, silver scurf, dry and soft rots, common and powdery scab. The germs of these diseases may be carried in the sacks.

Where Co-operation Pays.—The South Jersey Farmers' Exchange has given a practical demonstration of the business advantages of co-operative marketing of farm products and purchasing of farm supplies. The exchange has been operating for five years. Its capital is about $28,000. This last year it did a business of over $700,000, and has made a profit of 52 percent. Its stock shares have doubled in value; its members not only have received good prices for their products, but have bought their supplies of every sort rock bottom prices. The 600 men who make up its membership are prosperous and well-satisfied with their business.

Institute Work.—In spite of the severe weather lately there was less attendance at farmers' institutes than in 1912-1913 according to reports made to the division in charge. The early sessions were remarkably well attended and the snows have prevented a record attendance. Enough interest has been aroused to justify the request for an increase in appropriation which will permit of 50 to 75 more days and 20 additional movable school days.

Horticulture

CARE OF YOUNG TREES AND SHRUBS

One reason why there is little danger of an over-production of fruit, is that only part of the trees, vines, etc., that are planted, ever come into profitable bearing. Many plant trees, perhaps, in sod and then leave them, and some of the young trees either die or fail to develop well. When a young tree is planted in the spring it has to do two things to live, viz: make leaves with which to get the greater part of its food from the atmosphere; and new roots with which to get the smaller supply from the soil. In order that it may get such a start as will give it a chance to develop naturally and normally into a full grown tree with a large capacity for fruit bearing, it must have fine, rich, moist soil in close contact with its roots.

Naturally the tree in its efforts to live will put forth new roots that it may get food from the soil. Water is the medium thru which the plant gets its food from the soil, hence, the more abundant and constant the supply of water, the better the chance of the tree to live and grow. Cultivation or mulching are the methods by which moisture is conserved and either one of these methods should be systematically adhered to. It is for the grower to determine which of these methods he should use.

ORCHARD INTERCROPPED WITH CARROTS AND EGG-PLANTS EVERY YEAR UNTIL LAST, WHEN SHADE BECAME TOO DENSE.

Last spring I was able to prove the value of frequent cultivation and the dust mulch around newly planted trees. An order of flowering shrubs to make a larger border on our grounds was shipped so it came to me in a very dry time. After root and top pruning, I planted them in dry but finely pulverized soil, taking much pains to compact the soil very closely over the roots. One month of dry cold weather followed. I did not water the shrubs, but nearly every evening stirred the soil around them with the hoe, and in the morning I noticed damp soil around them showing that capillary attraction had brought up moisture to their roots, and cultivating the soil had temporarily sealed the capillary tubes. Every shrub lived and is growing finely. The same plan has been practiced in my young orchard with the same good results.

When it is practicable, as with the large orchard, or in the garden culture of trees, the benefits of cultivation are best obtained by some system of intercropping that necessitates frequent cultivation of the crop. The ground is gone over every few days with cultivator and hoes, so that it takes but little extra work to cultivate the soil close around the trees. There is no reason why profitable cultivated crops cannot be grown in young orchards for a few years after the orchards are planted so as to get nearly as large returns from it as if no trees were on the ground. In this way fertilizer applied to the crop, and the clean and thoro cultivation necessary to maintain it furnish just the right condition for the growth of the trees. The choice of the intercrop will depend on the use one can make of it. It can be potatoes, corn (sweet corn or low growing kinds are best), beans, cabbages, small fruits, etc., or even dwarf trees. I am growing strawberries in my young orchard because I have a local market for fine berries at a good price. When trees are planted in places where it is not convenient to cultivate them frequently the best way to make the young tree live and keep it growing is to mulch heavily around the tree when first planted, preferably with coarse manure. Afterward grass, weeds, refuse from the garden and farm, or whatever will retain moisture may be used and the decomposition of these materials furnish humus. I would prefer to have this mulch placed in a circle covering a space of 3 or 4 feet around the tree, but not quite close up to it, as the rain will better soak into the ground.

The leaf surface of a tree should be in proportion to the root growth. To preserve a balance between the leaf and the roots, the leaf surface of young trees should be enlarged gradually by right pruning. When the tree is planted the branches should be shortened perhaps one-third or more, and it may be well the first year to pinch off some of the leaves or sprouts on these when planning for a symmetrical, vase-shaped top. The second year still more shoots may be allowed to grow, keeping in mind a balance between the root and leaves and at the same time trying to establish a permanent head of the right shape. The more we cultivate the tree and conserve moisture for it, and promote root growth, the larger is the surface of foliage to be utilized by the tree, and consequently the more rapid will be its growth.

Ideally this culture of young trees by intercropping or mulching should be continued until they come into profitable bearing, and are beginning to occupy the spaces between the rows. Care should be taken to apply fertilizers to the cultivated crops that are suitable both to them and the trees. In this connection it might be said that there is a right use of such chemicals as nitrate of soda, and acid phosphates, and perhaps in some cases potash, but it is safer to depend on animal manures. With the practice I have outlined, the time for a fruit tree to come into bearing can be much shortened, and the fact that one may get nice fruit in 3 to 5 years should encourage one to plant trees and rightly care for them. —W. H. Jenkins, Delaware Co., N. Y.

A WOMAN'S VEGETABLE GARDEN

If women would only realize the value of fresh air and out-of-door exercise as a substitute for doctors and drugs, this old world would be more of a paradise. Onions are a wonderful panacea. Even the smell of onions is sleep producing and if eaten they are a tonic. I once heard a doctor say that if people would eat onions once a week they would have less need of a physician. Roasted onions applied on the outside of the neck have saved me doctor's bills in severe cases of quinsy. I came from my boarding place in the city so bowed down with ill health, I had no heart in anything, and if I should say which one crop was the best for a sick person to raise I would say onions. However, while raising onions one can raise many other vegetables.

The garden commences when the seed catalogs commence to come. The seeds are selected at this time. Do not buy the cheapest, but get the guaranteed seeds. When the ground is not frozen it is well to get some good rich dirt in the house; then the seeds for early vegetables may be planted in the house.

At the writer's home the box in which they are planted is placed on the heater in the cellar until the seeds break thru the dirt when they are taken from the cellar and placed in a sunny south window. When they are large enough they are transplanted to the cold frame and there they continue to grow until all danger of frost is over and they can be set out in the garden.

The garden should be cleared and made to look neat in the fall. All insect harboring vines or rubbish should be burned and the garden covered with a heavy coat of manure. The first thing in the spring the ground can be plowed. When the furrows are finished, with rake and hoe in hand a woman can find pleasant and profitable occupation. The dirt must be mellowed and raked smooth, and straight rows marked out. It is wise to make a plan of the garden on paper during the long winter evenings and plan just where you will plant different vegetables.

Peas are the first to be planted as they are not afraid of frost. The vines can be well up before the last snow has come and gone. The onion seed can and must be sown early to insure the plants maturing from seed, if it is desired to get them from seed rather than from sets. The time for planting lima beans must be watched with the utmost care. To one with little experience it seems all a lottery, but by careful observation from year to year, much may be learned. I have started several hills of lima beans in bottomless tin cans in the cold frame and as soon as all danger of frost is over they can be slipped out of the cans, if watered well before handling the earth, and when placed will not show they were moved. In that way we have our first mess of lima beans 10 days or 2 weeks earlier. We never tire of them from that time until frost comes and kills the vines in the autumn. When we have warning of frost we pull the vines and carry them to shelter and thus save the beans. The surplus beans from 7 rows (Fordhook Bush potato limas), 135 feet long, brought a profit of $12. The season of 1910 was the first season during which we raised all bush lima beans, and they proved so satisfactory that double the amount has been planted since.

The two rows of rhubarb are 135 feet long. It is heavily mulched in winter and we have the very earliest found out of doors. The surplus sold from these two rows has amounted to as high as $25 a season. After the first freeze in the fall, a few roots are dug up and carted to the heater cellar where the mild temperature causes the stalks to commence growth immediately. It is watered occasionally and in a few weeks the beautiful pink stalks spring up and we have rhubarb all winter. The darkness of the cellar prevents leaf growth and the stalks are far more beautiful than any grown in the field. It grows so quickly it is very tender and brittle.

Celery seed is sown very early and only given a slight covering of dirt and then a thin layer of salt hay. As soon as the seeds commence to sprout the hay is taken off. It is a great saving to raise your own plants and the surplus plants from the ounce of seed usually amounts to about ten dollars, selling at the rate of 25 cents a hundred. Celery is a second crop. The plants are set out where a crop of potatoes, onions, beets or early corn has been harvested. Aside from having delicious celery for the home table from the first of October to the last of March, about $50 worth is sold from the ten or twelve rows 150 feet long. One season $75 worth was sold.

Three 150 foot rows of parsley from one ounce of seed, garnished dishes for the home table, the neighbors' tables and brought in $3 per row from what was not given away. Four plantings of corn, two or three weeks apart, keep the home table supplied with boiling corn thru the season. Oh the joy of always having the tender, juicy ears plucked from your own raising!

How eagerly we await the ripening of the earliest variety of strawberries. With an early and late variety we make the strawberry season as long drawn out as possible. Following the strawberries come a few rows of blackberries and raspberries. When the snow was falling in January we were still picking from our last year's garden, celery, salsify, brussels sprouts, spinach, turnips and parsley, as they are all cold weather crops.

We have less than an acre counting house and barn, flower garden and vegetable garden. There is one large apple tree which is a treasure. When the wind blew it down we had it pulled up and braced, so that it went on bearing fruit. We never sell any apples. When there is a surplus we have them made into cider, and thus we have our own vinegar. We do not wish to shade the land with big trees, so we planted a dozen dwarf pear and apple trees. Each year I can 250 quart cans of fruit and vegetables and 100 cans of tomatoes from our surplus.

By a little extra care we have the very earliest tomatoes, the plants being in blossom when they are taken from the cold-frames, and we have fresh tomatoes for the table until after New Years.

Our chicken yard is limited in space, as it would not be wise to allow the chickens the liberty of the garden. The little flock does good work when eggs are 50 cents a dozen, but we do not sell any that we can use in the home. We intend to install the Skinner Irrigation system to regulate the rainfall and add materially to the freshness, the profit and the productiveness of the soil.—Cora J. Sheppard, Cumberland Co., N. J.

TOMATO CULTURE

WITH an International Harvester disk harrow the ground is so prepared that it stores away and holds the moisture from snow and early rains, liberating it to the roots of your growing crops at the time when they need it most.

International Harvester disk harrows are built to do this work as it should be done. They are strong enough to stand up under meadow slicing and tilling hard ground. The disks are of steel that keeps an edge. The bearings are as nearly dust and dirt proof as disk bearings can be built.

The full line includes every style of disk and smoothing harrow and the best line of drills and cultivators built. See the I H C local dealer for full information about the line, or send to us for catalogues.

"The Disk Harrow," a book which illustrates and explains the proper preparation of a seed bed, and gives examples of the value of disking — 32 pages of valuable information — is yours for four cents to cover postage and packing. Write for it.

UP-KEEP AND NOT FIRST COST DETERMINES THE ECONOMY
of any farm improvement which is built for continued use. A seeming saving in first cost may be entirely wiped out in up-keep expense within a few years and the improvement then becomes an item of expense instead of one of economy.
DEXTER PORTLAND CEMENT
enables every farmer to build improvements that are good for all time at a low first cost and with up-keep expense eliminated. Barns and other outbuildings, silos, cisterns, water-tanks, foundations, walks, fence posts are only a few of the many farm uses for good cement. Your dealer has Dexter Portland Cement or can get it for you if you insist on having the best.

ALLENS BOOK OF BERRIES 1914

the most favorable soil conditions; that is if it is not impoverished by excessive cropping and insufficient feeding. That they can be successfully grown upon such soil, but with indifferent success upon gravel, wet clayey soils or after sod, we know by experience. To prepare the land for tomatoes, it is well to give it a broadcasting of well-rotted manure, plowing this under and harrowing the surface fine and smooth. The field is then marked off with a furrowing sled set for a distance of four feet between furrows in one direction over the field and four and one-half feet between the intersecting furrows. This give hills at convenient distance for growth and cultivation. A handful of some good fertilizer in the hill gives better results than a shovelful of manure. This formula recommended by the New Jersey Agricultural Experiment Station worked successfully with tomatoes on loamy soil:

150 pounds of Nitrate of Soda.
100 pounds of Muriate of Potash.
150 pounds of Dried Blood.
600 pounds of Acid Phosphate.

Here is a good one for late tomatoes:

150 pounds of Nitrate of Soda.
250 pounds of Bone Tankage.
300 pounds of Acid Phosphate.
300 pounds of Muriate of Potash.

For the early tomatoes more potash than is recommended in the first formula given, gives better yield.

The plants to be set for early bearing should be planted by May 10th. They should be stocky and vigorous and from six to eight inches tall in the bed or greenhouse where they were grown. In this locality, hot-house or hot-bed grown plants may be had in boxes for fifteen dollars per thousand.

They should be handled quickly and in cloudy or moist weather, if possible, and set an inch or an inch and a half lower in the hills than they were in the beds.

It facilitates the work very much to have the furrows in one direction opened with a one-horse plow, a man following and dropping a handful of the fertilizer in each hill or point of intersection with the cross-furrow. Behind these goes the planter who with his short-handled hoe or other tool quickly covers the fertilizer, sets the plant above it and draws the soil about it, firmly pressing the earth about its roots.

As soon as the plants are set cultivation should begin, to stir up the soil where the tramping of the planters has packed it, continuing once a week until the vines are too large and spreading to allow the cultivator to pass readily between them. Disturbing the feeding roots with the cultivator may mean great loss in yield after the plants have reached this size. A mere surface scratching with a straight-toothed cultivator set very shallow is safest.

After the plants have been out about a month—say about June 10th—an application of nitrate of soda, using a handful to every three plants will be found very helpful. It is applied on the surface near the plant but not touching it. Occasional hoeings are necessary about the hills to remove weeds care being taken not to cut into the hill.

A sufficient quantity of the above-mentioned fertilizer applied in the hill will cost in the neighborhood of $19 and the later application of nitrate of soda will cost about $10 per acre.

Tomatoes for late bearing should be set from June 10th to June 25th. Small plants set out about June 10th give better results than large plants set as late as June 25th.—M. Robert Conover, Monmouth Co., N. J.

THIS YEAR'S CARE AND NEXT YEAR'S ASPARAGUS CROP

During the cutting season, the asparagus root has been continuously taxed, the early shoots forced up by the plant for its own use having been taken. All this the plant must regain during an unmolested growing season following the period of cutting. Such is the redundancy of the asparagus plant that it will do this and in addition, add to its root stock, so that more yield may be expected of the bed each ensuing year if the cutting period is not unduly prolonged.

Because uninterrupted growth during late summer is vital, the processes of fertilizing, cultivating, etc., must be carried on regularly. If a good fertilizer is applied when the ridged bed is plowed down, the roots will get it in short order and the regular cultivation will insure its even distribution.

As soon as the spears come up after plowing off, cultivation should begin, using either a one-horse or two-horse cultivator. This cultivation should continue regularly so that the surface of the ground is at all times mealy and loose.

As the season advances, it will be necessary to throw toward the plants a furrow of earth and still later another. This serves as a support, helping to keep the top erect as the tops spread and sag and winds wave the stalks back and forth, straining at the roots. Stalks supported thus are less likely to be injured by the passing of the horse and cultivator.

During this period the rootstocks are adding to their bulk by prolonging the main root. When this addition is well under way, up comes a sprout from close to the older portion. This sprout partly supported by the old and new growth and working to promote the growth of the new, is the visible sign of advance, a proof of new root formation and the means of its continuance.

Over a bed of asparagus in full feathery foliage, this new growth can be noted by its contrast of lighter green color. This new growth occurs in successive periods as the general conditions of cultivation, fertilization, moisture and warmth, favor its development.—M. R. C., Monmouth Co., N. J.

MANURE FOR YOUNG PEACH TREES

We have a peach orchard consisting of 240 trees, some of which have been producing fruit for 20 years. Most of these trees have been planted in the last few years. We practice clean cultivation, also spray yearly with home boiled lime-sulphur. We have never used fertilizer, except barnyard manure, which we use yearly. The trees are the picture of health, and are doing finely, yet we have been told manure will injure the trees and cause them to die sooner or later. Please let us have your opinion.—J. S. C., Brick Church, Pa.

I do not agree with the theorists who say that barnyard manure will injure trees of any kind. I own large orchards in Pennsylvania, some of which have been producing commercially for 7 years. I have not yet seen any evil results of barnyard manure judiciously applied. I use it on all fruit trees when needed and when I can get it. Two important points must be remembered concerning its use: One is that if the trees are growing rankly it should be discontinued, as they do not need it; and the other is that where there is blight prevalent apple, pear and quince trees are more liable to be blighted with fire blight, black blight or pear blight, when manure is used around them than when they are not manured. These are the only two conditions of injury from this source that I see. Also manure may be applied so late in the summer as to induce new growth that may freeze easily. If the trees have not grown sufficiently rapidly nothing better can be done for them than to manure them. Of course, under such circumstances cultivation is also beneficial, but much depends upon your method of orcharding. Good sod mulch combined with manure is excellent for apple trees, while cultivation is probably best for stone fruits. I can recommend manure on peach trees where the growth is not already too rank. I do not use it nor recommend it on any kind of trees where the soil is especially fertile or damp and the growth is rank.—H. A. Surface.

FARMING LIKE MANUFACTURING

In many ways, farming is similar to manufacturing. The farmer has a "plant"—his farm—and he may operate it to make a dividend, or permit the overhead expense to eat up all the profit. He may waste part of his material, or he may utilize it. He may get full value out of his animals and his fields, or he may get only part of what they should produce. The manufacturer succeeds best when he plans his work, uses machinery and sells a completely finished product just as the farmer succeeds best who does the same. The advertisements in the Pennsylvania Farmer will help you farm better, if you make use of them. Many things are offered that will make your work more profitable.

"For the land's sake, use Bowker's Fertilizers; they enrich the earth and those who till it."—Adv.

Does the Fertilizer You Buy Enrich Your Soil for Future Use?

If it does not, you are not buying the right kind of fertilizer. READING BONE FERTILIZERS, being made up from ANIMAL BONE, BLOOD and TANKAGE, not only nourish the crop to which they are applied but enrich the soil for future use and bring the farm on which they are used up to a high degree of fertility. This is the reason why constant users of Reading Bone Fertilizers grow prize winning crops.

500 Bushels of Potatoes
100 Bushels of Oats, and
160 Bushels of Corn

to the acre were grown by users of Reading Bone Fertilizers. Made up by a Company composed of ONE HUNDRED GOOD PENNSYLVANIA GERMAN FARMERS.

In justice to yourself and your family it is your duty to buy the best fertilizer and it will pay you to buy Reading Bone goods. THE PROFIT ON THE FARM IS IN THE SURPLUS BUSHELS.

READING BONE FERTILIZER CO., READING, PA.

"Cow Efficiency"

Measured by the Cow Testing Association.

By DAVE K. SLOAN, Canton Farm Bureau, Bradford Co., Pa.

Records of milk and butter production of various individuals of the dairy breeds show that 1,000 pounds of butter per cow per year is no longer considered an impossibility; but merely an increased efficiency of the dairy cow. It is readily granted that methods applied to reach the 1,000-pound mark would not apply to the vast multitude of commercial producers that are feeding the world this very essential commodity. However, the commercial producer, better known as the average farmer, will eventually feel the result of this increased efficiency. The offspring from record cows will be available as a nucleus of better seed to increase the profit of their grade or purebred herds. For this reason it is indeed essential that the dairymen keep sight of these high butter marks and take advantage of any of that blood from which he might produce a more efficient cow. A world's record breaker was not produced in one year in an off-handed manner. She is the ultimate result of untiring effort along the lines of "Production Records and Pedigrees," blended with wise herdsmanship.

MAGGIE CONCORDIA 110514. HOLSTEIN COW

Owned by H. C. Gates, Bradford Co., Pa. Produced 96.1 lbs. butter in one month and leads the Association to date.

The above feature, namely "production records," has indeed a very significant place for detecting the powers that make possible these records, as conformation and pedigrees alone do not offer a sufficient clue. The co-operative cow-testing association is the organization that gives the dairyman this information in the best form and at the least cost. Doubtless the association accomplishes the most by pointing out the cows in the herd that are being kept at a loss, but it also possesses other features of equal importance.

Many members of the Western Bradford County Cow Testing Association actually knew that they had no boarder cows, but still realized that there was a great variation even among their profitable ones. In order to increase the efficiency of their herd they are desirous of retaining only the most profitable individuals as "seed" for the "coming generation." Why do they demand this increased efficiency? Simply because they well realize that the dairy business is subject to changes in policy, markets, methods, etc., and in order to meet these changes, the cow that was once profitable, now should be disposed of for beef.

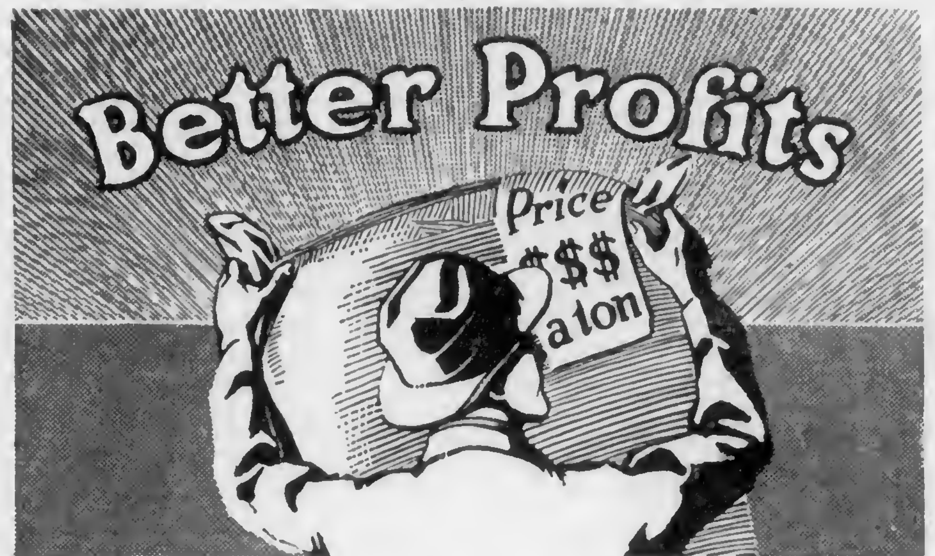
Even tho the table submitted shows cows of equal age and calving period, it points out conclusively that animals have a wide range in efficiency for profitable production. The careful study of the record book which each member possesses often reveals the fact that cows have not the same ability to utilize even more food at a profit.

	Cost of feed	Profit above feed
Cow number 1	...$3.63	$8.00
Cow number 2	... 4.65	9.12
Cow number 3	... 8.23	10.25
Cow number 4	...11.12	4.93
Cow number 5	... 6.46	5.34
Cow number 6	... 8.42	14.86

The past success in dairying was due to the great amount of rough lands used as pasture. Pastures fed the cow from the time she freshened in April or May until she gradually dried off in December and was wintered on rough feed to await her calving time the next spring. Such methods did not demand high-priced feeds and barn equipment. As it now is, the pasture method is not sufficiently complete to give the necessary profit, and the farmer is compelled to supplement his past methods with better cows and other feeds. This fact makes permanent the profitable use of corn silage and concentrated grains for the winter as well as the summer. Winter dairying not only obtains better prices for the products, but offers better distribution of farm labor and affords a more systematic handling of the manure which is a very essential part of permanent fertility.

The Western Bradford County Cow Testing Association started work July 15, 1913, with 33 members as owners of 600 cows. The price charged for testing was at the rate of one dollar per cow per year, which practically finances the association. In addition to this, several minor contributions have been received which have made possible the low rates. This number of cows in so many herds has demanded very thoro and competent work on the part of the tester. That position in any association is one of very much importance as the tester in a great way directs the work of an association. He surely must have an intensely flexible dsposition in order to agreeably fit into the thirty-three homes he visits each month. In this respect this association has been very fortunate in its relations.

This association is strung out over a section of the county about fifteen miles long and about four to six miles wide and covers a very intense part of the dairy industry of the county. The present plan is to reorganize next year with not more than 500 cows in not more than 28 herds. This plan will of course demand a higher price per cow. In connection with the association there is published each month a list of all those cows that have produced 40 pounds or more of butter fat. This roll of honor is a stimulus for better methods and better cows, and serves as a quick classification for the interested observer and dairyman. For the past seven months there have been from 25 to 42 cows each month that merited such classification.



Look Beyond the Price!

Lowest priced does not always mean cheapest. Don't you know the real cost depends upon results obtained?

Is a horse cheap that can't work? Is a tree cheap that bears poor fruit? Is seed cheap that produces a small yield?

Some things are "dear at any price." When it comes to feed for your cows, the saving of a few cents on a bag may lose you three times as much in the value of milk produced. Look beyond the price tag. You feed your cows to get more milk and lots of it, and if the cheap feed does not produce the milk it's a dear feed.

Larro-feed

is one of the highest-priced dairy feeds made, yet it's the *cheapest* for you, because Larro-feed will more than pay, in increased milk flow, the extra price over any other you can buy or mix yourself.

It will cost you, on an average, 20 cents per bag more than other feeds. That means 2 cents a day per cow if you use 10 lbs. daily One additional pint of milk per day is all you need to make up that difference.

Cut out the "too high-priced talk." Small feed bills often mean small milk checks. *Profits* are what count—and we guarantee better profits from Larro-feed than from any other feed you can use.

If you believe in spending an extra dollar to get back two, you'll say "Larro-feed" to your dealer today, or write us direct.

The Larrowe Milling Co., 634 Gillespie Building, DETROIT, MICH.

Makers of Larro-feed

LIVERPOOL SALE & PEDIGREE CO.'S
FOURTH CONSIGNMENT SALE
180 - HEAD - 180
SYRACUSE, N. Y.
April 14-15, 1914

From the entries received, it is certain, that this will be the BEST SALE OF THE SEASON. All sound animals of very superior breeding. Animals that will improve any herd. All tuberculin tested.

Some of the best breeders in the country are sending their "GOOD ONES" to this sale. Plan to attend.

LIVERPOOL SALE & PEDIGREE CO. Liverpool, N. Y.

Improvement of Permanent Pastures.---No. III.

By JOHN H. REISNER, Cornell University.

Reseeding Pastures

Reseeding will prove a profitable practice, especially where the sod is thin or where different plants are desired in the pasture. The investment per acre should not be large and care should be taken in the seed or the mixture of seeds to be sown. The conditions calling for partial reseeding would probably be such as to demand pasturage for the same season and clovers would be introduced for quick results and the other grasses would mature more slowly, such as timothy, blue grass and the fescues. Mixtures and their relative values will be taken up in detail later on. Our chief consideration is that this is a practically sure method of improvement, other conditions being favorable, and can be applied to almost every class of pasture land when needed. This practice would call for the seeds being sown in some cases in the early fall if the land were not grazed and the winter not too severe for the grasses to be planted. More often it would need to be done in the early spring when the seed would be broadcasted on the open ground before it had compacted after the last thawing of the soil. It can also be practiced after cultivation, either surface or deep, a consideration of which will now be taken up.

BROWN PET, GRADE JERSEY

Owned by M. A. Taylor, Bradford Co., Pa. Produced over 40 Pounds of Butterfat for several months, and is second in production in the Association with 85.6 pounds butter in one month.

Cultivation

The last method of improvement to be considered is cultivation, both shallow or surface, and deep. Surface and shallow cultivation can be followed by partial reseeding. Deep cultivation would be followed preferably by a cultivated crop and then reseeding with or without the use of a nurse crop. The type of cultivation would be determined by the conditions of growth in the pasture and by the topography of the land. Shallow cultivation lends itself fairly well to nearly all lands. The steeper slopes, where cultivated crops can not be grown on account of washing and the land too rough for extensive crops that must be harvested with machinery, can be cultivated without danger of injury from washing, with spike tooth or disk harrows.

Lands of the above types should usually be reseeded at time of cultivation. If the lands are so rough as not to permit the use of farm machinery, the seed can be worked into the ground by the use of brush harrows. Further, our best pasture lands can be improved in the same way. Often on these reseeding may not be necessary or advisable. The effects of shallow cultivation are first that it breaks up the "sod-bound" condition often observed in our better located pastures where the soil is heavy; second, it allows aeration and betters the physical condition of the soil; third, it distributes the droppings of the cattle; fourth, it decreases run-off of rainfall and increases the catch of rainfall; fifth, it affords a seed bed for seeding and more favorable conditions of growth for the new plants.

When reseeding, shallow cultivation, cutting down weeds, addition of soil fertility and other methods fail, the pasture may be plowed up and planted to a cultivated crop which is corn, by preference. Before plowing, if it is available, a heavy application of manure is desirable. An application of lime some time early in the period of cultivation should be made. The corn should be cultivated thoroly not so much on account of the yield, but on account of its effect on the soil and to make sure that the weeds have all been killed—a second or even third cultivated crop may be necessary. The methods of reseeding must largely be determined by local practice. Whether or not a nurse crop is to be used at all or what the nurse crop is to be, must be decided by the owner. We should not forget, however, whatever the local practice may be, that reseeding should not occur until the weeds had been all destroyed, the soil put in good tilth and in as high a state of fertility as possible, and that a fine firm seed bed is desirable on most soils. However, clay seed beds require a rough surface and more seed sown. Where the pasture is to stay down for a long time, the soil good and a good mixture of grass seeds is to be used, and climate and soil conditions permit fall planting, the nurse crop may be advantageously omitted.

Successful Holstein Sale.—The Liverpool Sale and Pedigree Company at a sale at Syracuse, March 10, sold 214 head of Holsteins for a total of $62,455, or an average of $292 per head. J. A. Miller, of Nazareth, Pa., paid the record price of the sale in the purchase of the cow Springdale Ononis Vale for $1,750.

DAIRY CATTLE

HOLSTEINS

Three grandsons of King of the Pontiacs, one year old and ready for service. Individuality the very best. One is dark, two light colored. Sire is a son of King of the Pontiacs from a 25-lb. three-year-old, her dam a 22-lb daughter of Hengerveld De Kol and full sister to the dam of our 37-lb cow. Dams of these bulls all have official records and splendid backing.—Must be sold before February 23rd.

HOGGING DOWN CORN

The Pennsylvania State College is now preparing a bulletin from some very interesting data collected in a recent experiment on "hogging down" corn. This subject is one in which very widespread interest is shown. It has been the basis of much discussion. A few years ago, "hogging down," or the turning of pigs into the field to harvest their own grain, was considered bad farm practice. The best farmers looked upon the system as slovenly and wasteful. Today opinion is changed, and in some localities this method is much approved. In the corn belt "hogging down" is recommended as the most economical way in which to produce pork. However, conditions in the East and West vary materially. What our farmers wish to know is whether the system will or will not be practical for them. The results of the experiment have answered this question.

From a standpoint of economy, the animals under the "hogging down" system required less labor than those fed by ordinary methods. They showed better thrift and higher condition than those fed dry grain. At the end of 10 weeks the hogs fed in the corn field showed an increase in weight which was 20 percent greater than that of the dry-lot animals. The gain was also made more economically. By "hogging down," a gain of 12.3 pounds to each bushel of corn fed was made, while an equal amount given as grain produced 11.6 pounds. At the close of the experiment the field had been well harvested, with but little loss. The fertility of the land was of a higher degree than under ordinary methods of harvesting, for unconsumed leaves and stems, as well as the droppings, had been returned to the soil. The system was best for the man, for the hog, and for the land.

In order to obtain the best results from this practice, a few fundamentals must be observed. To avoid a sudden change of diet, small quantities of new corn are first fed for several days. The hogs are then turned into the field just as the corn is beginning to dent, and they are left there except in wet weather. The area should not be larger than they can eat down in three weeks, or grain will be wasted. An acre yielding 60 bushels will keep twenty 125-pound pigs for such a period. In order to obtain a balanced ration, it is well to sow cow-peas or soy-beans in the corn at the last cultivation. The fattened animals should be sold as soon as they are taken from the field for they may lose weight when put on a new diet.—Rush P. Marshal, State College, Pa.

Raised on a Lancaster County Farm.

"MAD STAGGERS" IN HORSES

The Department of Agriculture at Washington has called my attention to a serious disease which has caused the death of a great many horses in our country which, with a little care, could easily have been avoided. Technically, this disease is the Cerebro-spinal Meningitis. It is commonly called "head disease," "mad staggers," etc. The symptoms are a muscular twitching of the neck and flanks, grinding of the teeth and colicy pains. If permitted the animal will walk at random, sometimes in a circle and will try to push thru any obstacle with which he comes in contact. If in the stable he will press his head against the stall or rest it on the manger. The second or third day he will lie down and will not get up. Sometimes he is practically paralyzed, and, at other times, his legs make the motion of trotting or pacing. The death rate is very high. Very little can be done to cure the animal. There are many patent medicines on the market, few of which are effective. The main thing is to clean the digestive tract thoroly. If necessary, use calomel, and, of course, give the animal good care, such as blanketing, etc. The disease is not contagious.

This is one of the diseases where prevention is the key to success rather than the cure. It seems to be caused by the eating of fungus on the fodder. It is likely to occur where the horses have been allowed to eat hay that is a bit mouldy. One or two instances have been brought to my attention where it has been caused by a damp manger and the moulding of the food which has dropped thru or laid in the corners of a poorly constructed manger. The horses seem to have an appetite for this form of fungus and will go to considerable inconvenience to lick it out of the corners of the manger or from the dark places underneath the manger. It has also been caused by wet spots in the pasture field where fungus has accumulated upon the grass in the vicinity.

The loss of our horses from this is so great that we must give it serious consideration. Look out for the leak in the roof which may cause moulding of the hay. Make sure that the stables are dry and that feed does not accumulate in any part of the manger or under the manger, and that the supply of water is reasonably pure. In case there is more than one animal with this disease you may rest assured that it did not pass from one animal to another, but came from the same source. Attention should be given immediately to the feed that the horses get.—Prof. F. R. Stevens, in L. V. R. R. Circular.

How I Envy Man.

TAKE OFF THE HORSE'S COAT ALSO

Do you go at the spring work with your overcoat on? Of course you don't—Coats are a burden—you even roll up your shirt sleeves. Then how can you expect the horses to show proper energy under the hot sun with the same heavy coats on that they have worn all winter and which hold the wet sweat and dirt? Clip them before the work begins with a

Stewart Ball-Bearing Clipping Machine

They will get all the nourishment from their feed—be healthier and look better. They will dry off quickly, be more easily cleaned and feel better generally—that means work better. The Stewart Machine is not an expense—but a highly profitable investment. It turns easily, does more and closer work than any other machine—can't get out of order. Gears all file hard and cut from solid steel bar—protected and run in oil. Includes 6 feet new style easy running flexible shaft and celebrated Stewart's Single-Tension Clipping Head. The only machine that can be used without change for horses, mules and cows. You can make money clipping your neighbors' horses while yours will do better work. Each machine guaranteed. If it doesn't give perfect satisfaction, return it and get your money back. Complete from your dealer at $7.50 If he can't supply you send $2 and and we will ship one C.O.D. for balance.

Get More Wool from your sheep, longer, better wool that will bring you from 15c to 20c more from each sheep. Your flock will feel better and look better also. The

Stewart No. 9 Ball Bearing Shearing Machine

will more than pay for itself the first season. Any boy can run it all day without tiring. All joints ball bearing with ball bearing shearing head. The equipment includes four sets of knives fully guaranteed. Price . . $11.50 If your dealer hasn't it, send $2.00 and pay balance C. O. D.

Building Up Fertility

Development and maintenance of soil fertility is every farmer's problem. Much is being said and written in condemnation of wastefulness of soil fertility on American farms. Men with pet theories and others with little or no knowledge of practical methods are continually harping on the need of more efficient conservation of fertility. They forget or never recognized the fact that the farmer's first duty as, indeed, his first necessity, it to make a living for himself and family. We believe that the farmer who is not operating his farm today with a view to maintaining if not gradually increasing the productivity of his soil is a rare exception. Certain it is that the farmers as a class are giving far greater attention to such conservation than are those who are annually decreasing the supply of other natural resources, such as lumber, coal, oil, minerals, etc. But farmers are from necessity making slow progress, as they are working with restricted capital and always with the necessity of taking from their soil enough to provide a living. Again, they are working with natural laws whose returns come slowly; too slowly for many people to maintain patience and interest. Much of the scientific teaching on this point has tended to discourage rather than assist the great mass of farmers. The soil building program that calls for heavy applications of stable or commercial manures, returns of heavy soiling and cover crops to the soil, purchase of quantities of lime, etc., is all right for the man who can afford it, and will bring quicker results where practiced, but it is out of reach of many of the men who need building-up methods. The series of articles now running in our Farm Crop Notes department discuss natural methods, and take up the development measures which are available to all farmers. They give hints on better ways of doing the ordinary operations in crop production and outline methods of securing full production and still leave the soil in a little better condition for succeeding crops. The natural methods will not give results as quickly as will the more extravagant systems, but they are sure and are within the reach of the actual, practising "shirt-sleeve" farmers; the class that produces the great bulk of our food products and that has in its charge the care of the great bulk of our farm lands.

Farm Independence

We all hear much about the trials and tribulations of the farmer. Admitting that the life of the tiller of the soil has its drawbacks, we must not lose sight of the fact that all vocations are more or less hedged in and have their limitations. It is often argued that the farmer's income is an uncertainty and dependent upon so many uncontrollable factors. The city man on a salary does have the advantage of knowing just what he may depend upon from month to month, but he is fortunate, if under present living conditions and the cost of foodstuffs and other commodities he can make his pocketbook fit his needs. With the farmer there is always a certainty of a livelihood. Commenting on this point a recent bulletin of the Department of Agriculture has the following to say: "The uncertainty of the farmer's cash income, however, is more than offset by the certainty of a livelihood and the sense of permanent security afforded by ownership or a long-term lease of the farm and equipment, and the fact that he is his own employer and does not have to make cash payments at frequent intervals for his house rent, water, fuel, and a large part of the food of his family which are supplied by the farm." Few occupations offer the independence enjoyed by the farmer. He is his own boss, and is responsible to no one but himself. His is the normal life, lived as it is, so much in the open. He enjoys the fruits of his own labors as few others are permitted to do and at the end of a season's toil the sense of achievement, of "something accomplished, something done" brings with it also the true joy of life. Such is the satisfaction accruing from earnest, constructive labor. The farmer's life is far from being a bed of roses, but it has its share of the compensations of life.

Cattle Feeding

Because of the increasing interest in cattle feeding in the East the first cattle feeders' convention, to be held at the Pennsylvania State College, April 3, should have the hearty support and co-operation of the farmers of the state. The primary object of this convention is to foster interest and give instruction in profitable feeding of beef cattle. The sixty head of steers which have been on feed in Station experiments during the winter will be on exhibition for purposes of study and comparison. The authorities in charge will explain methods of feeding and present data on costs, gains and profits, and an experienced cattle buyer will appraise the various lots according to market value. Thus the visitors will be able to gather all of the desired information on the season's feeding in one brief day. The experimental feeding has been done with the specific view to determining methods nd rations most economical under the prevailing conditions of this state and section. The lessons will be of vital interest to every cattle feeder of the East. It has been shown repeatedly that profits in feeding depend upon type of cattle selected, cost and value of feed consumed, the compounding of rations from which the cheapest pound of gain can be produced, proper housing and following with hogs to consume waste products. All of these points will be demonstrated at the coming convention. Mastery of these points means more and better cattle, greater profits on more animals to be turned off at present high prices. These prices, which are practically certain to increase in coming years, make beef production on a small scale, at least, attractive to eastern farmers. The feeders convention should prove a very helpful factor in directing increased attention to this branch of farm work.

Farm Accounting

If farming is to be based upon the broad business principles characteristic of every other successful industry it is necessary that the farmer know how much he is making or losing on his business each year; how much he is making or losing on each crop or class of animals, and how he can improve his business so as to make more money. To this end he should keep a set of farm cost accounts. It is possible that some farmers are desirous of keeping accounts of this sort but do not know how. For any such Bulletin No. 572 of the Department of Agriculture may solve a problem. While farm cost accounting naturally involves many estimates, this should not discourage the starting and continuance of the book keeping incident to cost records. It is not expected that these records can be absolutely exact. The systems of accounts used by large corporations involve as many estimates as would a simple system of farm accounts and the former do not give any more accurate results than do the latter. An easy system outlined by the bulletin referred to involves, according to answers on time estimates received from farmers who have used it, anywhere from 2 to 10 minutes, with an average of about five minutes, for the daily entries. To this is added also the number of hours of work at the end of the year to balance the accounts. With a plan free from complexity, no bookkeeping knowledge is necessary. Farm accounts should start on the ordinary farm some time after the last crop is harvested in the fall and before the first crop preparations are started in the spring. The exact date must be a matter of judgment and will depend principally upon the type of farming practiced. Whatever the plan used, it should be simple, quick and as complete as is consistent with ease of handling.

STATE CAPITAL NEWS

Medical Inspection.—Medical inspection of children of fourth class districts in the State is nearly completed and shows that over 400,000 children have been looked over and the condition of their eyes, ears, noses and teeth noted. About 1800 districts out of 2200 on the list have been inspected this year. When the state began medical inspection, which is optional in third and fourth class districts there was more or less objection because the scope was not understood, less than 400 districts being covered the first year. Results were so beneficial that the following year 1200 districts were covered. The manner of following up inspections is aiding the work. When a child is examined a report is made and a copy given to parents and teacher. Often the state supplies all the medical advice needed and the parent given a report on just what the child requires. Over 2,000 districts should be covered next year.

Orchard Work.—The State Zoologist hopes to have orchard demonstration work for the week of March 30 conducted in fifteen counties and in twenty the following week. The work was started this week in southern counties, some of the northern and mountain counties being included in the first list. Demands for inspectors are expected to be large. When demonstration periods are ended inspectors will give advice on methods of cultivating. They will also aid in building up the proposed index of all state orchards. About 2,100 orchards will be under the direct supervision of the State's field men during the year.

Grade Crossings.—Scores of grade crossings in rural districts of the State are being investigated by the Public Service Commission so that proper consideration may be given their regulation in rules to be issued by the commission. Many grade crossings in cities and boroughs are being eliminated, but virtually nothing has been done in country districts.

More Money For Fairs.—The first steps toward securing additional money for encouragement of State Fairs were taken recently when an association of county fairs formed a year ago held its second annual meeting. The State now gives $100,000 which is divided; $250,000 will be asked for on the ground that every dollar encourages agricultural or stock breeding effort. This association is opposed to the proposed State fair urged last year and accomplished the defeat of the project, notwithstanding strong argument in its favor. It will probably attack any state fair bill next winter and will meanwhile start its move for more money and better rates for transportation of animals for exhibits.

No Clerical Rates.—The long discussed question of reduced rates or free transportation to clergymen has been settled by a ruling that clergymen are not entitled to receive favors under the constitution and the public service company law. This decision will probably govern in many other cases such as hauling coal and other commodities free or at reduced rates for hospitals or charitable institutions, granting of free water by water companies to churches or similar institutions and the giving of free current by light companies.

Little Road Money Available.—Owing to the unsettled state of the controversy over the use of the income from automobile licenses there is little money for the maintenance of the 8,000 miles of state roads. Less than $100,000 is available for this purpose. By reason of this dilatory policy the highway department will go under fire again this year. Unless all signs fail this will be one of the most unsatisfactory years in road matter due chiefly to the phrasing of an act. The officials, who have known of the question since last fall, have not gotten the matter into court for final judicial determination. It could have been submitted in January and probably decided by this time.

Many Raising Catties. — The State Fisheries Commissioner thinks the raising of fish in the country districts of the state for food purposes will probably be greater this year than ever, many demands having been made by farmers for young fish from the state hatcheries. Shipments are now being made and farmers who agree to make reports on how the fish stand being planted in streams will be favored as much as possible. Many people are reported to be raising catfish for food in the southern counties.

Farm Counsellors.—The staff of 10 state counsellors under the state department of Agriculture will start work April 1.

Liability Law.—It is reported that a bill exempting employers of a small number of persons, such as farmers and storekeepers on a small scale, as well as the home, will be drafted.—Hamilton, Harrisburg, March 23.

NEW JERSEY FARM NEWS

Fish and Game Laws and Bills.—Forty-four fish and game measures have been introduced in the legislature this year. Two have become laws. They are House bill No. 124, making it illegal to hunt wild turkeys for five years, and House bill, No. 133, providing that the sum of $50 paid for pound net fishing in the Atlantic Ocean and $10 for each pound net in Sandy Hook or Raritan bays shall be void after December 31, next. The first named law is of especial interest. Years ago the wild turkey was abundant in New Jersey, but is now practically extinct. The State fish and game commission began a year ago to raise birds from several pairs received in Virginia, and about 60 will soon be liberated in pairs, believing that they will multiply rapidly if given protection. The latter law provides that licenses shall expire with the calendar year and will not affect the menhaden industry, of so great importance to the fertilizer and farming interests of the State. Assemblyman Weart's bill making it unlawful for anyone to shoot any English or ring necked pheasant for the next two years, penalty $30 fine, will pass. Extended protection will also be afforded to wild water fowl and other game.

School Affairs.—About sixty measures have been introduced into the legislature having a more or less direct bearing upon school and educational affairs. House bill No. 671, Hammond, would completely destroy the present appointive State board of education consisting of 8 members, serving without salaries, creating in its stead an

elective board, of one member from each county, salary $1,200 each, payable semi-monthly. A Senate bill would take away from the State board of education all power to determine the style, character, cost and location of all school buildings and vest such power and authority in municipal officials. Neither the State board of education nor the State commissioner of education could, under this bill, withhold from any school district any money as a means of enforcing obedience to the State board's rules and regulations. Several other bills are directed against the State board.

State Road Affairs.—Road matters have occupied much of the time of the legislature. Senator Wheaton's bill would make every contractor guarantee a road for a period of 5 years, all contracts for road building to be subject to the provisions of this act. Assemblyman Griffith's bill makes it a misdemeanor to put oil on a highway without covering it with sand. Assemblyman Nutting's bill authorizes adjoining counties to build bridges, etc. No appropriation has as yet been forthcoming for the taking over of the Delaware River toll bridges and making them free. The Pennsylvania legislature has appropriated $100,000 for this purpose, and New Jersey should reciprocate. The members of the legislature are favorably disposed toward an appropriation to meet the requirements of the National Good Roads Bill should it become a Federal Law. The Standard Oil Company will, early in the spring, place on all the public roads in the State, ornamental steel signs, pointing directions and giving the distances to various points, the State road commissioner having approved the project.

Automobile Reciprocity. — Senator Guant, Master of the State grange, is fathering a bill providing for automobile reciprocity on a revenue basis. In a statement he maintains that as many more foreign autoists use the State roads than do residents, they should be compelled to pay some part of the road maintenance expense. He would have foreign autoists in State having reciprocal relations with New Jersey pay a license equal to three-fourths of the fee charged resident autoists. In other States, the fee would be the same as that charged residents. This bill should become a law. Some levy a personal tax upon automobiles. Cities must pave and maintain streets at their own expense. In townships and boroughs roads are built at the expense of the State and counties, cities also contributing part of the cost, in many instances.

Grade Crossing Again.—Maintaining that the Edge bill requiring the railroads of the State to protect their grade crossings is not necessary because ample power now rests with the State board of utility commissioners to enforce the necessary protection, representatives of all the big railroad companies operating in the State are striving to bring about its defeat. Senator Edge has submitted several amendments which make the bill less stringent, but even with these considered the railroad men continue to oppose it. The bill will probably be modified in committee.

Matter of Taxation.—The bill permitting payment of taxes by installments has passed in the Senate. It stipulates, however, that to avail himself of the privilege, a taxpayer must pay at least one-quarter of the assessment at a time. A bill has been introduced authorizing the board of taxation in each county to divide the county into assessment districts before September 1, 1914. This also authorizes the appointment of an assessor in each assessment district, whose salary shall be fixed by the county board; work of assessment to be completed by June 1 of each year; bills to be sent on August 15.

Fire Protection.—House bill No. 576, is in the hands of the committee of agriculture. It creates the office of State fire marshal, the Governor to appoint such official whose term shall run concurrently with the commissioner of labor; annual salary $1,000 and expenses, he to appoint such assistant as may appear necessary. Senate bill No. 115, imposes a penalty on owners of woodland who permit brush to accumulate on their property.

State Banks Prosperous.—The banks of the State have on deposit $550,057,022, an increase of $12,109,441. A great part of this increase is in banks in the rural districts.

Ravages of Horse Nettle.—Farmers in certain sections of the state have started a campaign to rid their fields and pastures of the troublesome weed known as horse nettle. It is a rank grower, resembling the potato in leaf character, and the stems bear long, straw-colored prickles. Farmers have found the best way to get rid of it is to cut down the stem close to the ground and throw salt freely around the stem and wherever the green leaves from the underground root make their appearance. This salting must be repeated at intervals.—D. T. Hendrickson.

NEW YORK LETTER

City Labor For Farms.—A plan has been suggested by Gov. Glynn and commissioner Huson, whereby idle laborers in New York City are to be transported at the expense of the state to central New York to work as farm laborers. Payment of transportation has been objected to by farmers procuring help thru the labor bureau of the department of agriculture, hence the state will deliver them to farm districts.

Those City Farmers.—The first installment of laborers from New York City was brought up state last week. There were 75 in the carload and about half the number found employment the same day. Some of these laborers knowing nothing about farming, wanted higher wages than farmers had been accustomed to pay local hired men which barred their getting employment promptly. The first venture was on the whole a success. Other importations will arrive in a few days at other points where this kind of labor can be used.

Arkport Exchange.—A Produce Exchange has been organized at Arkport and incorporated under the new cooperative act of the legislature. It will deal principally with supplies for the farms tho some arrangement is expected to be made with the Long Island Potato Growers' Association whereby potatoes can be sold.

A New Idea.—A new thought in cooperation in this state is the plan adopted by a creamery association recently organized at Hurleysville, which proposes to divide its surplus profits into three parts as follows: 50 percent to go to the farmers who supply the creamery with milk, 25 percent to the consumers and 25 percent into the reserve fund of the association. It is proposed to organize the consumers who patronize the creamery so that the product of the factory may be delivered direct to them by representatives of the company.

Highway Matters.—There will be no more highway legislation at this session, nor any changes made in the personnel of the department. Any further investigating of the department will be done by the Assembly committee, other probes seemingly having been dropped.

Day Of Rest Bill.—The senate has passed the bill exempting employees of creameries, cheese factories, milk stations and ice cream plants from the provisions of the law requiring them to observe one day of rest in the seven.

Briefs.—Gen. W. T. Russell has been appointed by Gov. Glynn as advisory engineer in the highway department. All temperance legislation has been killed for this year. Gov. Glynn sent a special message to the legislature proposing the establishment of auction markets in cities. A bill has passed both Houses providing for the employment of state prison convicts on the state highways. It is likely to become a law. The farm credits bill seems to have been laid aside for this year.

Health Statistics.—The last session of the state grange was much stirred by the Public Health committee's report to the effect that the rural death rate is larger than that of the cities. The subject has been discussed considerably and one Pomona grange has passed resolutions against reckoning the deaths in state institutions located in the country, protested against including cities or towns of several thousand population, in the rural districts. The facts are, however, that all deaths are credited to the locality in which they occur and therefore those persons who have gone from the country to city hospitals and have died there more than counterbalance the deaths of persons in state hospitals and other state institutions that are located in the country.—D.

MARYLAND NOTES

Cannery Prices.—In Caroline county the local canners will pay $9 per ton for tomatoes the coming season, or 15 cents per five-eighth basket. It is thought these prices will very likely rule thruout the state. Farmers in Kent county are holding out for 16 cents a basket. Complaints are heard that the canners have agreed not to pay over a certain price, and farmers are threatening to cut out tomatoes and plant other crops. The Talbot Packing and Preserving Company has opened an office at Cordova to make contracts with farmers to grow peas, corn and tomatoes for their cannery. They are offering for peas, $50 per ton; $9 for corn and $8 for tomatoes.

Produce Exchange Organized.—Talbot county farmers have organized a Produce Exchange. Electors are to manage the exchange this year. Capital stock is to be $10,000 and 2,000 shares at $5 per share will be issued. One man cannot hold over 50 shares, and owners of shares are prohibited from selling any shares before offering them to the exchange. This is to prevent cornering of shares by one or more stock holders. In a few minutes $3,000 worth of stock was subscribed for.

The Anne Arundel Produce Exchange.—This is another new organization which was born last week at Glen Burnie in that County. Altho gotten up on short notice 54 persons subscribed to the stock of the new organization.

Club Banquet. — The White Hall Farmers Club and Improvement Association held its annual banquet March 12.—G. O. B.

NEW JERSEY GAME LAW

The New Jersey Farm News letter in a recent issue of Pennsylvania Farmer contained the following: "Two bills which deserve defeat are those repealing the gunners' license act of 1909, and one making it unnecessary for a resident to have a license to hunt in his own county." I was indeed surprised to read this in a farm paper with a New Jersey circulation. The last of these two bills, House bill No. 392, was introduced by me for the benefit of the farmer and laboring man. Being a farmer myself I am interested in all legislation that affects the farmer and if this is a bad bill for the farmer I certainly want to know all about it. I would be pleased to have your correspondent state thru Pennsylvania Farmer the bad features of a bill that, if enacted, would allow farmers to hunt and enjoy a day of sport with their neighbors or friends for the game which they harbor the entire year, often to the detriment of their crops, without taking out a license; and that will also bring a revenue to the Game and Fish Commissioner by making it necessary to have a license to hunt outside of the county of which a person is a resident and tax payer.—Oliver J. West, Gloucester Co., N. J.

The gunners' license act should not be repealed. The moneys received therefrom have gone a long ways towards stocking the state with game, and preventing irresponsible hunters from running across our fields, mowing down berry canes, young trees and grape vines, as well as an occasional "barnyard pheasant." General opinion opposes repealing such a good law. Now as to House Bill No. 392. As very few farmers go gunning beyond their own county, that bill would virtually repeal the 1909 act, and is so considered. It would have a tendency to turn loose upon our premises a horde of hunters from the villages and towns, who never have the price of a license, but are always able to borrow some sort of a gun. The farmers of New Jersey, and I know the rank and file of them, wish the license fee were $100 instead of $1. They want no let-down in the law of 1909.—D. T. Hendrickson, Monmouth Co., N. J.

VALUABLE FREE CATALOGS

Your Bargain Book.—The new 1914 catalog of The Charles William Stores, called "Your Bargain Book" should be in every farm home. It is a complete mail-order catalog of 1110 pages listing goods for every department of the farm and home. The Charles William Stores carry the endorsement of some of the strongest banking institutions in New York City, and all goods are sold under the following guarantee: That all merchandise shown in the catalogs is exactly as illustrated and described; full and complete satisfaction when you purchase; articles sold represent full value and will give all the service and satisfaction you have a right to expect. If any article purchased is unsatisfactory it may be returned at the expense of the company and exchanged for something else or money refunded and transportation charges paid. The catalog is free upon request to our readers. Address The Charles William Stores, 1015 Stores Bldg., New York City.

Future of Potatoes.—The future of potato growing in this country presents some real problems. The crop last year was short nearly 100,000,000 bushels. The tariff has been removed from foreign potatoes. The quarantine is to be lifted on potatoes from additional countries. The last two conditions will tend to lower prices somewhat, but we have demonstrated that we can compete successfully with foreign countries in potato growing. The average American price for the past three years has been about 64 cents per bushel. There is a profit in potatoes at 50 cents, but the profit will depend upon cost of production. Sure profits demand best labor-saving machinery, and best potato machinery means the Bateman line, including planters, cultivators, sprayers and diggers. A postal card request for catalogs and circulars addressed to The Bateman Mfg. Co., Box 243 Grenloch, N. J., will bring you full information.

COUNTY NOTES

Steuben Co., N. Y., (S.E.) March 16.—There has been more snow this winter than in a good many years. There is now about 20 inches—perhaps more; and there have been many days when the temperature has not been much above zero; several times it has fallen to 17 degrees and more below zero. Farmers have hauled logs to mills to be sawed into lumber; some for home uses and some for market. Doing chores and getting up wood is now the principal work of the farmer.—F. H. Dow.

Chautauqua Co., N. Y., (S.W.) March 16.—Weather fine and spring-like. Stock in good condition. Cows from $60 to $100 or more; good horses, $200 to $300 each. Pigs rather scarce at $4.00 each. Pork selling at 10 to 10½c lb, dressed; butter, 28c; eggs, 26c. Work well along and help is more plentiful than for a few years back at $25 to $30 per month and board.—J. L. Barber.

Montgomery Co., N. Y., (S.E.) Mar. 16.— Very cold and stormy. Much snow. Butter, 30c; eggs, 28c; dressed veal, 14c; fowls, 18c. Roads in bad condition. Snow money appropriated all used in most towns. Pomona Grange met at Fonda March 18. Farm Bureau makes contract with Allen S. Merchant, an expert, to be County Agent.—John L. England.

Clinton Co., N. Y. (N.E.) March 16. —Weather fine and cold. No sugar made yet. All cattle in good demand and prices high on beef cattle and milk cows. Milk a little lower than at this time last year; $1.55 per cwt at shipping stations. Most farmers have enough coarse feed to winter their stock. The ground heavily covered with snow.—Henry S. Gilbert.

Ocean Co., N. J., (C.) March 14.—Weather fair; warm for several days. Very little live stock changed hands last 2 months. Good fresh cow $75 to $90; good horses $250; poorer grades $125@$150; plugs any price. Hogs are more plentiful than last year; more breeders. Work at a standstill on account of snow. Prospects are grain and grass will be smothered with the coating of ice.—C. M. Rorer.

Lycoming Co., Pa., (N.C.) March 16. —Windy March weather, melting snow quite rapidly. Sleighing gone; roads in bad condition owing to ditches being full of drifted snow and water running in road. Wheat and rye look bad where snow is off but too early to tell whether it is damaged or not. Some manure being hauled but no promise of any real farm work being done this month. A good many farm sales. Stock of all kinds selling high. Farm implements and equipment going slow and mostly under price. Lots of moving. Some farms changing owners. A good many farms for sale. Farm labor scarce and high.—Clyde E. Hall.

CONFERENCE ON MARKETING AND FARM CREDITS

The Second National Conference on Marketing and Farm Credits will be held at Chicago, Ill., April 14 to 16, 1914, with headquarters at the Sherman House. A program national in scope and purpose has been arranged. The conference will consider the problem of marketing from the standpoints of producer and consumer.

Jersey Cattle Club Fees.—The report of the Committee on Fees and Revenue of the American Jersey Cattle Club is now ready for distribution. The report is of interest to every Jersey breeder. It is mailed from the office of the Club at 324 West 23 St., New York City.

POULTRY.

PEN-Y-BRYN FARM
AMBLER, BOX P 36, PA.
Breeders of S. C. W. Leghorns, White Wyandottes, Imperial Pekin and White Indian Runner Ducks. Eggs, Chicks, Ducklings, and White Leghorn Pullets for sale.

GRANDVIEW FARM
Single Comb W. Leghorns
Best laying strain, vigorous stock. Eggs for hatching, $1.00 per 15; $3.00 per 50; $5.00 per 100. If 50 percent hatch is not secured they will be REPLACED AT HALF PRICE. Let us book your orders early. J. M. & C. C. McCURDY, Hartstown, Penna.

EGGS FOR HATCHING
From Kulpe famous 242 egg strains. S. C White Leghorns, S. C. Rhode Island Reds, free range breeders, $1.50 per 15, $6.00 per hundred, day old chicks, $12.00 per hundred. Good Cockerels, $2.00 each. Limited number of Improved Silver Campine eggs $3.00 per 15. H. A Bacon, Hillcrest Poultry Farm, Berwyn, Md.

CHESTERBROOK FARM.
S. C. White Leghorns—Baby Chicks, $10 per 100. Hatching Eggs, $7 per 100. Imperial Pekin Ducklings—Baby Ducklings, $15 per 100. Hatching Eggs, $10 per 100. Write for circulars. Satisfaction guaranteed. We are now booking orders.
Chesterbrook Farm, Berwyn, Pa.

SINGLE COMB WHITE LEGHORNS,
Farmstead utility strain. Pullets lay at 4 1-2 months old. Breeding stock, hatching eggs, and day old chicks, Cockerels March hatched. Imperial Pekin Ducks, Afton Farm strain. Breeders and hatching eggs. Write for details to CAPE MAY FARMSTEAD, Cape May, N. J. Geo. C. Rea, Supt.

S. C. White Leghorn Chicks and Eggs
in any quantity. Chicks 12c each. Eggs 5c each. Large, vigorous farm raised stock. True Leghorn type. Hot water Mammoth incubators used. Is seven years experience worthy of consideration?
Vancrest Poultry Farm, Salt Point, N. Y.

WHITE LEGHORN CHICKS. PURE BLOODed from free range stock, the kind that lay winter eggs. Hatches every week. April 12c each; May 10c; June 8c.
ARTHUR MORRIS, Box 53, Ischua, Rt. 1, N. Y.

First and Special Again, Madison Square Garden. World's greatest winning Indian Runner Ducks, Barred Rocks, White Leghorns. Folder "Hatching and Care of Ducklings." Setting $1. up. GAEBEL BROS., Box G-62, Morristown, N. J.

Leghorns; White and Brown 15 Eggs postpaid, $1.15; 100 eggs, $4.50; 100 Chicks, $12.50.
GLICK'S POULTRY FARMS, SMOKETOWN, PA. Box 63.

Single Comb White Leghorns
Hatching Eggs, $5.00 per 100. Day-old chicks: April, $12.00 per 100. May, $10.00 per 100. Delivery Guaranteed. GEO. FROST, Levanna, Cayuga Co., N. Y.

Wild & Bronze Turkey Eggs —Chicken Eggs Handsome catalog 2c stamp, showing pure wild gobbler from the mountain. Valley View Poultry Farm, Belleville, Pa

60 page catalog free. 60 varieties, chickens, ducks, geese, turkeys, guineas and Bel. Hares. Stock and eggs, low prices. H. A. Souder. Bx. P. Sellersville, Pa.

Runner Ducks, Fawne and Pure Whites, silver cup winners. Bargains. Also White China Ganders ·Nelson Bros., Grove City, Pa.

60 Page Book Free During Next 30 Days. Includes our Store of Poultry, Dogs, Ferrets Hares and Pigeons. J. A. BERGEY, Telford, Penna

Giant Bronze Turkey Eggs, $4.00 per 10. R. C. Red Eggs, $1.00 per 15. Fawn or pure white I. R. Duck eggs $1 per 12. H. J. VanDyke, Gettysburg, Pa

MONEY MAKERS. Colored Muscovy, Pekin, Mallard ducks, geese, W. turkeys, guineas, Rocks, Wyandottes, Leghorns. Catal B. F. Kahler, Hughesville, Pa.

64 Varieties Poultry, Hares, Stock and Eggs for hatching at reasonable prices. Valuable Illus. Desc. Catalogue free. H. D ROTH, Box 2 Souderton, Pa.

Indian Runners—Fawn and White. Prize winners. White egg strain. Eggs $1.25 and $2.00 per 13. Catalog free Geo. F. Williamson, Box 145, Flanders, N. J.

White Indian Runner Ducks, Fishel's strain, and Blue Andalusians. Stock and eggs at all times J. S. WILE, Souderton, R. 2, Pa.

BLACK LEGHORNS—Baby Chicks, Hatching Eggs —the kind that lay. A. E Hampton, Pittstown, N. J.

Dollars For You 14 varieties, land and water fowls. 200 egg strain. Send 2c stamp for catalog. Maple Cove Farm, Rt. 24, Athens, Pa.

White Langshans Eggs, $1.00 per 15; $5.00 per 100. White Indian Runner Duck Eggs, $3.00 per 12. R. H. Moore, Nellie, Ohio

Eggs from pure bred Rocks, Wyandottes, Orpingtons, Reds, Brah., Leg., Min., Anconas, Hamburgs, etc. Low prices. Cata. free. H. Mohr, R. 3, Quakertown, Pa.

Indian Runner Ducks, best strains; standard, fawn and white, Pure white eggs, $2.00 a dozen. F. E. PUFF, Rockdale Farm, R-7, Butler, Pa.

$5 Buys a trio S. C. Buff Leghorns, nice ones. (Tecumseh Strain.) Cockerels, $1.50 each. G. S. HALL ·Farmdale, Ohio

UTILITY AMERICAN DOMINIQUES
Money makers. HERBERT D. ROOKS, Mills, Pa.

THOROUGHBRED High Grade White Plymouth Rocks. Eggs, 15 for $1.50; 30 for $2.50. FRANK H. STEVENOT, R. F. D. 5, Mt. Sinai, N. Y.

White Leghorn EGGS FOR INCUBATION MATHEWS PURE STRAIN $6.00 per hundred crated; $1.00 per doz. Parcel Post. Cash with order.
L. B. MATHEWS Rosemont, N. J.

WHITE HOLLAND TURKEYS, pure bred, large, vigorous, white Wyandottes and Pekin Duck eggs for hatching. H. W. Anderson, Stewartstown, Pa.

20 Varieties Cochins, Wyandottes, Leghorns, Plymouth Rocks, Hares and Bantams. Stock and eggs for sale. J. M. NYCE Elroy, Pa.

Barred Rocks I have a combination of some of the best strains. Pullet line only. Eggs $1 per 15, $5 per 100. Send for mating list. CHAS. T. DOWNING, R. D. 2, West Chester, Pa.

FAWN & WHITE Indian Runner duck Eggs and Single Comb White Leghorn Eggs, 20 Eggs for $1.30 Parcel Post. Bay View Poultry Farms, Shelltown, Md

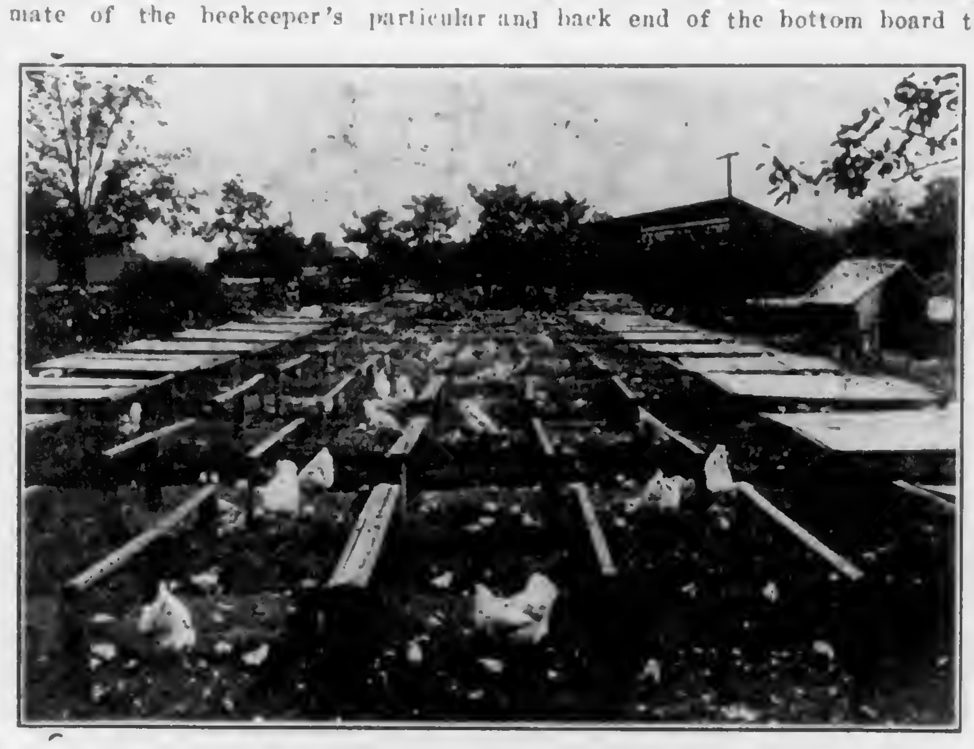
20 EGGS $1.00. Leading Varieties. Prize Poultry, Pigeons, Hares, etc. Booklet free. Illustrated Catalogue 10c. F G. WILE, Box 18, Telford, Pa.

Poultry

THE HIVE TO SELECT AND HOW TO MAKE IT

The safest and best rule in making or selecting hives and implements for the apiary is to have them simple and accurate in construction. A plain box with frames and as few other loose parts as possible will yield in the hands of a skilful beemaster far better results than the most elaborately constructed bee palace manipulated by one who does not understand the nature and requirements of bees; in fact, the most experienced generally prefer the former. The important point to decide in connection with any proposed modification or adjunct of the hive is whether its adoption will more than compensate for the resultant loss of simplicity.

In regard to the particular style or form of hive to be used to insure the best results, it should be stated that while an intelligent apiarist whose experience has been considerable may be successful with almost any hive, even with poor ones, there can be no doubt that a hive not only adapted to the nature of the bees but also to the climate of the beekeeper's particular locality, and at the same time perimtting the rapid performance of all operations necessary in securing surplus honey, will very materially affect the net profit of an apiary.



INDIVIDUAL PENS FOR YOUNG BROODS.
Niagara Poultry Farm, Niagara Co., N. Y.

It cannot be insisted too strongly that the only profitable way to keep bees is in hives with movable frames. The bees build their combs in these frames, which can then be manipulated by the bee-keeper as necessary.

The first hives should be bought from a regular manufacturer of bee supplies, and for a beginner it might be advisable to have one of them made up at the factory, so he can see just exactly how the pieces should go together. After he learns how to handle the hives and frames, and realizes the importance of absolute accuracy and uniformity he may make the hives himself, if he is a fairly good handy man with a saw and plane. The Langstroth hive is generally recognized as the standard and is a safe hive for any beginner to adopt. There is no patent on this hive or any of its parts, so that any one is at liberty to make it if he wants to do so. Bees in this style of hive will sell from 10 to 20 percent higher than in any other size hives. The hive body is made of lumber ⅞ inch, 20 inches long, 9½ inches deep, and 13⅞ inches wide, outside measure. Eight frames and a division board are used in the brood chamber. The section case is the same size as the body and takes twenty-four 4¼ by 4¼ by 1⅞ inches slotted sections, in section holders.

Many bee-keepers are good mechanics, and located near planing mills that do good, accurate work. Such men can save money by making their own hives, frames, supers, etc. Whatever hive is chosen, there are certain important points which should be insisted on. The material should be of the best; the parts must be accurately made, so that all frames or hives in the apiary are interchangeable. All hives should be of the same style and size; they should be as simple as it is possible to make them, to facilitate operation. Simple frames diminish the amount of manipulation. The frame and hive most in use in this country is the invention of Langstroth, and this hive with slight modifications, has been generally adopted. The bars composing frames are usually made ⅞ inch wide, altho some prefer to have the top bar 1 inch or even 1⅛ inches wide, and the bottom bar is made as narrow as ⅜ inch or even ⅜ inch square. The narrower bottom bar, at least down to a width of ⅜ inch, renders the removal of the frames less difficult.

The bottom board is simply a plain board with cleats at the end to prevent warping. Strips of wood, ½ inch by ⅞ inch are nailed around the sides and back end of the bottom board to support the hives above it. In place of nailing on a strip at the back end, this portion of the bottom board may be formed by allowing the cleat at the back end to project ½ inch above the surface of the bottom board. I also think favorabley of what has been called the reversible bottom board, that is, a bottom board made exactly as I have described with the addition of ⅞ inch strips on the under side. With such an arrangement the bottom board can be turned over in hot weather and this gives an entrance of ⅞ inch in height, instead of ½ inch. It adds very little to the cost, and is certainly a benefit in hot weather. Many persons place the bottom boards directly on the ground, and the majority have them but 3 or 4 inches above the surface. By arranging them farther from the ground, at least 6 to 8 inches, dampness is avoided and the ease in manipulation is greatly increased. A good, tight roof or cover is indispensable, and should be well painted, so that no drop of water can get in from above. A flat roof slanting from front to rear will answer, but a ventilation gable roof with the sides well slanted is far preferable. Great accuracy of parts must be insisted upon in hives and frames, because covers and top stories should be made to fit interchangeably, and also because the bees carry out their own work with great precision, so that ease in manipulation of combs can be secured only by nice adjustment. Hives should be painted to protect them from the weather. It is usually desirable to use white paint to prevent excessive heat in the colony during hot weather. —F. G. Herman, Bergen Co., N. J.

PROFITS IN POULTRY WORK

In our experience as adviser along all lines of poultry work we find that farmers are specializing on white eggs for the better markets. We have been engaged among poultrymen and farmers in 16 counties of the state and find many paying flocks of chickens numbering from 200 to 6,000 birds and in most places these birds are white leghorns for egg production. We find that these people are breeding, feeding and housing their flocks with one object in view, viz: eggs of good size, white in color and in many cases infertile or sterile for the New York market, for which eggs they command from 5 to 10 cents above market prices.

We are often asked by breeders and farmers how this advance above market prices can be obtained and when they are informed that by keeping the nesting material clean and doing away with the male birds in the flock so that the eggs can be guaranteed to be of the best quality, clean and not spoiled, it is easy. The trouble with most of those who are keeping hens is that they do not pay strict enough attention to the flock as regards cleanliness, suitable quarters and proper food.

Many persons start in on too large a scale without any experience and fail, while others starting with a few hens or chicks are successful simply because they grow with the business. We visited the farm of J. H. Frank in Lancaster County.

Several years ago Mrs. Frank had a mixed flock of chickens which she believed made money for her. She, however, purchased 50 white Leghorn baby chicks as a foundation for a paying flock from which to produce eggs for a good market. During the period from October 1, 1912, to October 1, 1913, from a flock of 450 hens and pullets including 12 male birds, this woman can show a profit of $858 and she will have a flock of 600 fowls to start business for another year; all of which is only an instance of what can be done on any farm by enterprising methods. The eggs from this farm are marketed in New York City and at the time of my first visit Mrs. Frank was receiving 60 cents per dozen for strictly fresh eggs.

We find many farmers trying to specialize on poultry but are sorry to be obliged to think that some of them are doing this part of their work as they have done the general farming for years, along lines that do not point to success. Too many of them do not study the habits and requirements of their flock, neglect the smaller details that go toward promoting the health of the flock, and thus fail. A good up-to-date poultry or farm paper would in many cases help people who have not the experience along these lines.—Frank Kline, Chester Co., Pa.

NOTE.—Mr. Kline, who may be addressed care of the Department of Agriculture, Harrisburg, Pa., or Spring City, Pa., will answer all queries along poultry lines or make a personal call in any part of the State, in his capacity as State Adviser in poultry work.—The Editors.

SOME POULTRY PESTS

Biting Lice.—Several species of these wingless insects often infest chickens and if numerous are indirectly responsible for diarrhea and general debility. These lice do no suck blood but feed on skin scales, blood clots, fine parts of the feathers and refuse on the bird's body. They are supplied with sharp claws, which continually scratch and irritate the chicken. The eggs are laid on the feathers and in warm weather hatch in about ten days. A few weeks later the lice are mature.

Treatment should include both fowls and houses, inasmuch as the lice can also be found on the perches and in the litter. The house should be sprayed with a ten percent kerosene emulsion or with benzine and afterward whitewashed thoroly.

The chickens can be dusted with pyrethrum or fine tobacco dust. Barn yard fowls will keep themselves fairly free if supplied with plenty of road dust, the finer the better. A dust box should always be available and large enough so that the dust will not be spilled. Prof. H. R. Lewis, of the New Jersey Station, recommends a lice powder made with 3 parts of gasoline, 1 part of crude 90 percent carbolic acid and enough plaster of Paris to absorb all of the moisture, about 4 quarts of plaster being necessary for 1 quart of the liquid. He also mentions the fact that crude petroleum is effective against lice, being sprayed by means of a simple air gun sprayer on the fowl, while it is suspended by one foot in a looped cord.

Mites.—Chicken mites are eight-legged creatures, grayish in color except when filled with blood, when they are red. Mites are not insects, but belong to the same group as spiders and differ from biting lice in that they suck the blood of the chickens, feeding usually during the night and hiding by day in cracks and crevices of the house.

The eggs are laid where dirt has accumulated or in the droppings, the young mites feeding at first on such material. Remedies must necessarily be applied to the house. First, clear the house of birds and then spray thoroly with either 10 percent kerosene emulsion, benzine, kerosene or hot water, reaching all cracks and crevices and drenching the roosts. The entire interior should then be whitewashed and it is a good plan to add 4 ounces of carbolic acid to each gallon of whitewash to increase its effectiveness. Repeated applications may be necessary but the mites are bound to be kept in check. The ends of the roosts where they come into contact with the supports should be smeared with coal tar, which will prevent the mites reaching the birds.

Another mite related to the chicken mite and known as the itch mite attacks the legs, combs and neck, burrowing under the skin and causing a crust to form. In this case it is necessary to wash the infested parts with warm soap and water and afterward apply an ointment containing sulphur.

Still another species lives in a white powdery substance at the bases of the quills. Sometimes the feathers break off or are pulled out by the chickens. The same treatment as for the itch mite applies here. Chickens hatched in an incubator should be free from lice and mites and remain so until brought near lousy birds or placed in infested houses.—Harry B. Weiss, New Jersey Experiment Station.

Does it Ever Occur to You
that the success of poultry raising depends entirely upon the Meat Scraps you use?
Maurer's Quality Meat Scraps
are pure and sweet and carry the recommendation of the foremost breeders. A postal brings you a valuable booklet. Sold direct from 10 pounds to any quantity.
MARTIN R. MAURER,
Box E. 112. Elizabeth, N. J.

Do you want to save Money and raise all the Chicks?
The Ideal Colony Brooder
Coal Burning --- Self Regulating
gives 100 per cent efficiency; no other system can equal these results. Coal burning, self regulating, economical and safe. Heats Poultry houses and broods large flocks. Save *All* your Chicks—Put Stamina into Them At Babyhood
Gilbert Hess,
Doctor of Medicine,
Doctor Veterinary Science

The annual loss of young chicks in the United States is staggering. *More than one-half* the yearly hatch die before reaching pullet age—die through leg weakness, gapes and indigestion. Talk about conservation—think of the millions of dollars that poultry raisers could save by saving most of these chicks.
Yes, most of them can be saved—saved by starting them on

Dr. Hess Poultry PAN-A-CE-A

Right from the very first feed. During my 25 years' experience as a doctor of medicine, a veterinary scientist and a successful poultry raiser, I discovered that, by using a certain nerve tonic and appetizer, *leg weakness could be absolutely overcome;* that the use of another certain chemical that is readily taken up by the blood would cure gapes, by causing the worms in the windpipe (the cause of gapes) to let go their hold and helping the chick throw them off. By combining these same ingredients with bitter tonics and laxatives, I found that I could control and invigorate the chick's digestion.
My Poultry Pan-a-ce-a helps put stamina into the chick, strengthens and cleanses its system and sends it along the road to maturity, hardy and robust. Most of the biggest poultry farms in the United States, where chicks are hatched out by the thousand every day during hatching season, feed my Pan-a-ce-a regularly.
Dr. Hess Poultry Pan-a-ce-a is the result of my successful poultry experience and scientific research in poultry culture—there is no guesswork about it. Ingredients printed on every package. Now listen to this

Get-Your-Money-Back Guarantee
You buy Dr. Hess Poultry Pan-a-ce-a of your dealer. If it does not help your chicks grow, keep them well, make your poultry healthy and your hens lay, he is authorized to refund your money; you can't possibly lose—Pan-a-ce-a must pay or you get your money back. Costs a penny a day to feed 30 fowl. 1½ lbs. 25c; 5 lbs. 60c; 25-lb. pail $2.50. Except in Canada and the far West. Buy of your dealer—Pan-a-ce-a is never sold by peddlers.

Dr. Hess Stock Tonic
Your stock need this tonic now to harden and condition them after the confined heavy feeding of winter. There's nothing better to put horses in trim for hard spring and summer work. Milch cows need it badly just now to prepare them for the heavy milking season ahead. Dr. Hess Stock Tonic makes all stock healthy—keeps them toned up and expels worms. Sold under money-back guarantee. 25-lb. pail $1.60; 100-lb. sack $5; smaller packages as low as 50c. Except in Canada, the far West and the South. Send 2c. for my *new* free Stock Tonic book.

Dr. Hess Instant Louse Killer
Kills lice on poultry and all farm stock. Dust the hens and chicks with it, sprinkle it on the roosts, in the cracks or if kept in the dust bath the hens will distribute it. Also destroys bugs on cucumber, squash and melon vines, cabbage worms, etc., slugs on rose bushes, etc. Comes in handy sifting-top cans, 1 lb. 25c; 3 lbs. 60c. Except in Canada and the far West. I guarantee it.

DR. HESS & CLARK, Ashland, Ohio

Potato Profits
A certain loss in potatoes has been turned into a profit of $30 an acre by more and better cultivation. Keeps the soil mellow, retains the moisture and kills the weeds.
IRON AGE Riding Cultivators
Carry every possible adjustment of points, gangs, wheels and frame to care for any row crops in any soil and especially for potatoes.
All steel but pole and neckyoke.
Built for wear and convenience.

Household

HOMEMAKERS' CONFERENCE AT CORNELL.

The recent Homemakers' Conference for farm women at New York College of Agriculture, Ithaca, N. Y., was a tremendous success. About 2,500 people attended Farmers' Week, and of this number more than 300 were women who came for the Homemakers' Conference, consisting of some 50 lectures or demonstrations given thruout the week by 26 instructors, either of Cornell or in similar institutions. The Conference resembled a school, continuous instruction being given along various lines. At 9 o'clock each morning there was a lecture and demonstration upon cooking. This began with a demonstration on egg cookery. The importance of fresh or well-kept eggs was emphasized, ways of detecting fresh and stale eggs in water and brine were demonstrated, and the method of preserving eggs in water glass was explained. Then followed a discussion and demonstration of the effect of heat on eggs, the advantage of low temperature in cooking being emphasized. Egg as a leavening agent was illustrated by a foamy omelet and by sponge cake.

At another lecture meat cuts were shown and discussed, the demonstration consisting in showing a side of beef divided into the ordinary retail cuts. The relative food value of the various cuts was considered; also the relative prices, and the fact was emphasized that market prices are no indication of the relative food value of meat. The principles underlying the cooking of tough and tender cuts of meat were illustrated. Two lectures dealt with bread making, each ingredient being first studied separately, then their effect when put together. Temperature, mixing, kneading and baking, were discussed and illustrated. Pastry and cake were discussed in a similar manner.

At 9 o'clock each day the sewing department lectures were given, and included textiles, sewing for school children, patterns and their application. The discussion of textiles noted the importance of women as factors in textile industries, and pointed out how the removal of most manufacturing industries from the home has destroyed women's ability to judge materials. To the end that every woman may be trained to buy textiles more intelligently, simple tests of materials often adulterated were taught, such as tests of damask or dress goods with light oil; for adulteration of wool by testing for cotton with a weak solution of hot caustic soda or the flame test; for detecting metallic salts weighting or filling of silks. An outline of sewing work was given for use in rural schools or with children in the home. ''Patterns and their application'' included the principles of altering commercial patterns to individual measurements, and the use of foundation patterns in the making of all of our gowns. ''Some problems of the home dressmaker'' covered a discussion of dress forms, pressing, shrinking, setting colors in fabrics, homemade trimmings, and individual problems.

From 11 until 1 o'clock each day an extension school was carried on in one of the cooking laboratories, similar to the one-week schools being given in various rural centers thruout the state. The program consisted of lectures and demonstrations upon cereals and rice, the cooking of meats, milk and vegetables and the making of salads. Emphasis was laid upon the scientific principles underlying all cookery.

The lectures given by the Department of Household Art, included ''A study of farm houses,'' by Prof. Helen Binkerd Young, who believes that there is need of a new type of architecture for farm houses. The farm house is much more difficult to plan than the city home, because it is the center of activities for all the operations that must be carried on upon the farm. We must find room for the laundry, the wash room, storage and an office, as well as for the usual working, living and sleeping space. The problem in the great majority of farm houses is how to make over inconvenient, poorly arranged structures into houses, each room of which shall serve its purpose well, and the whole be convenient and attractive.

In ''Color in the home and school,'' Prof. Annette Warner showed that color reacts upon the individual. Nature uses bright colors only in touches or during short seasons of the year, and we would do well to copy nature by using bright reds, yellows or blues only in small amounts. Grayed colors serve best as backgrounds, with merely touches of the brilliant hues. In ''Taste in Dress'' emphasis was laid upon the fact that it is possible for every woman to be in style and yet not wear gowns that are unbecoming, because extreme. Every fashion permits of modifications which may be adapted to the individual.

At 10 o'clock each morning Prof. Flora Rose lectured on nutrition. She urged the need of more fruits, cereals and vegetables, and less meat in the average dietary. She stated that all foods serve one of three purposes: They are body builders, body regulators, or energy yielders. The average dietary lacks body-regulating food, with the result that a great many people are suffering from constipation and other digestive troubles. She showed how we can reduce the cost of food by substituting less expensive vegetables, cheaper cuts of meat, the less expensive fruits, and more cereal products. She emphasized that for children milk, eggs, cereals and fruits should be included in the dietary with meat after the fifth year; that butter fat is necessary to stimulate growth, hence it is not advisable to substitute other fats in the dietary of the child. As ''the human harvest'' depends upon heredity and environment, the health of parents as well as knowledge of food needs of the child should be considered. The function of various food stuffs and the effect of methods of cooking upon appetite and digestion were clearly shown in Prof. Rose's own logical way.

Prof. Martha Van Rennselaer, Supervisor of Cornell Reading-Course for the Farm Home, and head of the Home Economics Department, caused every housekeeper to think about her share in the present cost of living. Forceful ficient housekeepers. It also offers many Rennselaer never fails to hold an audience, whatever may be her subject. Speaking on ''Education in Home Economics,'' she said that every effective course trains girls, first of all, to be ef-convincing, conversational, Miss Van opportunities in municipal work, for which women are peculiarly fitted. The scope of home economics is exceedingly broad, and is concerned with all phases of human welfare.

Edith C. Fleming, financial secretary of the Department of Home Economics, outlined a simple method of keeping household accounts, and urged the need of general instruction along that line in rural and urban schools.

D. J. Crosby, of the U. S. Department of Agriculture, talked on ''Sanitary Plumbing''. Helen Knowlton, instructor in the Department of Economics, gave a series of talks on ''Fresh air'' and ''Clean water.'' Lectures were given upon ''First aid to the injured'' and ''Fighting incipient fires.'' Lectures by Mrs. Carrie Chapman Catt and Dr. Anna Howard Shaw of the National Woman Suffrage Association created a great deal of interest and enthusiasm. The new Auditorium, seating 2,500 people, was practically filled.

The Home Economics cafeteria, under the management of Miss Anna Hunn, a young graduate of the Department, deserves special commendation for its share in the hospitality of Farmers' Week. With a force of 35 helpers, Miss Hunn served approximately 2,000 people each day. As a whole this conference was the ''best yet.''—Claribel Nye.

Mitchell

If the average Farmer is as shrewd a merchant as he is said to be—and we *know* he is—the fact explains why so many Mitchell cars are in *daily use on the farm.*

It is because the Mitchell is a sturdy and lasting proposition and may be maintained with maximum economy that the farmer finds it suited to his needs. When he buys it he realizes that he has made an investment which *pays big dividends in efficiency.*

The car that does the most work, lasts the longest and can be kept up with the least expense for repairs, is *the car that the Business Farmer needs* and this we declare to be the Mitchell because years of experience have *proved* it definitely.

The purpose of this advertisement is to request you Business Farmers to go at once to the nearest Mitchell dealer, examine the car carefully, take a ride in it and *drive it yourself* so as to get the *personal feel* and the *personal touch.* If it proves its merit it is the car you want. That's the *only way* to *buy* an automobile and the only real way to *sell* one.

Equipment of All the Mitchell Models That is Included in the List Prices:

Electric self-starter and generator—electric lights—electric horn—electric magnetic exploring lamp—speedometer—Tungsten valves—mohair top and dust cover—Jiffy quick-action side curtains—quick-action rain vision wind-shield—demountable rims with one extra—double extra tire carriers—Bair bow holders—license plate bracket—pump, jack and complete set of tools.

SHOP NOTES

''Galore'' is just the word to describe the beads one sees everywhere this season. Every shop has counters full of them dangling alluringly before the eyes of the shoppers. One sees them on the necks of old and young, and also around the waists for girdles and on hats for trimming. There are beads at all prices from 10 cent glass ones to hundreds and thousands of dollars for pearls and precious stones. And there are quantities of wooden beads dyed in all shades of brown, yellow, red, blue and green. Many of these are as pigeon or bantam eggs, and altho the strands are long enough to reach from the neck to the waist, fashion is not satisfied with this so the strands are doubled. Then they are lengthened with danglers of odd shapes, ending with silk tassels. These range in price from twenty-five cents for the small ones to one dollar and a half for the long ones.

For twenty-five cents one may get a pretty string of glass beads to match almost any gown no matter what the shade may be. And with the frilly white neck fixings that are still so popular these are very pretty and becoming. For those who do not care for beads there are many styles of necklets made of chains of gun metal, silver, or compositions of different kinds. These are ornamented with imitation pearls, amethysts, topaz, emerald, opal or other precious stones, and have odd and pretty pendents to match the ornamentation. They are priced at 50 cents to $2, according to quality and workmanship.

Tango ties are the novelties offered for those who do not fancy the long strands of great tango beads. These ties are made of satin piping half an inch wide, fastened at the ends with a pendant made of oddly shaped and brilliantly colored beads. These ties sell for 50 cents each in most of the stores and are attractive when worn with filmy lace or lingerie waists or with the black chiffon waists.

The New Handkerchiefs.—Brilliant color is the note that predominates in all the new spring fashions. Everything has a touch of brightness about it, hats, gowns, waists, skirts, coats and wraps, so it is not surprising that handkerchiefs for both men and women come in colors or with colored borders. There are colored handkerchiefs with designs embroidered in white and white handkerchiefs with colored embroidery, and there is the same combination in bars and stripes. Some sheer white handkerchiefs with broad hems have tiny edges of lavender, blue, pink or green lace. These new spring handkerchiefs may be bought at 25 to 50 cents each, according to quality.—Nevada Davis Hitchcock.

PENNSYLVANIA FARMER PATTERNS

Be sure to give the figures and letters of each pattern exactly as printed at the beginning of each description. We will not be responsible for correct filling of your orders unless you do so. Also give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 214-18 So. 12th St., Philadelphia, Pa.

Winston of the Prairie

By HAROLD BINDLOSS

Copyrighted by Frederick A. Stokes Company.

CHAPTER XXVI (Continued)

"I fancy you are wrong, and I wish my brother were here," she said. "We could not refuse Mr. Winston permission to call, but whatever passes between us will have more than its individual significance. Anything we tacitly promise, the others will agree to, and I feel the responsibilty of deciding for Silverdale."

Miss Barrington went out; but her niece, who understood her smile and that she had received a warning, sat still with a strained expression in her eyes. The prosperity of Silverdale had been dear to her, but she knew she must let something that was dearer still slip away from her, or, since they must come from her, trample on her pride as she made the first advances. It seemed a very long while before there was a knocking at the outer door, and she rose with a little quiver when light steps came up the stairway.

In the meanwhile two men stood beside the stove in the hall until an English maid returned to them.

"Colonel Barrington is away, but Miss Barrington and Miss Maud are at home," she said. "Will you go forward into the morning-room when you have taken off your furs?"

"Did you know Barrington was not here?" asked Winston, when the maid moved away.

Dane appeared embarrassed. "The fact is, I did."

"Then," said Winston dryly, "I am a little astonished you did not think fit to tell me."

Dane's face flushed, but he laid his hand on his comrade's arm. "No" he said, "I didn't. Now, listen to me for the last time, Winston. I've not been blind, you see, and, as I told you, your comrades have decided that they wish you to stay. Could you sink your confounded pride, and take what is offered you?"

Winston shook his grasp off, and there was weariness in his face. "You need not go thru it all again. I made my decision a long while ago."

"Well," said Dane, with a gesture of hopelessness, "I've done all I could and, since you are going on, I'll look at that trace clip while you tell Miss Barrington. I mean the younger one."

"The harness can wait," said Winston. "You are coming with me."

A little grim smile crept into Dane's eyes. "I am not. I wouldn't raise a finger to help you now," he said, and retreated hastily.

It was five minutes later when Winston walked quietly into Maud Barrington's presence, and sat down when the girl signed to him. He wondered if she guessed how his heart was beating.

"It is very good of you to receive me, but I felt I could not slip away without acknowledging the kindness you and Miss Barrington have shown me," he said. "I did not know Colonel Barrington was away."

The girl smiled a little. "Or you would not have come? Then we should have had no opportunity of congratulating you on your triumphant acquittal. You see, it must be mentioned."

"I'm afraid there was a miscarriage of justice," said Winston quietly. "Still, tho it is a difficult subject, the deposition of the man I supplanted went a long way, and the police did not seem desirous of pressing a charge against me. Perhaps I should have insisted on implicating myself, but you would scarcely have looked for that after what you now know of me."

Maud Barrington braced herself for an effort, tho she was outwardly very calm. "No," she said, "no one would have looked for it from any man placed as you were, and you are purposing to do more than is required of you. Why will you go away?"

"I am a poor man," said Winston. "One must have means to live at Silverdale!"

"Then," said the girl with a soft laugh which cost her a good deal, "it is because you prefer poverty, and you have at least one opportunity at Silverdale. Courthorne's land was mine to all intents and purposes before it was his, and now it reverts to me. I owe him nothing, and he did not give it to me. Will you stay and farm it on whatever arrangement Dane and Macdonald may consider equitable? My uncle's hands are too full for him to attempt it."

"No," said Winston, and his voice trembled a little. "Your friends would resent it."

"Then," said the girl, "why have they urged you to stay?"

"A generous impulse. They would repent of it by and by. I am not one of them, and they know it, now, as I did at the beginning. No doubt they would be courteous, but you see a half-contemptuous toleration would gall me."

There was a little smile on Maud Barrington's lips, but it was not in keeping with the tinge in her cheek and the flash in her eyes.

"I once told you that you were poor at subterfuge, and you know you are wronging them," she said. "You also know that even if they were hostile to you, you could stay and compel them to acknowledge you. I fancy you once admitted as much to me. What has become of the pride of the democracy you showed me?"

Winston made a deprecatory gesture. "You must have laughed at me. I had not been long at Silverdale then," he said dryly. "I should feel very lonely now. One man against long generations. Wouldn't it be a trifle unequal?"

Maud Barrington smiled again. "I did not laugh and this is not England, tho what you consider prejudices do not count for so much as they used to there, while there is, one is told frequently, no limit to what a man may attain to here, if he dares sufficiently."

A little quiver ran thru Winston, and he rose and stood looking down on her, with one brown hand clenched on the table and the veins showing on his forehead.

"You would have me stay?" he said.

Maud Barrington met his eyes, for the spirit that was in her was the equal of his. "I would have you be yourself—what you were when you came here in defiance of Colonel Barrington, and again when you sowed the last acre of Courthorne's land, while my friends, who are yours too, looked on wondering. Then you would stay—if it pleased you. Where has your splendid audacity gone?"

Winston slowly straightened himself, and the girl noticed the damp the struggle had brought there on his forehead, for he understood that if he would stretch out his hand and take it what he longed might be his.

"I do not know, any more than I know where it came from, for until I met Courthorne I had never made a big venture in my life," he said. "It seems it has served its turn and left me—for now there are things I am afraid to do."

"So you will go away and forget us!"

Winston stood very still a moment, and the girl, who felt her heart beating, noticed that his face was drawn. Still, she could go no further. Then he said very slowly, "I should be under the shadow always if I stay, and my friends would feel it even more deeply than I would do. I may win the right to come back again if I go away."

Maud Barrington made no answer, but both knew no further word could be spoken on that subject until, if fate ever willed it, the man returned again, and it was a relief when Miss Barrington came in with Dane. He glanced at his comrade keenly, and then seeing the grimness in his face, quietly declined the white-haired lady's offer of hospitality. Five minutes later the farewells were said, and Maud Barrington stood with the stinging flakes whirling about her in the doorway, while the sleigh slid out into the filmy whiteness that drove across the prairie. When it vanished, she turned back into the warmth and brightness with a little shiver and one hand tightly closed.

The great room seemed very lonely when, while the wind moaned outside, she and her aunt sat down to dinner. Neither of them appeared communicative, and both felt it a relief when the meal was over. Then Maud Barrington smiled curiously as she rose and stood with hands stretched out towards the stove.

"Aunt," she said. "Twoinette has twice asked me to go back to Montreal, and I think I will. The prairie is very dreary in the winter."

It was about this time when, as the whitened horses floundered thru the lee of a bluff where there was shelter from the wind, the men in the sleigh found opportunity for speech.

"Now," said Dane quietly, "I know that we have lost you, for a while at least. Will you ever come back, Winston?"

Winston nodded. "Yes," he said. "When time has done its work and Colonel Barrington asks me, if I can buy land enough to give me a standing at Silverdale."

"That," said Dane, " will need a good many dollars, and you insist on flinging those you had away. How are you going to make them?"

"I don't know," said Winston simply. "Still, by some means it will be done."

It was next day when he walked into Graham's office at Winnipeg, and laughed when the broker shook hands and passed the cigar box across to him.

"We had better understand each other first," he said. "You have heard what has happened to me and will not find me a profitable customer today."

"These cigars are the best in the city, or I wouldn't ask you to have one," said Graham dryly. "You understand me, any way. Wait until I tell my clerk that if anybody comes round I'm busy."

A bell rang, a little window opened and shut again, and Winston smiled over his cigar.

"I want to make thirty thousand dollars as soon as I can, and it seems to me there are going to be opportunities in this business. Do you know anybody who would take me as clerk or salesman?"

Graham did not appear astonished. "You'll scarcely make them that way if I find you a berth at fifty a month," he said.

"No," said Winston. "Still, I wouldn't purpose keeping it for more than six months or so. By that time I should know a little about the business."

"Got any money now?"

"One thousand dollars," said Winston quietly.

Graham nodded. "Smoke that cigar out, and don't worry me. I've got some thinking to do."

Winston took up a journal, and laid it down again twenty minutes later. "Well," he said, "you think it's too big a thing?"

"No," said Graham. "It depends upon the man, and it might be done. Knowing the business goes a good way, and so does having dollars in hand, but there's something that's born in one man in a thousand that goes a long way further still. I can't tell what it is, but I know it when I see it."

"Then," said Winston, "you have seen this thing in me?"

Graham nodded gravely. "Yes, sir, but you don't want to get proud. You had nothing to do with the getting of it. It was given you. Now, we're going to have a year that will not be forgotten by those who handle wheat and flour, and the men with the long heads will roll the money in. Well, I've no use for another clerk, and my salesman's good enough for me, but if we can agree on the items I'll take you for a partner."

The offer was made and accepted quietly, and when a rough draft of the arrangement had been agreed upon, Graham nodded as he lighted another cigar.

"You may as well take hold at once, and there's work ready now," he said. "You've heard of the old St. Louis mills back on the edge of the bush country. Never did any good. Folks who had them were short of money, and didn't know how they should be run. Well, I and two other men have bought them for a song, and, while the place is tumbling in, the plant seems good. Now, I can get hold of orders for flour when I want them, and everybody with dollars to spare will plank them right into any concern handling foodstuffs this year. You go down tomorrow with an engineer, and, when you've got the mills running and orders coming in we'll sell out to a company, if we don't want them."

Winston sat silent a space turning over a big bundle of plans and estimates. Then he said, "You'll have to lay out a pile of money."

Graham laughed. "That's going to be your affair. When you want them the dollars will be ready, and there's only one condition. Every dollar we put down has got to bring another in."

"But," said Winston, "I don't know anything about milling."

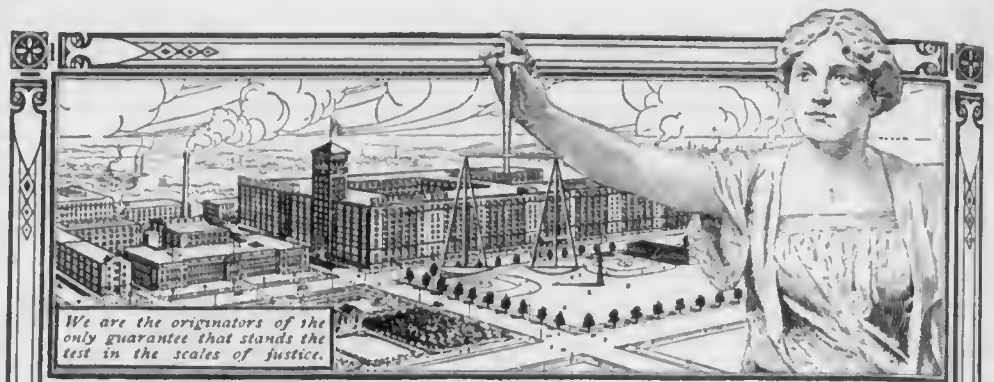
"Then," said Graham dryly, "You have got to learn. A good many men have got quite rich in this country running things they didn't know much about when they took hold of thom."

"There's one more point," said Winston. "I must make those thirty thousand dollars soon or they'll be no great use to me, and when I have them I may want to leave you."

"That's all right," said Graham. "By the time you've done it, you'll have made sixty for me. We'll go out and have some lunch to clinch the deal if you're ready."

(To be continued)

Corn Silage For Fattening Two Year Old Steers.—From the Missouri Experiment Station, Columbia, Missouri, comes its Bulletin No. 112 covering this subject. The Bulletin gives weight records, compares quality and cost of feeds, and outlines equipment and methods of feeding. It should be of interest to those interested in steer feeding and economical methods of feeding.



We are the originators of the only guarantee that stands the test in the scales of justice.

Solid Comfort Vehicles

GREATER values than we have ever before been able to offer are shown this year in our complete line of Solid Comfort Vehicles as illustrated and described on the vehicle pages of our General Catalog.

Our *Leader*, illustrated below, is the biggest selling buggy ever manufactured. More than 50,000 are in daily use. But we offer equal values in other buggies, surreys, runabouts and spring wagons. Every vehicle we sell is guaranteed to give perfect satisfaction always. Our enormous vehicle business enables us to furnish the fullest measure of quality, style and workmanship, at prices a great deal lower than others ask.

Our price for the splendid buggy illustrated below is **$61.90.** It has triple panel auto seat, genuine leather upholstering, highest type body construction, triple braced shafts, best wheels made, full wrought fifth wheel, real long distance self oiling axle. Shipped from a warehouse near you.

If you want to read the complete description of this and many other vehicle bargains, turn to the vehicle pages of our big General Catalog. Compare the quality and prices with others and remember the guarantee of satisfaction we give you.

If you haven't our big General Catalog, simply say "Vehicles—84P69 on a postal card and mail to

Genasco

THE TRINIDAD-LAKE-ASPHALT

Ready Roofing

Put a cover on your roof that stays weather-proof.

It takes no more of your time or it costs no more for labor to lay *enduring* Genasco Roofing than you'd spend on inferior roofing whose service is short-lived.

Genasco is waterproofed through-and-through with "Nature's everlasting waterproofer".

The natural oils of Trinidad Lake asphalt give Genasco life and lasting resistance to sun, rain, wind, snow, heat, cold, alkalis, and acids.

It means economy from beginning to end.

Ask your dealer for Genasco—smooth or mineral surface; several weights. Look for the trademark. The KANT-LEAK KLEET makes seams water-tight without cement and prevents nail-leaks. Write us for the Good Roof Guide Book and samples. Free.

Save Half the Cost Of Digging Ditches

Don't *dig* them out—*blow* them out. "The cost of making ditches with explosives is less than half the cost of hand digging," says the Michigan Experiment Station. You can do the work yourself, making a ditch 3 to 4 feet deep, 5 feet wide at top and 3 at bottom for 3 to 5 cents a running foot, with

Atlas Farm Powder
THE SAFEST EXPLOSIVE

Put in a row of holes, load, fire and the work is done—as much in a day as a dozen men could dig in a week. The soil is spread over the land, not heaped up to occupy valuable space. The Atlas ditch is smooth and satisfactory.

Atlas Farm Powder is economical and easy to use. Get it for stump-blasting and boulder-breaking. Improve the fertility of your land by breaking up the subsoil. Set fruit trees in blasted holes, to get thrifty, early-bearing orchards.

Markets

PHILADELPHIA PRODUCE

Philadelphia, Pa., March 23, 1914.

Butter receipts were light and demand absorbed all offerings of fine goods at firm prices. There was a fair demand for desirable fresh eggs and the market ruled steady with prices under good control. Offerings of poultry were moderate but ample. Trade in fruit and vegetables was quiet, but values generally were well sustained under moderate offerings.

Butter.—Western creamery, 29c; extras, 27c; firsts to seconds, 23@25c; special prints, 33@36c; near-by prints 30c.

Eggs.—Candled 27@29c doz.; extras 24c. Current receipts at $6.60 per standard case.

Poultry.—Fowls, 18@18½c; old roosters 12@13c; pigeons, 30@32c pair.

Dressed Poultry.—Western fowls 12@18½c; roosters, 15c; turkeys, 20@26c; squabs $2@4.85 doz.

Vegetables.—White potatoes, Pa., 75@90c bu. Onions $3@3.25 per 100-lb bag. Peppers $1.50@1.75 per carrier. Eggplant $2@2.25 carrier. Lettuce $2.50@3.50 hamper. Beets 5@8c per bch. Sweet potatoes 45@55c bas. String beans $3@4.50 hamper Squash $2@3 per crate. Cucumbers, Florida $4@5 hamper. Celery $3.75 per crate. Cabbage, new $1.00@1.25 per hamper. Cauliflower $1.75@2.25 per ½-bbl. box.

Fruit.—Apples $4@6.50 bbl. Pineapples, per crt $3.00@4.00. Pears, 50@75c basket. Grapes $3@8 per keg; cranberries $3@4 box; lemons, $2@3 box; grape fruit $2@4 per box; oranges, $2@3.50 per box.

Hay and Grain.—No. 1 hay, large bales, $18@18.50; No 1 medium $17.50@18.00 no grade, $10.00@12.00. Clover mixed hay, light mixed at $16.50@17.00; straw No. 1 new straight rye, $16.50; No. 2 do., $15@15.50; No. 1 tangled rye straw new $12; No. 2 do., $11.00@12.00; No. 1 wheat straw, $10@10.50; No. 1 oat straw, $10.50@11; new shelled corn No. 2 yellow 74@74½c. Wheat No. 2 red $1.00½; No. 1 Northern, $1.05½@1.06½; No. 2 white oats 46@46½; No. 3, white 44½@45c; Standard white 45½@46c.

Coffee.—Rio 7s 8⅝c; Santos 4s 11½c. Mild Coffee.—Cordova 12½@16½c.

PHILADELPHIA LIVE STOCK

Philadelphia, Pa., March 23, 1914.

Beef Cattle.—There was scarcely any life in the market and tho the run of cattle was light prices moved downward on every grade. Lancaster County, Pa., Virginia, Ohio and Western stock was on sale. Calves closed at a sharp decline and cows were considerably lower.

Medium steers	7.50@7.75
Common steers	7.00@7.25
Bulls	5.00@6.50
Fat cows	5.25@6.00
Medium cows	3.50@5.00
Thin cows	2.75@3.00

Veal calves lower.

Best calves	$9.50@10.00
Good to choice do	9.00 9.50
Medium	7.50@8.00
Common do	6.50@7.00

Sheep and Lambs.—Values in a general way showed no material change. With increasing arrivals the market manifested a clearing-up disposition.

Choice wethers	$6.00@6.25
Good do.	5.25@5.75
Common to medium	3.50@5.00
Ewes, fat	5.25@5.75
Extra lambs	8.25@8.35
Good to choice do	8.00@8.25
Common to medium	5.50@8.00

Hogs.—Inquiry was of a seasonable character, with a strong undertone prevailing. Westerns as to size and quality $12.50@12.75.

City Dressed Stock.—Calves were a fraction lower, but outside of that meats in the choice and prime class commanded steady prices. Steers, 12@14c; heifers, 10½@14c; cows, 9½@11c. Veal calves, 13@14c; country dressed calves, 14@15c; extra do., 15½c. Sheep, 9@11c; extra wethers, 11½c. Spring lambs 13@14c. Hogs 12¾@13c.

PITTSBURGH LIVE STOCK

Pittsburgh, Pa., March 23, 1914.

Cattle.—With a supply of 90 cars compared with 115 loads the week before, the market opened slow and ruled about steady on the fat tidy cattle except the weighty grades, which ruled a little lower as did the cattle of all weights that were on the plain and coarse order, which are slow sale at low prices. Fat cows, heifers and bulls sold at about steady prices. Best fresh cows stronger, while springers and medium grade fresh cows were slow and easier. Today's supply totaled 90 loads. The market ruled active with prices steady on all grades.

Good to choice	$8.40@9.00
Good 1,300-1,400 lb	8.30@8.60
Medium to good 1,200-1,300 lb	8.10@8.30
Tidy 1,050-1,150 lb.	8.10@8.35
Fair to medium, 900-1,100 lb	7.40@7.90
Rough, half-fat, 1,000-1,300 lb.	5.00@7.00
Common, 700 to 900 lbs.	5.50@6.50
Rough, half-fat	5.00@7.00
Common to good fat oxen	4.00@6.50
Common to good fat bulls	5.00@7.75
Common to good fat cows	4.25@6.50
Heifers	5.50@8.00
Bologna cows	4.00@4.40
Fresh cows and springer	25.00@85.00

Calves.—Veal calves in fair supply and market closed 50 cents per cwt lower than Monday's prices. Today's receipts 600 head

Heavy and thin calves	$5.00@7.00
Veal calves	7.50@10.00

Sheep and Lambs.—Sheep and lambs in light supply. Sheep met with the better demand and ruled steady on choice, while the plain and medium grades are very slow sale. Lambs met with a poor demand and top grades closed 25 cents lower than Monday, while the plain and medium grades are very hard sale. Today's receipts were 15 double-deck loads. The market was active and higher on lambs and best sheep, and firm on other grades of sheep. Spring lambs sold steady.

Prime wethers	$6.15@6.35
Good mixed	5.50@5.85
Fair mixed ewes and wethers	4.75@5.25
Culls to common	3.00@4.25
Prime lambs	5.50@8.25
Spring lambs,	9.00@11.00

Hogs.—The supply of hogs during the week has been fair and with a good demand the market closed 5 cents per cwt. higher on heavy hogs, while other grades sold 15 to 20 cents per cwt. higher. Today's receipts were 500 double-deck loads, and the market ruled steady.

Prime heavy	$9.25@
Prime medium weights	9.35@
Heavy mixed	9.35@
Best heavy Yorkers	9.35@
Light Yorkers	9.25@
Pigs	8.75@9.10
Common to good roughs	7.75@8.50
Stags	7.00@7.25

BUFFALO LIVE STOCK

Buffalo, N. Y., March 23, 1914.

Cattle.—The slow opening on Monday and the lower basis depressed the market for the balance of the week. The demand for mixed butchers was fair. On the close the market was slow on ordinary grades. With 3,000 cattle in the yards this morning, the market was strong with firm to higher prices on all grades.

Choice heavy steers	$8.50@9.00
Medium	8.25@8.60
Yearlings	8.00@8.50
Handy butchers	6.75@8.25
Good to choice fat cows	6.75@7.25
Good to choice heifers	6.50@8.00
Butcher bulls	6.50@8.50
Feeders	6.25@7.25
Stockers	5.00@6.25
Cows and springers	30.00@90.00

Calves.—The liberal receipts on Monday and lower basis had influenced the market thruout the week. The opening basis was $10@10.50 and the trade for the week was slow. On the closing days the trade showed some improvement and the basis was 50 cents higher. Calf receipts this morning numbered 1,000.

Choice veals	$10.50@11.00
Lights and thin	6.00@8.75

Sheep and Lambs.—The trade at the opening was in good position and desirable grades 5 cents higher on account of the good general demand. Yearlings were in good demand and firm. Sheep were in good demand. The demand was better on the close from all sides. Yearlings ruled firm. With a 12,000 run, sheep and lambs were firm today.

Choice lambs	$8.25@8.40
Yearlings	7.00@7.25
Wethers	6.25@6.50
Ewes	5.50@6.00
Sheep	6.00@6.25

Hogs.—Notwithstanding the liberal receipts the trade was active and higher at the opening. The general demand was good. The basis on Yorkers was $9.15@9.25. Medium and heavy sold lower. On the close the trade was active and 5 to 10 cents higher. The pig trade was active; medium and heavy were higher. Today's receipts numbered 12,800 head. The market was strong.

Heavies	$9.25@9.30
Mixed and medium	9.25@9.30
Yorkers	9.25@9.30
Light Yorkers	9.25@9.30
Pigs	9.25@9.30
Roughs	8.30@8.50
Stags	6.50@7.50

Horses.—Some 550 head were sold at fair prices. Best workers were in demand.—S.

NEW YORK LIVE STOCK

New York City, March 23, 1914.

Beef Cattle.—Receipts for week 2,900 head. Market irregular

Steers	$6.50@9.35
Bulls	5.75@7.50
Cows	3.50@6.60
Dressed beef	12@13½c.

Calf receipts 4,700 head. Market higher.

Choice	$8.00@12.00
Culls	6.00@7.50

Dressed calves higher. Dressed veals, 13@18c.

Sheep and lamb receipts 7,100 head. Market steady.

Sheep	$4.25@6.00
Culls	3.50@4.00
Spring lambs	7.25@8.50

Hog receipts 10,900 head. Market lower. Choice, $9.20@9.40; roughs, 8.25@8.40.

BALTIMORE LIVE STOCK

Baltimore, Md., March 23, 1914.

Cattle.—Receipts for the week 1,348 head against 3,421 last week.

Steers	$6.25@8.35
Heifers	5.50@7.00
Cows	3.00@5.75
Bulls	5.25@7.00
Fresh cows	35.00@75.00

Sheep and lamb receipts for the week were 1,361 head against 3,596 last week. Light supply; market strong.

Sheep	$3.75@6.25
Lambs	6.00@8.60

Hog receipts for the week were 10,680 head against 11,876 last week.

Light western	$9.55@9.65
Heavy to medium	9.60@9.70
Near-by	9.55@9.65
Pigs	9.10@9.15

Calves.—Receipts for the week were 368 head, against 399 head last week. Liberal supply, market lower at $5.50@10.00

PITTSBURGH HAY AND GRAIN MARKET

Pittsburgh, Pa., March 23, 1914.

Hay.—Receipts of hay have eased up considerably lately but demand is not very enthusiastic. However, the market is apt to rule stronger should the light receipts continue. Off grades are still hard to place as there is plenty arriving with no buyers. Light mixed and No 1 clover mixed are in fair demand

No. 1 timothy	$16.75@17.25
No. 2 timothy	14.50@15.50
No 1 light mixed	14.75@15.25
No. 1 clover mixed	14.75@15.25
No. 2 clover mixed	11.00@12.00
No 1 clover	11.00@14.50
No. 2 clover	10.00@12.00

Straw.—Demand fair, receipts not heavy but equal to demand.

No. 1 Oats	$9.00@9.25
No. 2 Oats	8.75@9.00
No. 1 Wheat	8.75@9.00
No. 2 Wheat	8.50@8.75
No. 1 Rye	9.25@9.50
No. 2 Rye	8.50@9.00

Ear Corn.—Demand is strong for good, sound, yellow ear corn, but there is considerable off-grade corn arriving which is hard to place.

New No. 2 yellow	70@70½c.
New No. 3 yellow	66½@68c.

Shell Corn.—Market looking a little stronger; prices higher; demand good.

New No. 2 yellow	73½@74c.
New yellow No. 3, natural	69@69½c.
New sample	66½@68c.

Oats.—Receipts continue liberal and demand only fair; market quiet.

No. 2 white	43¾@44c.
Standard oats	43@43½c.
Standard No. 3 oats	42@42½c.

Millfeed.—Bran scarce and in demand but middlings is quiet

No. 2 white midds	$28.00@28.50
No. 1 brown midds	26.50@27.00
W. W. Bran, course,	28.00@28.50
W. W. Bran, medium	27.50@28.00

NEW YORK HAY MARKET

New York City, March 21, 1914.

Hay prices are quoted as fairly steady. Receipts are increasing somewhat, amounting to 1,034 tons today. Timothy, No. 1, $1.05, standard, $1.00; No. 2, 95c; No. 3, 85@90c; clover 60@95c.

Straw rules firm. Receipts today were 20 tons. Oat straw, 55@60c bale; rye, 90@95c.

NEW YORK MILK MARKET

New York City, March 23, 1914.

The conditions have changed little in the market in the course of the last week. The supply is increasing while the demand remains poor for the season of the year, owing to the continuation of cold weather. The supply, in fact is greater than usual for the time of year. Owing to the heavy ice in the Hudson river, the Ramsdell boats will not begin carrying milk much before April 1.

The receipts of milk and cream in 40-quart cans for the week ending March 21, were as follows:

Railroad	Milk	Cream
Erie	46,044	2,126
Susquehanna	8,162	352
West Shore	17,360	440
Lackawanna	57,575	1,510
N. Y. Central (long haul)	83,463	1,624
N. Y Central (short haul)	11,910	89
Ontario	39,142	2,834
Lehigh Valley	31,907	1,052
Homer Ramsdell Line	....	....
New Haven	8,336	175
Pennsylvania	4,347	113
Other sources	1,670	18
Totals	309,916	10,312

ELGIN BUTTER QUOTATION

Elgin, Ill., March 23, 1914.

The quotation committee of the Elgin Board of Trade this afternoon declared butter firm at 26⅝ cents.

CHICAGO HORSE MARKET

Chicago, March 23, 1914.

Horses continued to be marketed in increasing numbers last week, but a much better general demand made firmer prices and some sales showed an advance of about $10 per head. Drivers sold at $75@125 mainly, with livery horses bringing $310@325 per pair while team horses went at $165@230. Small chunks sold at $185@235, and there was a lively trade in farm horses, geldings bringing $280@400 per pair and mares $325@575 per pair. Choice pairs of heavy drafters found an outlet at $575@650, with not many prime enough to sell up to $600. Drafters sold singly at $185@300 or more.—F.

TOBACCO MARKET

The pooling movement was the principal topic in market circles. At present less than one-third of the 1913 crop has been sold. Local packers are afraid to take hold owing to the perturbed situation and the factories are not in the market at present; hence there is practically no movement of the new crop. The cigar industry is not flourishing thus contributing another stagnant feature to the situation. Growers are anxious to begin preparations for the new crop but it seems that one cold blast follows another so closely that there is little opportunity to pursue spring operations. The present outlook would indicate the probable growth of an average crop, and should the pooling movement prosper during the next few weeks the acreage will be raised to some extent.

The interest in the Kimbrough pooling movement and the new Seedleaf Tobacco Growers' Company continued unabated. At a recent meeting Mr. Kimbrough further strengthened his claims as an organizer by reference to the success he has met in other sections instructing the wheat growers of the northwest, the tobacco farmers of Kentucky, the fruit growers of Florida and the cotton raisers of Georgia. He explained the proposed scale of future prices which are to increase gradually from $10 and $2.50 at present to $15 and $5 in 1918. Local packers and other enemies of the prosperity of tobacco raisers are directing various attacks against the new movement, prominently the claim that the organizer is not a practical tobacco man and is thus not able to understandingly grasp the situation. Of course such a claim is not worth serious consideration. It is the part of all successful organizers to deal with men and this success is measured by the worth of their plans and their ability to select efficient leaders. It seems that local banks, too, are militating against the movement, but it is probable that they are controlled by tobacco interests.

In view of the unjust attacks that have been made on the movement the board of directors of the Seedleaf Growers' Company adopted resolutions of confidence in the new movement concluding with the significant declaration that the whole object is to benefit the tobacco grower by informing him as to the market conditions and the general management of his business.—H. E. Tweed, March 23, 1914.

Veterinary

(Conducted by W. C. Fair, V. S.)

(Advice thru this department is free to our subscribers. Each communication should state history and symptoms of the case in full; also the name and address of writer. Initials only will be published. We cannot make reply by mail. This is one of the most valuable columns of the paper and we invite readers to make use of it. Clippings from this column, when properly preserved and classified, would make one of the most valuable medical symposiums a farmer-stockman could obtain.)

Splint.—A 2-year-old colt, only partially broken to drive, shows some soreness and lameness in right fore leg. I have examined his leg carefully and find a small hard bunch on lower part of knee and on inside of leg. He shows most soreness when first taken out of stable or after standing still a few minutes, but after a short drive he travels almost sound. W. H. J., Scranton, Pa.—I am quite sure colt is suffering from splint lameness. He may strike shin with opposite foot. If so, by proper shoeing you will remove cause and this will greatly aid you in effecting a cure. Give him rest. Apply 1 part red iodide mercury and 8 parts fresh lard to bunch every 6 or 8 days.

Cracked Heels—Scratches.—We have a 3-year-old colt that has been driven almost daily. He has scratches. Home remedies appear to do very little good. He seems to be in good health, but hind legs stock during night and Sunday. L. S., Meadville, Pa.—The legs should be rubbed dry or be bandaged in cotton when brought into barn. If hair interferes with sores, cut it off and dissolve ½ lb. acetate lead, 3 oz. sulphate zinc and 3 oz carbolic acid in a gallon of water and apply to sores, 3 times a day. Also give him ½ oz. Fowler's solution at a dose, 3 times a day.

Garget.—I have two cows that have bunches in their udders. Very little milk can be drawn from either of the quarters affected. When they came fresh the calf sucked for three days, after that we milked them. D. J., Brockton, N. Y.—There are many causes of udder troubles in cows, but I believe poor milking is one of the chief causes. When a cow is milked every drop should be taken from udder; deep milkers should be milked three times a day. Lazy milkers destroy udders. Apply 1 part iodine and 15 parts lard to bunches, 3 times a week. Hand rubbing has a good effect.

Too Much Corn to Pigs.—We have 18 pigs, five months old, that are not doing well. Four of them show weakness in either back or hind legs. They have a nice dry pen and are fed plenty of corn and have good water to drink. I keep these pigs on cement floor, but the pen is on dry land, therefore I do not believe it too damp for hogs. M. T. A., Syracuse, N. Y.—Their food supply is unbalanced for either such pigs or for older hogs. Too much corn and fat-producing food cause weakness of this kind. Feed less corn, more oil meal, roots and tankage, then they will soon show improvement. See that they have more exercise and if their bowels are costive give them either Epsom salt or castor oil. Give each sick pig 10 grains sodium salicylate every time you feed them.

Leg Weakness.—Two chickens are troubled with leg weakness. I keep 48 fowls and only two of them seem to be ailing. P. G., Albany, N. Y.—Leg weakness is not a disease, but a result of other ailments. Having only two sick fowls and not knowing what ails them, you had better keep them by themselves or destroy them. Mix together equal parts ginger, gentian, bicarbonate soda and charcoal and give each sick fowl 30 grains at a dose, 3 times a day.

Malignant Tumor.—Cow has a sore on side of face, below eye, that partially heals and from time to time breaks open, discharging pus. This is the third winter she has been troubled with these small boils on face. When warm weather comes the boils heal up and scabs dry off but her face remains swollen and thickened. She is in thriving condition and eats well. She is also a regular breeder. This winter we have been feeding her milk to hogs. J. W. D., Newport, Pa.—A chronic ailment of this kind is not easily cured. Apply iodine to swollen portion of face, 3 or 4 times a week, especially to wall of abscess. Give her a tablespoonful of hypo-sulphite of soda at a dose in feed, 3 times a day. If there is no pus coming from sore I know of no reason why her milk could not be used.

Use KEROSENE Engine Free!

Amazing "DETROIT" Kerosene Engine shipped on 15 days' FREE Trial, proves kerosene cheapest, safest, most powerful fuel. If satisfied, pay lowest price ever given on reliable farm engine; if not pay nothing. No waste, no evaporation, no explosion from coal oil.

Gasoline Going Up!

Gasoline is 9c to 15c higher than coal oil. Still going up. Two pints of coal oil do work of three pints gasoline.

Amazing "DETROIT"

—only engine running on coal oil successfully, uses alcohol, gasoline and benzine, too. Starts without cranking. Only three moving parts—no cams—no sprockets—no gears—no valves—the utmost in simplicity, power and strength. Mounted on skids. All sizes, 2 to 20 h. p., in stock ready to ship. Engine tested before crating. Comes all ready to run. Pumps, saws, threshes, churns, separates milk, grinds feed, shells corn, runs home electric lighting plant. Prices (stripped), $29.50 up. Sent any place on 15 days' Free Trial. Don't buy an engine till you investigate the money-saving, power-saving "DETROIT." Thousands in use. Costs only postal to find out. "Better than leather For all kinds of weather"

Cut Your Shoe Cost and Have Real Foot Comfort

The cost of leather is jumping higher. More leather is used every day. The automobile makers alone take enough to put the price up. That is why leather shoes cost more than ever before.

Here are work shoes far better than any of leather. They are right in fit—absolutely waterproof—comfortable—and cost less than leather work shoes, because they always outlast them. Buy a pair today. Ask for them by this name—**Hub-Mark Bootees.** They mean money saved—no rheumatism, no corns, no bunions, no callouses—in short, real foot comfort.

Note this:—Look for the **Hub-Mark** on all kinds and styles of rubber footwear for men, women, boys, and girls. You can rely on anything you buy from dealers who sell **Hub-Mark Bootees**—they are square dealers.

Gentlemen:—I received the roofing in good condition. I am pleased with it and the promptness with which you sent it. Yours truly, S. C. Moyer.

Fredonia, Pa., June 17, 1913.
Dear Sirs:—Received the Garden Cultivator O. K. It is a very good tool and I am well pleased with it. Samuel McBurney.

Milroy, Pa., Dec. 26, 1913.
Dear Sirs:—Enclosed find check for $160 in payment of the gasoline engine bought from you on the 30 days trial offer. It has proved satisfactory and works fine. Yours truly, W. D. McNitt.

33 Big Factories Cut The Cost To Save You Money

You Can See the Goods Before You Pay—
Try Them 30 Days Before You Pay—

I want to show you that you can buy a thousand different articles—all guaranteed—including Ready Roofing of all kinds—Metal Roofings—House Paints—Barn Paints—Buggies, Wagons, Harness—Fencing for every purpose—Furniture—Incubators—Pianos—Farm Implements—Gasoline Engines—Cream Separators—and many other items for which you would likely pay *one-third or one-half more than we ask,* for our fully guaranteed factory products which we sell on the unusual plan outlined. I will positively ship any article listed in the United Factories Catalog to any responsible person, anywhere in the U. S.

No Money Down — No Deposit — No C. O. D.

You don't have to even make a bank deposit. Nothing like this offer was ever made before. My plan makes it entirely safe for every buyer who wants to save money. All chance of dissatisfaction, all risk, all expense, if no sale, is with us. You cannot lose one cent. We don't handle thousands of little things, priced cheap, but which cost you in the long run more than you would have to pay at home for the same goods. But we can save you money, and give you the best of satisfaction, on the many lines we make, and we will let you see the articles you select before you pay—try them 30 days if you wish to do so. If you want to save money on a large number of items—*the saving of which amounts to a real benefit*—write today for our

90c Per Roll
Think of buying reliable, dependable, ready-to-use roofing—see before you pay. Test the material—keep it 30 days—pay after you have had a chance to compare it, and find out what it is made of. That's the way we sell all our roofing—any kind you want and all you want. Get our Prepared Roofing samples Free. Test them by our rigid methods. Write for estimates. Buy your roofing the new way—
See it before you pay one cent.
UNITO Challenge Prepared Roofing including Cement, Nails and directions for laying. PER ROLL 90c

—Get Our Prices on Metal Roofing —Big Reduction.
We can save you big money on your roofing material this year. Big reduction in factory prices. Write for estimates, and get our catalog which shows roofing of all kinds, rules for measuring, and illustrates all fixtures and accessories for making the finest kind of metal roof. The style here shown we quote at startling prices. If you are going to build, or put on new roof this year, be sure to get our prices, estimates and samples. You can see the roof you select before you pay. Examine it—test it—if not satisfactory you are not out one cent.

—Try a Unito Gasoline Engine 30 Days
No deposit—no C. O. D. We furnish any size engine up to 12 h. p. Unito engines are fully guaranteed for five years. You can buy Unito Engines direct from us.
1½ H.P. to 12 H.P. $27.75 and up
Unito Engines can be had mounted for sawing, on skids, or with iron base. Style shown is water cooled 1½ h. p. and is a dandy. Get our catalog and select the engine you want on our favorable terms. Our price for this 1½ h. p. Unito, only............ $27.75
PAY AFTER YOU TEST THE ENGINE.

—Drive a Fine Buggy 30 Days Before You Pay
$39.55 and up
Unito Buggies are designed and built to stand the greatest wear and tear, and have all the style, snap, finish and elegance money can buy. We guarantee every job "extraordinary" value. Order one—test it out—drive 30 days and then if satisfied pay our low direct from factory price. We won't ask you for a dollar until you have had an opportunity to prove every statement made regarding any style you choose from our catalog.
The test here shown is the most rigid that can be given any buggy and our book explains how you can judge and test every part from the shafts to the running gear and wheels. If you want to save money on a buggy get our Factories catalog—order your buggy on our favorable terms. We guarantee every job for three years from date of purchase.
SEE BEFORE YOU PAY.

Use This Harness 30 Days Before You Pay $10.98
Full description of this splendid value can be had by sending for our 160-page catalog, showing single and double harness. Harness No. 5501 has ⅞ inch lines, ⅝ inch bridle, shaft tugs ⅞ inch, Griffith Belly Band, traces 1⅛ inch, double and stitched.
No. 5501 Breast Collar Style $10.98

PAINT — Before You Pay
We will sell you barn paint or house paint—or any other kind you want on the above terms. Not a cent in advance—Guarantee it for **five years.** Our prices are lower than the dealer has to pay.
70c PER GALLON
is all we ask for barn and silo paint—other prices in proportion.
Free Color Cards also "Paint Hints and Color Helps." Our new book on how to select paints, and the best colors to use.

Commission Merchants and The 35-Cent Dollar

By FRED W. DEAN, Susquehanna Co., Pa.

FRED W. DEAN.

Having been a shipper of farm produce for 30 years, I long since discovered discrepancies in returns from commission men that could not be accounted for in any way except that the goods were grafted. In the fall of 1907, I shipped 204 barrels of fancy Baldwin apples to a well-known and supposedly reliable commission house in a large city in western Pennsylvania. In a short time I got returns for 176 barrels of apples at a very low price. A letter accompanying the returns stated that the apples were badly rotted and that there was a shortage of 28 barrels because of the rotten condition of the fruit; also a charge of $10 for labor in resorting the apples. This letter explained that the charge covered only a part of the labor of resorting, but that they felt sorry for me and so only charged a part of the cost up to me. The balance of the apples, they said, brought a low price because of the dull color and poor appearance of the fruit after being sorted over.

My loss being something over $1 per barrel, or over $200 on the lot, I naturally felt quite worked up over the deal. I wrote the firm a letter stating in substance that they were thieves. I got a letter in reply intimating that if I wrote them any more such letters they would have me arrested for using the mails for uttering a libel. I was somewhat worried over this state of affairs, so I let the matter drop for the time being. Four years later I went to another shipping station in this state and opened up correspondence with this same firm under an assumed name, stating that I had a few nice apples to ship to some reliable commission house and that I understood that they were a reliable house. I soon got a reply asserting their reliability and saying that they would be very glad to handle my goods and predicting that the deal would be mutually beneficial.

Upon receipt of this letter I made a shipment of barreled apples in marked packages, leaving another shipment with a friend to be shipped one week later. I then took the train for the city. Upon arrival I secured a room near the produce district, under still another assumed name. The following morning I went into the produce district, making the acquaintance of my commission merchant, as a buyer of fancy apples. In about one week, I discovered early one morning that my apples had come in during the night and were at the freight station. I kept close watch and at length saw the firm's team come and get these apples. I next transferred my activities to the wholesale house of the firm upon the street, where the goods were soon unloaded. I appeared upon the scene early in quest of fancy Baldwin and Spy apples, of which my shipment consisted. After being shown several lots, none of which suited me, I was shown my own goods. These I purchased, being careful to take an itemized account of sales or purchase.

After buying the goods I secured the services of a cartman and took the apples to a cold storage plant in the city and put them in storage. I then stayed around the city, calling upon this house every day or two. I bragged up the goods I had bought and mentioned that if they should get any more apples like those, I would like to buy them. As the time drew near for the next shipment to arrive, I again kept watch at the freight station. Again early one morning I discovered that my second shipment of goods had arrived during the night. I saw the apples carted to the wholesale house and unloaded as before. I again appeared on the scene as a purchaser, but this time I was recognized at once and notified that they had another consignment of apples from the same party that I bought of before; and they certainly did brag up those goods as being very fine. I quietly purchased these goods and, as before, took an itemized bill of the goods; and, as before, I took them to the cold storage plant and placed them in storage. I then left for home.

I got my mail thru a friend. When the returns came in on the first shipment, the price was short about 50 cents on each barrel, and when the returns came for the second lot, they were short about $1 per barrel. Between the two shipments the market price of apples had advanced about 50 cents per barrel. I then wrote the firm to know why my second shipment of apples had not brought a better price, calling attention to the advance in the meantime. I also asked them to give me the name and address of the party who had purchased the apples as I wished to come to their city and interview him. In reply to this I got a letter saying that the apples arrived in bad order and they sold them to a cheap peddler for cash and that they did not get his name and that their books did not show who he was.

I expected just such a letter as this from my previous experience. Armed with this letter and others, also the bill of sales and bills rendered, I went back to the city and secured the services of a good lawyer, and commenced prosecution. All at once there was consternation in the whole produce section of the city. The commission men were organized into a league and one man's fight was every man's fight. A conference was held at their suggestion in my lawyer's office at which several prominent men of the city, including a state senator, were present. I was threatened with dire calamity. I found out that the produce dealers' association was more worried about the publicity of the deal than they were about the legal part. With their influence they appeared to feel that they could handle the

SHORT-COURSE STUDENTS AT THE NEW JERSEY COLLEGE OF AGRICULTURE, SEASON OF 1914.

Sows Fertilizers QUICKLY EVENLY

Sows broadcast or in rows all kinds of commercial fertilizers—nitrate, phosphate, guano, lime, ashes, etc. Distributes it fast and evenly in amounts from one hundred to several thousand pounds per acre. Simple and strong. Gauge is easily and quickly set.

The Chicopee Line

STEVENS Fertilizer Sower

Has only force feed which will sow successfully all kinds of commercial fertilizers in large or small quantities. No springs or gears in box. Order one this season. We'll refer you to a dealer if none near you. Send today for 64-page Catalog of Chicopee Line tools—the line of 61 years' sterling reputation. There's an implement for every farm need.

$10,000.00 BACKS THIS DRILL

If this drill does not satisfy you in every way after **30 DAYS' FREE TRIAL** ship it back at our expense and we will refund all your money, or forfeit $10,000 held in trust by our bankers to protect you. This is the best all round drill on the market—sows all kinds of seed, grain or fertilizers. Strong, durable, exact. High broad tires lighten pull. We also make a low down and plain seed drill. We sell direct from factory—save you $10 to $20 dealers' profits.
HERTZLER & ZOOK CO., Box 118, Belleville, Pa.

legal fight, but the newspapers would got hold of the evidence and it would not do to let it get out. A claim set up by the firm was that they had sold the goods to themsolves at the depot, and that I got the market price at the switch, and the advance was theirs. But the bill rendered contained a charge for cartage of 5 cents per barrel, so they were balked there and their claim would not hold water.

As I held both ends of the bag and also the goods and the letters I was not much worried about the outcome of the deal. The parties, however, were stubborn and the case was fought clear up to the door of the grand jury room before settlement was secured. The firm paid the full amount, including balance on the old account of four years previous. After settlement was secured, we got quite chummy and the head of the firm, as we parted at the close of the deal, said: "Well, Mr. Dean, I am no worse than the rest. They all do the same thing." I might mention that this man was a prominent member of the church and stood high in the business community. My lawyer complimented me upon the legal aspects of the case, as I had the avenues of escape all cut off before I pulled the strings.

NOTE:—The second article in this series will be published next week.—The Editors.

Growing of Winter Vetch.

By Prof. A. E. GRANTHAM, Delaware Experiment Station.

Winter vetch is a legume that deserves to be better known by the eastern farmer. The plant is adapted to a variety of soils, altho a sandy loam will probably give the best results. Any soil that is well drained will give a good growth of vetch. The extreme types of soil, such as the clays and even some of the more sandy soils, will produce an excellent crop if properly managed. On the heavier lands, such as clay loam, earlier seeding is desirable, owing to the less rapid fall growth on such soils.

The vetch plant has a large capacity for gathering and storing nitrogen and it probably surpasses in this respect any of the legumes which have equal periods of growth. While the plant does not have the root system of the clovers, yet the growth made above ground is very heavy. Investigations show that a ton of dry vetch contains phosphoric acid and 48 pounds of pot- 54 pounds of nitrogen, 19 pounds of

SAND VETCH AND CRIMSON CLOVER MIXED AND SOWN AT LAST CULTIVATION OF CORN.
Photo was taken in late October.

ash. These figures indicate the high fertilizing qualities of the crop.

Winter vetch starts growth rather slowly and should be sown early enough to become well established before winter. Seeding from the 15th of August to the first of September will generally be satisfactory if sown on specially prepared land. As the plant is a winter legume, it best serves the purpose of soil improvement by sowing in the standing corn, tomatoes or after early potatoes have been removed. Where it is desirable the land may be especially fitted, as in the case of wheat or oats stubble. In the open, sowings may be made a little later than among growing crops. In corn or tomatoes vetch may be sown broadcast at the last cultivation of the crop. If conditions are not favorable for sowing at this time, the vetch may be sown broadcast in the corn and covered with a small A-harrow run between the rows.

Vetch has some advantage over crimson clover from the fact that it may be planted or covered deeper than crimson clover. One of the drawbacks to the culture of crimson clover in corn is often due to the lack of moisture at the surface of the soil. As the seed will not allow deep covering, the clover may fail to come up or the young plants die from drought. Vetch may be covered much deeper, in that way coming in contact with the moist soil. To get a good stand of vetch, about 30 pounds of seed are required per acre. With good seed and a well prepared soil, 18 or 20 pounds of vetch will make a good stand.

Vetch may be mixed with either rye or crimson clover and grown together. If the vetch is to be cut for hay, it will be necessary to sow with either wheat or rye to hold up the vetch. This mixture should be harvested when the rye or wheat just begins to fill. Large yields of fairly good hay can be grown in this manner. Three pecks to one bushel of rye and 20 pounds of vetch are used for an acre.

Where winter and spring pasture is desired, as well as a green manure crop, crimson clover may be added to the rye and vetch. This makes a very thick growth and will afford considerable spring pasture. The seeding mixture is composed of 8 pounds of crimson clover, 15 pounds of vetch and two pecks of rye. A machine that we have found very useful in sowing this mixture is a one-horse wheat drill made to sow wheat between the rows of standing corn. The crimson clover seed is placed in the grass seeding compartment of the drill while the rye and vetch mixed are put in the grain box. In this way the rye and vetch are sown at the depth of wheat while the clover is lightly covered by the drill hoes.

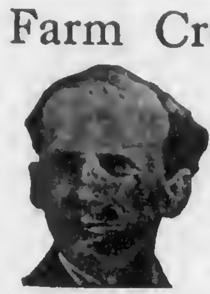
Vetch takes up considerable quantities of the mineral fertilizers, phosphoric acid and potash; therefore a moderate application of a mixture of 4 parts of acid phosphate to 1 part of muriate of potash should be used. Where vetch has not been previously grown, care should be taken to inoculate the seed as the growth is greatly stimulated by thoro inoculation. Cultures for inoculation may be secured from commercial concerns or from the Department of Agriculture at Washington. Unsatisfactory results with vetch are often due to lack of inoculation.

If the vetch is grown for green manure alone, no support crop need be sown with it. Our experience has been that crimson clover and vetch sown together will make a greater growth for plowing under than either crop alone. The crimson clover spreads out close to the ground while the vetch makes little growth at the base and trails like a vine. The clover will prevent the vetch from lying so flat on the ground.

Whether grown alone or in combination with other crop, vetch will be found decidedly beneficial in the restoration of worn-out soils. In hardiness it will surpass crimson clover and can be grown anywhere in the corn belt. The seed of vetch is becoming cheaper year by year, which will allow more extensive sowings. There is no reason why the seed cannot be produced at home for seeding purposes. Since a support crop must be used, the rye is threshed with the vetch. The mixture may be used for seed again. A machine, it is claimed, has been recently invented that will separate the vetch seed from the wheat or rye.

In buying vetch seed, be sure to get Hairy or Winter vetch. The spring vetch, the seed of which is sometimes mistaken for hairy vetch, is not hardy and will be killed by the winter.

Farm Crop Notes



By
R. P. KESTER
Counselor on Soils to the State Department of Agriculture.

Thru this department Mr. Kester will discuss queries from Pennsylvania Farmer readers on soils, field crops and general farm practice. Address all queries to Pennsylvania Farmer, Philadelphia, Pa.

Some Questions

Flax Seed and Buckwheat.—James R., North Carolina, writes: I have some whole flax seed. How could I prepare it for hogs, and how should it be fed? Can buckwheat be threshed with a common grain thresher? How should it be fed to hogs?

I do not think whole flax seed is ever used in any considerable quantities. Flax seed meal is made by grinding the cake produced by the process of pressing the oil from the seed. Even this must be fed in relatively small quantities. Buckwheat is threshed on a regular grain thresher. The concave holding the under teeth is generally removed, turned upside down, or is lowered beyond reach of all cylinder teeth. If left as for other grain, the buckwheat is badly broken. Buckwheat may be ground or chopped as other grain, and should be mixed with other grain. When fed in any considerable quantities to hogs, it often produces irritating skin eruptions.

Preparation for Corn, Potatoes and Tobacco

J. N. L., Lancaster Co., Pa.—"I have a field that was in corn last year. It was sown to crimson clover. I got a fair stand. I gave the field a pretty fair coating of manure. Part of it will be planted to corn. I have been thinking of liming the field after it is plowed. What kind would you prefer and how much would you use? What do you think of broadcasting about 400 or 500 pounds of a 10-7 fertilizer? The corn will be planted in check rows. How far apart and how many grains to the hill? Another part of the field will be planted to potatoes. Will the clover and manure give me enough nitrogen, and what do you think of about 500 pounds per acre of a 10-7 fertilizer. The rest of the field will be planted to tobacco. Would 3-3-20 fertilizer be all right? Some of my clover leaves are red. Does that indicate that the land needs lime? Would broadcasting the fertilizer for potatoes be better than drilling in row."

The amount and kind of fertilizers suggested by our friend is probably as good as could be suggested at long range. No opinion will be expressed for tobacco fertilizer as that requires a still more intimate knowledge of the soil in the field where it is to be used. I am glad to see a more general recognition of the need for more phosphoric acid than potash. This is true on most Pennsylvania soils.

It is best to broadcast at least two-thirds of the fertilizer, and distribute the balance in the row. It is possible that it would pay to add some nitrogen to the potato fertilizer, say about 2 percent, or, to distribute 100 pounds nitrate soda along the row and cultivate it in when the tops are 4 or 5 inches high.

As to the kind of lime to use, that will depend upon the relative cost. Several splendid articles have recently appeared in this paper on that subject. The last one in issue of March 14th. You can usually get more lime for a dollar in the burned, lump form than any other but when the ground limestone can be bought cheap enough it is preferable, but remember to use twice the quantity.

Some of the largest yields of corn raised in southeastern Pennsylvania are planted so as to secure three stalks to the hill and the rows 46 to 48 inches apart. It is hard to say what is the matter with the clover plants. There are several insects as well as fungus diseases that injure clover. If it does not die and is fairly thrifty, it is possible that an application of lime will remedy the trouble.—R. P. K.

CITY MARKET PROBLEMS

Distribution Needs

I read with interest an editorial in a recent number of Pennsylvania Farmer about a municipal market that the city of Philadelphia is preparing to test out. The proposed system was to provide a means for the farmers of the surrounding sections to place their products directly before the city consumers thereby dispensing with the middle men. I also note that you say the success of the undertaking will depend largely upon the extent to which the farmers make use of the opportunity offered. This is a matter of importance to both the farmer and city consumer. To my mind there are three very important items that must be taken into consideration: First, the city must provide the market place; second, must teach the city consumer to go to market and buy direct; third, must provide an adequate delivery system from the market place to the homes in every section of the city.

The third item will prove the hardest one to solve, and without it I fail to see how a farmers' market of any importance can be a success. I am not wise enough to solve the riddle, but firmly believe that a trolley-freight system, thoroly organized and run from the market place to all parts of the city, at least two days per week, would be the means of saving thousands of dollars each month to the householders of Philadelphia, and also help the farmers receive more satisfactory returns for their products. With trolley-freight cars built for the purpose a large amount of farm produce could be delivered without interfering with traffic, and add to the revenue of the operating company.

The city should have at least two large markets or receiving stations, one along the Delaware River front and another along the Schuylkill, where farm products could be delivered by tide water and rail. They should there be sold direct to the trade, both wholesale and retail, without being carted thru the rough streets by careless drivers from the depots to commission houses and then thru the hands of so many middle men as is now the practice. The business farmer does not have time to go to market in truck season. He sells his goods where he can get the best price. Last July I quit sending cucumbers to Philadelphia when selling for 60 cents per basket, less freight 6 cents and commission 6 cents, netting me 48 cents per basket. I sold them to a local dealer for $1.05 per small crate, less 10 cents for crate, netting me 95 cents. They were shipped with green tomatoes in iced cars to Arizona.

From the farmer's viewpoint the question of a municipal market in Philadelphia can be summed up in a very few words: Give us a real farmer's market, worthy of the name with an adequate delivery system. Keep out the huckster and fakers, and we will ship our products fresh from the farms.—W. S., Gloucester County, N. J.

Notice

If you are receiving two copies of Pennsylvania Farmer please advise us so that we can discontinue one copy. It frequently happens in sending in renewal orders people give different initials from those on their original order consequently receive two copies instead of one.

If you receive a notice to renew your subscription after you have sent us your renewal order, kindly disregard it, unless you fail to receive Pennsylvania Farmer each week, or are receiving two copies in which case please notify us and one copy will be discontinued and proper credit given you.

Low 30-Day Price On Edwards STEEL Shingles

Never Rot Rust or Burn

Don't make a single move toward that new roof until you get Edwards' Special Cut-Price Proposition for April. Save $15 to $30 under best wood shingles and get a genuine leak proof, rust-proof, fire-proof and lightning-proof STEEL Shingle roof. A roof that will outlast your house or barn.

Put On With Hammer and Nails

You can lay an Edwards Steel Shingle Roof ten times as easy and ten times as quick as wood shingles. Shingles come in big sheets, 100 in a cluster. Lay them right over old roof or sheathing if you like. No painting, no extras to buy. Everything furnished.

Can't Leak—Can't Burn

Edwards "Tightcote" process (covered by patents) means dipping in melted zinc after cutting and stamping. Close-fitting overlap protects nail-holes. No place for rust to start or water to get in. Roof when laid is really all one piece. No Edwards Steel Roof ever struck by lightning. We back this statement with a $10,000 guarantee bond. You get this guarantee when you buy.

Special April Price, Freight Paid

Recently we made a most advantageous purchase of steel. So for 30 days only we are able to quote a price that will astonish you. Send for new Bargain Circular No. 491 and give dimension of roof if you can. Thousands are writing, so don't delay.

THE EDWARDS MFG. CO.
4341-4391 Lock St. Cincinnati, Ohio

85c Per Roll 108 Sq. Ft. Ready Roofing Freight Prepaid

Lowest price ever made on ready roofing of this weight and quality. This is the famous **Ajax Brand** made from best long fibre felt, densely saturated with asphalt. Storm proof, absolutely water-tight, fire resistant. Each roll contains three to five pieces—108 square feet in all. Quality guaranteed.

FREIGHT PREPAID PRICES

Where Men of Ambition Prosper

NOWHERE is ambition rewarded more generously than in the Southeast. Small capital and energy will accomplish wonderful results for you in this favored land.

Dairying, trucking, fruit growing, poultry raising and general farming are making Southern farmers independent.

Land from $15 an Acre Up

Plenty of rain and ample sunshine every month, irrigation unnecessary. Growing season from 7 to 10 months duration. Two and three crops raised annually. Local markets plentiful and profitable. Early vegetables and fruit bring high prices in Northern cities.

Modern schools and highways, good churches, rural telephones, healthful climate and delightful summers and winters make the South the most desirable location in America for Homeseekers.

Learn How to Make Money

Send for the "Southern Field" magazine, booklets and farm lists which give the whole facts.

1913 RECORD *Magnificent Crops in all Western Canada*

All parts of the Provinces of Manitoba, Saskatchewan and Alberta, have produced wonderful yields of Wheat, Oats, Barley and Flax. Wheat graded from Contract to No. 1 Hard, weighed heavy and yielded from 20 to 45 bushels per acre; 22 bushels was about the total average. Mixed Farming may be considered fully as profitable an industry as grain raising. The excellent grasses full of nutrition, are the only food required either for beef or dairy purposes. In 1912, at Chicago, Western Canada carried off the Championship for beef steer. Good schools, markets convenient, climate excellent. For the homesteader, the man who wishes to farm extensively, or the investor, Canada offers the biggest opportunity of any place on the continent.

Apply for descriptive literature and reduced railway rates to Superintendent of Immigration, Ottawa, Canada, or to Canadian Government Agent.

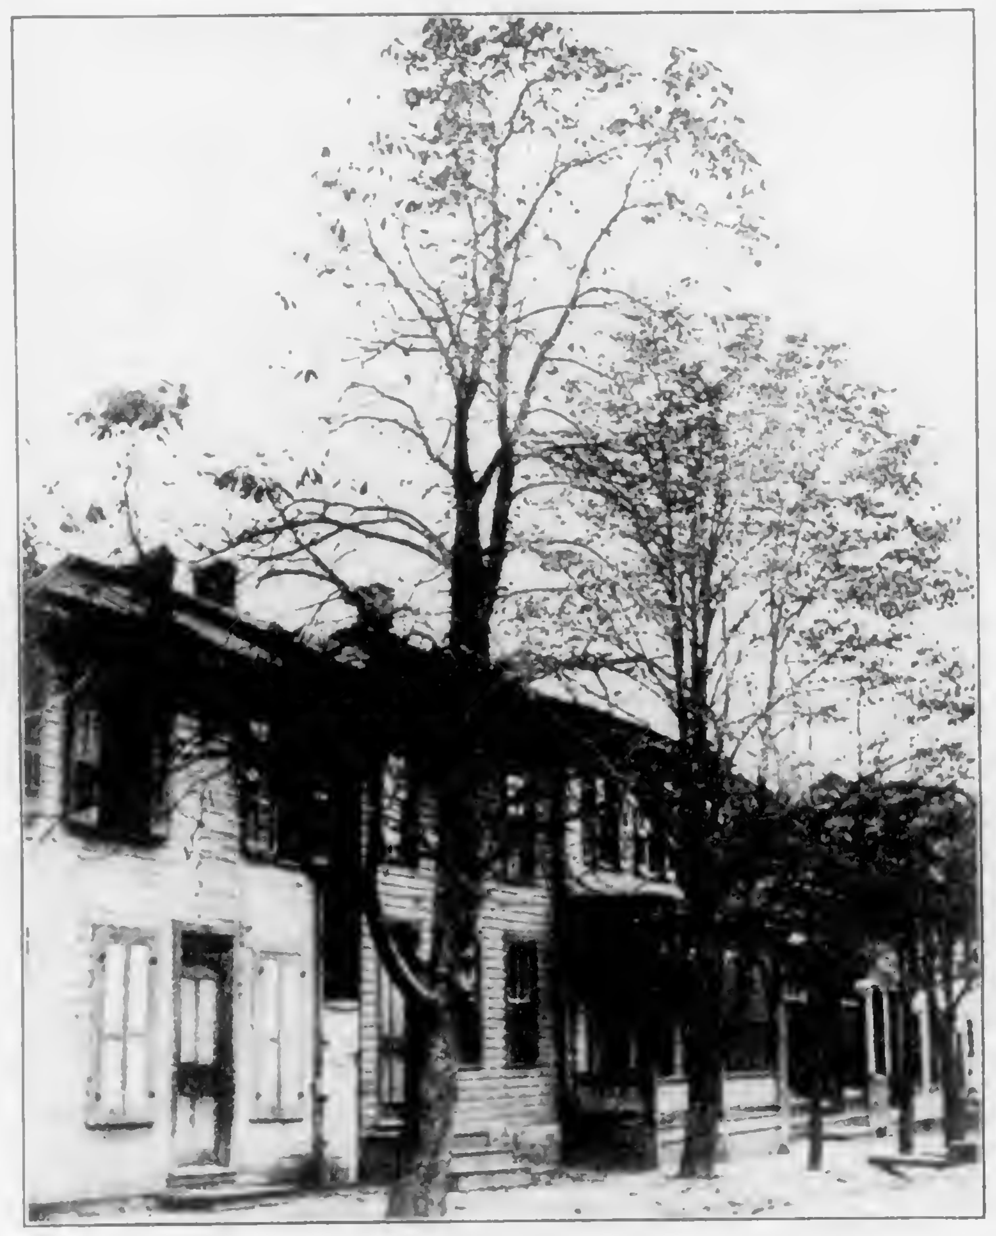
SELECTION OF SHADE TREES

An item to which too little importance is often attached is the selection of shade trees. As with all other matters pertaining to the house and grounds, a little thought at the right time will mean much toward future comfort and satisfaction.

Of the trees used for shade purposes may be mentioned the horse chestnut, the North Carolina poplar, the ash, the locust and the maple. The maples include several different types, viz; the Norway maple and the silver maple. To this list may be added also the weeping mulberry, the elm and the oriental plane.

In selecting trees for shade purposes see that they are varieties that tend to produce heavy leafage at the time when shade is needed; that thrive in the particular climate desired; that do not have heavy masses of roots to tear up sidewalk materials and close up sewers or drains; and, finally, trees that hold their leaves until late fall.

Among the trees named the horse chestnut is one of the most used and poorest of the shade trees. Its leaves begin to die and fall as early as the middle of August, especially when the tree becomes old. These leaves keep sidewalks and lawns littered up. With the season's advance comes the crop of horse chestnuts. Hulls and nuts increase the litter.



HORSE CHESTNUT TREES BARE AND UGLY NOV. 1.

The North Carolina poplar has enjoyed much popularity. It has heavy foliage and is easy to grow. When it is used in cities or towns where there are pavements and sewers, the roots cause damage. Many municipalities now have ordinances prohibiting their use.

With the exception of silver maple all maple trees are excellent for shade. The Norway is best for city conditions particularly where soot and drouth are to be encountered. Maples are largely used in the North for shade purposes.

In some sections the weeping mulberry, which has a heavy foliage, is used. Because of its stateliness the elm makes a good ornamental. Its leaves, while small are borne in abundance. The ash is a good shade producer and holds its leaves until late in the season.

For ornamental and shade purposes the Oriental plane or buttonwood tree is giving excellent satisfaction. It combines beauty, heavy foliage and thriftiness and does not shed its leaves early. The second illustration shows two of these trees. The photograph was taken November first and indicates the tenacity with which the leaves cling to the tree. Contrast these trees with the horse chestnut trees shown in the first illustration, with leaves few and far between.—E. E. Claspby, Mifflin Co., Pa.

ORCHARD HEATING

Some interesting information on the subject of heating orchards as a means of saving budding fruit trees from freezing by reason of late spring frosts is contained in a recent bulletin from the department of Agriculture.

Of the classes of heaters used there are the oil burning and coal burning varieties. The oil burning heaters are of all sizes and shapes at prices ranging from 20 to 75 cents each. There are many different makes which may be compared by securing catalogs from the different manufacturers. The lard pail type is extremely serviceable and simple and is easily stored because it nests and requires little space, and may be made by the local tinsmith if desired. A useful size is 7 inches across at the bottom, 9 inches at the top and 12 inches high, which will hold 3 gallons of oil and burn about one quart per hour, thus burning 12 hours at one filling. Smaller heaters have the disadvantage of requiring to be filled often. This type is fitted with cover. The rectangular type is usually divided into a storage compartment and burning compartment, both being provided with covers. The size of flame can be controlled to suit the temperature of the air. This type is large and rather costly, very serviceable and desirable, but requires considerable storage space. Empty metal paint kegs, fitted with covers, may be utilized.

In lighting new oil heaters it is usually necessary to use burlap or excelsior to act as a wick. After a deposit forms on the sides of the heater the wick is no longer necessary. Usually a few drops of gasoline are thrown over the oil and the torch applied at once. A wad of cotton wrapped with wire and dipped in oil makes a good torch. There is on the market a combination gasoline discharger and torch, which is extremely useful.

Of the coal burning class of heaters are the circular or angular types with parallel sides or inverted cone-shaped with broad flaring sides. The latter is always lighted from the bottom, while some of the former are lighted from the bottom and others from the top. Kindling wood and oil-soaked burlap or excelsior are necessary aids in lighting the coal burners.

Small piles of wood, brush, oil-soaked sawdust and other combustible materials are sometimes used as makeshift heaters, and often with good success. The object is to produce heat at the proper time and place, no matter what is used to do it.

Comparing the oil and coal heaters, we find that the oil heaters are quickly filled, easily lighted, throw off the maximum heat almost instantly, can have size of flame regulated by the cover, can be replenished quickly and can be extinguished instantly by replacing the cover. The coal heaters require considerable time and care to be filled properly, are slow in starting when lighted, throw off little heat at first, cannot well be exinguished except by dumping, and even then the fuel will continue to burn for some time; can be quickly replenished while burning, and must be refilled after each burning.

Where coal is cheap coal heaters may be most desirable even tho more labor is required in operating them; otherwise the oil heaters are to be preferred; soot from oil heaters may, it is suspected, collect in sufficient quantities on the blossoms to prevent pollination. This point remains to be proven. As to the number of heaters necessary, better have too many than too few. They should be placed from 20 to 22 feet apart each way in rows between the trees, rather than near to or under the trees, and on the windward side they should be about 10 feet apart in a row, perhaps 15 or 20 feet away from the first row of trees and outside of the orchard. This outside row will thus have an extra number of heaters because it must protect the first row of trees and because the heat from it is so much scattered that fewer heaters could not give the necessary protection. Heaters are placed in rows to facilitate filling, lighting and extinguishing.

As soon as buds begin to open 32 degrees had better be warning of trouble. Unopened buds will stand a lower temperature and heating is seldom resorted to until they begin to open. Do not burn fuel uselessly. Have tested thermometers distributed thruout the orchard and at a couple of points outside the orchard for comparison. If the temperature goes down slowly during the night and reaches 32 degrees a short time before sunrise, it will not be necessary to light the heaters. If it reaches 32 degrees earlier in the night, every fourth heater should be lighted and more if necessary to keep it at 32 degrees or a little higher. The thermometers outside the orchard must be watched so as to know how cold it is away from the heated area. In case of a rapid drop in temperature in the evening or during the night, the grower must be alert and get fires going before 32 degrees is reached, as it is easier to maintain a safe temperature than it is to raise an injurious one.

An alarm thermometer working automatically and connected with the house may save time and worry in keeping the temperature of the orchard properly adjusted.

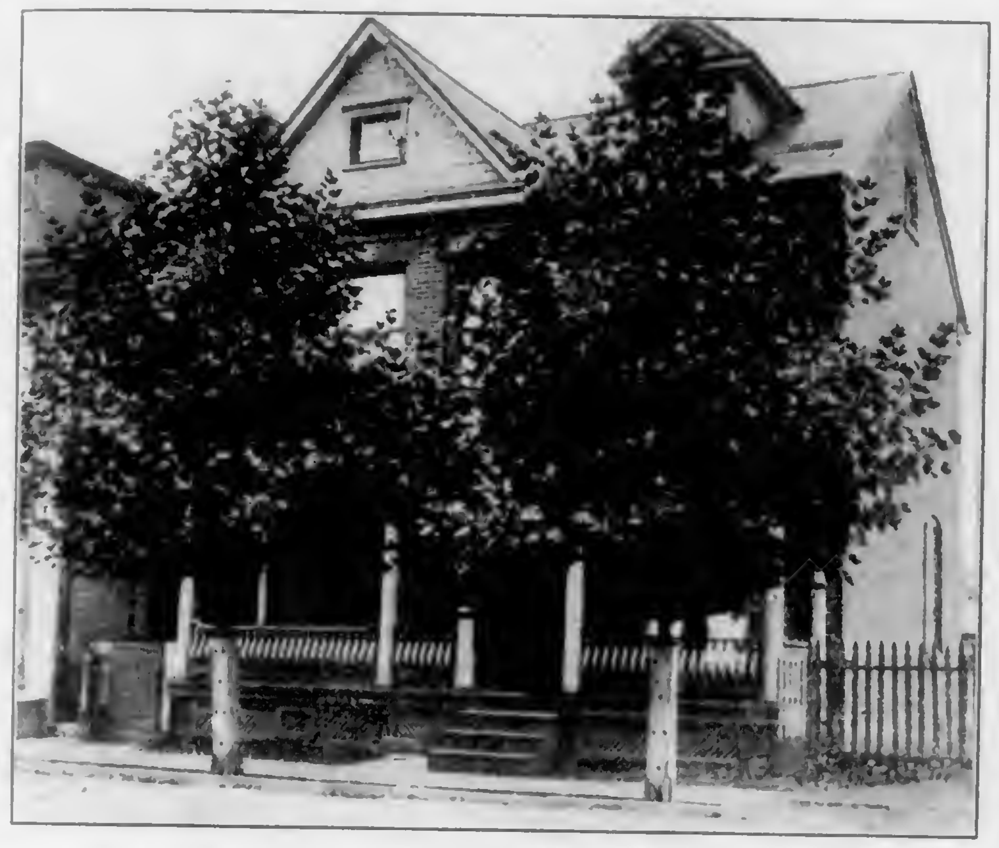
It is essential to have storage tanks near at hand for convenience in refilling the heaters.

One hundred heaters per acre will burn 100 quarts of oil per hour or 100 gallons in 4 hours. In most sections a consumption of 300 gallons or less per season is sufficient but it is not safe to risk having less than this amount on hand. A thoro understanding should be had with the jobber to ship oil immediately upon receipt of telegraphic orders.

Storage tanks may be made of wood, iron or cement. A wagon tank with large faucet and short piece of hose is desirable for distributing tho oil in the orchard.

The kind of oil used, whether crude, fuel or distillate, will depend upon which is available in the different sections. Oils with a paraffin base are better than those with asphaltum base, the later leaving too much unburnable residue.

Oil heaters cost from $20 to $75 per acre, depending upon the kind used. At least 300 gallons of oil per acre must be on hand to begin with and this will cost from $9 to $20. Distributing tanks and storage tanks will add to the expense according to size and kind. Buckets, torches, etc., do not add much to the expense.



ORIENTAL PLANE SHADE TREES IN FULL FOLIAGE WHEN PHOTOGRAPHED NOV. 1, 1913.

Coal heaters cost from $20 to $30 per acre, and since the coal may be dumped on the ground there is no expense for storage. Coal may be distributed in piles in the orchard and the heaters refilled from these without more equipment than ordinary baskets and shovels.

It is better to have an oversupply than an undersupply of equipment, as failure to heat at a critical time causes all expense for that year to go for naught.

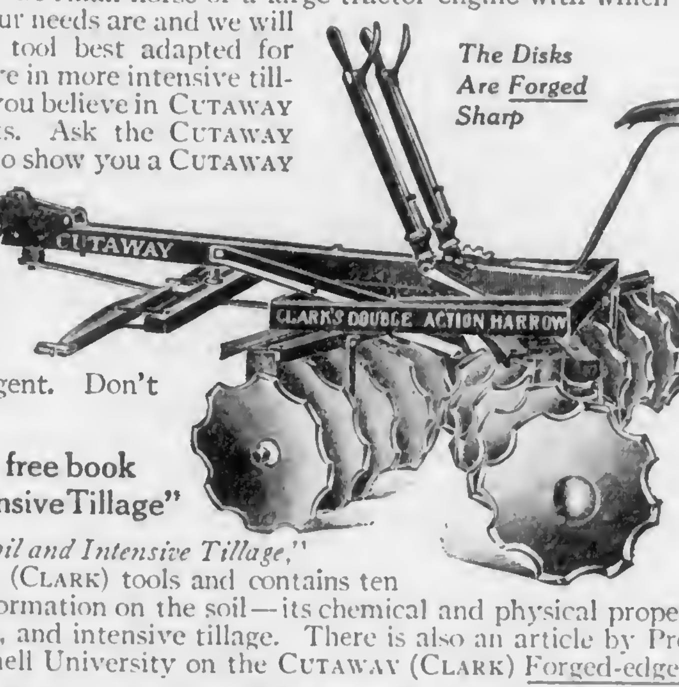
Cutaway (CLARK) Disk Harrows Work Up The Soil Finer Than Other Harrows And Are Lighter Draft

For more than a quarter century we have been making CUTAWAY (CLARK) disk harrows for men who want to till their land more thoroughly, more intensively, than is generally practised. Today CUTAWAY (CLARK) implements are the standard of real worth. They are constructed with utter disregard of the designs followed by makers of other disk harrows. They are built to pulverize the soil finer than other harrows will do, and to do it without increasing the draft. We make

OVER 100 STYLES AND SIZES

of CUTAWAY (CLARK) disk harrows and plows. We have one for every farmer whether he has but one small horse or a large tractor engine with which to pull it. Tell us what your needs are and we will tell you about the tool best adapted for them. If you believe in more intensive tillage of the soil, then you believe in CUTAWAY (CLARK) implements. Ask the CUTAWAY dealer in your town to show you a CUTAWAY (CLARK) disk harrow or plow. If we have no dealer there, write to us for catalog. We ship direct where we are not represented by an agent. Don't accept a substitute.



Write today for free book "The Soil and Intensive Tillage"

Our booklet, "*The Soil and Intensive Tillage*," illustrates CUTAWAY (CLARK) tools and contains ten pages of valuable information on the soil—its chemical and physical properties—the feeding of plants, and intensive tillage. There is also an article by Professor G. B. Upton of Cornell University on the CUTAWAY (CLARK) Forged-edge Disk.

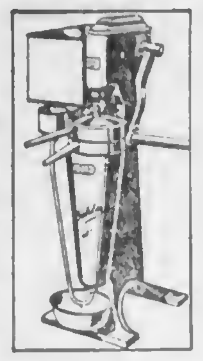
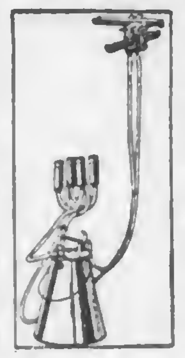
SHARPLES
TUBULAR
CREAM SEPARATOR



Patterned after the great world spinning on its axis, the revolving bowl of the TUBULAR has no fixed shaft and no fixed bearing. It is suspended by a flexible steel spindle, its weight being borne by a resilient ball bearing, permitting the bowl to run practically without rocking, with ease, smoothness and precision. Increases the centrifugal force without increasing the speed. The TUBULAR skims close, is easily and quickly cleaned, is built sturdily in all of its few parts. All gears are enclosed. It is constructed to afford a lifetime of durability and consumes little oil. Its suspension is natural and is not eccentric to its center of gravity.

SHARPLES
MILKER



The MILKER is in daily use under all widely varying conditions in dairies of different classes, in all dairying sections of the United States and Canada. The teat cup with the upward squeeze is almost human in its ability to adapt itself to the proper way of milking cows of different temperaments. The fresh and heavy milker, the hard milker, the hold-up milker—all are milked as they should be milked.

The SEPARATOR CATALOG and the MILKER BOOK give full details regarding the construction and utility of these dependable SHARPLES products.

Improvement of Permanent Pastures.---No. IV.

By JOHN H. REISNER, Cornell University.

The Pasture Grasses

Let us consider only those grasses, a combination of which will give the qualities essential for a good pasture, which are (1) quick green growth in spring; (2) a large production of green matter; (3) feed which is palatable, nutritious and digestible; (4) continuous supply of pasturage thruout the season; (5) a turf that will resist injury from tramping and overgrazing. After considering the qualities of some of the best pasture grasses for Pennsylvania we can then determine what mixture of grasses is desirable under any given conditions. The essential qualities of this mixture are that the grasses, in addition to fulfilling the requirements of a good pasture as stated above have (1) different soil and moisture requirements; (2) have different root systems, that is occupy different strata of soil; (3) have different stooling habits and (4) have different seasons of leaf growth.

PASTURE LAND BEING RECLAIMED BY ANGORA GOATS.
The goats are a source of profit in addition to cleaning the land.

Kentucky Bluegrass.—This grass does best on well-limed soils, not prominent on wet lands as on the high elevations. Considerable growth of lower leaves; widely spreading in habits and forms dense sod under favorable conditions. It has slow growth during warmer part of summer, good growth in spring and fall; reaches maturity only after 3 or 4 years. It is Pennsylvania's most reliable and extensive pasture plant. It should be included in all seedings used for permanent pasture lands except on very poor or wet soils.

A STRETCH OF GOOD PASTURE LAND UNDER GOOD TREATMENT.

Canadian Bluegrass.—Closely resembles Kentucky bluegrass; will thrive on a poorer and drier soil than Kentucky bluegrass. It is relished by stock even after matured and becomes dry but does not produce as much herbage as the Kentucky bluegrass. On good soils it can not compete with Kentucky bluegrass. It should be included in mixtures for poor lands.

Timothy.—Does best on well-drained sweet, clay soils, but found under wide diversity of conditions. Its growth is compact. It is palatable and nutritious and rather deep rooted; fairly permanent but is crowded out by bluegrass. Should always form the basis for a pasture seeding.

Meadow Fescue.—The habit of growth of meadow fescue is similar to timothy. It does best on rich soils; does not do well on soils that are very dry or lack fertility; is nutritious. It is not widely distributed in Pennsylvania pasture. The seed is rather expensive. Should be included in mixtures to be used on rich lands.

Red Top.—Grows well on poorly drained and acid soils. Least relished of our common grasses but indispensable on wet lands. Forms dense sod; grows rapidly from seed and ready to graze in a short time. Is to wet sour lands what timothy is to well drained and sweet lands. Should be used liberally in mixtures for poor lands.

Orchard Grass.—Well drained and fertile soils necessary. Among the earliest of our pasture grasses. Habit of growth is tufted; vigorous grower. When young and tender, it is liked by cattle. Becomes tough and unpalatable if not pastured early. A good grass to include in mixture for well drained rich soils.

Red Clover.—Valuable as a pasture plant only in mixture. Must be reseeded every two or three years; adapted to well-drained and sweet soils. Deep rooted. Should always be included in a new seeding.

Alsike Clover.—Will grow under acid and wet soil conditions. Is hardier than red clover. Must be resown after a few years. Deep rooted. Should be included in all mixtures in amounts varying with soil conditions.

White Clover.—A valuable pasture plant; wants same conditions of growth as demanded by Kentucky bluegrass and grows well with the latter. Habit of growth creeping. Good green growth. Palatable and nutritious. Should be included in pasture mixtures.

Mixtures for Permanent Pastures

Mixtures For Good Soils.—The mixture given below (taken from Bulletin 280, N. Y. State College of Agriculture) is suggested for a new seeding or a reseeding. If a new seeding, the amounts can be used as they stand. If the mixture is used for reseeding, the quantities can be lessened without changing the proportion. It may even be wise to omit some of them altogether, depending upon the given conditions: Timothy, 8 to 12 pounds; Kentucky bluegrass, 4 pounds; meadow fescue, 1 to 4 pounds; orchard grass, 1 to 4 pounds; red clover, 6 pounds; alsike clover, 3 pounds; white clover, 1 to 2 pounds.

In this mixture, for the first two or three years timothy, orchard grass, red and alsike clover will furnish most of the green pasturage. Eventually Kentucky bluegrass, meadow fescue and white clover will furnish most of it. If the soil is inclined to be wet, 4 pounds of red top can be substituted for the orchard grass.

Mixture For Poor Soil.—This mixture will differ from the one above by the omission of the Kentucky bluegrass, the meadow fescue, and the orchard grass,. Redtop and Canadian bluegrass are substituted in order to meet the changed soil conditions: Timothy, 8 to 12 pounds; red top, 4 pounds; Canadian bluegrass, 4 pounds; red clover, 6 pounds; alsike, 3 pounds; white clover, 1 pound. Here again for the first few years timothy, red top, red and alsike clover will furnish the largest amounts of forage, and then, unless these grasses are reseeded, Canadian bluegrass and red top will predominate.

One word more. Do not attempt to buy these mixtures. Buy the amounts of the different seeds separately and mix them at home, yourself. It will not only be cheaper but you will also know exactly what the mixture is and what to expect from it. It would be an excellent thing to do, if the seeds purchased could be tested for purity before seeding. This could be accomplished by sending small samples of each seed to the state college of agriculture and having the test made there. It can scarcely be called good management to sow grass seed that contains a considerable amount of the seeds of weeds and other foreign plants, when such results can be obviated by having the seeds tested for their purity. A guarantee is not a certain evidence that the seeds bought contain no foreign seeds.

What a
DE LAVAL
Cream Separator
SAVES
over any other separator or creaming system

Quantity of cream that no other separator will recover completely, particularly under the harder conditions of every day use.

Quality of cream as evidenced by De Laval butter always scoring highest in every important contest.

Labor in every way over any gravity system, and also over any other separator, by turning easier, being simpler, easiest to clean and requiring no adjustment.

Time by hours over any gravity system, and as well over any other separator by reason of greater capacity and the same reasons that save labor.

Cost since while a De Laval cream separator may cost a little more than a poor one to begin with it will last from ten to twenty years, while other separators wear out and require to be replaced in from one to five years.

Profit in more and better cream, with less labor and effort, every time milk is put through the machine, twice a day, or 730 times a year for every year the separator lasts.

Satisfaction, which is no small consideration, and can only come from knowing you have the best separator, with which you are sure you are at all times accomplishing the best possible results.

Easily proven—these are all facts capable of easy demonstration and proof to any user or intending buyer of a cream separator. Every De Laval agent is glad of a chance to prove them by a De Laval machine itself—without the slightest obligation on your part unless entirely satisfied.

If you don't know the nearest De Laval agent, simply address the nearest main office as below.

FOUR FEET TO TRAMP; ONE MOUTH TO EAT

Now in early April comes the temptation to pasture bare meadows and permanent pastures. Damage to the land is positive and great, with little or no real benefit to the restless stock other than that of a little exercise that would be just as beneficial if secured in an open field or wood lot. Moreover, the scant and frozen grass is often actually detrimental to the health and production of the dairy cow. The amount of injurious tramping and packing of wet soils by cattle in the spring season is almost beyond estimate. In fact, almost every property of a productive soil is, figuratively speaking, insulted. Yet in a 17-mile ride recently cattle were seen tramping over semi-snow covered fields where the bare spots evinced about as much real pasture as the face of a 15-year-old boy demonstrates the need of a razor.

About five cents worth of hay and seven cents worth of corn ensilage will supply the wholesome roughage for each cow for 24 hours, and after eating this the animals can lie down and rest. Another saving in keeping the cattle confined to a more limited space for each 24 hours is that the greater part of the manure can be saved and utilized to make still more fertile the acres of the farm. The excrement of a well-nourished dairy cow should, if properly conserved and applied to the soil, be worth each day the outlay for ensilage,—seven cents.—D. H. Watts, Clearfield Co., Pa.

COW RATION

Kindly give me a proper ration for a family cow. I have but the one cow. She came fresh Mar. 22. She gives milk from but three teats, having lost the other last year. The blind quarter is now very hard.—A. D., Bristol, Pa.

As you have but the one cow we assume that you have no silage and not a large variety of home-grown feeds. If you buy hay, get as good quality clover as possible, and alfalfa hay will be still better if available at a reasonable price. A good grain ration may be made up of 5 parts corn meal, 1½ parts gluten feed and 1 part cottonseed meal, by weight. Start feeding about 6 pounds of this mixture, with all the roughage the cow will clean up per day. Increase gradually as long as the cow continues to increase in production of milk. An occasional feeding of roots or even small potatoes or potato parings from the kitchen will benefit the cow.

If you have use for all the milk a good cow will produce or have a market for surplus milk it will likely pay you to dispose of this cow and buy another with four good teats and normal production. Very few three-teated cows have any place in the dairy except as breeders, and a three-teater is equally unprofitable when kept alone. From your description of the case we judge that there is little likelihood of the other quarter of udder ever being restored.

Mock Silage.—The Vermont Station has been making some experiments with mock silage made from dry corn fodder. Three tons of water were added to 8 tons of shredded fodder. Five days later 2.5 tons more water were added, in another 3 days 4 tons more, a week later 2 tons, and daily waterings during the following week aggregating about 1,500 pounds. The final product contained about 25 percent of dry matter.

Sold Direct from Factory to Farm

Just fill in, cut out and mail the Free Coupon below, **right now.** Yes sir, I want you, the man who is holding this paper in his hands right now, to write to me right away. I've got something special to offer every one of you.

Listen! For the next few months, I am going to make you the most amazing, the most liberal offer you ever heard of in your life. I want every dairyman, every owner of two or more cows, in this country to get the benefit of this new Special Offer of mine. So write me today without fail. My Offer is new and original. It's different. It has never before been equalled in the history of this country. It's a combination offer. I not only save you all the middlemen's profits but I sell you a better machine and give you a bonus as well to try it, which shows my faith in my separator, my proposition and my plan. Learn all about my plan and offer **now.** Just mail coupon today before you lay this paper down.

SAVE $35.00 TO $50.00

On the best, most modern, most sanitary and closest skimming cream separator in the world. Travel 20,000 miles. Look over every factory in the United States and all foreign countries, you won't find its superior at any price. The New Galloway Sanitary is the latest and greatest product of my big Chain of Factories. It's the mechanical masterpiece of all my years in the manufacturing business. It's absolutely in a class by itself. But I am not going to ask you to take merely my word or anybody else's word for my machine. Not for a single second. I am going to give you the opportunity of finding out the real facts for yourself.

Try it 90 Days at My Risk

I'll let you try my New Improved Galloway Sanitary any way you wish. I'll send you one of my wonderful new separators, size you want, right to your farm for 30, 60 or 90 days' trial absolutely free. I want you to test it out every way you can think of. Compare it with any other machine that you know of, no matter what the price. If anybody else is trying to sell you a separater, make them let you take their machine and set it right up by the side of mine. Compare them at every point—easy running, easy cleaning, close skimming, mechanical construction, sanitary features, in any way you can think of and then keep the machine that suits you best.

If you think that there is any other separator in the world at any price that you would rather have than the Galloway, after you have given it a good, fair test, ship it right back to me at my expense. I'll agree right now to pay all the freight both ways so you won't be out a penny or under the slightest obligation if you decide not to keep the separator after having had the free trial. If you decide to keep it, I'll guarantee to save you from $30 to $50 besides giving you a separator that absolutely has no equal in the world at any price. Then on top of this remarkable offer, remember my New Galloway Sanitary is backed by a

10 Year Guarantee—$25,000 Bond

Every single New Galloway Sanitary cream separator that leaves my factory has a straight 10-year guarantee on materials and $25,000 legal bond back of it. You take no risk of my separator not only giving you the greatest of satisfaction for a 90-day trial period but for practically a lifetime. My 10-year guarantee and my bond are printed in black and white and there are no strings tied to them. They are regular contracts that protect every Galloway customer. Accept this most liberal offer with this positive protection back of it. Don't delay. Write me now. Get my catalog and full details of my Offer. Just fill in, cut out and mail the coupon.

FREE Cut Out and Mail Coupon for My Free Catalog and Valuable Dairy Cow Book.

My New 1914 Book shows my New Galloway Sanitary Cream separator and explains my liberal, direct from factory, plan of selling it at the lowest prices ever made on a strictly standard, high grade separator. Don't fail to get this book and investigate my new separator before you think of buying any other style or make. It's money in your pocket for it means a saving of $35 to $50 to you.

Then when you send for my catalog I am going to give you full details of my New Special 1914 Offer—the most liberal offer ever made and a coupon which entitles you to a **free** copy of my valuable book of information—Galloway's Dairy Cow Book—regular price $1.25. You want my Dairy Cow Book without fail. It's chuck full of cow facts. It will help you make your cows pay you a whole lot bigger profit. It tells how to feed and stable your cows—How to build up a milk-producing herd—How to make top quality butter—How to test your milk and many other important things you ought to know if you want to make big money in the Dairy business. This book is free to you. Just fill in, cut out and mail free coupon or write me a postal. Then as a clincher, I am going to make you a still bigger offer—one that will help you get your separator partly or entirely without cost to you in the end. This is my Co-operative-Profit Sharing Offer that has helped thousands of men pay for their machines. No canvassing. No soliciting. Just a straight business proposition. Write me today. Poultry

IDEAS HELP SELL POULTRY PRODUCTS

A Kansas man was dining in Chicago with a well-to-do friend. Having always been a raiser and fancier of poultry, as well as having a good appetite for a well-raised and properly cooked bird, he ordered half of a milk-fed chicken. It was delicious. Summoning the head waiter, he learned that it had been shipped by a firm in Topeka and had been raised on a farm within fifty miles of his home. The host paid the bill, $1.50 for half, or $3 for the entire chicken. The farmer had been paid twelve cents a pound for the chicken, which thus brought him only thirty-five to fifty cents.

It was not the expense of shipping or handling the chicken that made it cost so much in Chicago, nor was it altogether the cooking and serving that made the price so high, altho the hotel made a good profit. The point is, the Topeka firm has a reputation for fine poultry and the hotels pay a big price for it. This firm has established a market, and the wealthy class is willing to pay for the goods with the reputation. There are poultrymen the country over, who are getting common prices because they do not go after the right kind of trade. It makes more work but that is only a detail compared with the increased profits.

In building up a poultry market, there are four outlets thru which the high-priced product passes: High-class hotels, good restaurants, country clubs, or fashionable clubs for that matter, and wealthy families in search of something extraordinarily fine. To be able to sell them poultry products one must have something to convince prospective customers that his stock is better than the ordinary, or, better still, better than the best that is being put out. Once a foothold is gained, the producer must keep it up to the standard and always be on the lookout for a chance to improve it.

One man who was trying to start went to the head of the purchasing department in one of the leading hotels of a large city and said: "Here are some eggs that are better than the ordinary. Take them, try them out, and tell me what you think of them." They were better. He had graded them perfectly as to the size and color of the shell. One was exactly the same as the other from all outward appearances, and they had been kept perfectly. They were put up in neat cartons with the trade name on them and the goods had individuality. The hotel man reported the eggs of extra quality, and the producer, who had a contract in his pocket, all ready to be signed, agreed to furnish all the eggs the hotel needed for three months at four cents more on the dozen than the market price. In less than three years he was furnishing all the hotels with eggs and dressed fowls, at ten to fourteen cents more on the dozen or pound than the rest were getting. The hotels never objected: they were getting products that they could give to their guests without fear of complaint.

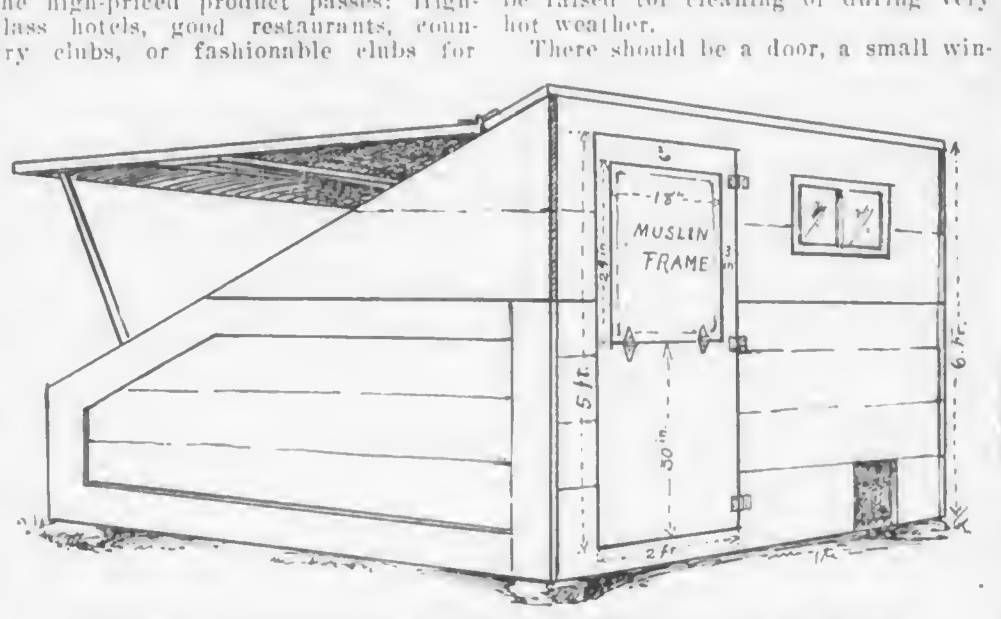
In naming the products, give something distinctive; even trade names for the various grades of the same product are useful when putting them before the public. One eastern poultry raiser had a catch phrase on all his packages and cartons, proclaiming that his chickens ate nothing but grain. It brought him trade, because some people hesitated about eating chickens which fed on filth.

There are ways of boning that make chickens sell better. These really are not much trouble if studied a little bit. Pamphlets have been put out showing exactly how it is done and how the fowls look when dressed in this way. A fact that should not be overlooked is that eggs are better if not fertilized. The reason is obvious. The fertilized egg will keep on germinating in a temperature as low as seventy degrees. The result is a small red spot. Altho perfectly good, many fastidious persons will regard them as unfit.

In any industry the individual who puts up a superior product, maintains his reputation for that product, and then uses a little enterprise in finding a market, is the profit maker.

POULTRY HOUSES FROM PIANO BOXES

Can you outline a method for utilizing old piano boxes as poultry houses; also mention a breed of fowls suitable for the production of broilers.—W. J. R., Sugar Grove, Pa. Every farm needs a few small portable poultry houses which may be used for a small breeding pen or which may be equipped with portable hovers or small brood coops and used for rearing chickens. Piano boxes may be used to good advantage in the contruction of such houses. A good method is to lay a box flat on its back and remove the entire top. Build up the sides and front, as shown in the accompanying sketch, making the front about 6 feet high. The back will be approximately 2 feet high. Hinge the top or roof at the front so that it can be raised for cleaning or during very hot weather.



PIANO BOX UTILIZED FOR CONSTRUCTION OF PORTABLE POULTRY HOUSE.

There should be a door, a small window, and a small door for fowls in the front. The door should be approximately 2 feet wide and 5 feet high. A window for ventilation should be placed in the upper part of the door. This window, 18 by 24 inches in size, equipped with a muslin covered frame hinged at the bottom to swing in and down, will provide ample ventilation for the house. This opening should be covered with fine mesh wire to keep sparrows out and fowls in when the muslin curtain is open. A four-light 8 by 10 inch glass window placed in the front will provide plenty of light. The chick door should be about 15 inches square. Cover the roof and sides with a good grade of roofing paper. The materials for this house should not cost more than $5 or $6.

This house is large enough to accommodate from 60 to 75 chicks. If hens are used for brooding, each hen should be confined to a small pen in the back of the house. Give each hen from 15 to 20 chicks depending upon the weather. As soon as the chicks are weaned, remove the hens and indoor pens and allow the chicks to run together in one flock. A good portable hover will satisfactorily care for 60 to 75 chicks.

A house of this size and type may be used for a small breeding pen of 6 to 8 fowls.

Avoid yarding fowls wherever possible. Move the house to a new location on the farm every few weeks and give the fowls or chicks free range. If this is not possible, provide two yards as large as convenient and allow the fowls to run for two weeks in one and then for two weeks in the other.

One of the American breeds—Plymouth Rock, Wyandotte, Rhode Island Red—will be advisable for the production of broilers. The question of breed is not of great importance. More depends upon the breeding and the care and management of the fowls than upon the breed.—Prof. M. C. Kilpatrick, State College, Pa.

Fit to Fire the Farm Engine
Costs no more—lasts longer
When you want a battery for any purpose—especially for your engine, auto or tractor—say Columbia and get the time-tried product of the largest battery makers in the world. Quarter century repute for batteries built for business. Columbias are sold all over the world. Every cell signed by the makers.

SKIM MILK FOR PIGS AND POULTRY

Will you kindly tell us something of the food value of skim milk for pigs and for chickens? L. S. D., Bridgeton, N. J.

There have been many experiments to determine the feeding value of skim milk for pigs. All of these have shown it to be of high value when fed in connection with grain. Trials at Wisconsin experiment station showed separator skim milk to have an actual feeding value for hogs of about one-fifth that of an equal weight of corn or mixed grain meal. That is, when properly mixed with other concentrates, from 500 to 600 pounds of separator skim milk had a feeding value for pigs equal to 100 pounds of corn meal or mixed meal. Best results were obtained when not over 300 pounds of skim milk were fed with 100 pounds of corn meal. Investigations have shown that when skim milk is fed in the above proportions with corn its feeding value is somewhere near 25 cents per 100 pounds as compared with corn at 60 cents per bushel.

Two rules have been laid down for determining the money value of skim milk for fattening hogs. The Hoard rule is as follows: To find the value of 100 pounds of skim milk when fed alone, multiply the market price of live hogs in cents per pound by 5; if fed in combination with corn, multiply by 6. Thus, with live hogs selling at 9½ cents per pound, the skim milk fed alone would be worth 5 times 9½ cents or 17½ cents per cwt.; if fed in combination with corn it would be worth 57 cents per cwt.

What is known as the Gurler rule, proposed many years ago, holds that the value of 100 pounds of skim milk when fed with corn to fattening hogs is half the price per bushel. Thus, with corn at 70 cents per bushel, skim milk would be worth about 35 cents per cwt.

Some stations have found that pigs fed on sour skim milk kept in more thrifty condition than those fed sweet milk.

Milk is very generally used in feeding and fattening poultry, but we have never seen figures on its food value with this class of stock. Can some of our poultry readers supply information on this point?

DOCK THE LAMBS

Much has been said and written about the advantages and value of docking lambs while they are young. We still find many flocks where the docking of lambs is neglected and put off until it is too late. Such flocks generally have among their numbers a lot of sheep that carry long tails, the wool of which is usually filled with manure and filth. Such sheep detract from the appearance of the flock and to a prospective buyer or visitor it indicates carlessness and poor management. Such sheep are also usually less thrifty, will not develop as well and will be less profitable to the grower than a flock where all have been docked and neatly trimmed.

Lambs that have not been docked will gather on their tails, especially during the fall and winter, all manner of refuse and filth. The tails will drag in the snow during the winter and become laden with water and ice. The tails of sheep left undocked are never dry and the accumulation of manure adds several pounds of useless weight for the sheep to carry around. Such lambs, when put in the feed lot, are always in a poorer condition and do not make as good use of the feed consumed as those that are docked. If undocked lambs are kept in the flock for breeders they are less desirable because of the difficulty in getting the ewes bred. During the spring and summer the tails are one of the most inviting breeding places for animal parasites and cause the flock master no end of trouble.

Docking lambs is a comparatively simple operation and should be performed while the lambs are young. The best time for this is when the lambs are from two to four weeks old. A sharp knife, pinchers or chisel and wooden block are some of the simplest implements to be used. The operation can be performed by one person, but it is more convenient and the job can be completed in less time when two do the work. One person can hold the lamb while the other removes the tail. In cutting the tail it is well to push the skin toward the body so that there is a surplus to cover the end of the tail. Cut the tail at about an inch from the body and try to strike the joint.

During early spring it is not necessary to disinfect the place where the tail has been cut. During warm weather, when there is more danger from flies, it is well to disinfect the stump of the tail with a weak solution of carbolic acid or some coal-tar dip. During early spring it is important that the lambs have a dry place so as to keep them from getting cold. It is well to do this work some day when the sun shines and the prospects are good for a warm day.

It may seem like a big job and considerable trouble to dock lambs. It is one of the small jobs however, that goes to make the sheep business a success and certainly means a better price for lambs when they go on the market in the fall, to say nothing of the inconvenience caused when breeding undocked ewes and also handling them in the feed lot.—Prof. W. H. Tomhave, Pennsylvania State College.

"ON THE SAFE SIDE." TWO-YEAR-OLD CARRIE COOKSON SWICKARD FEEDING THE PIGGIES.

ROMNEY SHEEP

A very interesting little booklet descriptive of the Romney sheep has just been issued by the American Romney Breeders' Association. As is well known among sheep men the Romney breed combines characteristics of hardiness, vigor, early fattening and heavy fleece which promise to make it of especial value to certain large areas in this country. At present there is a demand for Romney rams for use in the range flocks of the West that is satisfied only by large importations from England and New Zealand. There would seem to be a promising future for the breed in the East, not only in development of breeding stock but for mutton and wool as well. The booklet is for general distribution and may be secured by addressing Secretary, Jos. E. Wing, Mechanicsburg, O.

STALLION LICENSES IN PENNSYLVANIA

Circular No. 27 of the Pennsylvania Live Stock Sanitary Board is a 92-page bulletin giving satistics on stallion registration in the state. There has been steady increase in the number of registrations of stallions since 1908, with the number of unregistered animals licensed remaining about the same. The total number of licenses issued in 1912 was 2,344, of which 954 were registered and 1,390 unregistered.

MORE MONEY EASIER AND FASTER WORK
You lose $1.00 on every six sheep you shear in the old way. The Stewart gets a length and quality of wool that brings the highest price. Extra profits soon pay for it. The Stewart has ball bearings in every part where friction or wear occurs. Has a ball bearing shearing head of the latest improved Stewart pattern. Its price complete, including 4 combs and 4 cutters of the celebrated Stewart quality is $11.50.
STEWART'S No 9 BALL BEARING SHEARING MACHINE PRICE $11.50
gets all the wool and takes it off quickly and smoothly in one unbroken blanket. To shear with the Stewart Machine seems like play to those who have labored with hand shears in the old, hard, sweaty way. You don't have the same swollen aching wrists. You don't scar and disfigure your sheep with uneven shearing and spoil the wool with second cuts like you used to do. Get one from your dealer, or send us $2.00 and we will ship C. O. D. for balance. Money back if you are not well pleased.

Stewart Ball Bearing Clipping Machine
For Horses, Mules and Cows
It pays to clip horses and mules in the spring—they look and feel better, do more work, rest better and get more good from their feed. Clipping the flanks and udders of cows prevents the dropping of filth into milk. The Stewart can be used for clipping horses, mules and cows without change. It's the easiest to turn, does the fastest work, stays sharp longer and is the most durable. Get one from your dealer, or send $2.00 and we will ship C.O.D. for the balance. Money back if not well pleased.
PRICE $7.50

International Special Dairy Feed
MIXED WITH CORN AND OATS COWS INCREASE ONE-THIRD
INTERNATIONAL SPECIAL MOLASSES DAIRY FEED
Mr. J. P. Goodall of Capron, Ill., writes us as follows: "I have used International Special Dairy Feed for two years, feeding 4 pounds per day mixed with ground corn and oats and by using your feed as above I have obtained an increase of one-third in milk production. My cows always keep healthy and eat with a relish."
International Special Dairy Feed costs less per ton than ground corn and oats. For each ton of International Special Dairy Feed that you will buy and use along with other grain feed you will make an extra profit of $10.00 to $15.00.
International Special Dairy Feed is also extensively used as an entire grain ration and used in this manner will produce more milk at less cost than can be obtained from any other method of feeding.
Ask your dealer for International Special Dairy Feed. If he don't keep it for sale, then send us your dealer's name and address—we will arrange with him to supply you. C-7

Philadelphia, Pa., April 4, 1914.

Rich Lancaster A report recently issued by the government census bureau has raised the old question as to which is the richest and most productive of the 2,950 counties of the country. The report places Los Angeles County, California, first with a total production value of $14,720,900; Lancaster Co., Pa., second with $13,059,600 and McLean County, Ill., third with $12,811,500. These valuations are on crop production alone and do not include live stock or live stock products. The above totals are sub-divided for each of the three counties as follows:

Los Angeles County.—Cereals, $806,507; other grains and seeds, $218,428; hay and forage, $3,430,698; vegetables, $1,255,093; fruits and nuts, $6,731,532; all other crops, $2,278,626. Total, $14,720,884.

Lancaster County.—Cereals, $5,459,810; other grains and seeds, $5,702; hay and forage, $2,287,361; vegetables, $1,137,034; fruits and nuts, $396,698; all other crops, $3,772,983. Total, $13,059,588.

McLean County. Cereal, $11,480,655; other grains and seeds, $8,714; hay and forage, $694,684; vegetables, $270,661; fruits and nuts, $121,062; all other crops, $235,730. Total, $12,811,506.

These figures represent the farm value of all crops produced. It will be noted that Los Angeles county has by far the largest return from fruits and nuts which are marketed in finished form. Lancaster and McLean counties have largest values in cereals (including corn) and hay and forage crops, which are marketed largely thru livestock as beef, pork and dairy products. While adding such by-products to crop totals multiplies production by duplication, it is necessary to take them into consideration to arrive at a fair estimate of money return from crops produced. The figures on live stock products for the three counties for 1909 are given as follows:

Los Angeles County.—Receipts from dairy products, $1,362,257; from poultry and eggs, $699,807; honey and wax produced, $93,569; wool and mohair produced, $32,366; from sales of animals, $710,569. Total, $2,898,568.

Lancaster County.—Receipts from dairy products, $2,212,252; from poultry and eggs, $1,219,989; honey and wax produced, $10,673; wool and mohair produced, $3,553; from sales of animals, $2,790,333. Total, $6,236,800.

McLean County. — Receipts from dairy products, $335,353; from poultry and eggs, $276,924; honey and wax produced, $1,009; wool and mohair produced, $23,535; from sales of animals, $4,144,602. Total, $4,781,423.

It will be noted that from this source of revenue Lancaster County is far in the lead. Other statistics on the agricultural phases of the three counties show that Los Angeles and McLean counties have larger, more highly capitalized farms, the former worked under intensive methods in the production of fruit, nuts and vegetables and the latter in extensive cereal and forage production. Lancaster is a county of small, moderately priced farms devoted to general farming. Census statistics on these phases are as follows:

Los Angeles County.—Total area in improved land 418,998 acres; total number of farms, 7,919; size of average farm, 95.7 acres, valued at $237.94 per acre. All farm property in the county is valued at $199,998,200, divided as follows: Land $180,354,798; buildings, $11,798,273; implements and machinery, $2,462,387; domestic animals, poultry and bees, $5,382,742. Average value of all property per farm, $25,255.

Lancaster County.—Total area of improved land, 472,795 acres; total number of farms, 10,835; size of average farm, 50.8 acres, valued at $69.90 per acre. All farm property in county is valued at $84,426,907, divided as follows: Land, $38,477,280; buildings, $32,808,583; implements and machinery, $4,716,136; domestic animals, poultry and bees, $8,424,908. Average value of all property per farm $7,792.

McLean County.—Total area improved land, 703,695 acres; total number of farms, 4,500; size of average farm, 162.9 acres, valued at $171.85 per acre. All farm property in the county is valued at $147,846,611, divided as follows: Land, $125,993,902; buildings, $11,430,312; implements and machinery, $2,073,574; domestic animals, poultry and bees, $8,348,823. Average value of all property per farm, $32,855.

These figures might form the basis of much comparative calculation, but we wish merely to point out the comparative earnings upon money invested. Good farming like good business is measured by the return from capital invested. Unfortunately we do not have the net returns, so must use the gross returns upon crops produced as given in the census report. Upon this basis it will be observed that Los Angeles County made a total return of $14,720,884 on a total farm valuation of $199,998,200, or a gross earning on investment of about 7.3 percent. Lancaster County made a total return of $13,059,588 on a total farm valuation of $84,426,907, or a gross earning on investment of about 15.4 percent. McLean County made a total return of $12,811,506 on a total farm valuation of $147,846,611, or a gross earring of 8.6 percent.

Farm Wages Government reports indicate that wages of farm laborers have increased more rapidly in the last 20 years than those for city workmen. During the last year the pay of the farm hand increased 2½ percent. The increase has been 11 percent in the past four years and 36 percent since 1902. Census reports indicate that in 1909 the amount of wages paid to farm laborers was $651,611,287, or almost double the cost in 1899, which was $357,391,930. Considerable increases in this item of expense are indicated since 1909. It is an established fact that along with this increase in the amount of wages paid there has been little enhancement in the profits from farm produce to the farmer and greater increase in the cost of land, production and marketing. While wages increased 37 percent from 1900 to 1910, farm land values nearly doubled, showing that in the "distribution of the proceeds from farming operations a larger proportion now goes to capital account and less to labor account than formerly; the interest rate of return on the capitalized value of land, however, is probably less than 25 or 30 years ago." From 1902 to 1912 the average wage rates of farm labor without board in the United States increased from $22.12 to $25.98 per month, or 33.7 percent. At the average rates of wages for farm labor without board per month in the United State (using $29.58 of 1912) and the average prices of farm products at the farm in 1913 such figures as 43 bushels of corn, 37 bushels of wheat, 43 bushels of potatoes, 101 pounds of butter, 90 dozen of eggs or 259 pounds of chickens are given as representing the amount necessary to pay a month's wages in 1913. While it is in a way surprising, statistics are mute evidence to the fact that those out of employment turn to farm work only as a last resort and this in the face of the large increase in the wage of farm laborers.

Commission Merchants The article on the first page of this issue is the first of a series giving the experiences of a Pennsylvania farmer and produce shipper with commission merchants in a number of eastern cities. The methods described in this first article were used in securing the facts that will be given in the remaining numbers in the series. The author did what few farmers can afford to do in making his various investigations. His summary of what he learned of marketing methods is mighty interesting reading. But this fact in itself is not sufficient reason for writing or publishing these articles. Neither the author nor ourselves have any desire to increase the unthinking, purposeless prejudice against the so-called middlemen who stand between the producers and consumers of farm products. Our only purpose in presenting this matter to our readers is the hope that it may lead to the development of needed reforms. It is not to be inferred that the practices here described are used by all commission men or that all middlemen are dishonest. The series will simply give details of practices that have been used, and every farmer who has shipped goods knows that these irregularities occur frequently enough to make the problem of efficient remedy an important one to both producers and consumers. An effort was made in the last session of the Pennsylvania legislature to pass a law requiring all middlemen to operate under a state license and provide limited state regulation. The effort failed largely because of the indifference of the farmers, and lack of support among those who should be most interested. It has not yet been determined that the plan proposed at that time would have proved efficient. Perhaps a better plan may be developed for consideration at this next session. It is a significant fact that the entire defense of the commission men before the legislative hearings on the bill two years ago was based upon the claim that the shippers were dishonest in the packing and grading of their goods, and that a remedial law, to be just to both sides, should enforce honesty on both sides. Every honest shipper will resent this charge just as every honest commission man will resent the charge of irregularity in his business. It would seem wiser to admit faults on both sides, and seek the remedy which will correct faults in both the shipper and the dealer. The final solution presents a problem for the serious consideration of farmers' clubs and all agricultural leaders.

STATE CAPITAL NEWS

Neglect Is Shown.—According to first returns made to the bureau of statistics few farms in the State can be classed as abandoned, altho a number of farms are badly neglected. Some of these farms are in such a run down condition that it will take much money to restore them. The state will suggest to the owners of such farms that they be used for pasturage. Reports show that in sections remote from railroads some farms have been found in run down condition.

The Bounty Act.—The question as to whether counties can be made to pay for the scalps of noxious animals and birds under the act making rewards for their killing regardless of the fact whether the legislature makes an appropriation for reimbursement or not has been settled by an opinion from the attorney general's department. It is held that counties are liable and that they must meet the claims made by killers of weasels, etc. The whole question comes out of half-baked legislation in the session of 1913, where it was provided that bounties should be paid for scalps of certain animals, one half of the income from hunters' licenses to be applied for reimbursement of counties; but the legislature failed to make the specific appropriation required for the purpose with the result that half of about $280,000 received from hunters' licenses is lying in the State Treasury. A situation similar to automobile license law.

Farm Counsellors.—The value of the farm advisors service which was inaugurated by the State last year was demonstrated a few days ago when the requests for the services of these counsellors were laid before them at the spring conference. Each advisor reported numerous requests for advice and in several instances letters reporting the manner in which suggestions had worked out or requesting further advice. The soil and drainage advisors appeared to have many requests.

About 400 farms will have to be visited in reply to applications now on hand.

Consolidation Of Schools.—A subject being given considerable attention by the State educational authorities at present, which will be laid before many rural school district boards in the next few days is the consolidation of schools. It is contended that the cost of transporting pupils to a centrally located, well equipped and adequate school will be only slightly in excess of the cost of separate smaller schools and that educational advantages reaped will be greater because of the grading and employment of more experienced teachers. The transportation item is the biggest one but that, it is claimed would be compensated for by the prevention of exposure to weather conditions. It is also contended that it is conducive to longer terms. Another claim is that by consolidating schools and transporting the pupils the farm will be made the ideal place to bring up children obviating the necessity of moving to towns for educational opportunities. Certain it is that it would be better for the next generation if the children in rural districts were provided with improved schools, grading and transportation facilities.

State Using Its Own.—The State has shown some thrift in employing students from State College to look after trees in Capitol Park. Heretofore hundreds of dollars were paid to experts in tree surgery, but a working arrangement has been consummated between the college and state officials in this matter which might be followed advantageously in other lines of state activity.—Hamilton, Harrisburg, March 30, 1914.

NEW JERSEY FARM NEWS

State College News.—More th [illegible] students received certificates at the recent annual commencement of the short courses in agriculture. This is the largest class that has ever been graduated from the short course. Prof. Melvin T. Blake delivered a lecture on "Market Gardening" for the benefit of the people of New Brunswick. The graduating class of the poultry department visited the world famous poultry farms at Freneau where a careful examination was made of the brooding system, incubator cellars and laying houses.

The Seed Potato Question.—The sole object of the New Jersey Potato Association is to encourage and stimulate in every possible way the production of good seed potatoes, free from disease and true to name. The association has no seed to sell and is not now and has no intention of competing with any individual or firm in the State. Prof. M. T. Cook, of the State College, is president, and, largely because of this connection, he has been able to emphasize to northern seed growers the feelings of New Jersey growers in regard to the seed question. Prof. Cook says the Maine authorities have taken prompt and vigorous action to prevent the spread of the powdery scab which exists in portions of the State near the Canadian border, and in the northern section of Aroostook county and that they have an inspection service for seed potatoes. The Maine railroads have agreed not to accept seed potatoes for shipment unless they have been certified by the proper authorities. New Jersey growers should be very careful about accepting Maine potatoes unless they have been certified as free from powdery scab by the proper authorities. As a main-crop potato, the Clyde is coming into favor as a variety a little earlier than the Green Mountain.

The Mercer County Potato Association.—Fred F. Gardner has been elected president of this organization. The members have decided in the future to sell their potatoes thru the Monmouth county farmers' exchange, after having first been graded and sorted. These potatoes will be sold under the trade mark of the Mercer County Potato Growers' Association.

Less Tomato Acreage.—As a result of R. V. Crine's recent trip to the west and his attendance at the convention of tomato packers in Baltimore the Crine Packing And Seed Company, of Morganville, will this year contract for about one-half its usual acreage in tomatoes. Other packers are said to be doing likewise. The company will pay $10 per ton for tomatoes this year and has already begun to sign up contracts with farmers to grow them. It was the opinion of the packers at the Baltimore convention that there were entirely too many tomatoes being packed and that another crop like last year might prove disastrous. Mr. Crine is also making contracts for furnishing tomato seed for the 1915 crop with the large seed houses and the number of acres the company will plant this year will depend largely upon the contracts made at this season of the year.

Bills Passed State Senate.—Several bills have just passed the State Senate and all of them will very likely become laws. No. 274 makes the sale of agricultural products by weight to conform with the weights and measures act. The Edge bill requires every railroad to protect all its grade crossings within a period of six months. The Egan bill provides State aid in the construction, operation or repair of bridges taken over by counties under the Road Improvement Act of 1913. Senator Gaunt of Gloucester county, Master of the State grange, has also succeeded in having passed his bill exempting from the provisions of the employers' liability act, farm laborers and domestic servants.

Fire Wardens Meet.—The annual meeting of the South Jersey district fire wardens was held at Millville. State Forester Gaskill told the fire wardens the State could not expect investors to purchase land and develop it for farming if they were not assured protection from forest fires. It was not the purpose of the Forestry Commission, he explained, to preserve all the woodland as it is, as some of the tracts were far too valuable for agricultural purposes. Mr. Gaskill urged the wardens to make an effort to increase the growing of shade trees.—H.

NEW YORK LETTER

Eleventh Hour Legislation. — Bills have been rushed thru by the score during the last days and thousands of dollars have been appropriated. Among the bills is one authorizing the senate to carry on an investigation of the highway department, brought about by the action taken by the Assembly in appointing its investigation committee and asking $40,000 for its expenses; which the senate leaders agreed to pass if the Assembly would pass a bill creating a senate committee to investigate the highways. The primary bills died in committee. Under an emergency message both houses passed the Fowley bill appropriating $10,000,000 for highway improvement and maintenance. A state employment bureau has been created in the department of labor. The Alder bill prohibiting the storage of foods "apparently" impure, and making it a misdemeanor for a person or company to offer impure food for storage has passed both houses and goes to the governor for his signature.

Another bill likely to pass creates a department of foods and markets, in charge of a commissioner to be appointed by the governor for a term of five years at a salary of $6,000. This commission may investigate cost of food stuffs, manner of marketing, provide for the establishment of public markets and make rules governing the sale of food stuffs.

Boys Back To The Farm.—New York city has bought a farm of 600 acres in Orange County to give the boys from the reformatory on Hart's Island some experience in farm life. Extensive buildings will be erected and farm and gardening experts will instruct the boys in the culture of all kinds of crops. Particular stress is laid on gardening, as vegetables find ready market in the city.

Good Showing.—The annual report of the Blockville creamery shows that it made 64,987 pounds of butter at an average selling price of 31 cents. The entire receipts of the creamery for the year were $19,573 and the expense of making was $1,787.33. The amount paid to patrons was $17,785.99.

Commissioner Huson.—The governor has re-appointed C. J. Huson as commissioner of agriculture and the legislature has raised his salary from $6,000 to $8,000. Commissioner Huson's appointment for another term gives general satisfaction. John F. Farrell will succeed Fritz Reichmann as state superintendent of weights and measures.

State Fair Commissioner.—The reappointment of George W. Driscoll, of Syracuse, to the state fair commission is displeasing to officials of the state grange. While they have nothing against Mr. Driscoll personally, they declare that agricultural interests have not been considered in his appointment. Until last year the grange has always had a representative on this commission. This year the names of several men who were members of the grange and who would have been acceptable to them were suggested, but they were ignored. The governor has been talking about the farmer and his needs the past winter but has missed a chance to prove that he meant what he said.

Chautauqua Farm Bureau.—The executive committee of the Chautauqua Farm Bureau recently reorganized for the year. Work this season will include demonstrations in special crops, testing of seed corn and other seeds, assistance in drainage matters, etc. A market association for the county is contemplated. A permanent office for the use of the farm bureau manager and officers will be opened within the Chautauqua grounds. Jared Hewes of Stedman is president and A. M. Loomis of Jamestown is secretary.—D.

MARYLAND NOTES

Creamery Progressing.—The Creamery established January 19th at Perryman is meeting with excellent success. It is already turning out 600 pounds of butter weekly. The plant has a capacity of about 1,500 pounds a week. Over 2,500 pounds of milk daily is now coming in.

Can Company Discontinued. — The plant of the American Can Co., at Havre De Grace recently discontinued. There is a rumor that an independent can company will soon be organized.

Cooling Station at Queene Anne.—A Philadelphia dairy company is erecting a milk cooling station at Queen Anne. It will be completed in a few days, and it is anticipated that a car load of milk will be shipped daily.

New Canning Company.—The Rich Bottom Canning Company has been organized in Easton and a new cannery of fully 20,000 case capacity will be erected.

Tomato Outlook Uncertain.—The outlook for tomato growers in most sections of Eastern Shore is not promising. It is reported the jobbers are too well stocked with last year's crop and that many canners also still have large supplies on hand. Packers are holding back in making contracts for coming season.

A number of farmers last fall stored sweet potatoes, expecting much greater prices about this period. They are now eagerly disposing of them, and the best prices last week in local market was 25 cents a basket.

Bounty on Buzzards.—Talbot County farmers are working to get a bounty placed on the killing of buzzards, the great hog cholera and other disease spreading nuisance.—B.

FARMS FOR SALE.

300 Acres Only $3500
1800 Apple Trees.
One thousand barrels of apples was the production last year; future crops will be greater; on 13 acres owner raised 4000 bu. potatoes in 1912; you can make money here, good 10-room house, 70-ft. barn, close to neighbors, mail delivered, only 2 miles to railroad; 110 acres in fields and pasture, cut 100 tons hay, balance valuable wood and timber; as it must be sold at once price is only $3500, easy terms, full details of this and a 120-acre farm completely equipped for $1200, see page 60, "Strout's Farm Catalogue 37," just out, copy free. Mrs. Grumble—"I see by this paper that most of the states are passing laws to prevent women from working over eight hours a day. That applies to everybody except us, I guess. We country women can work all day and half the night and nobody cares."

Anty Drudge—"The way *you* work is enough to make anybody gloomy. But you can make your own eight-hour law if you want to. Just use Fels-Naptha Soap. It will get your work done for you in even less than eight hours every day, *even wash-day.*"

Fels-Naptha Soap stops overwork and overtime. It's better than any laws, *because it gets the work done*, instead of just preventing you from working.

On wash day, soap your clothes with Fels-Naptha and put them to soak for 30 minutes in cool or lukewarm water, then rub them a bit with your hands or on the washboard, rinse and hang out. Fels-Naptha does everything as quickly and easily.

Better buy it by the box or carton and use it every day. Follow the directions on the Red and Green Wrapper.

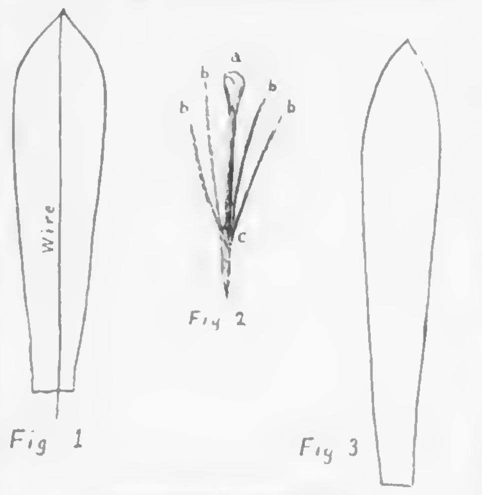
Fels & Co., Philadelphia.

Household

SUGGESTIONS FOR EASTER DECORATIONS

The decoration of the home never ceases to be an interesting subject for all classes, and many are coming to realize and appreciate the wonderful artistic possibilities of crepe and tissue paper as a decorative medium. Making paper flowers is so simple as to be almost kindergarten work, but the skillful and original touches of the woman who "knows how" are always evident in work of this kind. The following instructions for making paper Easter lilies are most explicit and easy to follow. For ladies who are interested in church, Grange and club decoration the paper flower supplies a long felt requirement, as it combines beauty with economy such as may be had with no other material. For home decoration it is also particularly practical as it eliminates the one very serious objection to the profuse use of the natural flower, the heavy sweet perfume so nauseating to many.

In making any paper flower it is advisable to have patterns of cardboard or heavy paper cut the exact size and shape required, thus insuring a uniform size for all the petals and leaves. For these Easter lilies each petal should be 7 inches long and about one inch wide. Fig. 1 shows the shape. That they be exact in size is most essential, else the flower will not be perfect. Fold the crepe paper in as many thicknesses as can be cut thru at one operation, holding the pattern firmly, cut carefully around it. The petals and leaves are cut lengthways of the crepe.



PATTERN FOR EASTER LILY

Wire the petals, as shown in Fig. 1, with white-covered wire. This may be bought on spools containing ten yards of wire for five cents. Time and work may be saved by covering several wires with paste at one time; applying them to the petals, before they dry.

Making The Centers.—To form the pistil, attach to top of a 5-inch wire a small ball of light green crushed tissue paper (Fig. 2, a). Wind around the ball and down the wire for about 3 inches with a narrow strip of the tissue. There are four or five stamens, (Fig. 2, b, b,), which are made by rolling a 5-inch strip of green tissue paper almost to a thread. Attach these firmly to the base of the pistil (Fig. 2, c), then wind the entire center on to an 18-inch heavy stem wire.

Paste the edges of the six petals together about half way up from the base, and gather around the center, attaching securely with fine wire. Cut a strip of dark green crepe paper about 2 inches wide and 15 inches long, (cut across the grain of the crepe). Fold double to make stronger, and wind two or three times around the base of the flower to prevent the petals from slipping loose. A touch of paste may be used to make them even more secure. Holding the paper loosely in the fingers of the left hand, with the right hand turn the stem wire from you, turning round and round, thus covering the stem tightly with the paper. Twist in six or eight leaves, cut as in Fig. 3, these leaves to vary in size from 5 to 8 inches.

To open the flower, bend the wires in the petals gracefully backward with the thumb and first finger. The leaves may also be curled by drawing back of the scissors under each leaf, holding the leaf firmly against the scissors with the thumb, then pull quickly upward toward the tip of the leaf. This operation will curl the leaf most naturally outward.

Care must be taken to use very little paste, and paste which is not too moist, as it will soften the paper and make it useless.

The Easter lily makes a most beautiful table decoration, particularly when used with a profusion of smilax vines. The stems are necessarily short if used for this purpose.—Leora Tobias, New York.

Braised Beef.—Select a piece of beef weighing 3 or 4 pounds, cut off of the shoulder or under part of the round, and if possible have it at least 3 inches thick. This last is important, for if the piece of beef is too thin it will fall to pieces too readily in the cooking. Cut ½ pound salt pork into dice. If you have no way of weighing the pork, cut enough for a heaping cupful. Then cut into dice or small pieces one large potato, carrot, onion, turnip, a head of celery, and one-fourth of a small head of cabbage. If all of these vegetables are not at hand, three or four will do. Divide the cut-up vegetables and salt pork into two equal parts. Place one part into the cooking kettle, then lay the beef, which has been washed and trimmed, on these. Add 6 whole black peppers, 4 bay leaves, some parsley, sage, thyme or savory,—in fact I usually put in a little of every kind of dried herbs that I have on hand. Pour over this 2 cups of boiling water, salt to taste, cover closely and put on the stove over a fire that will just keep it simmering gently for from four to six hours. Then lift the meat carefully on to a platter, pour the vegetables around it and serve. Be careful not to let the fire get hot enough to make the contents of the kettle boil briskly or the beef will fall to pieces, and there will be beef stew instead of braised beef. This dish is nice to cook in a fireless cooker. Also it is good to have when the housewife wants to go to church Sunday morning preparing it Saturday night.—N. D. H.

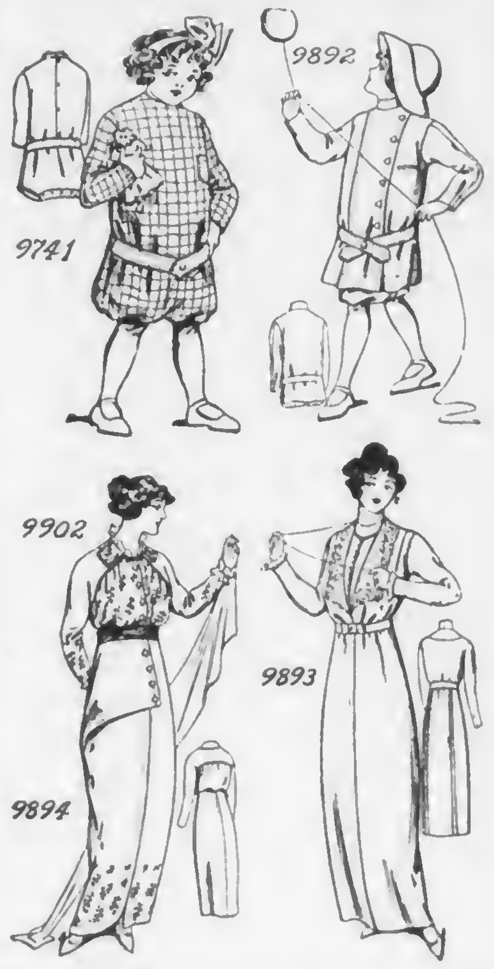
PENNSYLVANIA FARMER PATTERNS

Be sure to give the figures and letters of each pattern exactly as printed at the beginning of each description. We will not be responsible for correct filling of your orders unless you do so. Also give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 214-18 So. 12th St., Philadelphia, Pa.

9741—Child's Rompers.—Cut in 4 sizes: 6 mos., 1, 2 and 3 years. It requires 2¼ yards of 36-inch material for a 3 year size. Price of pattern, 10 cents.

9892—Boy's Russian Suit.—Cut in 4 sizes: 3, 4, 5 and 6 years. It requires 3 yards of 44-inch material for a 5-year size. Price, 10 cents.

9902—9894. — Ladies' Costume. — Waist, 9902, cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches, bust measure. Skirt, 9894, cut in 6 sizes: 22, 24, 26, 28, 30 and 32 inches, waist measure. It requires 5¼ yards of 44-inch material for the entire costume in a 36-inch size. The skirt measures 1½ yard at the foot. Two separate patterns, 10 cents for each pattern.



9893—Ladies Dress for Maternity or Invalid Wear.—Cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches, bust measure. It requires 6¼ yards of 44-inch material for a 38-inch size. Price, 10 cents.

MONTGOMERY WARD & CO
My Father Loved that Book
R. F. Schabelitz

Drawn Expressly for Montgomery Ward & Co., by R. F. Schabelitz

---and they lived happy ever after

Love has found a way--

Now they can be married in June and have a cozy home full of good things and all on a modest salary. She had it all figured out--down to the last pie tin, selected from the big book of bargains which--for reasons we need not explain--had slipped to the floor.

So the big yearly Catalogue of Montgomery Ward & Company has made possible a low cost of living to millions of families. So has it month by month stripped merchandise of all unnecessary profits, and offered it in full value at low prices. The world's best creations, such as you might see in a huge Paris, London, New York or Chicago department store are sent to your home with these savings by Montgomery Ward & Company and you suffer none of the rush or distractions of shopping but make your selections from the Catalogue at your leisure with the family gathered round.

Many families, like this young couple, have not only started *from* this book but they have lived *with* it. So it may truly be written of thousands who have experienced its benefits—"and they lived happy ever after." Join today the happy good-living, world-wide family of those who use the Catalogue of Montgomery Ward & Company. Join them today by simply writing us (use the coupon) for a copy of the latest Catalogue.

OUR BEST CROP

In the language of our everyday life we speak of our crops as to their importance on the basis of the money value they have in business, or because they are helpful in the maintenance of a diversified system of farming. We hail King corn not only because of the tremendous values in his empire, but also because of the ability that corn has to increase and stimulate value in other lines of production. We speak of many of our crops in terms of such magnitude that we cannot comprehend the amounts indicated by the figures. We state the relative size and condition of our large commercial and industrial institutions in like terms, and refer to them as our great industries. But these are the terms of the market, the counter and the exchange.

When we get down to the terms of real life, to the things that call out the largest sacrifice, the most constant devotion and for the benefit of which we appropriate such a generous share of these products of the soil and the factory as well as the income of brawn and brain, it is not of cereals or machines, animals or plants, books or bank accounts that we think, but of the babies in the home. In the home of the poor, except where liquor has set up a false standard, the loving mother bends to the thousand daily duties and submits to the many personal sacrifices for their good. The father in the strength of his affection thinks and plans and works that his children may have every possible advantage. In the home of the wealthy so many are the luxuries lavished upon beloved children as to actually prove a barrier and a handicap in their development.

I say these are the great values in the terms of real life and we all admit them when some crucial test brings them directly to our notice but when so much of our time is taken up in the effort to maintain our position in society and to acquire the material things that love prompts as necessary to our properly conducted homes. When no sickness draws our attention to the child as an individual, when no physical deformity calls for the consideration of the child as a unit, we are too apt to be led aside from the things which in our serious moments we admit are the things worth while.

For instance, in our educational system we are too apt to look upon education as preparation for some trade or business, rather than a development of the intellectual part of a being whose future occupation is undetermined and whose destiny is eternal. If a child can be taught to think and reason logically and at the same time become expert in a particular line of work, well and good, but it must not be forgotten that a great deal of what we call technical education does not require that close application of the analytical powers of the minds as give to the brain the fullest development in the power to think and reason logically. This is the all-important requirement in an education. We cannot tell where or how the after life of the child will be worked out, but we are sure of two things, namely; that wherever he goes he will have to think matters out to a logical conclusion and determine his future course by that decision, and, as well, in all that part of his life that has to do with concerted effort with his fellows, he will also need the power of expression. If these abilities are gained the groundwork is laid for any line of work to which the future may lead.

Another instance: We are glad to see our children grow to a full development physically, and we become disturbed if we see any stagnation in that normal growth. But in relation to character, unless there is some abnormal peculiarity that concentrates our attention upon the particular need of a particular child, we are too likely to be satisfied with a growth that is slow and uneven. In the books they read they can be delighted without being filled with trash. They can enjoy with the imagination clean pictures just as fully as foul ones. They can be enthused with a story that tells the truth as fully as with one that carries a false interpretation of life.

And in their amusement, they can be instructed as well as entertained. It is an astounding commentary upon modern conception of entertainment to notice in our metropolitan press what our city cousins are satisfied with in the nature of amusement, and if the nickelodions' offerings to the list were published, it would be even worse. It is a pity that any such taste should be formed in any child. Situations can be funny without a half-covered suggestion of evil. Wit and humor can have full play without undermining faith and hope and peace of mind. There is ample variety and abundance of splendid, clean amusement offered today in the lyceum bureaus and entertainments of that character that not only delight but uplift. You go away from many of them almost in pain from excessive laughter, and as well strengthened and made better by the interwoven appeals to the best things in life. A little teamwork in each community would give our children a taste for this kind of amusement, and who can calculate the value of such an established taste to the individual who must later come in contact with the trash which so many places offer.

In another article I want to finish the argument that leads, I think, logically, to this statement that we are not giving to our children the opportunity of a full, rounded development in this generation that our material intellectual and spiritual advantages warrant. The criticisms that herein have been and which will later be made in this brief study of our greatest and best product, are not intended as finding fault but rather as suggestions as to how a community can correct some of the deficiencies in this regard.—John A. McSparran, Lancaster County, Pa.

MARYLAND GRANGE FAVORS COLLEGE APPROPRIATION

Still Pond Grange gave a reception to its Overseer and his bride on March 14. A very interesting program was given, the chief speaker being Prof. T. B. Symons of the Maryland Agricultural College. He prefaced his remarks with some helpful hints on "Domestic Science," the study of successful home-making. This was followed by a few very timely sentences on the disgraceful conditions of our country roads, and every one saw the truth in what he said.

He followed with a fervent address on behalf of our Agricultural College, and all those who thru indifference had not exactly approved of the project, are now convinced that the plans for development will fill the many needs of our farmers. His figures showed that a man owning a $5,000 farm would have only 12 cents additional taxes to pay on this $1,000,000 appropriation they are asking for. He urged the farmers not to be economical with themselves, when vast sums of money are spent each year by the legislature, of which the farmers get no benefit. These various bills are passed and the men on the farms know nothing of them, so he urged all to look out for themselves this time, and get what was due them.

The farmers from the whole county will meet later to discuss the canning situation. All are urged to bring their wives, as the Grange is to serve tea.—Evelyn Harris.

THE GRANGE FIELD

New Grange State.—Last month another grange state was organized, making 32 in all. It was the state of North Dakota. The first annual meeting was held at Bismark when 16 granges were represented and the organization perfected. National Master Wilson was present as also was Gov. L. B. Hanna, who addressed the meeting. L. D. Wiley, of Solon was elected State Master; Mrs. C. F. Schick, of Lark, lecturer and Ray McKaig, of Fort Rice, secretary. A full complement of officers was chosen.

Grange Insurance.—One of the most successful grange insurance companies in the United States is that located at Olathe, Kas. The company closed its last year on December 31, with $18,184,198 in insurance on its books. The total receipts of the company for the year were $82,441.84 and the entire operating expenses were $7,738.50. The association closed the year with $55,904.39 in its treasury.

Grange Property.—The National Grange Monthly is authority for the statement that the granges of Ohio own 171 grange halls valued at $265,000 and it is further stated that the musical instruments in these halls are worth $27,000, besides all other furniture contained. There are more than 20,000 books in the grange libraries of Ohio.

Top notch butter is mostly up to the cow—and the salt

Is *your* dairy salt as good as your cream?

You will find a big difference in flavor—between merely salting your butter and *Worcester Salting* it.

Expert dairymen are "on" to this. They use nothing but Worcester Salt because its pure, even grains are easy to work in—and quick to bring out the full flavor—

And you know fine flavor and high prices always go together.

WORCESTER SALT

The Salt with the Savor

Worcester Salt is also best for cooking and table use. Its snow white crystals are genuinely salty. Have the wife try it.

Send your dealer's name and address and we will mail you a free copy of booklet, "Buttermaking on the Farm."

Worcester Salt comes in 28 and 56 pound Irish linen bags for dairy use. Smaller bags down to the 5c size for home use.

WORCESTER SALT COMPANY

Largest Producers of High-Grade Salt in the World.

NEW YORK

The Long-Life SILO

GREEN MOUNTAIN Round Stave silos are dipped in pure creosote oil preservative, such as the government recommends for fence posts and timbers. These silos will last during your life time. There are other superior features. Ask for catalogue.

OLD SILOS

At a very small cost can be made up-to-date and better than ever. We have the greatest patent that has ever been put on a wood stave silo. Your silo will last longer and make better silage—no danger of it blowing down—you never have to tighten and loosen the hoops—our patent automatically takes care of this part. Our customers say it is just what they have long been looking for.

If you are going to build a new silo you can save big money by writing us before placing your order. You will want our patent improvements on your silo after seeing them on your neighbors', and now is the time to investigate before building.

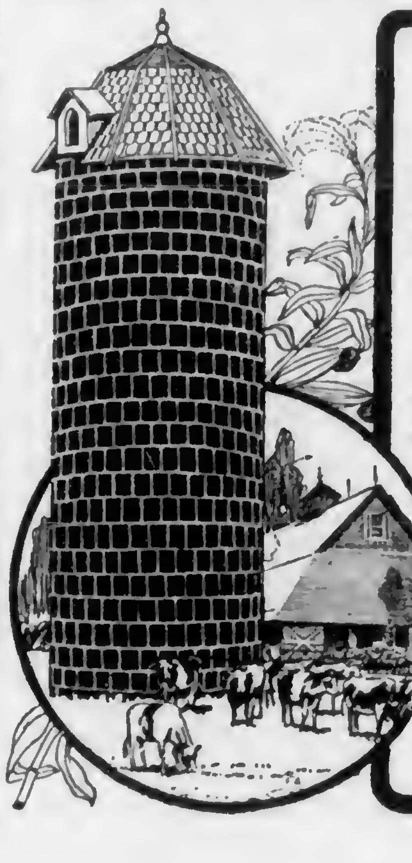
BOUGHT—Bears, Foxes, Minks, Ducks, Guineas and all kinds of birds and animals. William J. Mackensen, Box 312, Yardley, Penna.



Feed Ensilage This Summer When Pastures Get Low

To secure the maximum results, stock should be fed green feed all the year round. Its succulence produces rapid growth and a heavy flow of milk. No other feed equals ensilage in succulence. It is as valuable and economical to feed in summer as in winter. It pays, then, to fill a silo for summer feeding. You will keep ensilage succulent and palatable all-the-year-round as the day the corn was cut, if you have a

Natco Imperishable Silo

(Patented)

Built of non-porous vitrified-clay hollow blocks; its glazed surface excludes air and moisture. The two dead air spaces protect contents from heat and cold. Each layer of blocks is reinforced by continuous steel bands.

Weather Proof—Decay Proof—Vermin Proof—Fireproof

The Natco Imperishable Silo will last for generations—any mason can erect it—never needs painting—walls will not warp or shrink—no hoops to tighten—no continual repair bills—the first cost is practically the only cost. The Natco Imperishable Silo has a survival value unequalled.

FREE SILO BOOK. Full of information about ensilage and summer feeding. Describes completely the Natco Imperishable Silo. Write today. Ask for catalog Q.

Winston of the Prairie

By HAROLD BINDLOSS

Copyrighted by Frederick A. Stokes Company.

CHAPTER XXVI (concluded.)

It might have appeared, unusual in England, but it was much less so in a country where the specialization of professions is still almost unknown, and the man who can adapt himself attains ascendency, and on the morrow Winston arrived at a big wooden building beside a pine-shrouded river. It appeared falling to pieces, and the engineer looked disdainfully at some of the machinery, but, somewhat against his wishes, he sat up with his companion most of the night in a little log hotel, and orders that occasioned one of Graham's associates consternation were mailed to the city next morning. Then machines came out by the carload, and men with tools in droves. Some of them murmured mutinously when they found they were expected to do as much as their leader, who was not a tradesman, but these were forthwith sent back again, and the rest were willing to stay and earn the premium he promised them for rapid work.

Before the frost grew arctic, the building stood firm, and the hammers rang inside it night and day until when the ice had bound the dam and lead, the fires were lighted and trials under steam began. It cost more than water, but buyers with orders from the East were clamoring for flour just then. For a fortnight Winston snatched his food in mouthfuls, and scarcely closed his eyes, while Graham found him pale and almost haggard when he came down with several men from the cities in response to a telegram. For an hour they moved up and down, watching whirring belt and humming roller, and then, whitened with the dust, stood very intent and quiet while one of them dipped up a little flour from the delivery hopper. His opinions on, and dealings in, that product were famous in the land. He said nothing for several minutes, and then brushing the white dust from his hands turned with a little smile to Graham.

"We'll have some baked, but I don't know that there's much use for it. This will grade a very good first," he said. "You can book me the thousand two eighties for a beginning now."

Winston's fingers trembled, but there was a twinkle in Graham's eyes as he brought his hand down on his shoulder.

"Gentlemen," he said, "I was figuring right on this when I brought the champagne along. It was all I could do, but Imperial Tokay wouldn't be good enough to rinse this dust down with, when every speck of it that's on you means dollars by the handful rolling in."

It was a very contented and slightly hilarious party that went back to the city, but Winston sat down before a shaded lamp wih a wet rag round his head when they left him, and bent over a sheaf of drawings until his eyes grew dim. Then he once more took up a little strip of paper that Graham had given him, and leaned forward with his arms upon the table. The mill was very silent at last, for of all who had toiled in it that day one weary man alone sat awake, staring, with aching eyes, in front of him. There was, however, a little smile in them, for roseate visions floated before them. If the promise that strip of paper held out was redeemed, they might materialize, for those who had toiled and wasted their substance that the eastern peoples might be fed would that year, at least, not go without their reward. Then he stretched out his arms wearily above his head.

"It almost seems that what I have hoped for may be mine," he said. "Still, there is a good deal to be done first, and not two hours left before I begin it tomorrow."

CHAPTER XXVII

Reinstatement

A year of tireless effort and some anxiety had passed since Winston had seen the first load of flour sent to the east, when he and Graham sat talking in their Winnipeg office. The products of the St. Louis mills were already in growing demand, and Graham appeared quietly contented as he turned over the letters before him. When he laid down the last one, however, he glanced at his companion anxiously.

"We have got to fix up something soon," he said. "I have booked all the St. Louis can turn out for six months ahead, and the syndicate is read to take the business over, tho I don't quite know whether it would be wise to let them. It seems to me that milling is going to pay tolerably well for another year, and if I knew what you were wanting, it would suit me better."

"I told you I wanted thirty thousand dollars," said Winston quietly.

"You've got them," said Graham. "When the next balance comes out you'll have a good many more. The question is, what you're going to do with them now they're yours?"

Winston took out a letter from Dane and passed it across to Graham.

"I'm sorry to tell you the Colonel is getting no better," it ran. "The specialist we brought in seems to think he will never be quite himself again, and, now he has let the reins go, things are falling to pieces at Silverdale. Somebody left Atterly a pile of money, and he is going back to the old country. Carshalton is going too, and, as they can't sell out to any one we don't approve of, the rest insisted on me seeing you. I purpose starting tomorrow."

"What happened to Colonel Barrington?" asked Graham.

"His sleigh turned over," said Winston. "Horse trampled on him, and it was an hour or two before his hired man could get him under shelter!"

"You would be content to turn farmer again?"

"I think I would," said Winston. "At least, at Silverdale."

Graham made a little grimace. "Well," he said resignedly, "I guess it's human nature, but I'm thankful now and then there's nothing about me but my money that would take the eye of any young woman. I figure they're kind of useful to wake up a man so he'll stir round looking for something to offer one of them, but he's apt to find his business must go second when she has got it and him, and he has to waste on house fixings what would give a man a fair start in life. Still, it's no use talking. What have you told him?"

Winston laughed a little. "Nothing," he said. "I will let him come, and you shall have my decision when I've been to Silverdale."

It was next day when Dane arrived at Winnipeg, and Winston listened gravely to all he had to tell him.

"I have two questions to ask," he said. "Would the others be unanimous in receiving me, and does Colonel Barrington know of your mission?"

"Yes to both," said Dane. "We haven't a man there who would not hold out his hand to you, and Barrington has been worrying and talking a good deal about you lately. He seems to fancy nothing has gone right at Silverdale since you left it, and others share his opinion. The fact is, the old man is losing his grip tolerably rapidly."

"Then," said Winston quietly, "I'll go down with you, but I can make no promise until I have heard the others."

Dane smiled a little. "That is all I want. I don't know whether I told you that Maud Barrington is there. Would tomorrow suit you?"

"No," said Winston. "I will come today."

It was early next morning when they stepped out of the stove-warmed car into the stinging cold of the prairie. Fur-clad figures, showing shapeless in the creeping light, clustered about them, and Winston felt himself thumped on the shoulders by mittened hands, while Alfreton's young voice broke thru the murmurs of welcome.

"Let him alone while he's hungry," he said. It's the first time in its history they've had breakfast ready at this hour in the hotel, and it would not have been accomplished if I hadn't spent most of yesterday playing cards with the man who keeps it, and making love to the young women!"

"That's quite right," said another lad. "When he takes off his cap you'll see how one of them rewarded him, but come along, Winston. It—is—ready."

The greetings might, of course, have been expressed differently, but Winston also was not addicted to displaying all he felt, and the little ring in the lads' voices was enough for him. As they moved towards the hotel he saw that Dane was looking at him.

"Well?" said the latter, "you see they want you."

That was probably the most hilarious breakfast that had ever been held in the wooden hotel, and before it was over, three of his companions had said to Winston, "Of course you'll drive in with me!"

"Boys," he said, as they put their furs on, and his voice shook a trifle, "I can't ride in with everybody who has asked me unless you dismember me."

Finally Alfreton, who was a trifle too quick for the others, got him into his sleigh, and they swept out behind a splendid team into the frozen stillness of the prairie. The white leagues rolled behind them, the cold grew intense, but while Winston was for the most part silent, and apparently preoccupied, Alfreton talked almost incessantly, and only once looked grave. That happened when Winston asked about Colonel Barrington.

The lad shook his head. "I scarcely think he will ever take told again," he said. "You will understand me better when you see him."

They stopped a while at mid-day at an outlying farm, out Winston glanced inquiringly at Alfreton when one of the sleighs went on. The lad smiled at him.

"Yes," he said. "He is going on to tell them we have got you."

"They would have found it out in a few more hours," said Winston.

Alfreton's eyes twinkled. "No doubt they would," he said dryly. "Still, you see, somebody was offering two to one that Dane couldn't bring you, and you know we're generally keen about any kind of a wager!"

The explanation, which was not quite out of keeping with the customs of the younger men at Silverdale, did not content Winston, but he said nothing. So far his return had resembled a triumph, and waile the sincerity of the welcome had its effect on him, he shrank a little from what he fancied might be waiting him.

The creeping darkness found them still upon the waste, and the cold grew keener when the stars peeped out. Even sound seemed frozen, and the faint muffled beat of hoofs unreal and out of place in the icy stillness of the wilderness. Still, the horses knew they were nearing home, and swung into a faster pace, while the men drew fur caps down, and the robes closer round them as the draught their passage made stung them with a cold that seemed to sear the skin where there was an inch left uncovered. Now and then a clump of willows or a birch bluff flitted out of the dimness, grew a trifle blacker, and was left behind, but there was still no sign of habitation, and Alfreton, too chilled at last to speak, passed the reins to Winston, and beat his mittened hands. Winston could scarcely grasp them, for he had lived in the cities, and the cold he had been sheltered from was numbing.

For another hour they slid onwards, and then a dim blur crept out of the white waste. It rose higher, cutting more blackly against the sky, and Winston recognized with a curious little quiver the birch bluff that sheltered Silverdale Grange. Then as they swept thru the gloom of it, a row of ruddy lights blinked across the snow, and Winston felt his heart beat as he watched the homestead grow into form. He had first come there an impositor, and had left it an outcast, while now it was amid the acclamations of those who had once looked on him with suspicion he was coming back again.

(To be concluded)

New Story by Kipling.—Rudyard Kipling contributes his latest story "The Dog Harvey" to the April number of the Century Magazine. It is a delightful tale with a touch of the supernatural in it.

Day and Night
Every Hour
ALPHA Portland Cement is inspected by chemists to make sure that the raw materials are of the proper grade and proportioned exactly right, that the burning is thorough, that the grinding is finer than required by standard specifications, that the finished product is as good as can be made.
ALPHA THE GUARANTEED PORTLAND CEMENT
is then properly aged before shipment, in storage houses that hold 2,000,000 barrels. ALPHA is an exceptional cement—the product of a company whose policy for 23 years has been to manufacture the best, strongest, safest Portland Cement that can be produced. Build with ALPHA and the job will be everlasting.
Ask the ALPHA dealer

Insist on the Guaranteed Portland Cement
When you build of concrete, you build for permanence, and you cannot afford to skimp on the quality of the cement you use. Be careful, advises the U. S. Government, to use a brand *guaranteed* to be up to the government standard for strength.
ALPHA THE GUARANTEED PORTLAND CEMENT
is warranted to more than meet the U. S. Government standard and *every other* standard test. The Government uses it in important forts, lighthouses, dams and breakwaters, where strength and permanence are required.
ALPHA always gives most satisfactory results on the farm. Use it for making walks, silos, barn floors, posts, etc. It goes further and is cheaper in actual use than "just-as-good" substitutes, which may cost a few cents less per sack. Your dealer can supply ALPHA, the Guaranteed Portland Cement. Be sure to order by the full name, because there are fair, good and better grades in Portland Cement, just as in lumber.
25-Cent Farm Concrete Book—FREE
Our book, "Concrete in the Country," 112 pages, fully illustrated, shows more than 100 ways to improve the farm with ALPHA. Regular price 25 cents; free if you send the coupon or write, mentioning this publication, and tell what you plan to build.

Studebaker WAGONS BUGGIES HARNESS
Bought his Studebaker when he came home from the civil war—using it yet
WHEN David Hire, of Syracuse, Ind., got home from the Civil War he bought a Studebaker Farm Wagon. That was 48 years ago, and the same wagon is still hauling fifty bushels of wheat at a load to market.
Here is what Mr. Hire has to say about his Studebaker wagon.
"It may interest you to know that I have in my possession a Studebaker Farm Wagon bought just after I returned from the war, about 1866, I think. It carried a guarantee to haul 50 bushels of wheat and though it has been in constant use since it was bought, it is still good to haul that amount to market. I hope to use it for many years yet, as it is in good condition."
A REAL VETERAN
That is the way with Studebaker wagons. Built of air dried timber, with inspections at every step of manufacture, they outlast the ordinary wagon from twenty to thirty years.
You may be offered a wagon at less cost than a Studebaker, but consider that the cheaper wagon may last five or ten years, while a Studebaker will last a lifetime. That makes the Studebaker the better investment, doesn't it?
"Build not the cheapest, but the best" has been the policy of Studebaker for over half a century.
You can't make a mistake if you buy a Studebaker Farm Wagon, Buggy or Harness.

Markets

PHILADELPHIA PRODUCE

Philadelphia, Pa., March 30, 1914

Most of the butter stock was of unattractive nature and values were irregular. Egg supplies were under pretty good control and values were well maintained. Supplies of poultry were small and market ruled firm, with demand equal to the offerings. Fruit and vegetables were quiet, with ample offerings at revised prices.

Butter.—Western creamery, 28c; extras, 26@27c; firsts to seconds, 23@24c; special prints, 33@36c; near-by prints 30c.

Eggs.—Candled 25@27c doz.; extras 22c. Current receipts at $6.00 per standard case.

Poultry.—Fowls, 12½@20c; old roosters 13@14c; pigeons, 28@32c pair.

Dressed Poultry.—Western fowls 12@19c; roosters, 15c; turkeys, 20@26c; squabs $2@4.85 doz.

Vegetables.—White potatoes, Pa., 75@90c bu. Onions $2.50@2.75 per 100-lb bag. Peppers, $4.00@5.00 per crate. Eggplant $3.00@4.00 carrier. Lettuce $2.50@3.50 hamper. Beets 5@8c per bch. Sweet potatoes 50@75c bas. String beans $3@4 per hamper. Squash $3.50@4 per crate. Cucumbers, Florida $1.50@2.00 doz. Celery $2@2.25 crate. Cabbage, new $1.00@1.25 per hamper. Cauliflower $1.75@2.25 per ½-bbl. box.

Fruit.—Apples, $5@6.00 bbl. Pineapples, per crt. $3.00@4.00. Pears, 75@85c basket. Cranberries $12@13 bbl; lemons, $2.75 per box; grape fruit $2@3 per box; oranges, $2.50@3.00 per box.

Hay and Grain.—No. 1 hay, large bales, $18@18.50; No 1 medium $17.50@18.00 no grade, $10.00@12.00. Clover mixed hay, light mixed at $16.50@17.00; straw No. 1 new straight rye, $16.50@17.00 No. 2 do., $15@15.50; No. 1 tangled rye straw new $12@12.50; No. 2 do., $11@11.50; No. 1, wheat straw, $10@10.50; No. 1 oat straw, $10.50@11; new shelled corn No. 2 yellow 75@75½c. Wheat No. 2 red $1.00½@1.01; No. 1 Northern, $1.05½@1.06½; No. 2 white oats 46@46½; No. 3, white 44½@45c; Standard white 45½@46c.

Coffee.—Rio 7s 9c; Santos 4s 11¾c. Mild Coffee.—Cordova 12½@16½c.

Sugar.—Cut loaf $5.05 cwt; cubes, $4.15; powdered, $4.00; granulated, , $3.90; standard granulated, 3.95; crystal A, $3.90.

Provisions.—City beef, in sets, smoked and air dried, 31@31½c. Beef hams, $40@42. Pork family, $23@24. Hams, cured, 13⅝@14c; skinned 14@14⅞c; smoked 17@18c. Other hams, smoked, city cured, as to brand, 17@18c. Picnic shoulders, 10⅝@10⅞c; do smoked, 13@13½c. Bellies in pickle, 13½@14¾c. Breakfast bacon, as to quality, 19@23c. Lard, refined, 11¼@11⅞c tcs; do in tubs, 11⅜@12c; do kettle rendered, 11¼@11¾c. Tallow, prime city 6⅞c; country, 6¾c; do dark, 5½c; do. cakes, 7c.

Philadelphia Retail.

NEW YORK PRODUCE

New York City, March 30, 1914.

Butter receipts were moderate, and the buying was conservative. There was a fair call for strictly high grade egg stock, but general trading is only moderate. Trade in poultry is slow and market generally unsatisfactory. Fruit and vegetables show little change.

Eggs.—State and near-by hennery whites, fine to fancy 25@26c; gathered whites 25c; fair to good 23@24c; fresh gathered firsts to extras 21@22c; seconds to thirds, 19@19½c; no grades 17½@19c; mixed 20@21c.

Butter.—Creamery firsts to extras 23½@25½c; thirds to seconds, 19@23c; state dairy 18@25c; packing stock 12@17c; process 16@20½c.

Cheese.—Whole milk specials, 19¼c; do common to fancy, 16@18¾c; skims 5@15c.

Dressed Poultry.—Turkeys, dry, 21@28c; chickens, 14@25c; fowls, 13@18c, old roosters, 14c; ducks, 12@18c.

Live Poultry.—Prices unsettled

Vegetables.—Cabbage, $1.50@1.75 bbl Green beans $3.00@6.00 bas. Carrots $1.25@1.75 bag. Cucumbers $1@1.50 doz. Lettuce $1.00@2.50 bas. Squash, $3@3.50 bbl. Celery $2@2.75 standard crate. Onions $2.25@2.75 100 lb bag. Tomatoes, 75c@$2.05 carrier, peppers $3@5.00 per box. Beets, $4@6.00 per 100 bunches. Potatoes $5.50@7.25 bbl. Sweet potatoes, $1@2 bbl. Egg plants, $1.50@3.50 per box. Cauliflower $2.25@2.50 standard crate.

Fruit.—Apples $2.50@5.75 bbl. Cranberries $9@15.00 bbl.

Grain.—Wheat No. 2 red $1.05, No. 1 Northern, $1.01¾; corn, new No. 3 yellow 75⅛c; oats, standard white 45½@46c

YORK PRODUCE MARKET

York, Pa., March 30, 1914.

Markets have shown little changes the past week. There is light trading at low prices. Eggs took a great tumble. Butter has also dropped.

Eggs.—18@21c doz.

Butter.—Country, 30@33c; separator, 35@36c. Milk, 6c per quart. Cream, 12c per pint.

Poultry.—Scarce. Hens 15@16c. Dressed poultry, 50@85c each.

Vegetables.—Potatoes 10@16c ½-pk; 50c@1.00 bu; cabbage 3@8c each; lettuce, 3@10c; beets, 5c bch; radishes, 5c bch; onions 5c bch., 15@18c per ½-pk; lima beans 14@16c qt; sweet potatoes, 12@15c per ½-pk; lard 14@16c lb; celery, 10@15c; peppers, 8@12c doz; turnips 10@12c ½ pk; soup beans, 10@12c qt; sauer kraut 8c qt; apple butter, 22@25c qt.

Fruit.—Apples, 20@35c ½-pk; pears, 15@20c per ½-pk; chestnuts, 12@15c qt; walnuts, 15c per ½-pk.

Retail Grain Market.—Wheat, $1.08 bu., corn, 82c; oats, 55c; rye, 77c; bran, $1.70 cwt; middlings, $1.70 cwt.

Wholesale Grain Market.—Wheat, 98c; corn, 74c; oats, 44c; rye, 67c.

PHILADELPHIA LIVE STOCK

Philadelphia, Pa., March 30, 1914.

Beef Cattle.—Trade was very slow, with offerings showing a slight increase and prices in a general way closing fairly steady. Lancaster County, Pa., Ohio and a sprinkling of Western cattle were included in the local run. Cows ruled easy and were little sought after, while calves closed weak.

	Beef Cattle	Sheep and Lambs	Hogs
Total for week	2,403	6,657	5,288
Previous week	2,265	7,997	4,137

Best steers	$8.50@8.75
Choice steers	8.25@8.50
Good	8.00@8.25
Medium steers	7.50@7.75
Common steers	7.00@7.25
Bulls	5.00@6.30
Fat cows	5.25@6.00
Medium cows	3.50@4.75
Thin cows	2.75@3.00

Veal calves steady

Best calves	$9.50@10.00
Good to choice do	9.00 9.50
Medium	7.50@8.00
Common do	6.50@7.00

Sheep and Lambs.—With lighter holdings there was a fair clearance with the better grades of lambs a fraction stronger, sheep were holding steady, the current output being more satisfactory.

Choice wethers	$6.25@6.50
Good do.	5.25@5.75
Common to medium	3.50@5.00
Ewes, fat	5.25@5.75
Extra lambs	8.50@8.75
Good to choice do	8.25@8.50
Common to medium	6.00@8.00

Hogs.—The market was about steady at the prices with demand of a seasonable character Westerns as to size and quality $12.50@12.75.

City Dressed Stock.—Every variety of choice and prime class commanded full rates but trade was very conservative. Steers, 12@14c; heifers, 10½@13c; cows, 9@11c. Veal calves, 13@14c; country dressed calves 13@14c; extra do., 14½c. Sheep, 9@11c; extra wethers, 12c. Spring lambs 13@14c. Hogs 12¾@13c.

PITTSBURGH LIVE STOCK

Pittsburgh, Pa., March 30, 1914.

Cattle.—The supply on sale last week was 90 loads, about the same number as a week ago. While the supply was not heavy the market ruled fairly active with the fat tidy cattle of all weigths generally 10 to 15 cents higher, while the cattle on the plain order were only steady. Heifers, fat cows and bulls were stronger. Bulls slow sale on account of warmer weather. Best fresh cows steady; other grades and springers slow. With 85 loads on sale this morning and only a moderate demand the market was slow at barely steady prices.

Good to choice	$8.70@8.85
Good 1,300-1,400 lb	8.30@8.60
Medium to good 1,200-1,300 lb	8.20@8.40
Tidy 1,050-1,150 lb.	8.20@8.40
Fair to medium, 900-1,100 lb	7.50@8.00
Rough, half-fat, 1,000-1,300 lb	5.00@7.00
Common, 700 to 900 lbs.	5.50@6.50
Rough, half-fat	5.00@7.00
Common to good fat oxen	4.00@6.50
Common to good fat bulls	5.00@7.75
Common to good fat cows	1.25@6.75
Heifers	5.50@8.00
Bologna cows	4.00@4.40
Fresh cows and springer	25.00@85.00

Calves.—Veal calves in fair supply and with a good demand market closed $1 per cwt. higher. Receipts today 700. Market steady.

Heavy and thin calves	$5.00@ 7.00
Veal calves	7.50@10.00

Sheep and Lambs. — The supply of sheep and lambs during the week was light and with a good demand sheep closed 25 cents per cwt. higher, while lambs closed steady to strong on the choice grades, and the plain and common grades were slow. There were 10 double-deck loads of sheep on sale today, mostly clipped. The demand was good and the market active and higher on all grades, both wooled and clipped.

Prime wethers	$6.00@6.85
Good mixed	5.75@6.10
Fair mixed ewes and wethers	4.75@5.50
Culls to common	3.00@4.00
Prime lambs	6.00@8.75
Clipped lambs	5.00@7.25
Clipped sheep	5.80@6.00
Spring lambs	10.00@12.00

Hogs.—Supply of hogs during the week was light and early part of week ruled steady to strong, but in sympathy with other markets the latter part of the week the market was slow and closed 15 to 20 cents under Monday's prices. There were 45 double-deck loads on sale today. Market was 10 cents higher on the best weight grades, while pigs and lights were steady.

Prime heavy	$9.10@
Prime medium weights	9.20@
Heavy mixed	9.10@
Best heavy Yorkers	9.20@
Light Yorkers	9.10@
Pigs	8.90@9.00
Common to good roughs	7.75@8.35
Stags	7.00@7.25

BUFFALO LIVE STOCK

Buffalo, N. Y., March 30, 1914.

Cattle.—The higher market Monday, due to moderate supply and cool weather, was well sustained during the week on the good butcher grades. On the close butcher grades were in good demand and firm. With 4,000 head in the yards this morning, the market was 10 cents lower on all grades.

Choice heavy steers	$8.90@9.10
Fair to good	7.85@8.15
Yearlings	7.75@8.65
Handy butchers	6.75@8.25
Good to choice fat cows	6.00@6.50
Good to choice heifers	6.00@7.75
Butcher bulls	6.00@7.75
Feeders	6.60@8.25
Cows and springer	40.00@60.00

Calves.—Calves advanced on Monday, and the trade was in good position during the week. On the close the basis was $10.50@10.75. Calf arrivals today numbered 1,000 head. The market was strong.

Choice veals	$10.50@11.00
Lights and thin	6.00@ 8.75

Sheep and Lambs.—Altho the supply was large on Monday the demand was active and the basis higher. Sheep were firm, and best lambs sold at $8.25@8.35. Yearlings ruled strong and wethers active. On the close the market was active and a quarter higher generally on best lambs. Yearlings were in light supply, active demand and higher. Receipts totaled 12,000 head today. The market was strong to higher

Choice lambs	$8.75@8.85
Yearlings	7.50@8.00
Wethers	6.75@7.00
Ewes	6.25@6.65
Sheep	6.00@6.25

Hogs.—The market was strong and higher. On the week's opening Yorkers opened at $9.30 under good demand. Pigs were in light supply and firmer. On the close the market was slow and a quarter lower all around. Outside orders were scarce. On the close a few loads were left over. Arrivals numbered 14,400 today. The market was steady at a decline of 10@15c.

Heavies	$9.15@9.20
Mixed and medium	9.15@9.20
Yorkers	9.15@9.20
Light Yorkers	9.15@9.20
Pigs	8.90@
Roughs	8.30@8.50
Stags	7.00@7.50

Horses.—Receipts today numbered 1,000 head. Buyers were numerous and horses were in excellent demand.

BALTIMORE LIVE STOCK

Baltimore, Md., March 30, 1914.

Cattle.—Receipts for the week 2182 head against 1318 last week.

Steers	$6.25@8.25
Heifers	5.50@6.75
Cows	3.00@5.75
Bulls	5.25@6.75
Fresh cows	32.50@72.50

Sheep and lamb receipts for the week were 3020 head against 1361 last week. Light supply: market higher.

Sheep	$4.00@6.50
Lambs	6.00@8.85

Hog receipts for the week were 12,771 head against 10,680 last week.

Light western	$9.40@9.45
Heavy to medium	9.15@9.30
Near-by	9.35@9.45
Pigs	9.00@9.10

Calves.—Receipts for the week were 303 head, against 368 head last week. Fair supply market lower at $5.50@9.00.

CHICAGO HORSE MARKET

Chicago, March 30, 1914.

Horses were marketed freely last week, and some weakness was seen in undesirable animals, which sold slowly, prices ruling around $50@100 per head, but good horses had a ready sale at generally steady values. Farm geldings sold on a basis of $125@200 for poor to prime, and farm mares at $185@225, some desirable pairs of mares going at $400 and thereabouts. Wagon horses brought $165@230 per head, while drafters sold at $225 and upwards, depending upon weight and quality, with sales of prime pairs at $600@650. Pairs of chunks brought $320@585. —F.

NEW YORK LIVE STOCK

New York City, March 30, 1914.

Beef Cattle Receipts for week 3,400 head Market irregular

Steers	$6.00@9.00
Bulls	[illegible]@7.50
Cows	3.00@3.65
Dressed beef	12@13½c.

Calf receipts 5,500 head. Market steady.

Choice	$8.00@11.75
Culls	6.00@ 7.50

Dressed calves higher. Dressed veals, 14@18c.

Sheep and lamb receipts 8,600 head. Market strong.

Sheep	$4.50@6.25
Culls	3.50@4.25
Spring lambs	7.50@9.00

Hog receipts 12,800 head. Market steady. Choice, $9.25@9.50.

NEW YORK HAY MARKET.

New York City, March 30, 1914.

Hay prices remain fairly steady for all grades. Demand during the week was moderate and mainly for the better grades. Receipts were 363 tons. Timothy, No. 1, $1.05; standard, $1.00; No. 2, 90c@95c; No. 3, 80c@85; clover 60c@95.

Straw is quiet and fairly steady. Receipts today were 50 tons. Oat straw, 55@60c bale; rye, 95c.

NEW YORK MILK MARKET

New York City, March 30, 1914.

The demand is still dull, so dull that the dealers are struggling with a surplus estimated at 10,000 cans. This they are working up into butter and cheese. It is probable that the rate which the producers will receive in April will approximate the Borden rate. It is likely that the Borden rates will play a considerable part in the making of the rates which will be paid to the farmers this summer, for there is no immediate prospect that the exchange will revive its quotations. It will be a basis. The situation is further complicated by the influx of dairy products from Canada and other countries since the change in the tariff. Foreign competition will have an effect on the price. It is likely to be lower this summer than it was last, taking the whole season thru.

The receipts of milk and cream in 40-quart cans for the week ending March 28 were as follows:

Railroad	Milk	Cream
Erie	45,787	2,116
Susquehanna	7,524	336
West Shore	18,458	475
Lackawanna	58,150	1,520
N. Y. Central (long haul)	79,181	1,916
N. Y. Central (short haul)	11,990	90

ELGIN BUTTER QUOTATION

Elgin, Ill., March 30, 1914.

The quotation committee of the Elgin Board of Trade this afternoon declared butter firm at 24½@25½ cents.

TOBACCO MARKET

There was very little business transacted during the week. The large manufacturers claim to be well stocked and are decidedly bearish in their attitude toward packers, the latter in turn making the claim that they are stocked up and also unable to pay prices asked by growers. The situation as a whole is slow, suggesting need of some sort of mediation. There were very few sales by growers these being at $7.50@9 per cwt. Many growers are ready and even a little anxious to sell in order to turn attention to the new crop. Owing to recent developments they are unwilling to listen to the depressing story of packers and the latter have not yet learned that they must soon allow the grower some say as to prices.

The new Lancaster Seed Leaf Tobacco Growers' Association continues to grow in strength and interest despite the opposition of certain prominent individuals who are acting purely thru selfish motives. Growers should ignore the "warnings" of outside parties and ever remember the necessity of united action. At a meeting at Farmersville there were 120 growers present. 44 of whom had not sold their 1913 crop. Another branch organization was effected at Rohrerstown with a membership of some 25 growers. Financial methods are now being discussed especially with reference to the tenant grower, who of course presents the most difficult phase of the financial question. A permanent board of directors will be chosen April 15th.

The general tobacco market as reported from New York was devoid of large transactions. There was considerable interest in Sumatra tobacco and but little demand for other sorts. In Ohio section the crop is being delivered at $11 to $12.50 per cwt the advanced price being largely on account of a very short crop. It is seldom that so many contingencies arise in a single season. Current price of seed leaf $10; little Dutch $8@10; Spanish, $13@21 per cwt. In Wisconsin practically the whole crop is in the hands of packers and attention is being turned to the new crop. In Connecticut there will be an effort to grow a greatly increased acreage about the only limitation being that of labor, which is scarce there as elsewhere.—H. E. Tweed, March 30, 1914.

A FREE TRIAL
of Perfect Harness Oil
Makes Your Harness Last Twice as Long
Perfect Harness Oil—scientifically prepared makes old harness soft and pliable. Penetrates every fibre. Gives new life and durability. Simply wonderful how Perfect Harness Oil restores wearing qualities to old harness. FREE TRIAL CAN sent postpaid during month of April. Write to

(Advice thru this department is free to our subscribers. Each communication should state history and symptoms of the case in full; also the name and address of writer. Initials only will be published. We cannot make reply by mail. This is one of the most valuable columns of the paper and we invite readers to make use of it. Clippings from this column, when properly preserved and classified, would make one of the most valuable medical symposiums a farmer-stockman could obtain.)

Feeding Question.—I have a calf that my father gave me to raise. Kindly tell me how to feed it. H. N. C., Berlin, N. J.—First of all keep feeding utensils clean. After they are washed place them in the sunlight and air every time they are used. After the calf is a few weeks old, give it some oat meal or oil meal, well cooked and mixed with the milk. An egg now and then added to its feed is good. Keep calf in a clean stable where sun shines in on it. As soon as grass comes, let it run out. A little well-cured clover or corn fodder is good feed for a growing calf. Follow the methods of your most successful neighbors.

Fetlock Joint Weakness.—I have a horse that seems all right until I drive him a long distance, then he becomes lame in his hind ankle. G. W. H., East New Market, Md.—Clip hair off fetlock joint and apply 1 part powdered cantharides and 6 parts fresh lard every week or 10 days. This light blister will strengthen ligaments of joint and he will soon get well. During treatment he should be rested.

Chronic Cough—Indigestion.—I have a 10-year-old mare that had distemper last fall. Since then she has been coughing and I fail to stop it. I also have a 10-year-old horse that has had several attacks of indigestion. Before these attacks come on, his bowels are very loose. When he is sick, he does not roll and tumble, but lays down and looks around at his side and seems to be in great pain. C. O. E., Titusville, Pa.—Give your horse ½ oz. ground licorice, ½ oz ground ginger and a teaspoonful muriate of ammonia at a dose in damp feed, 3 times a day. Feed your horse carefully and give him a dessert spoonful of hypo-sulphite of soda and 1 oz. of ground ginger at a dose in feed, 3 times a day. Watering horses too soon after giving them grain is a common cause of this ailment.

Horse Needs Company.—I purchased a horse 11 years old, that has always been among other horses. I only keep one and think lonesomeness and want of company makes him irritable and nervous. He paws, jumps and pushes anything that he can reach with his hind parts, but does not seem to pull on the halter. When on road he is fearless and a good roadster. I dislike to part with him because he suits me to use. S. C. L., Pemberton, N. J.—In time he should wean away from his companions, but I have known similar cases that never did get over it. I have often suggested the placing of a window in stable where the horse could look out and see sights that attracted their attention which seemed to satisfy them. In other cases, I have suggested keeping a dog in the barn with the horse for company. This seemed to work fairly well. In other cases keeping a goat in the stable seems to satisfy. A cow kept in the same barn often quiets the nervous horse.

Warbles.—Sometime ago I bought 3 young heifers from a dealer. They were in bad condition and every one of them lousy. I sprayed them with disinfectant dip and now I find several swollen spots resembling a boil. I squeezed the bunches and out came insects something like woodworms. The cattle eat well but do not thrive as they should. The hair around these spots is dry and the skin scurvey-like. G. R., Fishers Ferry, Pa.—Your heifers are troubled with parasites known as grubs, warbles or bots, which are the larvae of a fly known as the heel fly or warble fly. Either the eggs or the moggots hatched from them are carried into the mouth by the cattle licking themselves and may hatch in the mouth or in the paunch and seem to migrate into the gullet and penetrate its walls, passing from there thru the tissues of the body and land in the back. They usually develop in the winter or spring. If you are unable to squeeze out grub, make opening in skin with a pen knife, squeezing them out, but not forgetting to kill them. Then apply 1 part carbolic acid and 30 parts water to grub holes, once a day. Give each of your heifers ½ oz. ground gentian, 1 dr. ground nux vomica and 1 oz. of ground ginger at a dose in feed, 3 times a day.

"Better than leather For all kinds of weather"

Your Footwear Problem Solved
Leather is growing dearer every day. Leather shoes cost more than ever before. Yet how to get satisfactory work shoes—at a low yearly cost—is no longer a puzzle. The Hub-Mark Bootees are the answer to that footwear problem.
Hub-Mark Bootees are made of the best grade of New Rubber and A1 Duck with leather insoles. They are reinforced at every point where the wear and the strain comes.
Buy a pair of these comfortable work shoes. Work day in and day out beside men who wear leather shoes. When their shoes are cracked, split, and useless yours will be solid. Bootees are cheaper than shoes made of leather, because they always outwear them.
Note this:—Look for the Hub-Mark on all kinds and styles of rubber footwear for men, women, boys and girls. You can rely on anything you buy from dealers who sell Hub-Mark Bootees—they are square dealers.
BOSTON RUBBER SHOE COMPANY, Malden, Mass.

"A Pony For Every Boy And Girl"

ONCE more The Farmer's Wife is offering a beautiful Shetland Pony with complete outfit to some lucky boy or girl. If you haven't a Shetland Pony this is certainly the finest chance you ever had to get one. Our Pony Club motto is, "A Pony for Every Boy and Girl" and the fact that we have already given away 173 ponies to 173 different Pony Club Members shows that we are living up to our motto. Not many children have a chance to get a dandy pony like **"Winkle"** (the next pony we will give away) but you have as good a chance as any other boy or girl if you send us your name and address right away so we can tell you all about our wonderful Pony Club and how to get **"Winkle"** for your own.

WE HAVE ALREADY GIVEN AWAY 173 PONIES

HERE ARE THE NAMES OF A FEW OF OUR 173 LUCKY PONY WINNERS

"Lucky,"	Mildred Struthers, Cochise Co., **Arizona**
"Beauty,"	Evelyn Russell, Greene Co., **Arkansas**
"Marmalade,"	Crystal Andreas, San Bernardino Co., **California**
"Pansy,"	Evelyn Culler, Windham Co., **Connecticut**
"Toby,"	Geo. Lynch, Lake Co., **Illinois**
"Roine,"	Clarence F. Busick, Adams Co., **Indiana**
"Empress,"	Avery and Orle Knight, Chickasaw Co., **Iowa**
"Jim,"	Joey Edwards, Barton Co., **Kansas**
"Stubby,"	Harold Quick, Jefferson Co., **Kentucky**
"Merry,"	Isabelle Whitcraft, Baltimore Co., **Maryland**
"Rollo,"	Lillian Davis, Dukes Co., **Massachusetts**
"Peter,"	Charlie Mahoney, Chippewa Co., **Michigan**
"Bunny,"	John M. Borsvald, Polk Co., **Minnesota**
"Evangeline,"	Gladys Houx, Saline Co., **Missouri**
"Kris Kringle,"	Mallena Vashus, Dawson Co., **Montana**
"Tom,"	Helen Herrman, Cuming Co., **Nebraska**
"Benny,"	Harold Kiley, Warren Co., **New Jersey**
"Joe,"	Harold R. Palmer, Oswego Co., **New York**
"Cub,"	Eugene Mumpower, Buncombe Co., **N. Carolina**
"Paul,"	Evelyn Sears, Grand Forks Co., **N. Dakota**
"Jolly,"	Hazel Cox, Darke Co., **Ohio**
"Pert,"	Georgia Spencer, Warren Co., **Pennsylvania**
"Irena,"	Colgate M. Searle, Kent Co., **Rhode Island**
"Sunshine,"	Eva Huddleston, Beadle Co., **South Dakota**
"Jean,"	John H. Elrod, Putnam Co., **Tennessee**
"Zip,"	Ella Fullam, Randolph Co., **Vermont**
"Lulu,"	Louise Damron, Benford Co., **Virginia**
"Scotty,"	Catherine Rohrbeck, Pacific Co., **Washington**
"Chum,"	Bozzie F. Thornton, Mercer Co., **W. Virginia**
"Pet,"	Sheldon Adams, Dane Co., **Wisconsin**

Notice we print the names of 30 of our 173 Lucky Pony Winners. We would gladly print the whole 173 names if we had room for them here, but we will send them to you just as soon as we hear from you. Possibly some of these happy children live in your county or a county near you and, if so, you probably know them because our Lucky Pony Winners are the best known children in their neighborhoods. However, it doesn't make any difference where you live; if you send us your name and are the lucky child to get "Winkle," he and his whole outfit will be shipped without one cent of cost to you. If you send us your name the day you read this, we will send you 1000 votes for "Winkle" and a big surprise that will double your chances of getting a Shetland Pony.

This Pony Free

"Winkle"

"WINKLE" is a beautiful little brown and white spotted Shetland. He stands about 42 inches high and weighs around 300 pounds. We have already given away 173 ponies to children all over the United States and "Winkle" is just as pretty a pony as any of these others. We selected "Winkle" from a big herd of Shetland Ponies because we thought he was the prettiest and cutest pony of them all just the kind of pet that any little boy or girl would love to own. "Winkle" is as gentle as a kitten and likes to play and romp with children all day long. He is a sturdy little fellow, too, and can haul along his little pony cart filled with happy children at a merry clip. If you send us your name and get "Winkle" he will carry you anywhere just about as fast as you want to go. Send us your name today and we will tell you just how to get him. Don't delay but do just as our other 173 Lucky Pony Winners did and send us your name at once.

Do You Want an Outfit Like This?

The Outfit

NOT only will we send "Winkle" to some lucky boy or girl, but we also send the finest kind of pony outfit along with him. The outfit includes a stylish four-wheeled pony buggy, a handsome nickel trimmed harness, a hand-made riding saddle and a wonderful Indian horsehair bridle. This bridle cannot be bought in stores, but is made especially for us by an old cowboy at Deer Lodge, Montana, out of beautifully colored horsehair which he weaves into remarkable Indian designs. No child has a prettier or more complete outfit than the one we send with "Winkle" and we know you will be the happiest boy or girl in your state if you send us your name and get this beautiful pony and outfit for your own. We had just as soon send "Winkle" and the Outfit to you as to any other boy or girl but first you must send us your name and address so we can tell you all about our easy plan. You may fill out the coupon below, or send us your name on a postal card but remember, do it now before it is too late.

Send Us Your Name Today If You Want To Own "Winkle"

Write Your Name and Address Here

THE FARMER'S WIFE PONY CLUB,
570 Webb Bldg., St. Paul, Minn.

Please send me pictures of "Winkle" and tell me about your Pony Club and also tell me how to take care of Shetland Ponies. I have no pony and want to belong to the Pony Club and get "Winkle" for my own.

Name..

R. F. D..

P. O.............................. State ....

GOOD FOR 1000 VOTES FOR "WINKLE"

JUST AS SOON as we hear from you we will tell you exactly how to go ahead and get **"Winkle."** Our Pony Club is known all over the country because it gives Shetland Ponies to good boys and girls. Don't let anybody persuade you that you cannot get this beautiful little pony and outfit because our plan of giving away ponies is different from others. The fact that we have already given 173 ponies and outfits to 173 boys and girls all over the United States, from the state of Vermont to the state of California, many going over 1,800 miles from St. Paul, is proof that we really give ponies away. The banker or postmaster in your town knows that the Webb Publishing Company of St. Paul, Minnesota, publishers of The Farmer's Wife and established over 30 years, is one of the largest publishing firms in the United States and can afford to give away ponies to advertise its papers. We never heard of a single one of the 173 children to whom we have already given ponies until they wrote and told us they wanted one and that is why you must send us your name and address at once, if you want us to send you **"Winkle"** and his elegant outfit.

EVERY CLUB MEMBER GETS A PRIZE

EVERY single child who sends us his name and joins the Pony Club will receive a handsome prize of his own choosing. Besides the Pony Outfit (and the Big Surprise we have for you) we will give Bicycles, Diamond Rings, Sewing Machines, Rifles, Cameras, Gold Watches, Flashlights and many other wonderful rewards that you never could get until now. Of course, **"Winkle"** and his dandy Outfit is the best prize of all and you have the same opportunity to get him as any other boy or girl if you send us your name now.

BE SURE TO ADDRESS YOUR POST CARD OR ENVELOPE TO

THE FARMER'S WIFE PONY CLUB

What One Happy Club Member Says

Dear Pony Club:— certainly am proud of my pony "Babe." He had such long hair during the winter, but now he has shed off so pretty and is the prettiest pony we ever saw. He is so fat, too. I have had lots of chances to sell "Babe," but no siree, nothing would buy him. I love him more every day and I don't know what I would do without him—I'd be so lonesome.

I can never say enough for the Webb Publishing Company. I thank them over and over for giving me such a nice pony and outfit. They did all they said they would and treated me right.—Roy Brown, McCook Co., South Dakota.

Girls' Garden and Canning Clubs.

By Mrs. H. W. GILBERTSON,
Sussex Co., New Jersey

CLUB PIN.

The first incentive to start the Garden and Canning Club work in Sussex County came thru hearing the specialist in charge of club work of the United States Department of Agriculture give an illustrated lecture explaining the work. The benefits of the work to the few girls who had already undertaken it made such a strong appeal that it was decided to give the girls of Sussex County the opportunities which the club work afforded. Altho in the Garden and Canning Club work a part of the 1-10 acre may be used for other vegetables, we decided to use the tomato only, in beginning the work, and thru the tomato to teach the canning of other vegetables. The club work was carried on as a part of the activities of the Sussex County Farm Bureau. The first steps taken were to secure the necessary prizes and to find grocers in the county who would be willing to purchase the tomatoes canned in tin cans. These details having been attended to, the enrolling of the club members began.

Getting The Enrollment

The County Superintendent of Schools co-operated with the Sussex County Farm Bureau in the work, and enrollment blanks and circulars were sent out to each teacher explaining the work, stating the prizes and basis of award. The basis of award was as follows: 30 points for profit on investment, 30 points for quantity of fruit raised, 20 points for quality and 20 points for the written essay on "How I Grow My Tomato Crop." Over forty schools were visited and talks on the club work given. The personal interview seemed to count for the most in getting the enrollment.

Planting Seeds, Preparation of Plot.

As members enrolled, two packages of Stone tomato seed, which had been tested, were given them by the Farm Bureau with the instructions for planting in window boxes. While the seeds were growing the girls selected their plots and had them prepared by the use of barn-yard manure, plowing and harrowing.

CLUB MEMBERS LOOKING FOR TOMATO WORMS.

When it came time for the first transplanting, various methods were used by the different girls. Some transplanted to other shallow boxes, some to tin cans, some to earthen pots, some to beds out of doors covered with glass, and others to tubes made of roofing paper cut 4 by 9 inches and fastened together at the top and bottom with paper clips. These tubes had no bottoms and were placed on boards which were set on tables out of doors during the day and put in the house at night. This was a very satisfactory method, for when it came time to place the plants in the plot the paper clips were removed and the dirt was left undisturbed.

When it was time to transplant into the field, each club plot was measured with a 100-foot measure and staked out, a record being taken of the length and width. The plots varied in shape, the ones which were two rods wide by eight rods long proved to be the easiest to cultivate. The number of plants to the tenth-acre varied from 272 to 544, according to the width between the rows and the distance between plants in the rows. This matter was left to the girls to decide. In transplanting they tried especially to avoid wilting and destruction by cut worms. The season was very late and most of the plants could not be set before the first week in June. Commercial fertilizers were used around the plants at this time to hasten the growth.

MOTHERS INTERESTED IN CANNING DEMONSTRATION.
X Shows Miss Lucy Bale, Winner of Eastern Championship.

Pruning and Staking

The next step was to visit each club member and teach "the how and why" of pruning and staking. The girls who took the pains to both stake and prune found that their plants bore earlier and for a longer period, ripened more evenly and the fruit being off the ground could be gathered with greater ease.

Combating Insect Pests and Diseases

The various plots were troubled at times by the flea beetles, potato bugs, blight, cut worms, green tomato worms and the bud-end rot. The latter was by far the most serious, as bushels of fruit had to be thrown away. The girls were taught to make bordeaux mixture and were given a lesson in spraying.

Club Meetings

Wherever there were as many as five club girls in the county living within a radius of four miles, regular monthly meetings were held the first Saturday of each month. The chief object of the meetings was to give instructions concerning the work which should be accomplished during the month. To add interest to the meetings we had a picnic, a spelling match, a lesson in making bordeaux mixture and spraying with it, besides out-of door canning demonstrations.

The Canning Work

The canning part of the club work seemed to be of greatest importance since it is true that at least 50 percent of all vegetables and fruits grown in our country go to waste for want of care at the proper time. By saving the surplus fruits and vegetables the high cost of living is reduced considerably and much waste is eliminated. Home canning thru club work provides a more varied diet for the home people, saves labor and time in the canning season, encourages greater production and teaches business management. While the tomatoes were ripening the girls were taught the canning of peas, string beans, beet greens, swiss chard, carrots, berries, apples, plums, etc., in glass for home use. The cold pack method, that is the cooking or sterilizing of the fruit or vegetable in the can, was taught in all of the canning work.

The girls found the canning in tin for market very interesting. The cans came with solder-hemmed caps which are soldered on by heating an iron called a "capping steel," and turning it on the cap until the solder is melted. We found that some of the ten-year-old girls did the soldering as neatly as the older ones. We used the National Club label for our cans and had the statement "Canned by the Girls of Sussex County, N. J.," printed at one end. Each girl in the club has a member's number which appears on each can she puts out. They are taught that when purchasers are satisfied with the quality and weight of the goods which they put out it will mean more orders to fill, while work poorly done will surely be traced back to the Club member. The Club motto "To Make the Best Better" is in itself an incentive to good work.

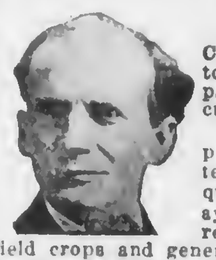
Canning Demonstration

Canning demonstrations were held at convenient points in the county so that each girl had a chance to learn each step of the work before undertaking to can at home. A small portable, out-of-door canner was used in giving demonstrations. A picnic dinner was planned for each meeting of this kind and the mothers were invited to come with the girls. In the early fall Mr. Benson, of the United States Department of Agriculture, gave an all-day canning demonstration in the county to which all housewives were invited. The club girls assisted him and over two hundred women attended the meetings. The late vegetables, such as cauliflower, lima beans, and sweet corn, were canned. The canning of sweet corn on the cob was of special interest to all present. Many instructions were given for the canning of various fruits and vegetables and the efficiency of various methods of canning were discussed and demonstrated.

AT CLOSE OF A LESSON IN CANNING.

(Continued on page 14.)

Farm Crop Notes



By
R. P. KESTER
Counselor on Soils to the State Department of Agriculture.

Thru this department Mr. Kester will discuss queries from Pennsylvania Farmer readers on soils, field crops and general farm practice. Address all queries to Pennsylvania Farmer, Philadelphia, Pa.

NATURAL METHODS OF SOIL IMPROVEMENT

Controlling Soil Moisture

No matter how much plant food may be present in the soil, unless the moisture condition is right, best plant growth is impossible. But where the right moisture condition is maintained thruout the growing season plants will grow, even on the poorest soils.

Water is the great solvent of minerals. It must be ever present in the soil so as to keep prepared a continuous supply of plant food in an available form. Not only does water perform this work, but it acts as a common carrier; it is the vehicle by which food is freighted to its destination in the body of the living thing,—plant or animal. Since this operation must go on continuously to maintain health and growth, it is for the farmer to do the right thing at the right time in dealing with his soil so that he may have ever present in the season of plant growth a sufficient supply of the great necessity—soil moisture.

There are two extreme conditions of soil moisture, either of which is fatal to best plant growth. The farmer gives as a cause of poor crops the prevalence of one of these extremes more frequently than any other; "it is too dry", or, "it is too wet." Either of these excuses is considered sufficient, and Providence is indirectly charged with the act of cutting short the food supply, yet the supply of soil moisture is largely within the control of the farmer. The successful farmer is invariably the one who has made the conditions of the soil such that the desired moisture conditions prevail thruout the growing season.

There is no doubt but what there is a greater variation in the moisture content of our soils now than there was a century or more ago. Strange as it may seem, the causes,—the destruction of our forests and the failure to maintain the normal humus content of the soil—bring upon us both the deluge and the drouth. When we awake more fully to our duties as a nation and are able to take the larger view we will stop the wholesale work of destruction and begin the work of construction. The first thing to do,—the thing of vital importance, is to reclothe the denuded mountains and steep hill-sides with trees. A regrettable thing is that public appreciation of this need is, as yet, so slight.

A great deal of time, labor and fertilizer are annually wasted on land that must be underdrained before full and paying crops can be grown. Not only fields that have spouty places but also low lying, or level fields in which the subsoil is too close or solid to permit free removal of water after heavy rains, must be underdrained to be satisfactory. Fields that were too wet when first cleared are found to contain and retain too much water at certain seasons. This is because the tree roots and the holes left by their rotting have disappeared, and also because of the lessened humus content. Failure to grow deep-rooting plants, as the clovers, also allows the under soil to close up and become too close for easy movement of water either upward or downward.

Too much water is detrimental to plant growth in several ways: It dilutes the plant-food solution; being heavier than air. It fills the interstices in the soil, excluding the air. It causes a cooling process—and thus lowers the temperature of the soil. It prevents early and sufficient cultivation.

Surface draining by open ditches helps some but does not do the work that tile drains will do when rightly installed. The distance apart and the depth to place drains depend upon the character of the soil and subsoil. In average gravelly or sandy loam, it may be estimated that a line will drain ten feet each side of the drain for each one foot in depth. In heavy, clay soils they should be closer. Unless stone of the right kind are at hand, and labor plenty, tile is the cheapest, and it makes a better and more permanent job. Draining land is expensive but the labor and fertilizer lost in farming wet land will soon pay for a draining system.

About 42 inches of water falls annually in the way of rain and snow in eastern United States. In spite of this, the average farm land, farmed in the ordinary way, suffers for the want of water after a very few days of dry weather in summer. Water sinks into the soil less readily than it did when first cleared because it has become more solid and contains less humus. Shallow plowing, always at the same depth, has produced a sort of artificial hard-pan almost as impervious to moisture, thus permitting less moisture to sink into the earth and causing more to run off the surface, thus washing. The place to begin correcting this condition is by deeper plowing, thus breaking up this artificial hard-pan and producing a deeper and more mellow soil that will more readily absorb water. Then as we increase the humus content by sowing catch crops, cover crops—especially deep rooting ones—growing heavy sods etc., we start on the way of being masters of the situation.

When warm weather begins, this soil water or moisture begins to move upwards to the surface by capillary attraction and is evaporated into the air. If the surface of the ground be covered so as to keep the sunshine and the air from it, evaporation can not take place and capillary action ceases as water does not come up any faster than it is removed from the surface. This mulching may be of any material such as straw, hay, leaves, manure, or dry, loose soil. The beneficial effects of a mulch are many and are too little noted or appreciated either by farmers or soil experts.

Harrowing or otherwise stirring the surface breaks up the top, thus causing it to dry and make a very satisfactory mulching material, as the dryer soil is, the less rapidly does water move thru it, either up or down. Harrowing fall plowing as soon as dry enough in the spring, and following the plow in spring with the harrow is the way to hold the generous supply of water in the soil we always have at that time. If we do this thoroly and in time, we can be reasonably independent of the summer shower. We might as well neglect to store and protect our summer's supply of ice in winter, because there is lots of it then, as to neglect to protect and keep for summer use the soil moisture because there is plenty of it in the spring. Harrow and cultivate early and often. Crop production can be increased and increased economically by regulating and controlling the supply of moisture by drains, mulching, and cultivation.

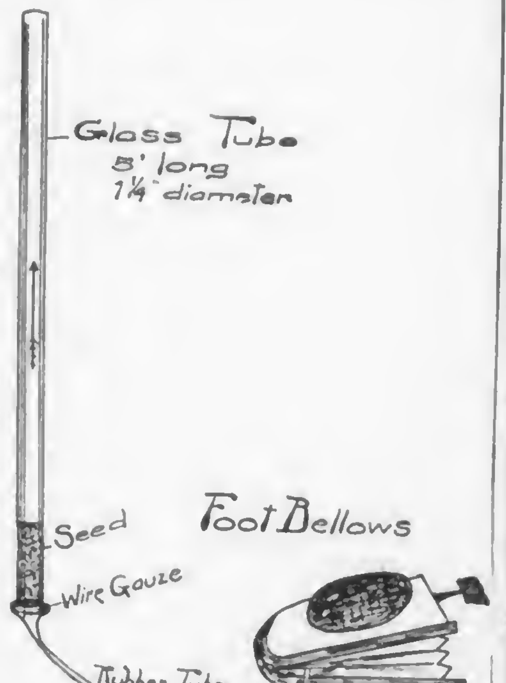
Next article, Humus and its increase. R. P. K.

CLEAN SEED AND CLEAN TOBACCO BEDS

Clean Seed.—The majority of farmers appreciate thoroly the value of cleaning their seed wheat, but how many tobacco farmers pay just as much attention to cleaning their tobacco seed? If one desires to produce a maximum crop of tobacco it is just as necessary to clean the tobacco seed as it is for the wheat farmer to clean his wheat seed.

How To Clean The Seed.—A very simple arrangement for cleaning tobacco seed may be made by attaching to a foot bellows, a glass tube about five feet long and 1¼ inches in diameter, having at its bottom end a small sieve, thru which the tobacco seed will not be able to pass. By means of a brass fitting the glass tube may be connected to a rubber tube from the bellows.

A suitable quantity of seed may be placed in the tube and by means of the foot bellows a steady stream of air can be forced thru the tube, which will blow out the dust and small undeveloped seeds. By blowing out the small seeds only the large and well-developed seeds will remain behind. If only the large and well developed seeds be sown, a much better and more even stand will be gotten.



TOBACCO SEED TESTING APPARATUS.

Steam Sterilization of Seed Beds.—The scarcity of good plants thruout the tobacco-producing sections of Pennsylvania during the season of 1913 has led to a development of much interest in the growing of plants. Quite a number of commercial growers have begun to steam sterilize their seed beds and have met with much success. The necessary equipment for the operation consists of a sterilizing pan and a steam boiler, with either pipe or steam hose connections. A convenient size for the pan is 6 feet wide and 10 feet long, with a depth of 14 inches. The platform of the pan may be made of wood and the sides of galvanized sheet iron. It is probably advisable, however, to make the platform as well as the side of sheet iron, since the wooden pan has been found to warp.

Again, if the entire pan is made of sheet iron, the life of the pan will be greatly increased. The connection for the steam pipe should be made to enter from the platform and should consist of a T-shaped pipe in order to scatter the steam and permit the tearing up of the soil. Preparatory to sterilizing the beds should be dug and raked ready for sowing. The sterilizing pan should then be inverted and pressed down into the soil in order to retain the steam. The steam should then be turned on from the boiler, which may be of any type of steam boiler or from a steam engine as is commonly used to run a threshing machine. A pressure of about 70 pounds should be maintained for not less than from 25 to 30 minutes. At the end of this period the pan should be moved along in the bed to a new position and burlap should be thrown over the sterilized portion in order to retain the heat as long as possible.

Results of Steam Sterilization.—Sterilization in the first place kills all weed seeds and dispenses entirely with the laborious job of weeding the beds. This saving in labor will in itself pay for the cost of sterilization. It also kills any fungous diseases or insects which may be harboring within the seed bed. The soil is gotten into a better physical condition for sowing and it has actually been demonstrated that plants may be grown within a shorter period of time when the beds have been steam sterilized. The practice saves labor and time.

Low Cost of Sterilization.—The cost of a suitable pan need not exceed $10 to $12 and when we consider that the pan should last from 8 to 10 years, the annual cost of the pan would be only about $1.50. The only additional cost is for the labor of two men, one to fire the engine and the other to assist in moving the pan, the cost of fuel and the hire of the engine. The plan of steam sterilizing beds has worked successfully with a number of commercial growers in the tobacco producing sections of Pennsylvania and it well deserves a trial by every tobacco grower.—H. R. Kraybill, Lancaster Co., Pa.

Commission Merchants and the 35-Cent Dollar---II.

By FRED W. DEAN, Susquehanna Co., Pa.

Accepting the suggestion given me in the experience related in my article last week "that all commission merchants do the same thing," the following winter I went to one of the large market cities of New Jersey where I felt that I had previously been swindled out of several thousands of dollars. Before I left home I marked up a lot of empty egg crates with private marks. Leaving my son to handle the home end of the deal, I traveled to the city. When I got off the train my name was William Morris. I secured the use of a small cellar in one of the suburbs of the city and rented a room near the produce market district.

The following day I made the acquaintance of several of the leading commission merchants as a buyer of strictly fresh eggs, vegetables, etc., taking care to show a considerable sum of money. Then I wrote my son to commence shipping eggs and always to ship on the train leaving our home town in the evening so that the goods would reach the city the next morning. I also interviewed the express company as to probable time of delivery in the produce section, and learned that it would be about 12 o'clock, noon. I always got on the job about 11 o'clock A. M., always keeping an eye on the commission house where my son was to ship. When the express wagon drove up to this house I watched for my crate of eggs.

I soon learned that these dealers did not like to sell to strangers and that they did not like to sell eggs until they had been repacked. Their reasons for this are apparent. I succeeded, however, in getting every crate of eggs shipped, up to four crates, one each from four different firms. By this time I began to get returns from home and they were what I had expected. The returns showed a graft of two to four cents per dozen on every crate. I then went over the same four houses with a second shipment. I had learned from experience that the shortage in returns is usually laid to the bookkeeper, hence the necessity of getting them on two counts.

We went over the four houses with a second shipment and I secured the next four crates, one from each house, also a crate of comb honey which had been included with a crate of eggs and purchased by myself. On these second shipments the graft was from four to six cents per dozen on the eggs and three cents per section, or 72 cents on the case of honey. One dealer wrote me a letter saying that he had sold my eggs at the very highest price, 40 cents per dozen. I held the sales bill at 45 cents! I was always careful to take an itemized bill of sales, showing just how much I had paid for the goods purchased. This firm, as did all of the others, deducted the express and commission charges from the price reported. I took all my purchases up to the rented cellar where I disposed of the good, keeping the empty crates.

The heads of the four firms that I had dealt with were the leaders in the produce business. One was the president of the produce dealer's association, and was said to be worth several million dollars. He was the responsible head of the oldest, largest and richest commission house in his city and was known to be a philanthropist and a power in politics, the right-hand man of one the United States Senators of the state. One of the others was secretary of the dealers' association, one of the "upper ten" of the produce business. I secured the services of an ex-judge as counsel but later found that he was a close friend of the president of the association and was looking for a rise in politics, which did not help my case any. I started suit under difficulties and finally insisted upon going before the grand jury of the county. When I got there I found that the members of the jury knew almost as much about the case as I did, and while they were very much interested in the evidence I presented and asked me a lot of questions showing a knowledge of the deal that they could only have obtained from the dealers themselves, they appeared to be more interested in indicting me for blackmail than in indicting the commission merchants for embezzlement. The county prosecutor finally agreed to allow me ten minutes to present my case, but when I got before the grand jury they were so interested that they took nearly one hour.

I found that I was to be sidetracked. I secured the services of another lawyer, and he told me that I had a hopeless case. He explained the political situation and showed the impossibility of securing an indictment against the president of the association. I then went to a large daily newspaper in the city, only to find that the rich man was a stockholder in this paper. I soon found out that I was only one against a powerful organization. I suspect that I would have found a lot of friends among the consumers if I could have gotten in communication with them, but all avenues were closed to me.

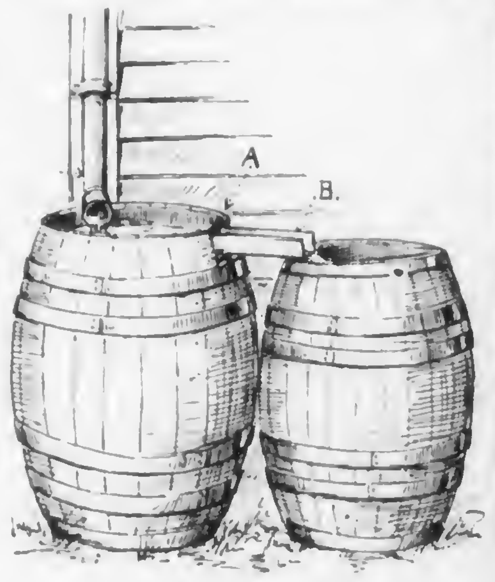
In the meantime the commission merchants got busy and sent me new bills of sales with checks inclosed covering the amount embezzled. I still hold those checks as proof of the transaction. One check is for $2 the amount held back on two crates of eggs. One is for $3.70, the amount retained out of two crates of eggs and one case of honey. One is for $1.71, on two crates of eggs. The fourth house failed to send a check for the amount retained, but it is over $2 on the two crates of eggs. As in the former deal, told of last week, the deficiencies were always greater on the second shipment than on the first.

These men as in other cases laid the errors in settlement to their bookkeepers. Poor bookkeepers! One dealer came to see me and he said that he had discharged his bookkeeper as he would not have any one around his place that was not strictly honest. But I recognized the man as the one I had done business with and it was his hand writing on the bill of sale, bill rendered and the check. He was his own bookkeeper. The grand jury asked me who I represented; the government or an association of shippers. I told them that I represented 50,000 grangers, which was true in a sense. But when I got home with my evidence I went before the grange with it. They were greatly interested but they could only give me sympathy, and sympathies do not count for much in such cases. I was already out in cash something over $200, but I had valuable information and experience.

NOTE.—The third article in this series will appear next week.—The Editors.

FERTILIZER WASTE

According to a recent bulletin, No. 37, of the Department of Agriculture, 75 percent of a highly valuable fertilizing material in the form of tankage and blood from the country slaughter of food animals is being wasted thruout the country. In addition, $22,000,000 worth of ammonia, from which ammonia sulphate, another valuable fertilizer could be made, is annually wasted by the practice of making coke in the beehive type of oven. After discussing the relative values of the different fertilizers the bulletin advocates a co-operative system among American farmers, such as that in vogue in Denmark, where killing is practiced on a co-operative basis in small country abattoirs and the blood carefully preserved for fertilizing purposes.



RAIN WATER STORAGE.

CATCHING RAIN WATER

If you have to depend upon barrels for catching and holding rain water try this plan. Secure two or more barrels. Set the first under the eave trough but block up so as to be higher than the next barrel. Cut off a stave or bore a hole about two inches from the top and fit in a metal trough or a short piece of pipe to carry water to the next barrel. By arrangement of blocking any desired number of barrels may be arranged in series.—Sylvanus Van Aken, Ulster Co., N. Y.

Plants—Sows
Fertilizer—Covers
Rows We are the only manufacturers of the original Eclipse Planters. All parts fit perfectly. Plants corn, beans, peas or beet seeds in hills or drills; at same time will drop wet or dry fertilizer in accurate amounts per acre in hill or drill. Only planter with concaved places each side of plow—places moist earth on seed just before fertilizer is dropped each side of seed.

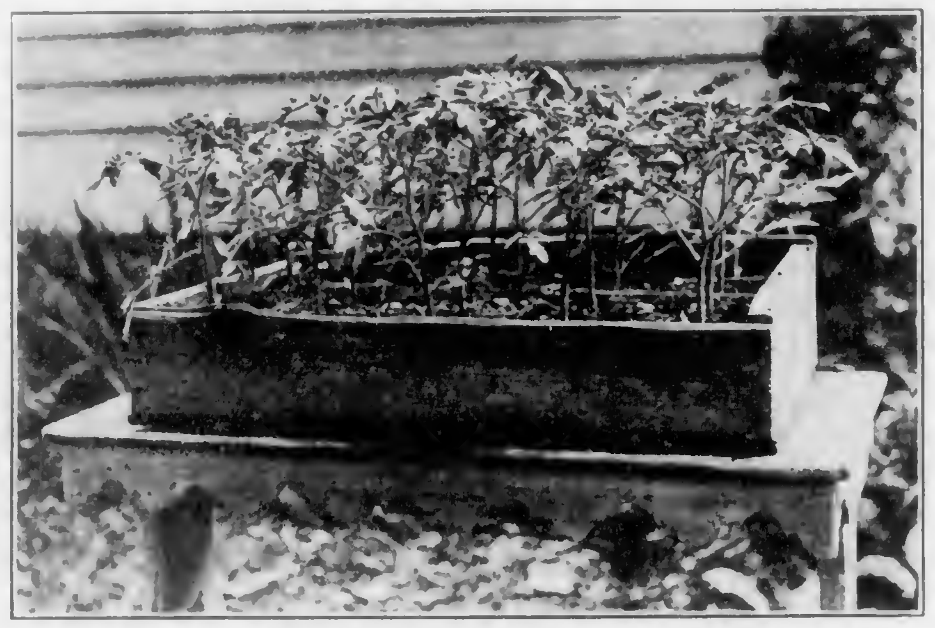
Horticulture

GROWING TOMATOES

The first essential in growing good tomatoes, is to have seed from good tomatoes to start the plants from. Seed should be saved from fruit that is solid, of good shape, fair size, and has ripened early in the season. By saving seed year after year from such tomatoes the strain will be improved and tomatoes that will ripen a little earlier each year will be secured.

In the fall some good garden soil should be stored in the cellar in which to start the plants the next spring. Unless one has an extra good place to keep the plants and care for them after the seeds germinate, I would not advise starting them very early. I have started them in April and had ripe tomatoes from the plants just as soon as I did from those twice as large that were budded when set, and both had the same care in setting and the same culture afterward. I prefer a shallow box in which to sow the seed. The soil should be finely pulverized, then firmed before sowing the seed. I take time enough when sowing to separate the seed so they are about half an inch apart. The plants will be more stocky than if the seed are sown close together in a tin can as some do, and they can be transplanted without disturbing the roots as much. After the seeds are placed on the soil they are covered with a fine soil to a depth of 1-8 inch, which is firmed, then carefully sprinkled with warm water, the box covered with glass or cloth and put in a warm place. Keep warm and moist and the seed will germinate in a few days.

When the plants have the third or fourth leaf on they are transplanted. I prefer to use boxes for most of my plants. It is less work to care for them and move them around than if in separate dishes. I use boxes about 4 inches deep and of convenient size to handle easily. After filling the box with finely pulverized garden soil, I divide it off into four-inch squares by pressing strips of pasteboard down in the soil. Small holes are made in the center of each square and a little water poured in. After standing a few minutes to let the water soak in the soil, the seedlings, which have been first watered to make as much soil cling to the roots as possible, are carefully transplanted, the soil is well firmed around the roots, and they are kept in the shade for a few days; then placed where they can have all the sunshine possible, and when warm enough, given plenty of air; for we want strong, stocky plants instead of tall, spindling ones.



PLANTS IN BOXES DIVIDED INTO SQUARES BY PRESSING STRIPS OF CARDBOARD INTO SOIL. EASILY HANDLED AND CAN BE TRANSPLANTED WITHOUT CHECKING GROWTH.

It is usually safe to transplant in the ground when the trees are in full leaf. By this time the plants in the boxes should have filled the squares with a mass of roots, which need not be disturbed enough when transplanting to check the growth of the plants, provided the plants were well watered a little while before so the soil will cling to the roots and not crumble off. Transplant just before a rain if possible. If not, water the plants after they are placed in the holes dug for them, then draw soil around them and tread firmly over the roots, setting plants so they are covered nearly to first leaves. If the plants have a long stem, dig a trench and lay them down so the stem will be all covered, bending the top of the plant carefully. Roots will grow from the whole length of the stem and the plant will have a much greater feeding capacity, and will have better soil in which to grow than if set in a deep hole.

Cultivate often and so keep mulch around the plants to conserve moisture, and if you have a fairly rich soil you will be rewarded by an abundance of tomatoes. Sometimes a mulch of strawy manure is placed around the plants after the fruit has set.

My method of supporting the plants is as follows: I set the plants in two rows running north and south. The row of plants on the east side are tied to posts set in the ground and held in place by being tied to a wire which is fastened to stout posts at either end of the row. The side shoots are pinched off from plants as soon as they appear, and the main stalk is tied to a post. You will get ripe tomatoes sooner by this method. In the second row the main branches are allowed to grow and are supported by a rack to which they are occasionally tied. The rack is made by nailing three long edgings or boards horizontally on three short ones about 2½ or 3 feet long, one being placed in the center and the others near each end, the lower board being placed near enough the ground to support the first clusters of tomatoes. Near the top of the end posts a short post is hinged by driving a large nail thru both. These will support the racks. After using for a season these racks can be folded up and placed under shelter and can be used for several years. The tomatoes that are started later to use green in the fall are not supported. They can be better protected from the early frosts without it. By combining the pole and rack methods in the way described, the plants will all get more sunshine, the tomatoes ripen sooner, and they will be handier to get at and easier to pick. It is well to remember that in cultivating tomatoes extreme care should be used so as not to break the tender shoots of the plant. Use a hoe where care is necessary.—M. W. Jenkins, Delaware Co., N. Y.

STRAWBERRIES ON THE HOME FARM

The strawberry is hardy, adapting itself to great extremes of environment, and is easy to cultivate.

New varieties are often grown from seed, which is a very simple matter. In this way new strains or varieties may be originated, differing in taste and color from the parent plant. In all events it is well to study the culture and habits of these plants if one wants even a small bed for home use; for like all fruit culture, neglect is the death of the plant. The writer once set over 2,000 plants in a cold northern climate and during the three years of effort to raise berries for profit much of great value was learned, regarding this pleasant garden work.

The soil best adapted for strawberry growth is found in the northeastern part of the United States, and is known as a warm, quick sandy or gravelly soil. Soils may be adapted to strawberry culture by adding sand where the soil is too heavy and black, and by fertilizing where the ground is too poor otherwise; in fact, they may be grown almost anywhere, by suiting conditions to their requirements; but, where the soil is naturally light and sandy, not only will the plant be better but the yield will be abundant and the berries will be larger in size and of a better color.

A southern or eastern exposure is best for results. By the use of mulches the time of ripening of the crop may be governed to suit the grower, even when but one or two sorts are grown. To ripen early, the mulch or winter covering must be withdrawn from the plant. Two weeks after the early crop is beginning to set on the vine remove the covering from the later crop.

The best berries are grown on land where some other cultivated crop has been grown for at least one year. In this way one may avoid the pests known as wireworm, white grub, and cutworm, that infest the new sod-land. Beans or potatoes are a good crop for the first year's tilling before the berries.

Let us suppose that our readers are thinking only of a small patch of berries: we will begin with the preparation of the land. The field methods where great crops are expected, differ somewhat from the small growers' methods. Plow the ground deep, so that all organic matter may be well turned under. Pulverize at once with a harrow, making the ground as fine as for a seed bed. Of course we are assuming that the soil has been studied and put in proper condition. In setting the plants, select rainy weather, either early in the spring, or during August or in this climate even as late as September. If the day is not cloudy and showery, soak the plants well after setting, and with an additional wetting of the ground about them, they should not wilt. The writer has had much better success with home grown plants than with shipped plants, for several reasons. In the home-grown plant a ball of the earth may be retained about plant when it is set; therefore, the roots are not disturbed, nor allowed to dry out. The other reason is that in many instances the long distance of shipment, and the consequent heating of the plant destroys it, or puts it back in growth.

Two persons make better progress in setting than one. A man, and a boy will do more work and better than one person. Home grown plants have less fine roots, or feed roots at time of setting and as these are dependent on the soil for food they should be set as soon as taken up. The roots should be spread out in the hole, umbrella-like, as this is their natural position. A spade is the right sort of a tool to set with. The spade should be lifted full of dirt which is scattered about the plant when set in and held in position by the "setter." The importance of setting just the right distance in the earth cannot be over-drawn. Setting the plants either too deep or too shallow is equally disastrous. When the feeding roots are well spread, in the broad, flat hole the earth should be pressed firmly up over all the roots, yet not covering the tender center leaf. Taking off two or three of the outside leaves gives the plant less work to do, and is of importance. The plants should be set at least three feet apart, leaving a space in which to train the runners, the runner system being the most natural way of producing new plants. These runners should not be allowed to run at random, as a row of plants is better than a bed in fruit gathering time. The old plants bearing well the second year, must be taken out after the third bearing or the third year of growth, but a little care will direct the new runner plant into its place, and the use of the hoe is then required in order to keep down weeds and also to keep a moisture conserving dust mulch about the new plants.

The home production of plants for sale is a paying matter, if one can take the time to develop the young plants. Several kinds should be selected upon the advice of a reliable grower for the start, after which the best plan is to cultivate up some new plants from your own beds, for the next setting. I have found that a plant set in the spring will produce several runner plants, only one of which should be allowed to mature. The rest are taken off as soon as they appear, sending the strength of the plant to its own roots.

When the plant is in bloom, some nitrate of soda, about 100 pounds to the acre used in solution rather than in the form of salt, brings the best results. Good berries may be grown without this, however.

The transfer of pollen from one plant to the other is important, as upon this operation hinges the success or failure of the crop. Good weather and an abundance of bees on the farm ensure proper cross pollination of strawberries. As the wind will not usually carry the pollen over more than four rows of plants it is necessary in order to be on the safe side to have about every fourth row a "perfect flower" plant, which will simply mean that the flower must have within itself both the male and female elements or "self fertilization" power.

It is hard to specify just when the plants shall be set, as the climate has much to do with it, and especially the rain-fall.

There are two ways of planting that are about equally good, one in hills where the hoe is depended upon for keeping the ground in shape, the other in rows where cultivation will be done with the plow. The last method is called matted-row cultivation, but for the small grower the first named has proven best. Some big growers set the plants 18 inches apart and make a great success of the culture. Everything depends upon the thoughtful care and cultivation of the plants.—H. I. Lockwood, Philadelphia Co., Pa.

Commercial Peach Growing.—Special Bulletin No. 63 of the Michigan Agricultural College deals with commercial peach growing in Michigan. While the bulletin deals more particularly with Michigan conditions it enumerates many general items applicable to any section of the country and does not differ in the essentials from treatises on this industry in other parts of the United States.

The easiest surest way to kill bugs!

No one will ever use a liquid sprayer who has once used the

CHAMPION INSECTICIDE DUSTER

The Champion works faster—dusts two rows at once—as fast as a man walks. Weighs only six pounds. Simple to operate, any farm hand, even a boy can use it. It gives better results, at less expense—in time and material used—than any other machine. No water to carry. Least danger because the poison is kept at a safe distance. Price $3.00. If your local dealer can't supply you, we will ship direct on receipt of price. Guaranteed satisfactory.

On large acreage, use the Beetle Duster. Dusts four rows as fast as a horse walks.

Improvement of Permanent Pastures.---No. V.

By JOHN H. REISNER, Cornell University.

The problem of adding fertility to the soil from an outside source has previously been discussed as a means of pasture improvement. It is one of the most serious considerations in pasture management, because what might improve one soil may not affect another, and varying conditions must be met in different ways. Where soil is acid and needs lime, the application of fertilizers to such land will likely be a complete loss. Lime should have been added first. Again, where the soil is poorly drained, lime, organic matter or commercial fertilizer might give no results whatever. What is needed, first and probably most, is simply drainage. The question comes up at once, how are we going to determine what to do, what to add, how much to add and when to add it for our meadows? Unless we know from experience what to do "profitably" we must experiment. This is absolutely necessary if we are to expect successful improvement.

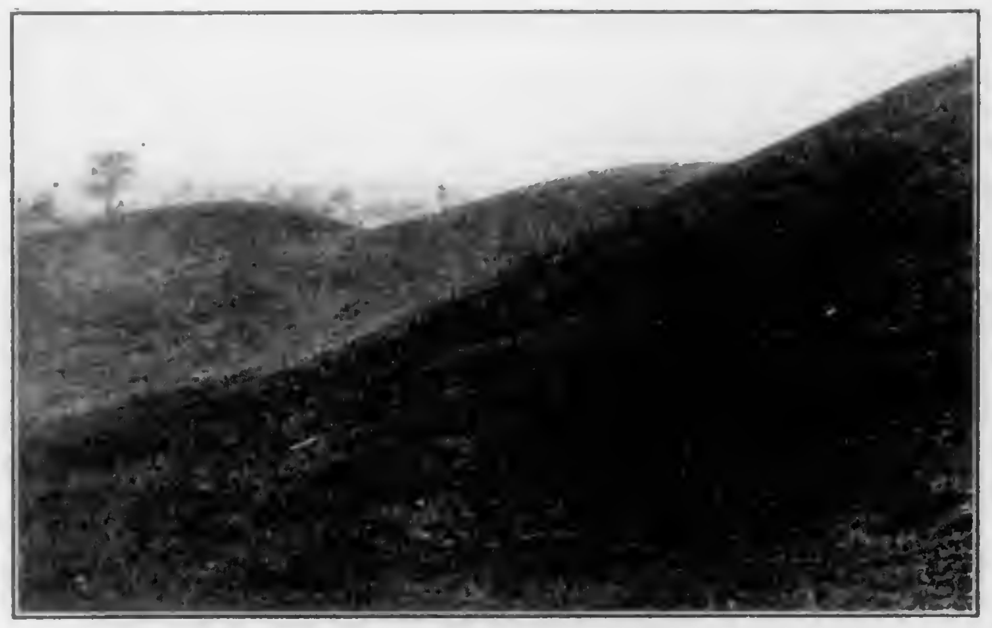

FIG. 1. THE ROBERTS PASTURE AT CORNELL UNIVERSITY HAS HEAVY STAND OF GRASS KENTUCKY BLUEGRASS AND WHITE CLOVER PREDOMINATING. HAS BEEN IN PASTURE FOR MORE THAN 30 YEARS.

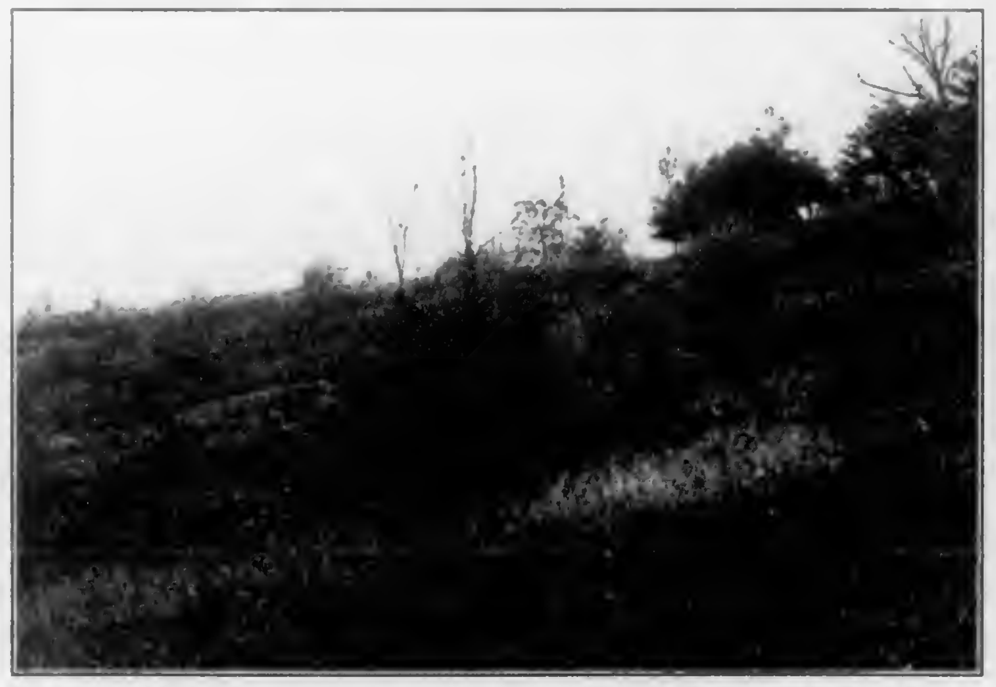

FIG. 2. THE OTHER SIDE OF THE HILL ON WHICH THE ROBERTS PASTURE IS LOCATED SHOWS WASTE FROM NEGLECT AND MISMANAGEMENT.

Photos from Bulletin 280, N. Y. College of Agriculture.

The accompanying diagram may be taken as suggestion for such experimentation, and changes made to conform to any local set of conditions. Those who do not wish to carry on very careful trials but who desire to test out the results of different soil treatments can do so by entirely disregarding the plans of the diagram. Applications of the manure, fertilizer and lime can be made to the grass and results noted. But the results will be only qualitative. There will be no certain basis of comparison by which we can determine quantitatively what application was the best. This will become more evident as we consider the diagram. Such procedure is not recommended.

Some certain part of the pasture should be taken, (1) because it is representative of the conditions generally in the same field or on the same farm; (2) because it will give uniform conditions of soil, drainage and sod, and the results obtained will be due to the treatment and that alone. Here then we have a fair and accurate basis of comparison. The units or squares as represented in the diagram represent 1-40 acre areas. The three long rows of plots, A, B, and C, represent tests for 1,000 pounds of burned lime, no lime, and 2,000 pounds burned lime per acre; while the short rows, 1, 2, 3, etc., represent tests with the fertilizers, manures, methods of cultivation and reseeding. Thus every plot, except the check plots, show a different experiment. The check plots are untreated so that we can see whether or not the experiments are successful. It should be noted that each row of the check plots will show the effects of 1,000 pounds lime in A2; 2,000 lbs in C2, and of no application of lime in B2. Row 1, for example, will show the effect of applying 100 pounds nitrate of soda to the grass, without lime; with 1,000 pounds lime added and with 2,000 pounds lime added. Thus a large number of experiments can be made without greatly increasing the labor and care.

The plots are laid out 2 rods square, which is just 1-40 of an acre thus making one side 99 feet and the length of the other side will be the number of plots required times 33 feet. The A, B, and C rows should be marked off first and limed, so that a few weeks can intervene between the application of the lime and the commercial fertilizers. Rows 1, 2, 3, etc, can be measured off and treated without much trouble. The treatments are given in acre amounts, and also in the amounts required for each individual plot. It will be noted that the application per plot is just 1-40 that of an acre.

1000 Lbs. Burned Lime or its Equivalent

	100 pounds Nitrate of Soda 2½ pounds per plot	Check Plots Shows effects of lime only	200 pounds Nitrate of Soda 5 pounds per plot	10 tons Manure ¼ ton per plot	Check Plots	5 tons Manure ⅛ ton per plot	Cultivation using disk., spike tooth or spring tooth Harrow	Check Plots	Cultivation and Reseeding	200 pounds Fertilizer 9:4:7 5 pounds per plot	Check Plots	360 pounds Fertilizer 9:4:7 9 pounds per plot

2000 Lbs. Burned Lime or its Equivalent

Tentative diagram of an experimental plot showing methods for determining best results that can be obtained by applying outside source of fertility to the grass lands. Each square is 2 rods by 2 rods and represents one-fortieth of an acre. Comparable results can only be secured in this way.

In comparing the results, the following considerations should be noted: 1) Which of the treatments show greatest effect on green growth? (2) Is this growth sufficient to offset the cost of the treatment? (3) Has the treatment had any effect on the palatability of the grasses as shown by the preference of the cattle for the grasses of these plots? Many are already objecting that these methods of experimentation require too much time, worry, etc. Only this can be said in answer, that we are considering pasture improvement as of great importance in our farm management, and until we are willing to make the effort to find out the best practices of improvement, our valuable pasture lands will continue in their present condition.

The experimental plots as diagramed are comprehensive, so that the number may be decreased if desirable. For the first year or two, it might be wise to run only a few plots, and then at a later time make a more complete trial. If this is done, the treatments to be used should be those which the experience of the farmer would indicate as being most likely to succeed. Needless experimentation should be avoided, but this is less likely to occur than too little experimenting on the part of the farmer.

A Recent
U. S. Government Report
Makes plain your need of a
UNITED STATES
CREAM SEPARATOR
The skimming device of which is GUARANTEED NEVER TO RUST.

The scientific staff of the dairy division in the **United States Department of Agriculture** recently conducted a series of experiments to learn what effect, if any, iron (rust) has on cream and butter.

The tests definitely established the fact that **even minute particles of iron (rust) caused certain undesirable flavors** and that in every instance when butter was scored a few days after the making, **the samples in which iron (rust) was present scored lower than the butter made from cream which contained no iron (rust).**

In using the United States Cream Separator with non-rusting skimming sections of **nickel silver** you avoid all risk of having "metallic" butter. **The U. S. sections are positively guaranteed never to rust.** No other separator manufacturer gives you a printed non-rusting guarantee.

Yet, United States Cream Separators with this big exclusive improvement are sold at **no higher prices** than other separators without it.

It is time well spent to learn from your U. S. dealer or us more about the exclusive U. S. non-rusting feature.

Farm drainage needs durable tile. Our drain tile are made of best Ohio clay, thoroughly hard burned. Don't have to dig 'em up to be replaced every few years. Write for prices. Sold in carload lots. Also manufacturers of the famous NATCO IMPERISHABLE SILO, Building Blocks and Sewer Pipe.
NATIONAL FIRE PROOFING COMPANY, Fulton Building, PITTSBURGH, PA.

NEW YORK MILK CONDITIONS

Conditions in the milk-shipping districts are as acute as ever, or possibly more so. The two big concerns that have the major portion of the business seem to be planning to more fully control the situation. They are most surely working together and have established practically the same prices wherever they go. They must be working in harmony and with a full understanding as to what the other is to do. They have dared to cut prices again this spring for the six months for which contracts are now made. This cut amounts to 7½ cents a hundred, averaging it as it is given out month by month. In other words, there is a cut of five cents during three of the months and ten cents the other three. The heavier cuts are in the months when the milk is in largest supply, therefore the real average is more than it figures by averaging the prices as given out.

This makes the average for the season $1.20. To this is to be added for a test of 3.7 percent, ten cents a hundred, and for conditions scoring 68 points another ten cents is added. Should the farmer get both of these all summer, his price would be $1.40. As both the test and the scoring are in the hands of the dealer, the farmer gets $1.20, $1.30 or $1.40 just as the dealer sees fit to give him. The real average is somewhere under these figures because of less production when milk is the highest. Dairymen are not satisfied, but there seems to be no way for them to help themselves at present. Whether or not the League will come to a commanding position is sometimes discussed, but there is little to help one to determine how it will be. It seems to be a good time to stay by the League, and assist it to do all it can.—H. H. Lyon, Chenango Co., N. Y.

INFLUENCE OF COWS' FEED ON FLAVOR OF MILK

The Department of Agriculture recently reported the result of experiments to test the effect of oats on the flavor of milk. These experiments showed that oats do not have the beneficial effect on the flavor of milk which many dairymen believe. But as corn and bran constituted the ration tested against oats, the public has gained the impression erroneously that the Department recommends the feeding of corn and bran to improve the flavor of milk. Of 50 opinions expressed regarding the flavor of the samples, 25 preferred the milk from cows fed corn and bran. As 16 preferred the milk from cows fed oats and 9 expressed no choice, it does not appear that either ration has any decided advantage over the other.

There can be no great superiority in the bran and corn when one half of the opinions were either indifferent or were in favor of the other milk. In view of these experiments the Department does not recommend the feeding of bran and corn to improve the flavor of milk. Oats, corn, alfalfa hay, cottonseed meal, linseed meal, bran, gluten and other good feeds for dairy cows when properly fed in reasonable amounts produce a fine flavored milk, but there is no substantial evidence that any one of them is superior to any of the others in this respect. The relative prices of the different feeds will determine in most cases which are to be preferred in making up a ration for dairy cows.—Department Circular.

The Proof of any Silo is in its Silage
If your silage is perfectly cured, succulent and palatable, free from mold, uniform from center to circumference, untainted by foreign matter; if it is not damaged by freezing in winter and never loses its flavor or juices through leakage or absorption, then you have a good silo. If you do not have these things you are not getting the results you are entitled to. The
INDIANA SILO
as it is built today is the result of years of progress and manufacturing experience. It is made with the primary purpose of preserving the contents perfectly; it is constructed throughout of selected material.
Wood is a non-conductor and retains the natural heat which is necessary to secure perfect silage.
Our staves are cut from the choicest timber, carefully selected by our own experts at the mills.
There is no metal in the Indiana Silo to corrode, no plaster to crumble, no masonry to crack when the foundation settles.
Write today for a free copy of our new book The Watch-Tower Story and our 1914 catalog. *Address nearest office*
For these reasons the contents of an Indiana Silo are always the best. More Indiana Silos are in use on American farms today than any other make. The first ones built are still standing and giving complete satisfaction to their owners.
Read the book "Silo Profits" which is written by hundreds of owners of Indiana Silos. It tells what the Indiana Silo has done for them and what it can do for you.

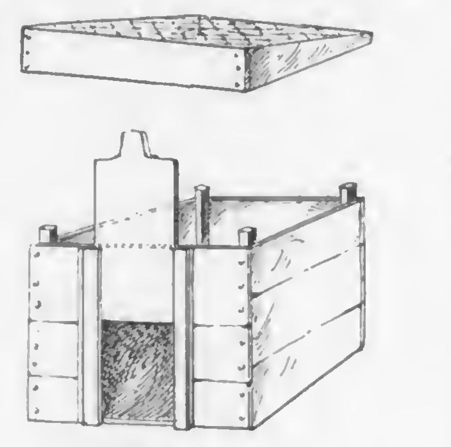
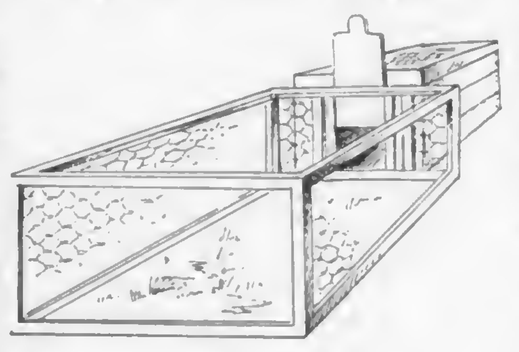
STORE BOX COOPS

We have had such good success raising chicks in our coops made out of store boxes that I am venturing to describe them for the benefit of the Farmer readers. In the first place we tried to get boxes with lids on them that were in as good condition as possible. The kind we like the best are the small boxes, running as short as 2 feet or a few inches over and about 20 inches wide. One has to take what he can get of course, so some of ours are much larger. Of course we wanted some of these large for the larger chicks.



BOX COOP AND COVER.

In making these coops cleats were nailed on the bottom at each end to keep the boxes off the ground. Then pieces were nailed to the lid of the box so as to make a small shed roof. Pieces or cleats were nailed in the corners of the box so that this roof would slip down over them and be held in place if the wind were blowing. These cleats kept any animals from pushing off the roof and getting at the chicks at night. In the front of the box a door was cut and cleats were nailed beside this opening so that a board could be slid down to close the box at night or when shifting the position in the day time. Three holes bored on each side at the top gave ventilation. In the summer time a piece of wire netting takes the place of the door.



COOP AND RUN.

A wire run a yard wide and a yard and a half long was made to set in front of this coop. There are steps at the door of the coop so that the little chicks can run in and out. It is a good idea to make this run of the inch mesh of wire. We lost some fine guineas one year because a weasel got in thru the wire of the run which was of the two inch mesh.

When our little chicks are two days old we put 30 chicks and one old hen in each of these boxes with its run. At the end of a week or 10 days the chicks have been trained to eat and go in at night so we take the hens and condense the broods putting 60 or 75 chicks together. We use a rather small box for them, putting them in a larger box as they grow.

One very nice thing about these boxes and runs is that they are light and may be carried into the barn or shed if cold wet weather comes. Or they may be kept under a shade tree when the sun gets too hot in the summer. We use the runs with them long after the little chicks are running free in the yards. In the morning when the grass is wet from rain or a heavy dew we don't take the coops away but feed the chicks there and let them stay until things dry up a bit. It is an easy matter to pull the runs away and let the chicks out. When we set the coops and runs in the barn we never lost a chick from the rats as would have been the case had we not been able to close our coops at night, and had not had the wire runs to protect the chicks thru the day.

The shed roof was covered with tar roofing paper so the coops never leaked even in heavy rains. When the hatching season is over and the coops no longer needed they are piled neatly away under a shed where they are protected from the wear and tear of the weather. There they are all ready for the next season.—Nevada D. Hitchcock.

APRIL IN THE APIARY

April is the month which marks renewed activities in the beeyard. The bees have been gathering fresh pollen and a little nectar from the maples and elms and brood-rearing is well under way in normal colonies.

At this time the beekeeper should open every hive on the first warm day to learn first, if it has a normal queen; second, the amount of food supply in the hive; and third the strength of the colony. If any colonies have died the dead bees should be crushed from the combs and the hive closed tight to preserve the combs from damage by the bee moth until they are again put in use. Any colonies which are very weak should be encouraged to rear all the brood possible by feeding each evening a half pint of warm syrup made of equal parts granulated sugar and hot water, and keeping the colony warm by extra packing; also by contracting the entrance to the capacity of one half an inch square to retain the cluster heat so that the colony can better protect its entrance against robber bees. Later when the colony gets stronger the entrance must be enlarged.

Colonies queenless at this time are rarely worth saving alone, since all the bees are old, altho it can be done by securing a queen from the south to introduce to the queenless colony. Usually the better plan is to unite the queenless bees with a weak queen-right colony. Greater precautions are needed against starvation at this time than at any other, since, if the colony has a prolific queen, immense quantities of honey are used in feeding the brood.

Nothing should be allowed to check brood-rearing at this time because the crop of honey from clover is in direct proportion to the number of bees reared from this time to June first, other things being equal.

Select a bright still warm day for the spring examination and keep the hive open no longer than is absolutely necessary. It is best at any season of the year that the hive be not disturbed unnecessarily, as each disturbance means an interruption of the hive work and a consequent loss to the beekeeper, but this must not be carried to the other extreme and the hive never opened, this practice being the greater of the two evils.

Resolve that this year you will get from the bees what rightfully belongs to you, a paying return from the time and money invested, but bear in mind that you must intelligently do your part or the bees cannot do theirs.—Elmer G. Carr, N. J. Deputy Bee Inspector.

"For the land's sake, use Bowker's Fertilizers; they enrich the earth and those who till it."—Adv.

Close Mesh Poultry Wire $3.90 Per Roll
165 feet
Five feet high. Spacing runs from one inch at bottom to four inches at top. No. 11 wire top and No. 12 wire bottom. Filling, No. 14 1-2 wire. Cross bars six inches apart. The best kind of wire. WHITE DIARRHEA KILLS CHICKS

Your cholera remedy is without a doubt the best remedy on the market. Last season I lost about 500 small chicks from white diarrhea until I started to use your remedy. So far this season have hatched about 600 chicks and out of 600 I have lost only 4 peeps from white diarrhea, due to the fact that these four did not take nourishment at all from the time I took them out of the machine. Others have used your remedy in this district with the same results.—Edward Reichard, Blandon, Pa.

This remedy for white diarrhea, chicken cholera and all other bowel ailments in poultry, mentioned above, may be secured from the Abbott Alkaloidal Company, Ravenswood, Chicago, 50c. and $1.00 boxes by parcel post. Money back if not satisfied.—Advertisement.

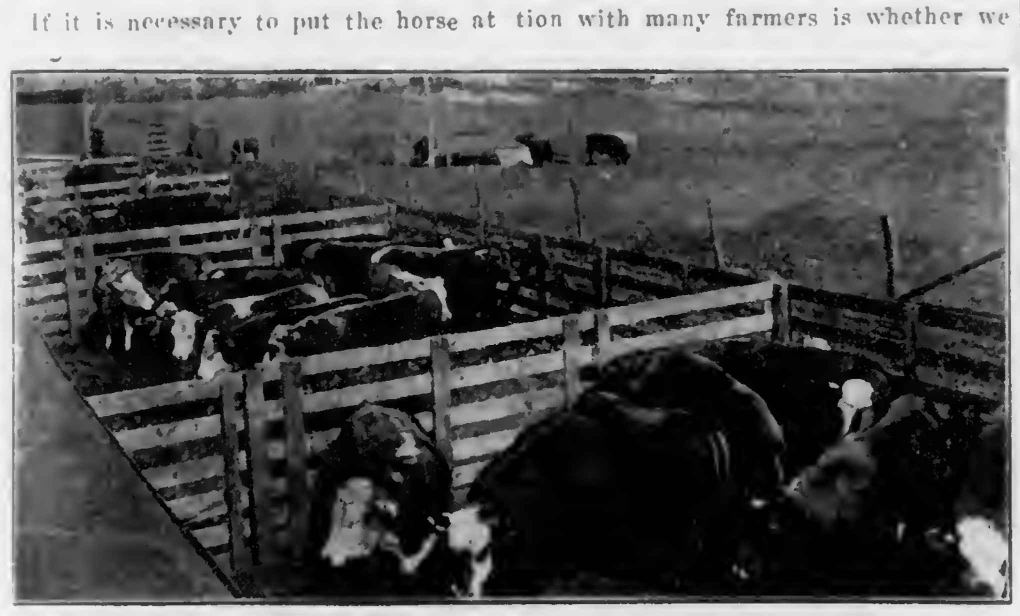
SPRING SEASONING OF THE FARM TEAM

There is no one thing more important in the management of the farm horse than to get him properly seasoned to his work before he is put into the heavy work of plowing and fitting the ground for the spring crops. At this season of the year the horses are more than likely to be debilitated from a lack of exercise during the winter, and the average farm horse is also burdened with a winter coat which is more suitable to the cold winter weather for which it was provided than to the warm days of early spring.

The horse's muscles are soft and his shoulders are tender at this season and unless he is worked into the collar rather gradually before the heavy work comes on, his future usefulness is in danger of being seriously impaired. Often at this season a horse is strained, overheated or overexerted, until some permanent blemish or unsoundness results; and all at comparatively light work which the horse could endure with ease when in the proper condition.



STEERS ON FEED AT PENNSYLVANIA STATE COLLEGE THIS WINTER.

If it is necessary to put the horse at hard work without sufficient preparation, some of the dangers can be avoided by removing his heavy coat of hair with the clippers, especially if the weather is warm. Then a properly fitting harness is another aid to the continued efficiency of the green horse. Too many farmers forget, a collar which may fit the fat, green horse, may get too large for him before he is worked many weeks, especially if he is put at hard work suddenly and without proper hardening. The result is that thru neglect the horse gets a sore shoulder from which it does not recover for months, and sometimes never without a surgical operation, a disfiguring scar resulting in either case, aside from the discomfort and lessened usefulness of the horse.

Sometimes a careless farmer will allow his horses to wear the shoes which were last set during an icy time in the winter until their toes are away too long and their heels grown over, thru pure neglect. This is a matter which should have attention at all times, but especially in the spring when an unusual strain is placed upon the farm horse thru the pressing labor which is incidental to the preparations for the spring planting. Then again, too great and too sudden change in the diet of the horse may cause indigestion and possibly the deadly colic which is more common in the spring than at any other season of the year for the reason noted.

Of course the horse at hard labor will need a more liberal ration than he has required when not at hard work or when running in the yard, but in making this change care should be taken to keep the horse's digestive system in as healthy a condition as possible. The horse should have some roots if possible at this season for a sort of spring tonic. If you have an abundance, or when potatoes are plentiful and cheap, nothing better can be found for this purpose, and a few bushels of potatoes fed to the farm horses at this season of the year will yield the farmer a far better profit than the same number of bushels sold at prevailing prices for the tubers.

Of course, regular feeding, regular and steady, rather than intermittent work, good grooming, etc., all count in the efficiency of the horse, but at no time to so great an extent as in the spring when the horse is in the seasoning process, and the wise farmer will see that all these conditions are provided which will add to the efficiency of his horses and lessen the danger of their temporary or permanent injury during the trying spring season.—I. W., Crawford County, Pa.

HORSES FOR EASTERN FARMS

I believe that the age of the horse has not passed. The tractor may take the place of the horse on the level land but not on the hilly farms. The question with many farmers is whether we shall buy our farm horses or raise them. I have been farming for 35 years, and during that time I do not charge up one cent to the initial cost of a purebred stallion, for after several years' service I can sell them for cost for breeding purposes, and I have bred my own farm mares too, from them. It is getting more difficult to find men to work on our farms, so we need to do our work with heavy farm machinery. I make a plea for the heavy draft horse that can easily draw heavy machinery, and will not wear out soon. If you are going to do draft work on the farm economically you must have horses specially bred for the purpose.

There should be a good brood mare on every farm, and we also need better horsemen. Breed the best mare you have or can get to the best stallion available. Work mare with foal moderately, but do not over-work her. Give her regular and moderate exercise, and do not feed too much fattening food, but a good strong ration.

One-half the colts lost die from naval infection. The cause is blood poisoning. The best place for the little colt is on the pasture where there is no infection. A disinfected stall is the next best place. It is always wise to wash the naval with a disinfectant. Do not compel the little colt to follow the mare when at work, but keep him in a box stall. Keep oats and bran in the box where the colt can get them at any time. Let him learn to eat out of the box with his mother. If I had hard work for the mother I would wean the colt at 12 weeks, and feed the colt cow's milk, bran and clover hay.—Feeder.

MR. PRATT —— A NEW SERIAL STORY

In next week's issue we will commence a new serial story by Joseph C. Lincoln, the inimitable author of sea tales and sailors' yarns. Like all of his stories, "Mr. Pratt" abounds in clean, wholesome humor, touching pathos and keen human interest so characteristic of the Lincoln story, but so expertly blended as to please while it instructs and teach while it entertains. The adventures of two rich New York businessmen who rent an island off the New England mainland in an effort to live the "natural life" and incidently to get away from business cares and avoid their apparent impending romances, are ludicrously related. Mr. Pratt, the old skipper, Nate Scudder and other equally interesting village characters are skilfully depicted. The trend of the romance is carefully preserved and the inevitable happy result is finally consummated. "Mr. Pratt" provides a maximum of wholesome entertainment for every member of the family. You will not want to miss a single chapter. Watch for the first installment next week.

Commodities Act The Commodities Act passed by the state legislature of 1913, requiring that all dry or liquid measures used in measuring commodities sold be marked to show actual capacity, has been rather widely discussed. Certain features of the bill have appeared to be unfavorable to farmers, particularly as it will affect fruit packages. However, the purpose and the main features of the law are right in principle and their enforcement will have a wholesome tendency in doing away with many questionable practices in the marketing of farm produce. The old practice of selling by crate, box or basket, which will be prohibited by this law was subject to much abuse. Such packages might be of any capacity desired and were unreliable as a standard of measure. The old berry box and basket, the retailers' potato crate, the apple package or box did not represent any standard quantity, and the variations found in size and shape of these measures in various markets made them still less reliable. Under the new law all of these packages will have to be plainly marked to show the quantity of the contents. All commodities must be sold by weight, measure or numerical count. The dealer who refuses to comply with these requirements will subject himself to the penalties of the act. The legislature of 1913 made a standard of weight per bushel for various commodities. The purchaser is entitled to receive the number of pounds as specified in that law for the particular commodity purchased, something he frequently did not get under the old system of selling. There has been complaint of injustice in new standards for certain fruits. If they prove to work a real injustice they should be corrected in the next session of the legislature. As the law fixes absolute standards, however, which affect buyer and seller alike it is fair to all within its range of application. What is needed to make the regulation complete is a uniformity of state standards to do away with irregularities in interstate shipments.

Freight Rates The railroads' appeal for a 5-percent increase in freight rates, now being argued before the Interstate Commerce Commission, is developing some highly interesting side lights on methods and practice of so-called big business. There is a general tendency to estimate the business and financial condition of the nation by the prosperity of the railroads, and in this instance many, if not most, of the city dailies as well as big business institutions declared in favor of granting the rate increase even before a word of testimony was heard. The "retrenchment" measures enforced by the railroads in the past few weeks, notably the retirement of 40,000 employes by two eastern roads has further increased sentiment favorable to roads in some quarters, and has even aroused or, possibly inspired, criticism of the interstate commission for delay in granting the request. A careful perusal of the testimony, however, seems to raise a legitimate question as to whether or not the much advertised retrenchment at this time is not enforced for the express purpose of influencing public opinion favorable to the railroads; and if the attitude of many of the influential papers is not assumed for the same purpose. The investigation in this case is of interest to every citizen, not alone as it will affect his pocketbook in the share of freight rates which he must bear, but in securing free and impartial judgment of existing conditions and a judicial decision based strictly upon the merits of the controversy. The public is as desirous of seeing justice done the railroads as it is of having its own rights protected. The time for "swatting" big business simply because it is big is happily past, and the inauguration and impartial decisions of the Interstate Commerce Commission has done as much as any single agency in bringing this about. But this square deal policy imposes an obligation on both parties and it is decidedly the public's business to know the real facts in this case, and to know if present conditions warrant the rate increase or even the curtailment of service now enforced. In direct testimony before the commission, President Smith, of the New York Central, admitted that the annual net operating revenue average for his road was $72,000,000 in the past five-year period as compared with $55,000,000 in the preceding five-year period; also that the net operating revenue was greater in 1913 than in any previous year except 1910. Vice president Shriver, of the Baltimore and Ohio, testified, under direct questioning, that the railroads showed greater prosperity in 1913 than in any previous year except 1910. President Rea, of the Pennsylvania system, admitted that his company earned 9.64 percent on its capital in 1913, above all operating expenses, taxes and fixed charges, but held that the roads should be permitted to earn dividends upon the unearned increment of their property and not upon capital alone. These statements of earnings upon investment under present methods of operation and under existing rates do not appear to warrant retrenchment, much less increased rates. And methods of operation have long been under question. A progressive farmer of this state recently said: "If farmers followed the much lauded business methods of the railroads for five years there would be a mortgage on every acre of farm land in this state." The weaknesses in management he had in mind have been developed in this and in past hearings, including concessions and special allowances in warehousing, switching, ferriage, etc., to special shippers which decrease the earnings of roads by millions of dollars every year. In the operation of a public service institution the question of economic management is as pertinent to increased rates as the question of earnings on investment. The statement of earnings and the indications of prosperity here quoted do not necessarily indicate that the roads are not entitled to higher rates. There are questions of valuation and practice to be determined upon. The commission has ruled that 7½ percent upon capital is a fair minimum earning for roads. But earnings should be based upon legitimate investment and honest management; there should be no interference with thoro investigation and no attempt at influencing public opinion by claims of poverty which cannot be substantiated by actual facts. The number of idle cars has decreased steadily since the first of the present year. Why are men being laid off while business is improving, and especially following the second most prosperous year in the history of railroading? The claims for increased rates seem to be sadly at variance with the established facts.

STATE CAPITAL NEWS

Over 200,000 At Institutes.—Figures show that 201,176 persons attended the Institutes during the past season and it is thought that but for recent blizzards the attendance would have exceeded the record of 209,383 made in 1910. Reports show that the people in rural districts are taking a big interest in this educational work and that the time was ripe for the establishment of the farm counsellor service. The institutes began in 1895 since which time 2,744,362 persons have attended the sessions. Originally $7,500 per annum was available. In 1899 it was raised to $12,500; in 1905 to $20,000 and in 1908 to $22,500 which it has since remained. The average attendance this year was 179 against 163 last year. This year 1,127 sessions were held with 461 days, and 54 lecturers employed. This year supplementing the institutes the Pennsylvania railroad ran dairy cars to 127 places, reaching over 25,000 people and the Lehigh Valley railroad ran a sanitary home car, visiting 75 points and reaching about 6,000 people. The department furnished the instructors on these cars and the work was so successful that it will be repeated next year. The next legislature will be asked for $25,000. An increase in the force of farm counsellors will be sought.

Orchard Work To End.—Spring orchard demonstrations will soon be closed after which attention will be given to supervision of orchards. The interest has been unusual.

To Investigate School Districts.—The State Board of Education will investigate the finances of some of the smaller and poorer school districts of the state, especially in rural counties, with a view to determining their needs. Many of the smaller districts are unable to provide the minimum period of schooling, and as they are also unable because of lack of taxes to afford consolidation, efforts have been made for several years to obtain equalization of the state appropriation. A bill for this purpose presented at the last session was lost and officials of the State Department of Public Instruction and State Board of Education have been working to devise some means of assisting poor districts.

Many New Schools.—The advance of education in the State is shown by the fact that 306 school buildings were constructed in 1913, about 90 of which were large additions to existing buildings and the rest of new construction. In the country districts about 100 were built, most of them on plans provided by the state. A system whereby standard plans can be furnished to all districts desiring small buildings has been put into practical working order.

Road Supervisors Meetings.—Meetings of supervisors have been held in almost every county in the state and the practical test of the new township road law will come this year. The state has offered free advice, plans and supervision to men in charge of township roads. Unfortunately there is little cash available. However, organizations have been perfected and there is a chance for the state to help.

Arbor Days.—Annual proclamation of arbor days has been made for this year and it is also announced that the State will set out over three and a half million trees. The arbor days are to be April 17 and 24 and in addition to urging educational work to bring to the attention of children the importance of planting trees steps will be taken to instruct them in the economic value of birds and animals, especially in the fields. The proclamation contains several useful suggestions.

Watch For Glanders.—The State Veterinarian has issued warning to owners of horses against outbreaks of glanders this spring, advising communicating with a veterinarian in case of suspicious symptoms. The law requires such cases to be reported to the State Veterinarian and horses and mules afflicted with the disease are to be killed, a limited appraisement being allowed if they have a market value. The state will give its help in cleaning up suspicious cases or centres of infection if report is made promptly.

Traction Licenses.—Figures show that 257 tractors have been licensed. This figure includes the traction engines over whose regulation many owners and the highway authorities are at odds. A determined effort to secure a change in the law will be made by the organization of traction engine and implement men now being formed in various parts of the State. Licenses issued to automobiles thus far aggregate 56,000, 4,350 being issued to solid tired vehicles or trucks. Over 5,400 motor cycles have been licensed. The total income from automobile and similar licenses thus far aggregates $700,000 for this year alone. And all of this must lie in the Treasury instead of being spent on repair of roads because of lack of specific acts by the legislature.—Hamilton, Harrisburg, April 6.

NEW JERSEY FARM NEWS

Fair News.—The old fashioned county fair may be brought into favor again. The farm management section of the National Department of Agriculture has come to the conclusion that the county fair is one of the best and most direct methods of reaching the farmer with the information the department wishes to distribute among them; hence the department is arranging to send out lecturers and demonstrators, to attend these fairs and to show the farmers the best way to do all kinds of work.

Farm Life Problems.—The actual number of cultivated farms in New Jersey has decreased about 1,500 in the last ten years, due in large degree to the taking of farm lands for building lots and putting dwelling-houses on them to accommodate those who do business in large cities but prefer to live in easily accessible rural or semi-urban locations. One plausible explanation for this is the lack of amusements on the farm. Home gatherings, spelling bees, debating societies, dancing parties, social meetings and the like, may furnish a solution of this problem.

The Mercer County Farm Bureau.—John H. Hankinson, Mercer County farm agent, in company with G. A. Billings, agriculturist of the National Department of Farm Management, has been making some farm surveys in the county. It is too early to draw any general conclusions and the particular results are, of course, strictly confidential. The survey recommends all farmers to top-dress their timothy sods which had not been top-dressed with manure, with 300 pounds of a fertilizer formula containing about 8 percent ammonia, 7 percent available phosphoric acid and 5 percent potash. It is important that this fertilizer be evenly distributed on the grass early. Hog cholera has appeared in Mercer county, and the farm bureau has sent out the following advice: "Keep your pens clean, use plenty of disinfectant, and have before your pigs a box containing equal parts of yellow sulphur, salt, bone meal and coal ashes." Much can be done to keep the disease in check by notifying promptly the farm bureau agent.

Mercer County Board Meets.—In his address before the thirtieth annual meeting of the Mercer county board of agriculture, President J. T. Allinson declared that every 35 cents' worth of food is separated by about 65 cents worth of transportation and commission men's charges, from the mouths it is ultimately to feed. President Allinson declared that every department in the experiment station and agricultural college is retarded because New Jersey pays less to support these institutions than any state of her population in the country. In spite of being constantly hampered, he added, the institutions are equipped with the strongest staff of scientific men found in any college in the United States. Resolutions were adopted expressing the sentiment of the Board concerning the pending appropriations for the Experiment Station and Agricultural College at New Brunswick.

Corn Contests.—Leaders in agricultural education in Monmouth county plan to interest 500 boys in an agricultural contest. Separate contests, with boys less than 15 years old and others between 16 and 20 years, divided into classes, will be conducted, with the growing of corn and potatoes as their aim. Special contests for different kinds of vegetables will be conducted also in connection with the Monmouth county fair association.

Mosquito Extermination Work.—Union was the first county in New Jersey to take advantage of the act of 1912, authorizing the creation of mosquito extermination commissions. The work that has been done has resulted already in increased comfort and freedom from disease, additional useful agricultural land has been secured from drained areas, and the increase in property values amounts to 25 percent in communities known to have become free of mosquitoes, an increase thru the State estimated to be $26,000,000. The county is divided into districts, each in turn being divided into smaller districts, and an inspector assigned to each one.

Farm Demonstration.—Under the auspices of the Sussex county farm bureau, public demonstrations of pruning and spraying fruit trees were given by Professor Farley of the State experiment station. These were attended by many farmers, who were well repaid for their time. Professor Alva Agee, State superintendent of farm demonstration, has appeared before the Bergen county board of freeholders in the interest of the appointment of a county farm demonstrator. He suggested that if the board appointed such a demonstrator, it should appropriate $2,000 for salary and expenses, one-third of the cost of maintaining the department to be paid by the State. Burlington county has decided to request the board of freeholders to make an appointment of a farm demonstrator. Senators Ackley, Smith and White have been appointed a committee to investigate the need of an agricultural and horticultural experimental station in South Jersey.—D. T. H.

NEW YORK LETTER

City Farm Laborers.—Thus far three carloads of laborers from New York city have been shipped up state and all have found employment. The last group was sent to Sodus, Wayne County. C. W. Larmon, of the state labor bureau, reports the first carload landed at Fonda are all employed and seem contented. Bad weather has delayed the despatching of more groups and the first lot was sent out too early.

Bureau of Markets.—If the Governor approves, we shall have a law establishing a Bureau of Markets, with a commissioner in charge, appointed for six years, at $6,000 per year. He will investigate cost of food production and marketing in all its phases; aid organization of co-operative societies among producers and consumers; advise in establishment of local markets operated by co-operative companies; make rules and regulations for grading, packing, handling, storage and sale of food stuffs within the state; investigate delays in transportation and initiate proper proceedings to prevent restraint of trade or unlawful combinations to fix prices. The bill also provides for the establishment of auction markets and licensing of auctioneers.

Rockefeller Gives $1,000,000.—The Rockefeller Institute for medical research has announced the gift of $1,000,000 by J. D. Rockefeller to be devoted to the study of animal diseases. James J. Hill has recently pledged $50,000 for the special investigation of hog cholera which is said to kill $60,000,000 worth of swine a year, in the northwest alone.

Several Items.—The New York Electric Railway association is planning to develop agricultural traffic along its lines which reach 500 rural communities with 1500 miles of road. The department of agriculture has recently issued a circular or pamphlet entitled "A Manual of Co-operation" which gives some important information on the organization of co-operative societies. The New York commissioners to Europe for the study of farm finances have submitted a report of their investigations in a volume of over 300 pages, finely illustrated.—D.

MARYLAND NOTES

Dairies Combine.—Four of the largest city dairies of Baltimore formed a combine last week to put out milk, cream and ice cream under one operating head. The four dealers sell 10,000 gallons of milk and cream and make 1,500 gallons of ice cream daily. It is proposed to build a large central plant, using an unusual amount of glass so that all manipulations can readily be viewed by visitors. School children will be invited to learn how milk is prepared, and the general public will always be welcome.

Good Roads Bill Passed.—The legislature has passed the good roads bill and the Governor has signed it. The appropriation is $1,250,000.

Cooling Station Stimulates Dairymen.—Since the establishing of a cooling station at Queen Anne, the farmers near in Caroline, Talbot and Queen Anne counties have added a number of dairy cows to their herds.

College Demonstration Work.—The Maryland Agricultural Experiment Station has been giving public demonstrations of spraying and pruning trees in Harford county and other parts of the State.

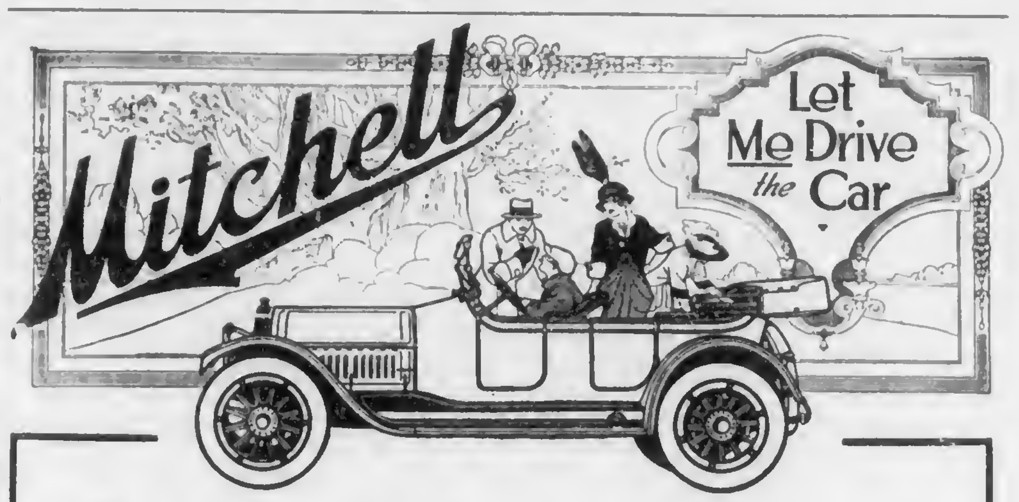
VALUABLE FREE CATALOGS

Book of Bargains.—The Book of Bargains now being issued by the Manufacturers Outlet Co., Dept. 291, Buffalo, N. Y., is just what its name implies. It offers bargains in a full line of household, builders and farm supplies. All goods are strictly new, purchased from surplus stock of over-loaded or hard-up manufacturers and sold at factory cost or below. A partial list includes lumber, roofing, plumbers' supplies, farm tools, steam and hot water furnaces, pumps, field and garden implements, fencing, boots and shoes, tools, harness, wagons, buggies, trunks, dishes, carpets, rugs, furniture, curtains, stoves, etc. The catalog is well printed and fully illustrated. It will be sent free upon postal card request to the above address.

Potato Machinery.—Time for planting potatoes will soon be here when every hour will mean money to the busy farmer. Value of time as well as thoroness of work require the best modern machinery. The O. K. Champion line of potato machinery fills every want from the beginning to the end of the potato season. A new catalog lists and describes this famous line of tools, including seed cutters, planters with or without fertilizer attachments, cultivators, spray outfits, diggers, sorters, and carriers. This line of tools is backed with a strong guarantee of quality and workmanship. The catalog will be sent free upon request. Address Champion Potato Machinery Co., 91 Chicago Ave., Hammond, Ind.

Lightning Rod Protection.—A new booklet issued by the International Lightning Rod Co., Department P, South Bend, Ind., contains a discussion of the theory and practice of rodding buildings. It gives illustrated directions for putting up rods and lists a full line of equipment. The booklet is free upon request to the above address.

A New Separator Idea. — The new 1914 Model United States Cream Separator has a non-rusting sanitary liner which keeps every drop of milk from touching any cast-iron or steel surface that is not removed and cleaned after using the separator. This liner is easily and quickly removed and washed with the other parts. It fits snugly into the bowl chamber and is held rigidly in place by a locking device. The new 1914 catalog gives full particulars. The catalog is free to our readers who write Vermont Farm Machine Co., Bellows Falls, Vt., for it.



Mitchell
Let Me Drive the Car

Get the Personal Touch!

Every man who owns an automobile should know how to run it. If he doesn't know how to run it he doesn't know *how to buy it.* He can't get the touch or the feel of the car through *some other man's hands.* The only real way to buy a car is to sit in the driver's seat, handle the car yourself and get the action of the whole business.

That's the way we are selling the Mitchell car this year. We are asking probable customers to try the car themselves and find out how it responds *to them.* Nine-tenths of the men who own cars are amateurs the first season and they know—and we know—that the only way to learn a car thoroughly is to ride in it, drive it and get the personal touch. *That kind of information is unbaised.* It's the only kind on which to base an investment.

Our dealers everywhere are prepared to co-operate with you to this end. They will willingly lend you a Mitchell model. If the car drives well and acts well under your guidance, than ask the dealer for the details of construction and the materials used therein. Ask your dealer to show you all the models. The engines all perform the same whether in the big and little sixes or the four. One acts as well as the other. Try one or try all. Suit yourself. But don't let some one else tell you how the cars operate. Drive them yourself.

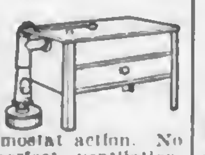
Here is the Equipment for all the Mitchell Models Which is included in the List Prices:

Electric self-starter and generator—electric lights—electric horn—electric magnetic exploring lamp—mohair top and dust cover—Tungsten valves—Jiffy quick-action side curtains—quick-action two piece rain vision wind-shield—demountable rims with one extra speedometer—double extra tire carrier—Bair bow holders—license plate bracket—pump jack and complete set of first class tools

Mitchell-Lewis Motor Co.
Racine, Wis. U.S.A.
Eighty years of faithful service to the American Public

$4. INCUBATOR
Greatest hatching machine ever offered. Operates in any living room. Most profitable for farmers. Operated at least possible expense and attention.

Nichols Incubator



Construction equal to many high priced incubators. Selected air and kiln-dried lumber. Detachable legs. Heating device—hot radiator covering entire top. Distributes heat evenly. Strictly fire proof. Regulator holds temperature to fraction of degree. Perfect thermostat action. No complicated machinery. Most perfect ventilation. Guaranteed thermometer. Excellent with large incubator to supply required fertile eggs to fill in after testing. Why pay $10 or $15 when you can get this incubator? Shipping weight 9 lbs. Furnished complete ready for use with full instructions only $4.
L. D. NICHOLS, 103 Emma St., Syracuse, N. Y.

New Model Watch-Shaped Automatic Lighter 50c
Most attractive and useful article ever presented. Operated with one hand; gives an instantaneous light. No battery, non explosive; does away with matches. Lights your pipe, cigar, cigarette, lamp, gas jet, etc. Dandy thing for the end of your chain. AGENTS WANTED EVERYWHERE Write for wholesale terms & prices. C. G. BRANDT MFG. CO., 148 Duane St., N. Y.

The School of Veterinary Medicine At The University of Pennsylvania
trains students in all lines of veterinary work. Facilities unexcelled. For catalog, address, Louis A. Klein, Dean, Dept. F., 39th St. & Woodland Ave., Phila., Pa.

Grange

HAS OUR LATE INDUSTRIAL AND POLITICAL DEVELOPMENT UPLIFTED THE RACE?

In a former article we took a causual study of the changed conditions of society that have destroyed the personal liberty of the individual to use liquor, and thus make him unfit to take his part in the great composite work of society. We now want to trace the consolidation and centralization that our industrial and political life has undergone, and inquire as to whether that development has benefited the race.

If you go back to colonial days you see the good housewife take the raw wool and proceed to wash, card, spin and weave it into cloth, and in many cases, in turn cut the cloth and make the garments needed by each member of the household. From the shearing of the sheep or the harvesting of the cotton until the garment was hung in the closet, the operations were almost entirely individual. What a marvelous change machinery has wrought in the consumation! Each machine means a different operator.

NORTH GHENT (Bradford Co., Pa.) DEBATING TEAM.
From Left to Right: Ira Holcomb, Edna Farrell and Vern Struble.

Go into one of the large abattoirs of today and note how each man along the line adds his few expert strokes until in an incredibly short time comparatively, the living animal is converted into food and the by-products prepared for their several places in trade. Very different from the custom where a single animal is slaughtered on the farm or by the small butcher. It is needless to multiply examples. In almost every line of industrial work this piece-work system has supplanted the master mechanic who at one time began with the raw material and ended with the finished product.

In our political life we have seen a like consolidation. In our early history our laws were few because each was a law unto himself, except where interference with each other demanded regulation. As population became more dense and cities took the place of settlements, laws multiplied until no one now-a-days pretends to know half the laws under which he must live. Each of these legal regulations supplants what was once a personal right and privilege.

But our object is not so much to bring out the fact of the condensation. That is self evident. Let us study the reflex influence this loss of individual decision and initiative has had on the character of our people. It can hardly be denied that in this piece-work system we have lost a great character builder in comparison to the master mechanic system. In the parlance of today, it takes more head to make a wagon than it does to make a spoke for a wagon wheel. The mind, as it turns to the making of each part, naturally and inevitably gathers judgment, decision and initiative much more rapidly than when it oversees one action day in and day out.

And in our political life, when the citizen is left with so few points in which he is the arbiter of his own destiny, the tendency is to give up being a sovereign and consign to the public official the responsibility of righteous government. It is a decidedly doubtful proposition that this centralization has been either necessary or beneficial. The complicated political situation has grown to an extent at least from the industrial trend.

The excuse has been made that this development has lessened cost of production and lowered the price to the consumer as well as improving the quality of the output. I say excuse, because it was necessary to offer some reason or excuse for breaking down these thousand small operators and creating one large operator. But the facts of experience have hardly borne out this assumption. It used to be that we could get good tin; now it is nearly impossible to do so, and the price has not followed the sliding scale of quality. The decadence in the quality of tools and machinery is proverbial, but the rise in price is almost equally so.

I think it may safely be said that the only benefit that has come to the consumer in lowering of price has been the result rather of new application of machinery than of consolidation; and that we have lost much in character by this transition is proven by a comparison of the operators of a large mill or factory with an equal number of persons doing business in the same line in a small way. The effect of competition makes the small operator study and think and plan, and that brings power, self reliance, stability and character. The elimination of competition breeds monopoly, and monopoly engenders greed, pride, domineering tendencies, lack of sympathy, sloth and carlessness in capital and human machines, in labor set to work out the same piece unendingly. While a certain amount of this centralization of effort is necessary, much of it is false and foolish, and it is a no more herculean task to accomplish a measure of decentralization and a restoration of individuality in the business world than it is to maintain a passably just relation between a powerfully centralized capital on the one hand and a powerfully centralized labor on the other hand.

And just in proportion as our civilization shall work out and restore the power of individuality in our industries will it restore the power of the individual in our political life, and thus again give to the sovereign citizen the place he was intended to hold in the economy of our government.—John A. McSparran.

BRADFORD COUNTY GRANGE DEBATES

Grange work is booming in Bradford County. A new grange has just been formed at Ghent, Sheshequin Township, which makes four granges in that township. We believe that is a record-breaker for any township in the state. If any one can beat it, let us hear from you.

The Grange at North Ghent has recently completed a series of debates which may be a help to some other Society. James VanCise is master of this Grange and Frank Payne secretary. Last fall Bro. Fred Fredericks was appointed as manager of debates and a debating team consisting of Bros. Vern Struble and Ira Holcomb and Sister Edna Farrell was chosen.

The first of a series arranged with the Rome Grange came off at North Ghent church and was won by the North Ghent team, the question being "Resolved that Life Insurance is as important to the farmer as fire insurance." The second number was given at Rome and was decided in favor of the Rome team. This question was "Resolved that Woman Suffrage would tend to purify American Politics." The third question "Resolved that diversified farming is of more importance to the farmers of Pennsylvania than specialized farming," was decided as a tie and consequently another debate will be held to decide the championship.

The Rome grange picked three for each debate from the following members: Myra Drake, Mrs. Clark, Clarence Vought, Frances Plott, Mrs. Pierce, Mrs. Dighton Clark, Robt. Cook and John Joyce. All these meetings were well attended and great interest was shown by all the members, whether directly interested or not.—L. C. Burroughs, Bradford Co., Pa.

NEW YORK'S NEW RURAL SCHOOL LAW

New York has a rural school bill which will place rural school districts on a par in several important particulars with city schools. The general provisions of the law are to the effect that the commissioner of education may lay out districts, of his own motion, suitable for central high schools anywhere in the state at any time, and in these schools there shall be taught the studies usually pursued in village or city high schools, as well as agriculture. These new school districts are to be laid out independently of the boundaries of existing school districts, towns or counties, and after a district has been laid out only those residing within the boundaries of the said district shall be permitted to vote on the proposition of establishing such a central high school.

Fifteen taxpayers may call for a meeting at which a vote shall be taken as to whether such a school shall be established and the school district shall have all the privileges of a union school district. It will receive from the state the same moneys that the territory included in it received when divided into several districts, and also the allowance made for high school instruction and for instruction in agriculture where such schools are maintained and instruction given.

This rural high school law is one of the most valuable acts of the state legislature for many years. It gives the country boy and girl educational advantages at home equal to any they would have in the city with the additional advantage of receiving instruction in the things with which they should be familiar and with which so large a majority of them will have to do in the future. These schools will also greatly tend to improve social conditions and will furnish social centres which will be attractive to the pupils and tend to build up a home pride in their communities and in rural affairs.

These schools will be directly and solely under the control of the farmers of the district thru a board of education chosen by themselves. They can make them what they will, and that they will make them such as to serve the interests of the farm and the locality wherein they are located, goes without saying. The general features of the plan of these schools have been approved by the commissioner of education at Washington. Ohio, we believe, has similar schools and Minnesota, Massachusetts and Rhode Island are engaged in a movement looking to their establishment. Let the work proceed. —D.

I Insist that The DESIGN Does it

And you can't get THIS DESIGN except in

The "TEMPLE" ENGINE

I don't have to tell you that VIBRATION and FRICTION cause tremendous wear and tear on an engine—besides wasting power, fuel and money. You know that.

But let me say this: that the "TEMPLE" Engine Design is the only one that really masters these ruinous forces. It does this by placing the Cylinder and Piston in a vertical position, with the head right down on the low, flat base (an exclusive "TEMPLE" feature.)

The shock and strain of explosions are, therefore, fully 80 per cent less than in engines having their Cylinder-Head or Explosion Chamber up in the air, above a high, wobbling base.

The "TEMPLE" vertical piston action—combined with especially designed gravity lubrication system (by which lubrication is supplied exactly when, where, and in quantity required)—almost entirely eliminates friction, and makes possible the economical, trouble-free delivery of a STEADY STREAM OF MAXIMUM POWER.

These special "Correct Design" features (joined with others made possible by them) make the "TEMPLE" run more quietly and smoothly—deliver more and steadier power—use 1-3 to 1-2 less fuel—weigh 1-3 to 1-2 less—have 2-3 less bulk—occupy 1-3 to 1-2 less space—more portable—wear less and last longer—than other engine types.

You simply CAN'T GET "TEMPLE" RESULTS in the vibrating, elevated cylinder designs. If you need economical POWER—to run a Thresher, Grist-Mill, Sawing Outfit, Shredder, Husker, Sprayer, Pump or any other INDOOR or OUTDOOR machinery requiring 2 H. P. to 50 H. P.—write to me at once. I'll tell you some other things, you never knew before, about correct engine DESIGN—something that may be worth hundreds of dollars to you in engine SERVICE.

Kenneth Kennedy, Gas Engine Expert (Formerly with U.S.Eng.Wks.) **Temple Mfg. Co.** 2134 S. 54th Ave., Cicero, Ill.

A NEW ROOF FREE

COST OF EARTH ROAD BUILDING

Mr. Henry Wedge, of Tioga Co., Pa., questions my statement of cost of building earth roads according to plan described in my article in Pennsylvania Farmer of January 17th, 1914. The article should read "my estimate for upkeep (instead of contruction) on such a road would be $100 per mile for first year, and $25 per year for each subsequent year"; to be dragged as often as needed to keep in perfect condition. I did not intend to make any estimate on material or actual construction of road, but I think in Crawford County, where our soil is largely clay loam and gravel it can be built for much less than Mr. Wedge estimates. I can dig a mile of that ditch in four days with 4 good teams and the right kind of a road machine, and eight days' work with pick and shovel will grade up the bottom of ditch, ready for tile. It is a short job to lay the tile and after the stone is filled in, the same team with road machine will replace the dirt in half the time it took to dig the ditch. A large part of the stone in Crawford County can be had convenient to the roads. Cobble stone from as large as a man's fist down to coarse gravel can be used, and is to be found in great abundance in gravel banks, and along streams.

If people could only be made to realize the great advantage both in expense and durability between a properly made dirt road and a macadam road, they would soon make their choice. All we need is a few well-built samples of dirt roads. We already have the samples of macadam, and have not only tried them, but have worn them out in about three years. I thank Mr. Wedge for calling my attention to the matter, as it was misleading and my only object in taking up the subject was to call attention to the great importance of building the most durable roads at the least expense.—W. R. McGill, Crawford Co., Pa.

THE SCRAPBOOK

Arrange your Pennsylvania Farmer clipping in a scrap book and you will have a valuable record. The old idea of keeping the weeklies filed in a closet is a poor one. Sometimes just the very issue that contains a subject that you desire to refer to is misplaced or lost. A systematic method overcomes that.

I have tried out several systems and all have advantages. One method is simply to pack each week's paper upon those last received in a closet or drawer. But it is a difficult, tedious matter to find what one desires at the time. In the next method a note book memorandum was kept to post the "issue" and the page of those articles I believed would be required for reference later. For instance: The notebook was indexed alphabetically. "Silos" appeared in issue October 10, page 6, which was posted on index page "S". Of course by this method each number of each years' issue must be kept intact. However, it takes considerable time to refer to the issue we desire.

The system I have used for some time has given me the best results. I use a notebook 16 inches long and 10 inches wide, containing 200 pages. One whole side of a page is given to a letter in the aphabet. That is my index. The last twelve pages are given to the 12 months in the year for "things to do." For example; the month of March is lamb market time, egg setting, feeders begin to get their nishing feed, etc. Each of these operations needs special attention which suggestions in my note book call to mind at the proper time.

Now each week my Pennsylvania Farmer comes to me I read it for the articles in which I am interested. Then I cut out those articles and paragraphs of direct interest to me and paste each one under its particular title in my scrapbook, and post the page number in the index; poultry under "P", orchards under "O", etc. This method suits my purpose best. If I desire to get information on any subject I locate in the index the page, turn to it and I may have a dozen or more articles on the question. After "cutting" out the articles and paragraphs, I store the papers, or what remains, in a box I keep for that purpose. For those who would keep a more elaborate "clipping" system, I would suggest a series of separate scrapbooks covering the subject of particular interest; each book to contain separate subjects. That system gives a more perfect method and soon one has accumulated a bookshelf full of knowledge of subjects under different covers.—The Country Doctor.

New Hampshire Grange Honored.—The state grange of New Hampshire, and not less the state itself, has been honored by the appointment of State Overseer Andrew L. Felker as Commissioner of Agriculture under the new regime. Heretofore there has been a state board of agriculture but this office was abolished by the last legislature and the office of commissioner of of agriculture was established. The position carries with it a salary of $3,500. He has been an active member of the grange for 17 years.

American Steel Fence Posts

Cheaper Than Wood and More Durable

Quality—High-class steel, heavily zinc coated inside and outside.

Strength—Strong enough to hold up any wire fence and furnish all necessary resistance.

Adaptability—Adapted to all conditions and will prove absolutely satisfactory wherever a good wire fence is desired.

Service—Give much more and much better service than can be expected of wood posts, and will not burn, rot or decay.

Durability—Have been in service since 1898, in every section of the United States, and the oldest posts are today as good as when set.

Adapted to All Wire Fences. Increase the life of a fence. Put a wire fence on permanent American Steel Posts and preserve the fence indefinitely; put it on wooden posts and it is like building a brick house on a wooden foundation.

For Sale By All Dealers.

We also make the celebrated AMERICAN FENCE, ELLWOOD FENCE, ROYAL FENCE, NATIONAL FENCE and the ANTHONY FENCE. These fences are galvanized by the wonderful new process we have developed and employed exclusively by us, effecting a heavier coat of zinc firmly united to the steel, affording absolute and permanent protection against destructive elements. The *greatest Galvanizing discovery of the age.* **Dealers Everywhere.**

GIRLS' GARDEN AND CANNING CLUBS

(Continued from page one)

Grading, Crating and Marketing

The girls found it very profitable to grade and crate their fresh tomatoes since they were able to sell a bushel crate for $1.50 all thru the summer when the local market was only paying 50 cents a bushel. For their late tomatoes they received $2.10 per bushel crate.

A good market can generally be found if it is sought. We found that our best market for the fresh fruit was the dining car service of the various railroads, as they buy only first-class goods and pay accordingly. Most of the graded, fresh tomatoes were sold to the dining car department of the D. L. & W. Ry., which also gave the girls an order for 100 dozen of their No. 3 cans of tomatoes at 10 cents per can. Several cases of canned tomatoes were also shipped to an Employees' Co-operative Association at Passaic, N. J. The girls received on an average 10 cents per No. 3 can while some of them were able to sell that size at two cans for 25 cents. Among the other tomato products canned by the girls are catsup, chili sauce, red tomato preserves, green tomato preserves, green tomato pickles, chowder, piccalilli, green tomato catsup and French chow chow. Some of the girls sold catsup at $1.00 per gallon.

Prizes Awarded on Farmer's Day

On November 22nd, in connection with a Farmer's Day and the Boys' Corn Show at the county seat, the Club work closed for the year. The essays on "How I Grew My Tomato Crop" were graded and up for inspection. These were illustrated with kodak pictures and were very interesting. Each girl also exhibited four cans of tomatoes canned in tin and one canned in glass. One tin can belonging to each member was opened and the quality judged by a chosen committee. The girls, together with their club leader, also had an exhibit of the various fruits and vegetables which they had canned during the season.

Did the Club Work Pay Financially?

Counting all the cost of production, cans, etc., a No. 3 can of tomatoes cost the girl who raised and canned it about 4½ cents, thus making her a profit of from 5 to 8 cents per can, and a saving of from 8 to 11 cents per can for what she canned for home use and did not have to buy at the grocers. Every girl in the Sussex County Garden and Canning Club this year made a profit. After paying all expenses and taking out 10 cents per hour for their time, the average clear profit made by each girl was about $33. The average amount of money actually paid out for supplies by each girl in the club work was $10.69 and the average number of hours spent by each girl in actual work was 85, while each received an average of 49 cents for every hour of time spent on the work. Considering that the ages of the club members ranged from 10 to 18 years this was a very fair return for time expended as it would be receiving at the rate of $4.90 per 10-hour day.

The girl who received the first prize in the county, Miss Lucy Bale, made a total profit of $71.58 from her 1-10 acre. She sold $8.80 worth of fresh tomatoes, $105.30 worth of canned tomatoes and used $9.15 worth in the home, making the total value of all products $123.25, at a total cost of $51.67. She canned 782 cans in tin and 223 cans in glass. As a prize she was given a free trip to Washington, D. C., where, with scores of other champion club members from 34 states who were guests of the United States Department of Agriculture, she spent a week in seeing the sights of the Capitol. Miss Lucy received first place among the girls of the Northern Central and Western States as well as the Championship of the State of New Jersey. She canned over 1,000 cans of tomatoes from her 1-10 acre plot. She is a sophomore in High School, and Sussex County as well as all New Jersey may be proud of what she accomplished.

An All-around Training

Not only did the Club work pay financially but we feel that this is only one side of the work. The value of undertaking and completing the work as a club member cannot be estimated, as it trains the whole child. Each girl who carried the work thru to the end, besides earning a fair profit and whatever she may have obtained, won a National Club pin as illustrated at the head of this article, given by the Sussex County Farm Bureau. Every part of the little pin has a meaning and explains the four-square education which the Club work stands for. The background of the pin is a book which signifies the need of an education and definite knowledge in order to do any work well. The word "Demonstrator" means that every club member is to be a demonstrator of the best known methods in agriculture and is to follow the instructions furnished by the Department of Agriculture for a period of not less than one season on a 1-10 acre plot in the Garden and Canning Club work.

The "H" seen on each petal of the four-leaf clover stands for the equal training of the Head, the Heart, the Hands and the Health. The four-square education trains the Head to think, to plan and to reason; the Heart to be kind, to be true and sympathetic; the Hands to be useful, helpful and skillful; and the Health to resist disease, to enjoy life, and to make for efficiency. As Prof. Benson puts it the 4-H education of the Club work "makes better citizens morally, intellectually, and economically."

TEACHING HOME CRAFT TO GIRLS

To manage the household is the average woman's lot, but most girls, the land over, do not attend homecraft schools as their brothers attend, the land over, agricultural, technical or law universities. Therefore our schools should train our daughters for their inevitable task.

Sixty-five percent of our girls marry previous to the 30th year. The other 35 percent enter careers of business or professional type. The usual high school program accords preparation for the latter, but for the girls who are to become housewives and mothers, this education is an uncompleted story. They don't learn the last chapter, the important chapter.

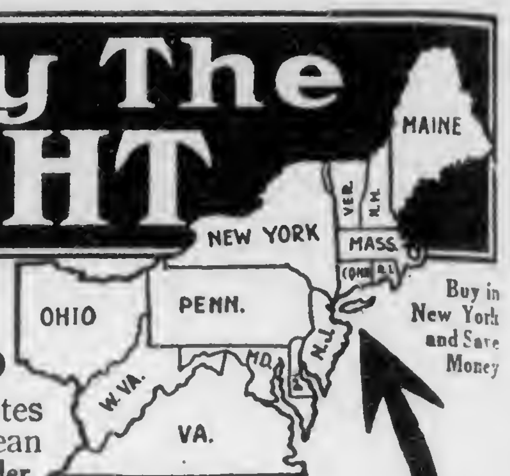
The majority of parents who desire their daughters to receive a high school education cannot afford to send them to college or training schools afterward. With yet other girls it is a case of personal disinclination to pursue their studies, either for want of studious instincts or because of the early prospect of marriage. They are not, in the majority of cases, properly prepared for their business, unless their mothers happen to be excellent housewives and have had the wisdom to impart their knowledge to the younger generation. Lawyers send their sons to law school, doctors' sons go to medical schools, farmers' sons go to agricultural colleges. Why expect the mothers alone to teach housecraftship to the daughters?

Dr. Rowe of New York has for some time past been calculating how to best fill this great gap in American home life. The plan has been accepted most enthusiastically by the mothers of his pupils and has received the approval of the Board of Education of the New York high schools. The first term saw 80 girls in the class, eager to prepare themselves for their life work. In this homecraft course girls are taught the art of reading, and their taste for and appreciation of real literature will be developed by the most competent instructors of the day.

Among the other required subjects are biology, domestic science and art, drawing, music and physical training, for the first year; the same studies with hygiene and sanitation in addition for the second year; household management and mathematics for the third year, social efficiency and essentials of conduct for the fourth year. The elective subjects include household arithmetic, vocation study, study of vocational fitness, current history, English history; clothing, its care and remodeling; German and French for the first year, millinery, household chemistry, European, American and ancient history; history of women's work, history of arts and crafts, current history and again German and French for the second year. For the third year applied design, applied physics and music are added, and economics, fundamentals of legal procedure, physiology, bacteriology and sanitation, household design and decoration complete the course during the fourth year.

The freedom in electives is a distinctive feature of this course. It aims at providing for the individuality of each student, and at the same time, thru the required subjects they receive the well-rounded training desirable for those who are not able to go further than the high school course. Moreover, the course has been so arranged that the girl who is unable to remain more than one year may receive some preparation for homecraft, which will better fit her for the duties of home and motherhood.

Every high school in the land, in rural districts and city communities, must sooner or later come to the homecraft plan of instruction, for our daughters must be fitted for life and its task if the race of American girls and mothers is to be advanced.



We Pay The FREIGHT

Buy in New York and Save Money

To Any State Shown on This Map

and part of the freight to all States beyond. Think of what it will mean to know to a penny **before you order** just what the goods will cost you laid down in your own town. Think of the money you can save in having

Nothing to Pay When the Goods Arrive.

If you live in one of the States shown on the map, we pay the freight on all shipments of 100 lbs. or more (excepting only vehicles and farm implements). You can get everything else delivered free. For example: Household Furniture, Sewing Machines, Stoves, Harness, Wall Paper, Paints, Roofing, Fencing, Incubators, Cream Separators, Hay Tools, Gasoline Engines, Dry Goods, Millinery, Clothing and Shoes for all the family. If you live anywhere outside the States named above, we will pay all delivery charges on Dry Goods, Wearing Apparel, Millinery, Shoes and Jewelry, and a liberal part of the freight charges on everything else excepting vehicles and farm implements. So no matter where you live you can enjoy this new Freight Paid advantage in part, if not all. No other big mail order house offers to pay the freight on almost everything for home, farm and shop.

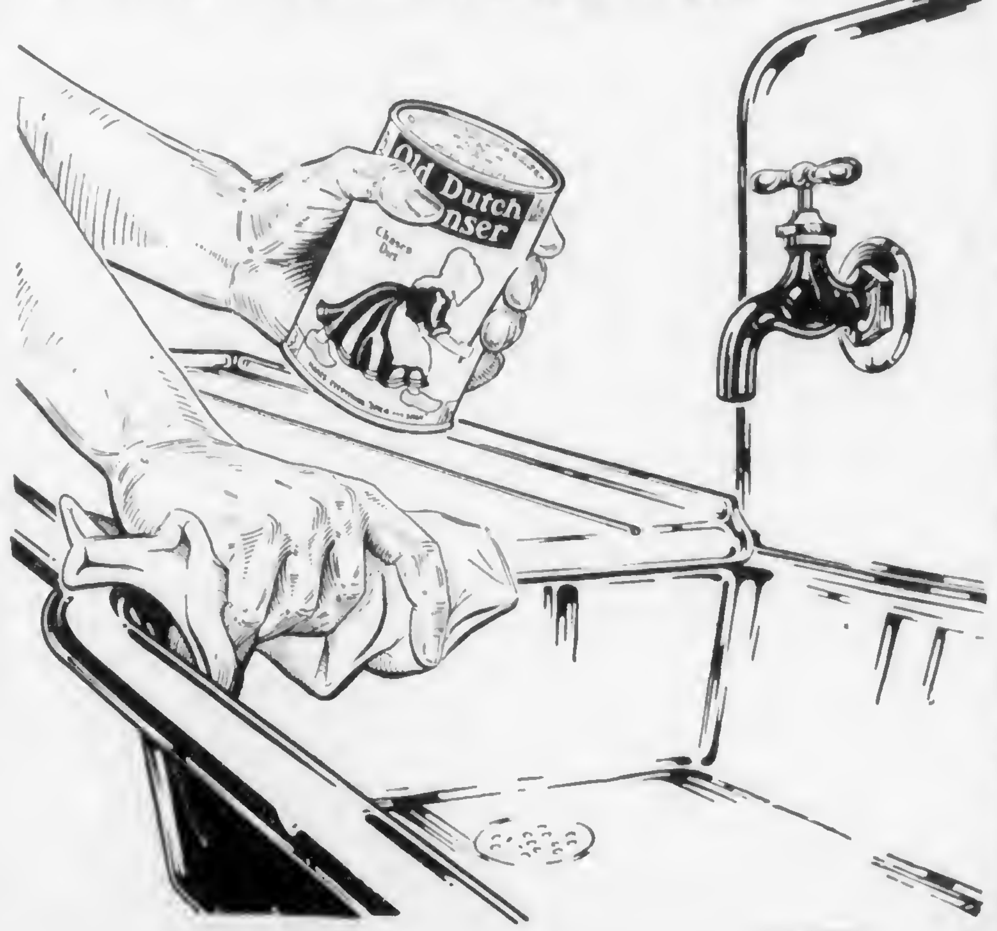
1015 Stores Building, 115 E. 23d Street, New York

Keeps SINKS SNOWY WHITE

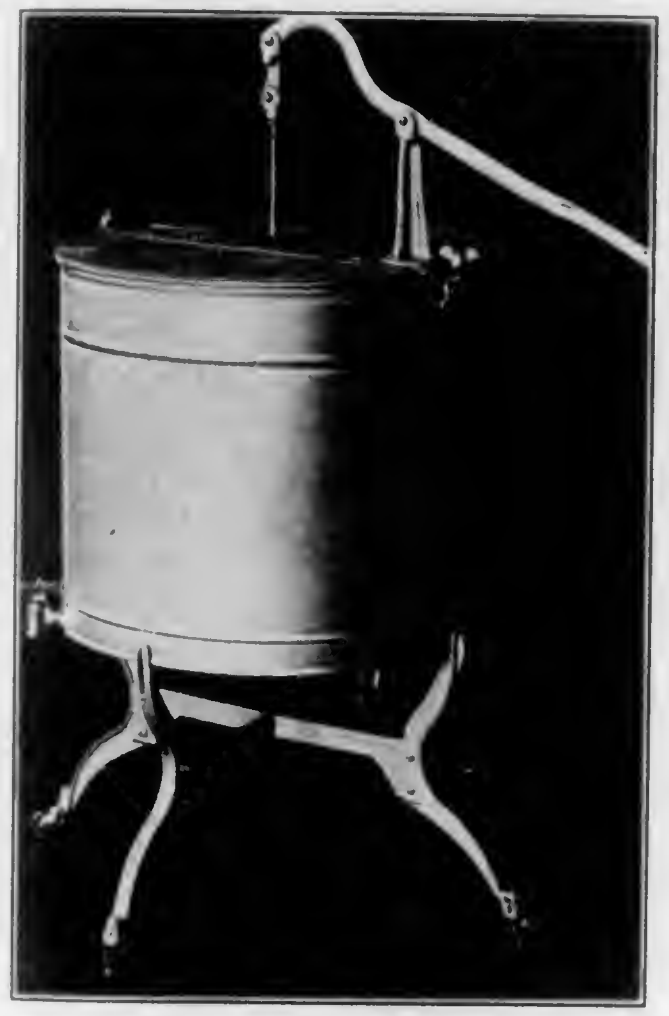
"OLD DUTCH" cleans the sink "as quick as a wink." Quickly banishes grease, dirt and stains from porcelain, enamel and metal parts. Equally effective for scrubbing wooden sink boards.

Don't Be Without It—10c Large Can



A MECHANICAL DISHWASHER

At last here is something practical towards increasing kitchen efficiency by reducing the time spent in dishwashing. The other day I went to have some duplicate door keys made. The key maker said that he could make half a dozen as quickly as he could make one. I thought to myself "If we housekeepers could only combine equally well many of our motions, how much better it would be for us and our families!" Here is a piece of kitchen equipment that does this very thing—it washes 25 or 50 dishes with the same motions that it would require to wash one or two. This is the way that it does it:



MECHANICAL DISH WASHER.

Pile the glasses, silver and general table dishes into separated wire racks, with their edges obliquely toward the tube in the center. Pour in hot suds, the suds having been made by means of a soap shaker, which should be a part of every kitchen equipment. It consists of a wire container, about 1½ by 2 by 3 inches in size, for holding small pieces of soap. It has a long handle by which you shake it about in the water and in a few seconds make a fine suds. Personally I like the naptha soaps best for dishwashing as they seem to clean the dishes more readily because the naptha cuts the grease better than the soaps ordinarily used. You will need for an ordinary family size dishwasher of this type about 8 quarts each of hot suds and of rinse water.

Pump the wire baskets up and down several times by means of the handle. This forces water thru the holes in the tube against the dishes, and also souses the suds well against them on all sides. Let them stand and soak a few minutes (about five will do) in the hot suds, then pump again before draining off the suds. This is drained into a pail or preferably into a floor drain to avoid lifting and carrying as much as possible. Rinse out the dishwasher with a dipperful of hot water then pour in boiling water and pump the basket up and down in this to thoroly rinse the dishes. Drain off this water, and let the dishes stand and dry themselves in the baskets, which they will do very nicely because they are so hot. Of course the glasses and silver will have a better polish if you take them out and polish them with a cloth, but the busy farm housekeeper can omit this on occasions. Thus, you see, a large number of dishes are washed and dried with the same motions. Is it not worth while to an overworked woman? The cost of such a machine for an ordinary family is $12. Your men folks will pay considerably more for a machine that is not used three times a day every day in the year. It is time that farm kitchens use more labor-savers like this. It is on casters so that it can be moved easily to the stove to receive the boiling water, to the drain for emptying, and to the table or the dish cupboard for putting the dishes away. It does all it possibly can to relieve the busy woman. No restaurant or hotel or club thinks of getting along without a mechanical dishwasher. The managers of such establishments say that they save their cost over and over in economy of time and in reduction of breakage, which is very great with hand washing and handling. The machine described herewith is constructed on the same principal as the large hotel-size dishwashers.—Harriet Mason.

Stop Your Feet From Hurting You

Learn to know what real comfort is by wearing this soft-as-velvet shoe, made to end the foot troubles of every woman. It "gives" wherever it needs to, takes the sting out of sore corns; stops the ache of constant pinching. Made of Duree Kid; soft, pliable, seamless, easy. YOU LOVE FLOWERS

THEN LET US SEND YOU THESE EIGHT BEAUTIFUL ROSES.

These are the kind that bloom every month in the growing season and possess the excellent qualities of vigorous growth, freedom of bloom, fragrance and beauty of flowers. The Collection includes one of each of the following:

CLIMBING AMERICAN BEAUTY
The realized dream of every rose grower in all its promise and glory. Just the same as the old American Beauty developed into a hardy outdoor climbing rose, an everbloomer, with a strong, sturdy habit of growth. Tough, leathery foliage which is immune to disease, insects and weather. The roses grow on single stems, measuring three to four inches across, vivid rosy crimson in color with the same delicious fragrance as American Beauty. Blooms the entire season with hundreds of beautiful fragrant flowers.

FRAU KARL DRUSCHI
This brilliant rose has come to be recognized as the highest type of its class—the best snow white rose ever produced. Healthy, sturdy grower with the hardiness of an oak and magnificent heavy foliage. A single plant will furnish hundreds of huge full double flowers composed of broad charmingly veined petals. Color marvelously white, positively without a suggestion of color; well deserves the name that distinguishes it as the white companion of our national red beauty.

MAMAN COCHET
A rose to excite the admiration of everyone. True outdoor rose, very hardy and rapid, vigorous grower. Blooms all the time producing immense elegantly formed flowers of a magnificent silvery pink.

ETOILE DE LYON
Grace of form, charm of color and vigor of growth are three characteristics which make this one of the finest roses ever offered. In color, a deep golden yellow, marvelously rich and pure with exquisite fragrance. Very hardy in growth and an abundant bloomer.

OLIVIA
A most gorgeous and distinct rose of deep, brilliant rosy red. It grows to perfection in any soil in all sections of the country and blooms continuously the entire season bearing lovely immense flowers. For bedding purposes it has no superior.

MAIDENS' BLUSH
An indispensable rose for bedding or decorative purposes. Vigorous, healthy grower, quickly forming a shapely bush and producing in amazing profusion large, double flowers which delicately blend rose tints in center, gradually shading into pale blush and creamy white.

ROSEMARY
A rose as beautiful as its name, absolutely hardy, always producing strong vigorous growth and leathery foliage. Flowers practically all the time, having great masses of the most beautiful fragrant roses of rich silvery pink, exquisitely shaded.

ETOILE DE FRANCE
This rose has been selected from the unlimited number of hardy roses as the acme of perfection. It is an upright, sturdy grower with beautiful, bronzy-green, insect-proof foliage and bears vast quantities of massive, deep cup-shaped flowers; color a clear, rich velvety-crimson.

HOW TO GET THIS COLLECTION OF BEAUTIFUL ROSES
We will send this entire collection postpaid for either of the following offers:
No. 1. for 2 new yearly subscriptions to Pennsylvania Farmer at 50 cents each.
No. 2 collection and 1 year's subscription to Pennsylvania Farmer for $1.00 (either new or renewal). Collection not given as a premium with single subscriptions unless 50 cents is added to the regular subscription price.

We are certain that every one of our readers who takes advantage of this opportunity will be delighted, and the plants are guaranteed to reach destination in good condition, promptly, and exactly as represented. Send your orders to
PENNSYLVANIA FARMER, 214-18 South 12th Street, Philadelphia, Pa.

Winston of the Prairie

By HAROLD BINDLOSS

Copyrighted by Frederick A. Stokes Company.

CHAPTER XXVII. (concluded.)

Still, he was almost too cold for any definite feeling but the sting of the frost, and it was very stiffly he stood up, shaken by vague emotions, when at last the horses stopped. A great door swung open, somebody grasped his hand, there was a murmur of voices, and partly dazed by the change of temperature he blundered into the warmth of the hall. The blaze of light bewildered him, and he was but dimly sensible that the men who greeted him were helping him to shake off his furs, while the next thing he was sure of was that a little white-haired lady was holding out her hand.

''We are very glad to see you back,'' she said, with a simplicity that yet suggested stateliness. ''Your friends insisted on coming over to welcome you, and Dane will not let you keep them waiting too long. Dinner is almost ready.''

Winston could not remember what he answered, but Miss Barrington smiled at him as she moved away, for the flush in his face was very eloquent. The man was very grateful for the greeting, and what it implied. It was a few minutes later when he found himself alone with Dane, who laughed softly as he nodded to him.

''You are convinced at last?'' he said. ''Still, there is a little more of the same thing to be faced, and, if it would relieve you, I will send for Alfreton, who has some taste in that direction, to fix that tie for you. You have been five minutes over it, and it evidently does not please you. It's the first time I've ever seen you worry about your dress.''

Winston turned, and a curious smile crept into his face as he laid a lean hand that shook a little on the toilet table.

''I also think it's the first time these fingers wouldn't do what I wanted them. You can deduce what you please from that,'' he said.

Dane only nodded, and when they went down together laid a kindly grasp upon his comrade's arm as he led him into the great dining-room. Every man at Silverdale was apparently there, as were most of the women, and Winston stood still a moment, very erect with shoulders square, because the posture enabled him to conceal the tremor that ran thru him when he saw the smiling faces turned upon him. Then he moved slowly down the room towards Maud Barrington, and felt her hand rest for a second between his fingers, which he feared were too responsive. After that, everybody seemed to speak to him, and he was glad when he found himself sitting next to Miss Barrington at the head of the long table, with her niece opposite him.

He could not remember what he or the others talked about during the meal but he had a vague notion that there was now and then a silence of attention when he answered a question, and that the little lady's face grew momentarily grave when, as the voices sank a trifle he turned to her.

''I would have paid my respects to Colonel Barrington, but Dane did not consider it advisable,'' he said.

''No,'' said Miss Barrington. ''He has talked a good deal about you during the last two days, but he is sleeping now, and we did not care to disturb him. I am afraid you will find a great change in him when you see him.''

Winston asked no more questions on that topic until later in the evening, when he found a place apart from the rest by Miss Barrington's side. He fancied this would not have happened without her connivance, and she seemed graver than usual when he stood by her chair.

''I don't wish to pain you, but I surmise that Colonel Barrington is scarcely well enough to be consulted about anything of importance just now,'' he said.

Miss Barrington made a little gesture of assent. ''We usually pay him the compliment, but I am almost afraid he will never make a decision of moment again.''

''Then,'' said Winston slowly, ''you stand in his place, and I fancy you know why I have come back to Silverdale. Will you listen for a very few minutes while I tell you about my parents and what my upbringing has been? I must return to Winnipeg, for a time at least, tomorrow.''

Miss Barrington signed her willingness, and the man spoke rapidly with a faint trace of hoarseness. Then he looked down on her.

''Madam,'' he said, '' I have told you everything, partly from respect for those who only by a grim sacrifice did what they could for me, and that you may realize the difference between myself and the rest at Silverdale. I want to be honest now at least, and I discovered, not without bitterness at the time, that the barriers between our casts are strong in the old country.''

Miss Barrington smiled a little. ''Have I ever made you feel it here?''

''No,'' said Winston gravely. ''Still, I am going to put your forbearance to a strenuous test. I want your approval. I have a question to ask your niece tonight.''

''If I withheld it?''

''It would hurt me,'' said Winston. ''Still, I would not be astonished, and I could not blame you.''

''But it would make no difference?''

''Yes,'' said Winston gravely. ''It would, but it would not cause me to desist. Nothing would do that, if Miss Barrington can overlook the past.''

The little white-haired lady smiled at him. ''Then,'' she said, ''if it is any comfort to you, you have my good wishes. I do not know what Maud's decision will be, but that is the spirit which would have induced me to listen in times long gone by!''

She rose and left him, and it may have been by her arranging that shortly afterwards Winston found Maud Barrington passing thru the dimly-lighted hall. He opened the door she moved towards a trifle, and then stood facing her, with it in his hand.

''Will you wait a moment, and then you may pass if you wish,'' he said. ''I had one great inducement for coming here tonight. I wonder if you know what it is?''

The girl stood still and met his gaze, tho, dim as the light was, the man could see the crimson in her cheeks.

''Yes,'' she said, very quietly.

''Then,'' said Winston, with a little smile, tho the fingers on the door quivered visibly, ''I think the audacity you once mentioned must have returned to me, for I am going to make a very great venture.''

For a moment Maud Barrington turned her eyes away. ''It is the daring venture that most frequently succeeds.''

Then she felt the man's hand on her shoulder, and that he was compelling her to look up at him.

''It is you I came for,'' he said quietly. ''Still, for you know the wrong I have done, I dare not urge you, and have little to offer. It is you who must give everything, if you can come down from your station and be content with mine.''

''One thing,'' said Maud Barrington, very softly, ''is however, necessary.''

''That,'' said Winston, ''was yours ever since we spent the night in the snow.''

The girl felt his grip upon her shoulder grow almost painful, but her eyes shone when she lifted her head again.

''Then,'' she said, ''what I can give is yours—and it seems you have already taken possession.''

Winston drew her towards him, and it may have been by Miss Barrington's arranging that nobody entered the hall, but at last the girl glanced up at the man half-shyly as she said, ''Why did you wait so long?''

''It was well worth while,'' said Winston. ''Still, I think you know.''

''Yes,'' said Maud Barrington softly. ''Now, at least, I can tell you I am glad you went away—but if you had asked me I would have gone with you.''

It was some little time later when Miss Barrington came in and, after a glance at Winston, kissed her niece. Then she turned to the man. ''My brother is asking for you,'' she said. ''Will you come up with me?''

Winston followed her, and hid his astonishment when he found Colonel Barrington lying in a big chair. His face was haggard and pale, his form seemed to have grown limp and fragile, and the hand he held out trembled.

''Lance,'' he said, ''I am very pleased to have you home again. I hear you have done wonders in the city, but you are, I think, the first of your family who could ever make money. I have, as you will see, not been well lately.''

''I am relieved to find you better than I expected, sir,'' said Winston quietly. Still, I fancy you are forgetting what I told you the night I went away.''

Barrington nodded, and then made a little impatient gesture. ''There was something unpleasant, but my memory seems to be going, and my sister has forgiven you. I know you did a good deal for us at Silverdale, and showed yourself a match for the best of them in the city. That pleases me. By and by, you will take hold here after me.''

Winston glanced at Miss Barrington, who smiled somewhat sadly.

''I am glad you mentioned that, sir, because I purpose staying at Silverdale now,'' he said. ''It leads up to what I have to ask you.''

Barrington's perceptions seemed to grow clearer, and he asked a few pertinent questions before he nodded approbation.

''Yes,'' he said, ''she is a good girl —a very good girl, and it would be a suitable match. I should like somebody to send for her.''

Maud Barrington came in softly, with a little glow in her eyes and a flush on her face, and Barrington smiled at her.

''My dear, I am very pleased, and wish you every happiness,'' he said. ''Once I would scarcely have trusted you to Lance, but he will forgive me, and has shown me that I was wrong. You and he will make Silverdale famous, and it is comforting to know, now my rest is very near, that you have chosen a man of your own station to follow me. With all our faults and blunders, blood is bound to tell.''

Winston saw that Miss Barrington's eyes were a trifle misty, and he felt his face grow hot, but the girl's fingers touched his arm, and he followed, when, while her aunt signed approbation, she led him away. Then when they stood outside she laid her hands upon his face and drew it down to her.

''You will forget it, dear, and he is still wrong. If you had been Lance Courthorne I should never have done this,'' she said.

''No,'' said the man gravely. ''I think there are many ways in which he is right, but you can be content with Winston the prairie farmer?''

Maud Barrington drew him closer to her with a little smile in her eyes. ''Yes,'' she said simply. ''There never was a Courthorne who could stand beside him.''

—:THE END:—

ARTHUR'S METHOD

By Nelson A. Jackson

''Say, Arthur, I think that you are foolish. You just keep working, working all the time, just as if you were afraid of being idle for one minute.''

Will Harton had left his work for a few moments and stood beside Arthur Janes, who was industriously winding a coil for an electrical machine.

''No, I am not afraid of being idle,'' Arthur replied. ''I am naturally lazy enough, but Mr. Colman pays me for my time. It belongs to him and I have no right to waste it.''

''You're too particular,'' Will said. ''Mr. Colman doesn't care if we take a little time off now and then. I have been working here longer than you have and I know him better than you do.''

''Why are you so quick to get back to your work, then, whenever you hear him coming?'' asked Arthur.

Will flushed guiltily. ''Oh, well,'' he answered, ''I don't know as I should care to have him find me idle, but it doesn't make any difference when he is out of the room or when his back is turned. I guess that fifteen minutes wasted now and then can't be of very much importance, because I am getting bigger wages than you do.''

''I know that your wages are higher, but what I earn I wish to earn honestly.''

''Do you mean to say that you think that I am dishonest?'' Will retorted angrily.

''I can't judge you. I know that I could not do as you do and have a clear conscience. Each one of us must have his own standard,'' was Arthur's quiet reply.

''I must say,'' said Will, ''that you have altogether too much Bible mixed up with your ideas of business. I tell you, you can't mix the two. I suppose you think it is necessary for you to come to the shop half an hour early each morning.''

''No, I do not think that it is at all needed, only I am anxious to find out all that I can about electricity. I wish to go to a technical school and to become an electrical engineer.''

''Oh, well, you will have to lose that conscience of yours, before you get along anywhere.''

''I think not.''

The conversation was broken off at this point, as Mr. Colman was heard approaching and Will made haste to reach his place and resume work.

Mr. Colman came slowly down the room between the rows of workmen and boys. He stopped by the side of Arthur Janes, spoke kindly to him, made a few suggestions and passed on. This was a compliment to Arthur, as Mr. Colman seldom spoke to his employes while they were at work. When he did, it was always with a pleasant smile and a helpful word.

As they were passing out after the day's work, Will Harton gave Arthur another tongue lash with the words, ''I see Old Colly is getting struck on you, but your goody-goody ways won't help you in the long run.''

''Come what may, I shall always try to do what is right,'' was his only reply.

Arthur had graduated from the village high school the preceding spring, where he had fitted himself to enter an engineering school. He had been bitterly disappointed when in the early summer financial losses had made assistance from his father impossible. He had then determined to enter the Colman general electrical works. Here he went at it to learn as much as possible concerning electricity and its practical workings while earning money for his college course. Arthur had never been accustomed to steady work and it was hard for him to don blue overalls and keep at his employment day after day. He rang true and soon realized that what had seemed a misfortune was in reality a blessing. He spent his evenings studying and reading along the lines of his work. Will Harton was jealous because Mr. Colman paid more attention to Arthur than to him. He was continually trying to get Arthur to slight his work, but to no avail.

The next morning when the men came to their work they found notices posted, which announced a meeting of all the employes at the noon hour. After lunches had been eaten the men gathered in the large storeroom on the first floor. Mr. Colman came before them with these words: ''Men, what I have to say hurts me and will entail hardship on many of you as well as myself. With few exceptions, you are good workmen. I have no complaint to make. You know that during the past few months the American people have been facing a financial crisis. I have been afraid it would reach us and it has. Our sales have fallen off over one-half and several big concerns which owe us large amounts have failed. As a result, it will be necessary to lay off a large portion of you. At present all the married men will be retained and a few others, who will be notified. The rest need not report for work Monday morning.''

That afternoon Arthur was filled with anxiety. He wondered what he could find to do. He might possibly be retained, but he thought it hardly possible, as he was one of the youngest and most inexperienced of the hands. As soon as Will had a chance he slipped over to Arthur's side and said, ''I'll bet you that I keep my job and that you get fired. I know the business too well to be dismissed. What do you think you'll do now?''

''I have absolutely no idea at present.''

''Possibly you can start your college course,'' Will went on tauntingly, ''and pay your way with your high-flown ideas of business principles.''

Arthur made no reply. He was too indignant even to look at Will. ''I am glad that I am not burdened with your narrow ideas of right and wrong,'' Will remarked, as he turned to talk to another boy.

When the pay envelopes were received at the close of the day's work, Will and Arthur each found a slip requesting them to report at Mr. Colman's office at noon.

''Mr. Harton first, Mr. Janes, if you will wait a few moments,'' Mr. Colman said and closed the door to his private office. He motioned Will to a seat and said kindly: ''Will, I wish to give you a little fatherly counsel. I shall not need your services any longer I shall retain Arthur Janes. You will want other work, but you have one lesson to learn before you can be successful anywhere. You are at present working on the principle of doing as little as possible and getting as much as possible. You are in the habit of wasting at least one hour a day of my time. In other words, you have stolen from me constantly.''

Will was white with rage. ''I'll bet Janes has blabbed on me,'' he exclaimed.

''No, Mr. Harton, no one has told anything. I have merely observed. An employer sees more than his men often give him credit for seeing. I know that I have used harsh words, but they are true. Now, my boy, the thing for you to do is to give your next employer your best. Then, and only then, will you become indispensable to your company. And remember it is the indispensable men who become foremen and managers. I started from the bottom and know the truth of my words. You have ability and are bright and quick You will succeed if you are honest with yourself and employer. That is all.''

As Will went out, he said to Arthur, ''I am fired; just my luck; I never work up anywhere.''

Mr. Colman, who had followed him to the door, caught the words and said, somewhat sharply, ''Your luck is just what you make it.''

Arthur entered the office. Mr. Colman took him by the hand and said, ''Arthur, I have been more than pleased with your work for the past few months. I should like to keep you, but I have something better for you. I am well acquainted with the superintendent of the electrical works at Orton. I have secured a place for you there. There you can earn your college expenses and at the same time be obtaining practical experience, which is so necessary in your chosen profession.''

''Thank you, thank you, Mr. Colman, how can I ever repay you for your kindness,'' and Arthur's eyes sparkled with joy.

''My boy, you have earned it.''

''I shall try to prove myself worthy of your trust and kindness.''

''You will, I have no fear.'' And he did.

SMILE WHENEVER YOU CAN

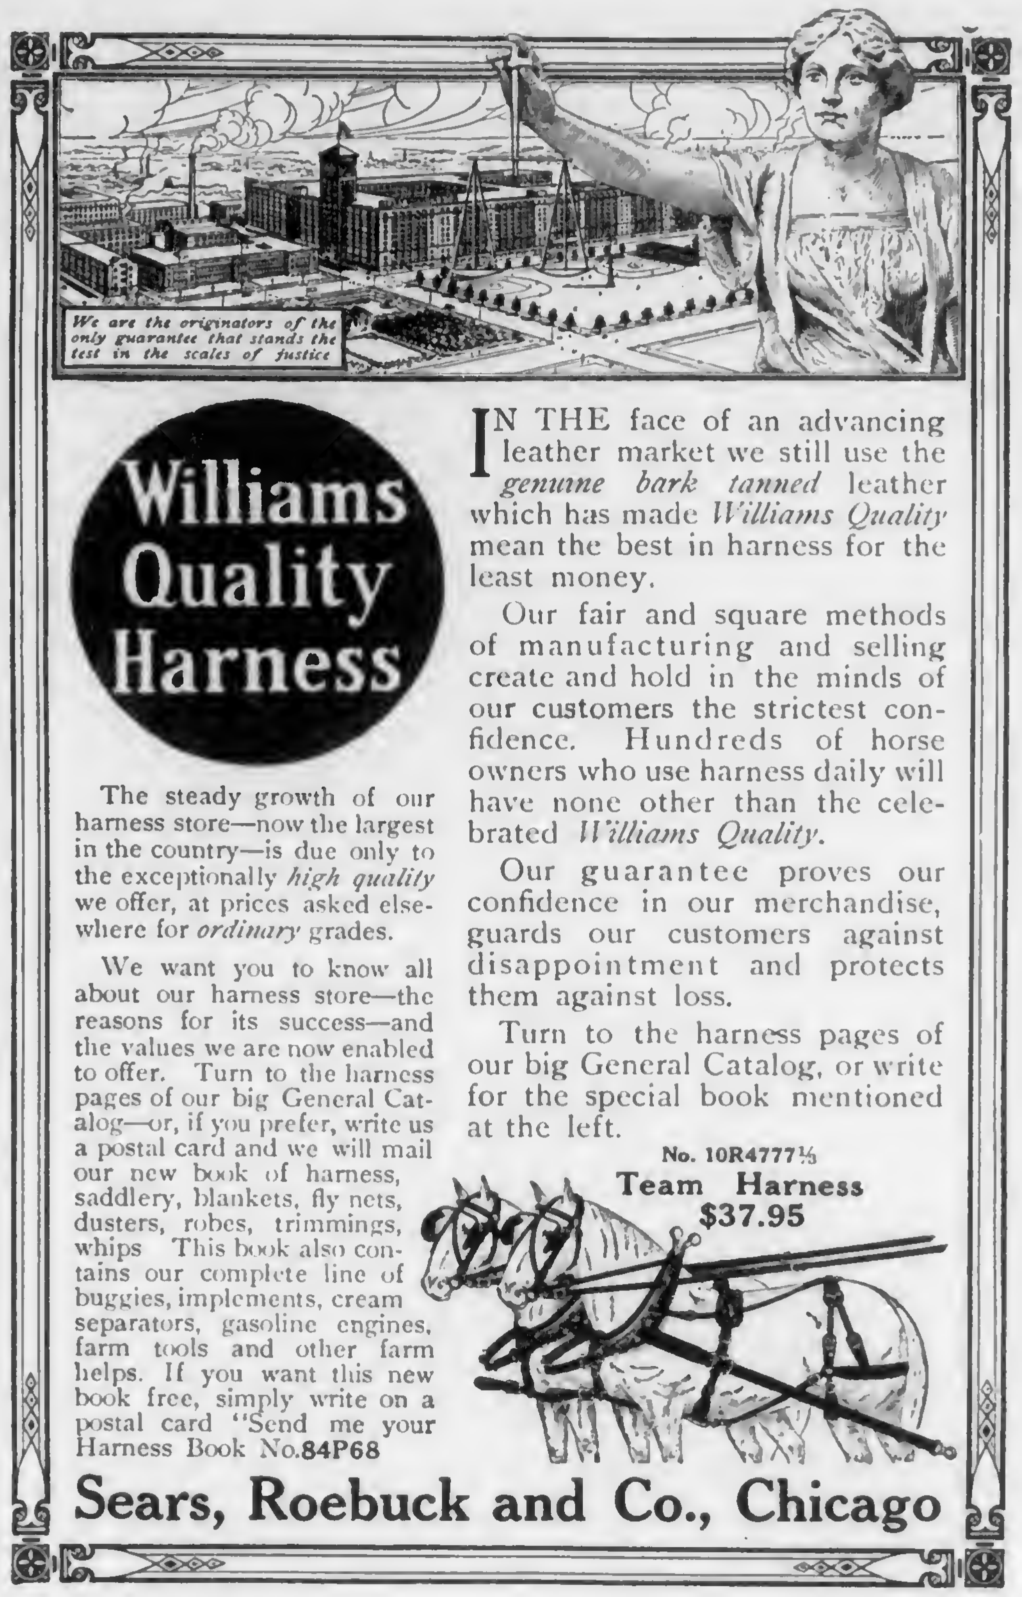
When things don't go to suit you
  And the world seems upside down,
Don't waste your time in fretting,
  But drive away that frown;
Since life is oft perplexing,
  'Tis much the wisest plan
To bear all trials bravely
  And smile whenever you can.

Why should you dread the morrow,
  And thus despoil today?
For when you borrow trouble
  You always have to pay.
It is a good old maxim
  Which should be often preached—
Don't cross the bridge before you
  Until the bridge is reached.

You might be spared much sighing
  If you would keep in mind
The thought that good and evil
  Are always here combined.
You may count up mighty riches
  In your store of earthly wealth
But miss that greater blessing,
  That precious jewel—health.

And tho you're strong and sturdy,
  You may have an empty purse—
And Earth has many trials
  Which I consider worse—
But whether joy or sorrow
  Fill up your mortal span,
'Twill make your pathway brighter
  To smile whenever you can.

—WILL A. ENGARD.



We are the originators of the only guarantee that stands the test in the scales of justice
Williams Quality Harness

IN THE face of an advancing leather market we still use the *genuine bark tanned* leather which has made *Williams Quality* mean the best in harness for the least money.

Our fair and square methods of manufacturing and selling create and hold in the minds of our customers the strictest confidence. Hundreds of horse owners who use harness daily will have none other than the celebrated *Williams Quality.*

Our guarantee proves our confidence in our merchandise, guards our customers against disappointment and protects them against loss.

Turn to the harness pages of our big General Catalog, or write for the special book mentioned at the left.

The steady growth of our harness store—now the largest in the country—is due only to the exceptionally *high quality* we offer, at prices asked elsewhere for *ordinary* grades.

We want you to know all about our harness store—the reasons for its success—and the values we are now enabled to offer. Turn to the harness pages of our big General Catalog—or, if you prefer, write us a postal card and we will mail our new book of harness, saddlery, blankets, fly nets, dusters, robes, trimmings, whips This book also contains our complete line of buggies, implements, cream separators, gasoline engines, farm tools and other farm helps. If you want this new book free, simply write on a postal card "Send me your Harness Book No.84P68

YORK PRODUCE MARKET

York, Pa., April 6, 1914.

The average attendance at the Friday and Saturday markets was very large. Inquiry was brisk but no heavy buying. The first home grown truck from the hot-beds is coming on the stalls. Eggs are plentiful and buying light.

Eggs.—16@19c doz.

Butter, Country, 30@33c; separator, 34@36c. Milk, 6c per quart. Cream, 12c per pint.

Poultry.—Scarce. Hens 15@16c. Dressed poultry, 40@85c each.

Vegetables.—Potatoes 12@16c ½-pk; 70c@$1.00 bu; cabbage 3@10c each; lettuce, 3@10c; beets, 5c bch; radishes 5@8c bch; onions 3c bch., 15@18c per ½-pk; lima beans 14@16c qt; sweet potatoes, 14@16c per ½-pk; lard 14@16c lb; celery, 10@12c; peppers, 8@12c doz; turnips 10@12c ½ pk; soup beans, 10@12c qt; sauer kraut 8c qt; apple butter, 22@25c qt.

Fruit.—Apples, 25@35c ½-pk; pears, 15@20c per ½-pk; chestnuts, 12c quart; walnuts, 15c per ½-pk.

Retail Grain Market.—Wheat, $1.08 bu., corn, 84c; oats, 55c, rye, 77c; bran, $1.60 cwt; middlings $1.60 cwt.

Wholesale Grain Market.—Wheat, 98c; corn, 74c, oats, 45c; rye, 70c.

PHILADELPHIA LIVE STOCK

Philadelphia, Pa., April 6, 1914.

Beef Cattle.—There was a little improvement in the market, particularly noticeable on the better class of steers. Lancaster County, Pa., cattle with Ohio and Western stock were on sale in moderate but sufficient numbers. Cows and calves were in ordinary request at former values.

	Beef Cattle	Sheep and Lambs	Hogs
Total for week	2,556	9,370	4,933
Previous week	2,403	6,657	5,288

Best steers	$8.60@8.80
Choice steers	8.37½@8.50
Good	8.00@8.25
Medium steers	7.50@7.75
Common steers	7.00@7.25
Bulls	5.00@6.50
Fat cows	5.25@6.00
Medium cows	3.50@4.75
Thin cows	2.75@3.00

Veal calves steady.

Best calves	$9.50@10.00
Good to choice do	9.00@9.50
Medium	7.50@8.00
Common do	6.50@7.00

Sheep and Lambs.—Supplies were increasing but prices as a rule were well maintained, choice stock commanding the better inquiry.

Choice wethers	$6.25@6.50
Good do.	5.25@5.75
Common to medium	3.50@5.00
Ewes, fat	5.25@5.75
Extra lambs	8.50@8.75
Good to choice do	$8.00@8.25
Common to medium	6.00@8.00

Hogs.—The market was about steady at the prices with demand of a seasonable character. Westerns as to size and quality $12.50@12.75.

City Dressed Stock.—Every variety of choice and prime class commanded full rates but trade was very conservative. Steers, 12@14c; heifers, 10½@13c; cows, 9@11½c. Veal calves, 13@14c; country dressed calves 13@14c; extra do., 14½c. Sheep, 9@11c; extra wethers, 12c. Spring lambs 13@14c. Hogs 12¾@13c.

PITTSBURGH LIVE STOCK

Pittsburgh, Pa., April 6, 1914.

Cattle.—With a supply of 85 loads on sale about the same number as a week ago, the market ruled steady on the tidy fat cattle while the best heavy cattle and the medium grades on the plain order were generally 10 to 15 cents per cwt. lower; plain light steers sold about steady. Bulls in light supply and sold steady. Heifers steady on best grades and easier on others. Cows in fair supply and all grades sold a little easier. Today's receipts were 80 loads. The market ruled active and stronger on all grades.

Good to choice	$8.75@9.00
Good 1,300-1,400 lb	8.55@8.70
Medium to good 1,200-1,300 lb	8.20@8.40
Tidy 1,050-1,150 lb.	8.20@8.40
Fair to medium, 900-1,100 lb	7.50@8.00
Rough half fat, 1,000-1,300 lb.	5.00@7.00
Common, 700 to 900 lbs.	5.50@6.50
Rough, half-fat	5.00@7.00
Common to good fat oxen	4.00@6.50
Common to good fat bulls	5.00@7.90
Common to good fat cows	4.25@6.75
Heifers	5.50@8.00
Bologna cows	3.75@4.25
Fresh cows and springer	25.00@85.00

Calves.—Veal calves in fair supply and market closed 50 cents per cwt. higher. Today's receipts were 700 head. The demand was good, and the market ruled 50 cents higher.

Heavy and thin calves	$5.00@7.00
Veal calves	8.00@11.50

Sheep and Lambs.—The supply of sheep and lambs has been fair all week and market ruled steady on all best grades, while the plain and medium grades were slow. Spring lambs steady. Today's receipts were 22 double-deck loads. The market was fairly active at steady prices on sheep, while lambs were lower. There was a fair supply of spring lambs, for which there was a good demand at prices steady with last week.

Prime wethers	$5.80@6.00
Good mixed	5.50@5.75
Fair mixed ewes and wethers	4.50@5.25
Culls to common	3.00@4.00
Prime lambs	6.00@7.35
Clipped lambs	5.00@7.25
Clipped sheep	5.80@6.00
Spring lambs	9.00@12.00

Hogs.—The supply during the week has only been fair and with a good demand the market ruled active and the close for the week was 20 cents per cwt. above Monday's prices. Today's receipts were 50 double-deck loads. The market ruled 5 to 10 cents lower than Saturday.

Prime heavy	$9.20@
Prime medium weights	9.30@
Heavy mixed	9.25@
Best heavy Yorkers	9.30@
Light Yorkers	9.30@
Pigs	9.10@9.20
Common to good roughs	7.75@8.35
Stags	7.00@7.25

BALTIMORE LIVE STOCK

Baltimore, Md., April 6, 1914.

Cattle.—Receipts for the week 1,317 head against 2,182 last week.

Steers	$6.35@8.35
Heifers	5.50@6.75
Cows	3.00@5.75
Bulls	5.25@6.75
Fresh cows	32.50@72.50

Sheep and lamb receipts for the week were 4,200 head against 3,020 last week. Light supply; market steady.

Sheep	$3.75@6.50
Lambs	6.00@8.65

Hog receipts for the week were 9,824 head against 12,771 last week.

Light western	9.55@9.60
Heavy to medium	9.35@9.40
Near by	9.55@9.60
Pigs	9.25@9.35

Calves.—Receipts for the week were 271 head, against 303 head last week. Light supply, market higher at $6.00@9.50.

BUFFALO LIVE STOCK

Buffalo, N. Y., April 6, 1914.

Cattle.—The week opened slow with a fair demand for choice. On the close the demand was only fair and no change in the market prices. Today's receipts were 4,000 head. Export cattle ruled firm, and other grades slow to steady.

Choice heavy steers	$9.00@9.25
Fair to good	8.00@8.75
Yearlings	7.75@8.65
Handy butchers	7.00@8.50
Good to choice fat cows	6.75@7.60
Good to choice heifers	7.50@8.15
Butcher bulls	6.00@7.75
Feeders	5.75@7.25
Cows and springers	30.00@85.00

Calves.—The demand opened good and the basis was 50 cents higher, being $10.75@11. On the close the market was active, the basis being $1 per cwt. higher. The basis on choice veals was $11.50@12. Today's receipts were 16,000 head.

Choice veals	$11.50@12.00
Lights and thin	6.00@8.75

Sheep and Lambs.—The week opened active and higher on choice stock. Sheep were in good demand and a shade higher. Yearlings have been in good demand for some time and moderate supply. On the close the market was active with light receipts and the basis 15 to 25 cents higher, the best lambs brought $8.60@8.65. There was a good demand for yearlings. Today's receipts were 16,000 head, and prices ruled lower.

Choice lambs	$8.25@8.50
Yearlings	7.25@7.50
Wethers	6.75@7.00
Ewes	6.25@6.50
Sheep	6.00@6.25

Hogs.—The week's demand opened active and the basis higher. Eastern buyers took light weights. Common grades were in fair demand. On the close the trade was active and 10@15c higher. York weights sold at $9.35@9.40. Pigs firm at $9@9.15. Common hogs were fairly active and firm. Today's receipts were 14,400 head, and the market ruled steady.

Heavies	$9.25@9.30
Mixed and medium	9.35@9.40
Yorkers	9.35@9.40
Light Yorkers	9.35@9.40
Pigs	9.15@9.25
Roughs	8.30@8.50
Stags	7.00@7.50

Horses.—Today's receipts were 850 head. There was a fair demand for workers. Best teams $700@750; good, $500@700, choice single workers, $175@250.—S.

NEW YORK LIVE STOCK

New York City, April 6, 1914.

Beef Cattle.—Receipts for week 3,200 head. Market firm.

Steers	$6.50@9.85
Bulls	5.25@7.75
Cows	3.25@7.00
Dressed beef	11¾@13½c.

Calf receipts 8,900 head. Market strong.

Choice	$8.50@12.00
Culls	6.50@8.00

Dressed calves steady. Dressed veals, 14@18c.

Sheep and lamb receipts 8,300 head. Market strong.

Sheep	$4.75@6.50
Culls	4.00@4.50
Spring lambs	7.50@8.75

Hog receipts 8,900 head. Market higher. Choice, $9.35@9.50.

CHICAGO HORSE MARKET

Chicago, Ill., April 6, 1914.

Horses were in ample supply and in good local and shipping demand last week, especially during the first three days, with prices ruling unchanged in most cases. Farm geldings sold mainly at $140@185 per head, a few selling as low as $125 while most of the farm mares brought $185@225. Light drafters sold at $225 and upward, with a choice class of heavier weights taken on the basis of $275@350, but not many sold as high as $300. Inferior horses were slow at $50@100, with drivers salable around $100@200. Receipts for the first quarter of the year aggregated 31,899 head and of this number shippers purchased 27,986 head.—F.

NEW YORK MILK MARKET

New York City, April 6, 1914.

The surplus is still growing as the supply is following the usual tendency in spring to increase. The demand is dull.

The receipts of milk and cream in 40-quart cans for the week ending April 4, were as follows:

Railroad	Milk	Cream
Erie	45,647	2,355
Susquehanna	8,872	360
West Shore	18,750	480
Lackawanna	58,750	1,570
N. Y. Central (long haul)	81,051	1,995
N. Y. Central (short haul)	11,995	91
Ontario	39,743	3,067
Lehigh Valley	36,229	1,166
Homer Ramsdell Line	1,960	42
New Haven	10,708	169
Pennsylvania	5,019	77
Other sources	1,675	20
Totals	320,399	11,391

ELGIN BUTTER QUOTATION

Elgin, Ill., April 6, 1914.

The quotation committee of the Elgin Board of Trade this afternoon declared butter firm at 24½ cents.

VISIBLE GRAIN MARKET

New York City, April 6, 1914.

Visible supply of grain:

Wheat decreased 1,772,000 bushels; in bond, increased 167,000.

Corn decreased 942,000.

Oats decreased 637,000; in bond, decreased 125,000.

Rye increased 8,000.

Barley decreased 182,000; in bond, increased 35,000.

GRASS SEED MARKET

Toledo, O., April 6, 1914.

Cloverseed.—Prime cash, $7.50. April, $7.47½; October, $7.55. Alsike—Prime cash, $9.75. Timothy.—Prime cash and April, $2.27½; September, $2.30.

PITTSBURGH HAY AND GRAIN MARKET

Pittsburgh, Pa., April 6, 1914.

Receipts of hay to this market are the lightest they have been for some time; billings in transit likewise. While there is no spirited demand, nevertheless, if receipts continue as they have been during the past week, market is bound to do better. We are of the opinion that now would be as good a time as any to market some good hay. Poor stock still hard to dispose of. The demand for clover hay has fallen off on account of the advent of spring.

No. 1 timothy	$17.00@17.25
No. 2 timothy	14.50@15.50
No. 1 light mixed	14.75@15.50
No. 1 clover mixed	14.25@14.75
No. 2 clover mixed	10.50@11.50
No. 1 clover	14.00@14.50
No. 2 clover	10.00@11.50

Straw.—Demand fair, receipts not heavy but equal to demand.

No. 1 Oats	$9.00@9.25
No. 2 Oats	8.75@9.00
No. 1 Wheat	8.75@9.00
No. 2 Wheat	8.50@8.75
No. 1 Rye	9.25@9.50
No. 2 Rye	8.50@9.00

Ear Corn.—Demand is strong for good, sound, yellow ear corn, but there is considerable off-grade corn arriving which is hard to place.

New No. 2 yellow	74½@75c
New No. 3 yellow	71@72½c

Oats.—Receipts continue liberal and demand only fair; market quiet.

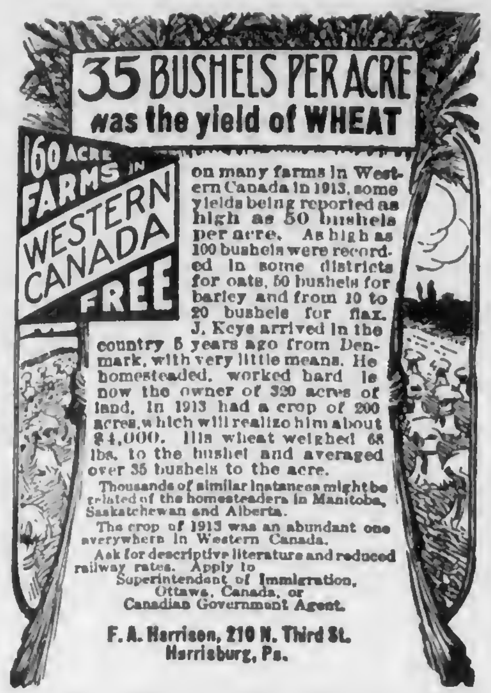
No. 2 white	43¼@43½c
Standard oats	42½@43c.
Standard No. 3 oats	41½@42c.

TOBACCO MARKET

A local dealer bought some 60,000 pounds of fairly good but slightly hail-cut tobacco at $2, $3 and $4 per cwt. Packers are well stocked with old tobacco. The cigar industry is quiet and the whole situation is dull and inactive with little demand for the 1913 crop. Growers are ready and in some instances anxious to sell that they may have the use of their money and turn attention to the growth of the new crop. Such in brief is the general situation outside the tobacco organization.

A bulletin issued by the Society of Tobacco Growers' Organization states that the company now holds 80,783 pounds of wrappers, 794 pounds of Havana and 19,794 pounds of filler tobacco. It also states that the wrapper tobacco was taken in by the company at an average of $8.50 per cwt. and that fillers have been sold at a price which nets the company 30 percent profit. Illustrating the advanced prices of the company a grower who had been offered $— per cwt., delivered and was graded at $1 and $2.50. The same grower refused to let his cash payments for stock be credited on the amount of his tobacco stock on a basis of 30 percent of the amount, and took that additional amount of stock in the company. Another grower gave $100 for additional stock and will thus have 100 more votes in the election of the permanent board of directors. Many meetings are being held and the general success of the movement is quieting much of the opposition recently heard.

The general tobacco market was characterized by less activity due more to diminished supplies than to decreased demand. It is conceded that climatic limitations alone can preclude a large crop in Connecticut the present year. Already an aggregate of many acres of white canvased tobacco beds are to be seen there and all preliminary processes are being pushed to the limit. In New York the situation is less advanced the none the less animated. The acreage will be increased and some trials will be made of a few special types which have recently attracted attention in market circles. The amount of tobacco remaining in growers' hands there is small. Unsold remnants are being carefully sought by buyers and in a short time there will be scarcely a crop remaining.—H. F. Tweed, April 6, 1914.



35 BUSHELS PER ACRE
was the yield of WHEAT
160 ACRE FARMS IN WESTERN CANADA FREE

on many farms in Western Canada in 1913, some yields being reported as high as 50 bushels per acre. As high as 100 bushels were recorded in some districts for oats, 50 bushels for barley and from 10 to 20 bushels for flax. J. Keys arrived in the country 5 years ago from Denmark, with very little means. He homesteaded, worked hard, is now the owner of 320 acres of land, in 1913 had a crop of 200 acres, which will realize him about $4,000. His wheat weighed 68 lbs. to the bushel and averaged over 35 bushels to the acre.

Thousands of similar instances might be related of the homesteaders in Manitoba, Saskatchewan and Alberta.

The crop of 1913 was an abundant one everywhere in Western Canada.

Veterinary

(Conducted by W. C. Fair, V. S.)

(Advice thru this department is free to our subscribers. Each communication should state history and symptoms of the case in full; also the name and address of writer. Initials only will be published. We cannot make reply by mail. This is one of the most valuable columns of the paper and we invite readers to make use of it. Clippings from this column, when properly preserved and classified, would make one of the most valuable medical symposiums a farmer-stockman could obtain.)

Sore Foot—Rheumatism.—I have a horse that lost hind shoe at which time he showed some lameness. After a rest he was shod, then went very lame. The shoe was removed and he gradually recovered. A few days later he went lame in left fore leg and I located lameness in shoulder, applied liniment and he improved. I also noticed today that he began to limp on hind right leg. The horse seems to move with difficulty in stable on fore feet and when making a step jerks as if suffering pain. This horse is about 15 years old and apparently healthy. H. C. H., Felton, Pa.—I am inclined to believe that your horse is rheumatic. Give him 2 dr. sodium salicylate and 2 dr. powdered nitrate of potash at a dose in feed, 3 times a day. Apply 1 part turpentine, 1 part aqua ammonia and 4 parts olive oil to sore parts every day.

Cough — Worms — Tonic Powder. — Will you give formula for cough in horses in powder form; also a remedy for worms in powder form and tell what to do for pin worms? I would also like to keep on hand a good tonic powder for run-down horses, something that will assist them in shedding their coat. F. L. G., Wawa, Pa.—For cough mix together equal parts of powdered licorice, ground ginger and powdered belladonna leaves and give a tablespoonful at a dose, 3 times a day. For worms mix together equal parts ground wormseed, ground gentian and powdered sulphate iron and give a dessert spoonful at a dose, 2 or 3 times a day. For pin worms drop 1 lb. of quassia chips in 2 gallons of boiling water, let it boil until it reduces to one gallon, then strain and inject a portion into rectum every 2 or 3 days. For a tonic mix together equal parts of ground red cinchona, ginger, fenugreek and salt.—Give a tablespoonful or two at a dose, 3 times a day. The above formulas are not the best, but are of moderate cost. To buy the best remedies for these ailments will oblige you to go deep in your pocket; therefore, I think best to prescribe inexpensive drugs.

Weak Fetlock Joints.—I have a horse that seems apparently all right until I drive him a long distance; then he seems to become lame in both hind ankles. G. W. H., East New Market, Md.—You should avoid exhausting your horse for he may be one of the soft kind that will never endure much hardship. Give him 1 dr. ground nux vomica, ½ oz. ground gentian and ½ oz. ginger at a dose in feed, 3 times a day. Rub his ankles with alcohol twice a day and bandage them in cotton after each drive.

Lung Fever.—What should I give a horse for lung fever? F. W. M., Mars, Pa.—I am led to understand that what you call lung fever is pneumonia or inflamation of the lungs. There is no specific treatment for pneumonia inasmuch as the pneumococcus is recognized as a specific cause. I presume that sometime there will be found a serum which will counteract the disease. In the treatment of pneumonia, we must treat the symptoms; therefore it is necessary to stimulate the heart. A strong heart tends to prevent consolidation and a weak one always encourages it. This being the case, nux vomica or strychnine must be given. The dose of powdered nux vomica for a horse is ½ to 2 drams. The dose of fluid extract is from ½ to 1½ drams and the dose of strychnine sulphate is from 1 to 3 grains. This medicine should be given 3, 4 or 5 times a day. It is necessary to apply antiphlogistine or other hot applications over the lungs. The horse should be kept in a dry, clean, well-ventilated place where he can have plenty of pure air, and the body should be warmly clothed. Drafts must be avoided. He should have cold water before him all the time. Offer him whatever kind of food he craves. Keep the bowels open, but do not give purgatives and do not get too much kidney action. In the second stages, give quinine, gentian, nux vomica and alcohol every few hours. Continue good nursing and give tonics and stimulants freely. There is no certain remedy for pneumonia.

You Smoke a "Better" Tobacco —Why Not Smoke The Best?

THE tobacco you now smoke you consider "better tobacco than you ever smoked before." Naturally, you kept trying until you found a "better" one.

But it stands to reason that since there *is* a difference in tobaccos, you may be missing *still greater* pleasure in a *still better* smoke—in the BEST smoke, in fact.

Tuxedo is the best smoke because no better tobacco leaf grows.

Tuxedo
The Perfect Tobacco for Pipe and Cigarette

Tuxedo is treated by the famous *original* "Tuxedo Process" for removing the sting and bite of the natural vegetable oils.

Tuxedo was born in 1904. Its first imitator appeared two years later. Since then a host of imitations have sprung up.

No *other* tobacco can give the unique pleasure of Tuxedo because no other maker has yet been able to equal the Tuxedo quality.

Purchase a Southern Farm

Look at the map of the United States. See how close to the big Eastern markets—by modern rapid transportation—are the states south of the Ohio and east of the Mississippi Rivers. Then consider the climate—mild winters pleasant summers, ample rainfall. The soil—suitable to all crops — corn, cotton, alfalfa, wheat, oats, potatoes, tobacco, fruits and garden truck. Then the price—

GOOD LAND AT $15 AND UP AN ACRE

according to the improvements and location. Remember there are no cold winters—stock can graze on green pastures the year round, making production costs low. Expensive barns are unnecessary. Large local demand for farm products at profitable prices. *Industrial opportunities everywhere.* The Panama Canal will greatly benefit the South. Investigate this section of good roads, schools, churches and healthful climate where *living is pleasant* and profitable. Booklets on the States of Virginia, North and South Carolina, Georgia, Florida, Alabama, Mississippi, Tennessee and Kentucky. In which are you interested? Our magazine "The Southern Field" sent on request.

$1.50 Worth of Goods for $1.00

Here's your chance to profit by the unavoidable misfortunes of others. Over 500 big manufacturers of fine merchandise nearly went into bankruptcy this year because of hard times. They made more goods than they could sell. We bought their surplus for spot cash at one-third less than cost to manufacture. And we will sell you their overstock of

Brand New Goods at Less Than Cost!

We saved 50 cents for every $1.00 spent and we will hand you that fifty on every dollar you spend with us.

Our profits of 4% are the same as ever. We figure that it is better business for us to give our customers *all* of the *saving*, because our wonderfully low prices will sell over four times as many goods as ever before.

Prove the saving or send the goods back. Compare our goods and prices with those of the local stores. If we don't save you Fifty Cents on every Dollar you spend,

just send the goods back and we'll refund your money in full.

But don't delay. It is almost certain that we won't be able to replace the goods listed in our new catalog without paying at least 50% more for them.

Notice to Storekeepers

We are receiving a large number of orders from storekeepers with requests to bill our goods on 30, 60 and 90 days time. Our small profit makes it impossible to do business on anything but a *strictly cash-with-order basis*. Kindly do not ask for credit. Our prices to you are *net*, as printed in our catalog. No discount to anyone under any circumstances.

The Manufacturers' Outlet Co.

If You Want These Goods at These Prices

ACT QUICK! Our stock is always changing because we only buy manufacturers' overstocks. That's why our prices are so low. When we buy cheaper, we lower prices, but when we have to pay more, we have to charge you more.

Goods are cheaper today than we have ever seen them. Send in your order while we have these low priced goods to ship. Don't be too late.

MAIL THE COUPON TODAY

Get the Fencing that Lasts

If you want a fence that will hold up under all conditions, don't buy before you get our big fencing sheet.

We have several thousand rods of the best grade of fencing that is made. Heavy pure steel wire, triple galvanized. Patent lock joint that cannot slip and will not rust like twisted or welded joints. This fencing would cost you more money direct from the manufacturer than we ask for it.

Get your order in quick before our stock is sold out.

Every piece of wire in these fences goes through a patented process which leaves a perfectly smooth surface for our heavy galvanizing.

Our big fencing sheet will tell you the best fence to use and give you a price per rod laid down at your railroad station. Our list of heavy all No. 9 fences will last a lifetime if stretched properly.

26-Inch Hog Fence, 17c Per Rod; 32-Inch Hog and Sheep Fence, 18c Per Rod; 4-Foot Field Fence, 22c Per Rod.

Send for Special Sheet! Get Our Delivered Prices!

Best Paint, $1.06

BUFFALO READY MIXED PAINT

Get your paint now, so as to have it ready when you need it in the spring. We offer to the first comers 3,500 gallons of specially mixed "farmers' paint," made to stand the extra hard wear that paint undergoes on the farm. Don't miss this opportunity. Order quick if you want the best farm paint ever made, at 44c less than you would have to pay at wholesale.

Reports from 176 of our customers show that Buffalo Farm Paint will cover 525 sq. ft. of wall or floor. Other paints of equal service cover only 400 sq. ft.

Our paint department is one of the largest in the country, and includes brushes, stains, varnishes—in fact, all painters' supplies, at bargain prices.

House Paint, $1.06 Per Gallon, in 5-Gallon Cans; Barn Paint, 78c Per Gallon; Cold Water Paint, inside, 6c Per Pound—outside, 9c Per Pound. SEND FOR LARGE COLOR CARD.

Bath Room Outfits

Sanitary plumbing today is a vital question all over the country. For years we have been installing complete outfits everywhere. Every piece, from enameled ware to pipe, that leaves our warehouses is guaranteed perfect. You don't get chipped or seconds when you buy of us. No mechanic is needed to install our outfits, as we can furnish all iron pipe connections and full instructions.

Let Us Install Your Water System

We make a specialty in water systems. Just tell us you want one and our engineers will do the rest, giving you size and all instructions for installing FREE. Our system is made extra heavy throughout, and you can rest assured, with a Buffalo Water System in your home, you never need worry.

Our Engineers Furnish All Plans Free

OUR GUARANTEE

Sure you can have goods on trial. If you find that everything is not exactly as we claimed, *fire them right back and we will refund your money by return mail.* We don't want one dissatisfied customer, and every article we sell is fresh, clean, up-to-the-minute. It is as easy to buy from us as from your home store. Just sit down and if it is not handy for you to get a postal or money order, send your personal check and enclose with it one of our order blanks. We'll do the rest.

Wall Board

$2.35 Per 100

Send for Sample & Delivered Price

This wonderful substitute for lath and plaster is becoming so well known that no further description need be given. Improved Buffalo Wall Board makes your home warmer in winter and cooler in the summer. Easy to put on. You just tack it to the studding or over old plaster and paper. Weighs so little the freight is practically nothing. Send us your room plan and we will give you a price delivered to your station. We have over a million feet bought, all of which we offer at $2.35 per 100 square feet or $22.50 per 1,000 square feet Don't delay—write us today.

MILLWORK and LUMBER

Everything in the building lines can be found in our BARGAIN BOOK. We will sell you material for an entire building, freight paid to your town, and give you a saving big enough to pay the entire labor cost of building. All A-1 new stuff and all guaranteed.

In this book all the material is listed at prices your wholesale dealer would have to pay. Don't be misled about freight charges, as we will give you delivered prices to your station on everything and show you where you can save big money.

Our building department includes nails, shingles, lath, siding, hardware, doors, windows and all inside and outside trim. (45)

SEND US YOUR LUMBER BILL

RUBBER ROOFING, 59c

We take the entire output of remnants from four large factories. Just think of it—a rubber roofing at 59c a roll, the lowest price ever quoted for this quality roofing. Guaranteed to resist heat, fire, water, snow, hail and acids. No painting is needed; easy to lay as a carpet; no tools required but hammer. This roofing in the 2-ply comes at 83c per roll.

Queen City Rubber Roofing

This is the best rubber roofing made. Only pure asphalt and wool felt is used, which are acknowledged the best water and weather proof roofing materials on the market today.

1-Ply, Guaranteed 5 Years, $1.03; 2-Ply, Guaranteed 10 Years, $1.30; 3-Ply, Guaranteed 15 Years, $1.60.

Other grades in our big delivered price sheets.

STEEL ROOFING

Owing to slack business this year several large steel mills are heavily overstocked. We have taken the surplus of four of them, and our prices on steel roofings are the lowest in years. Don't think of buying any of this material until you have seen our delivered prices. For quality and prices we beat the world on steel roofing.

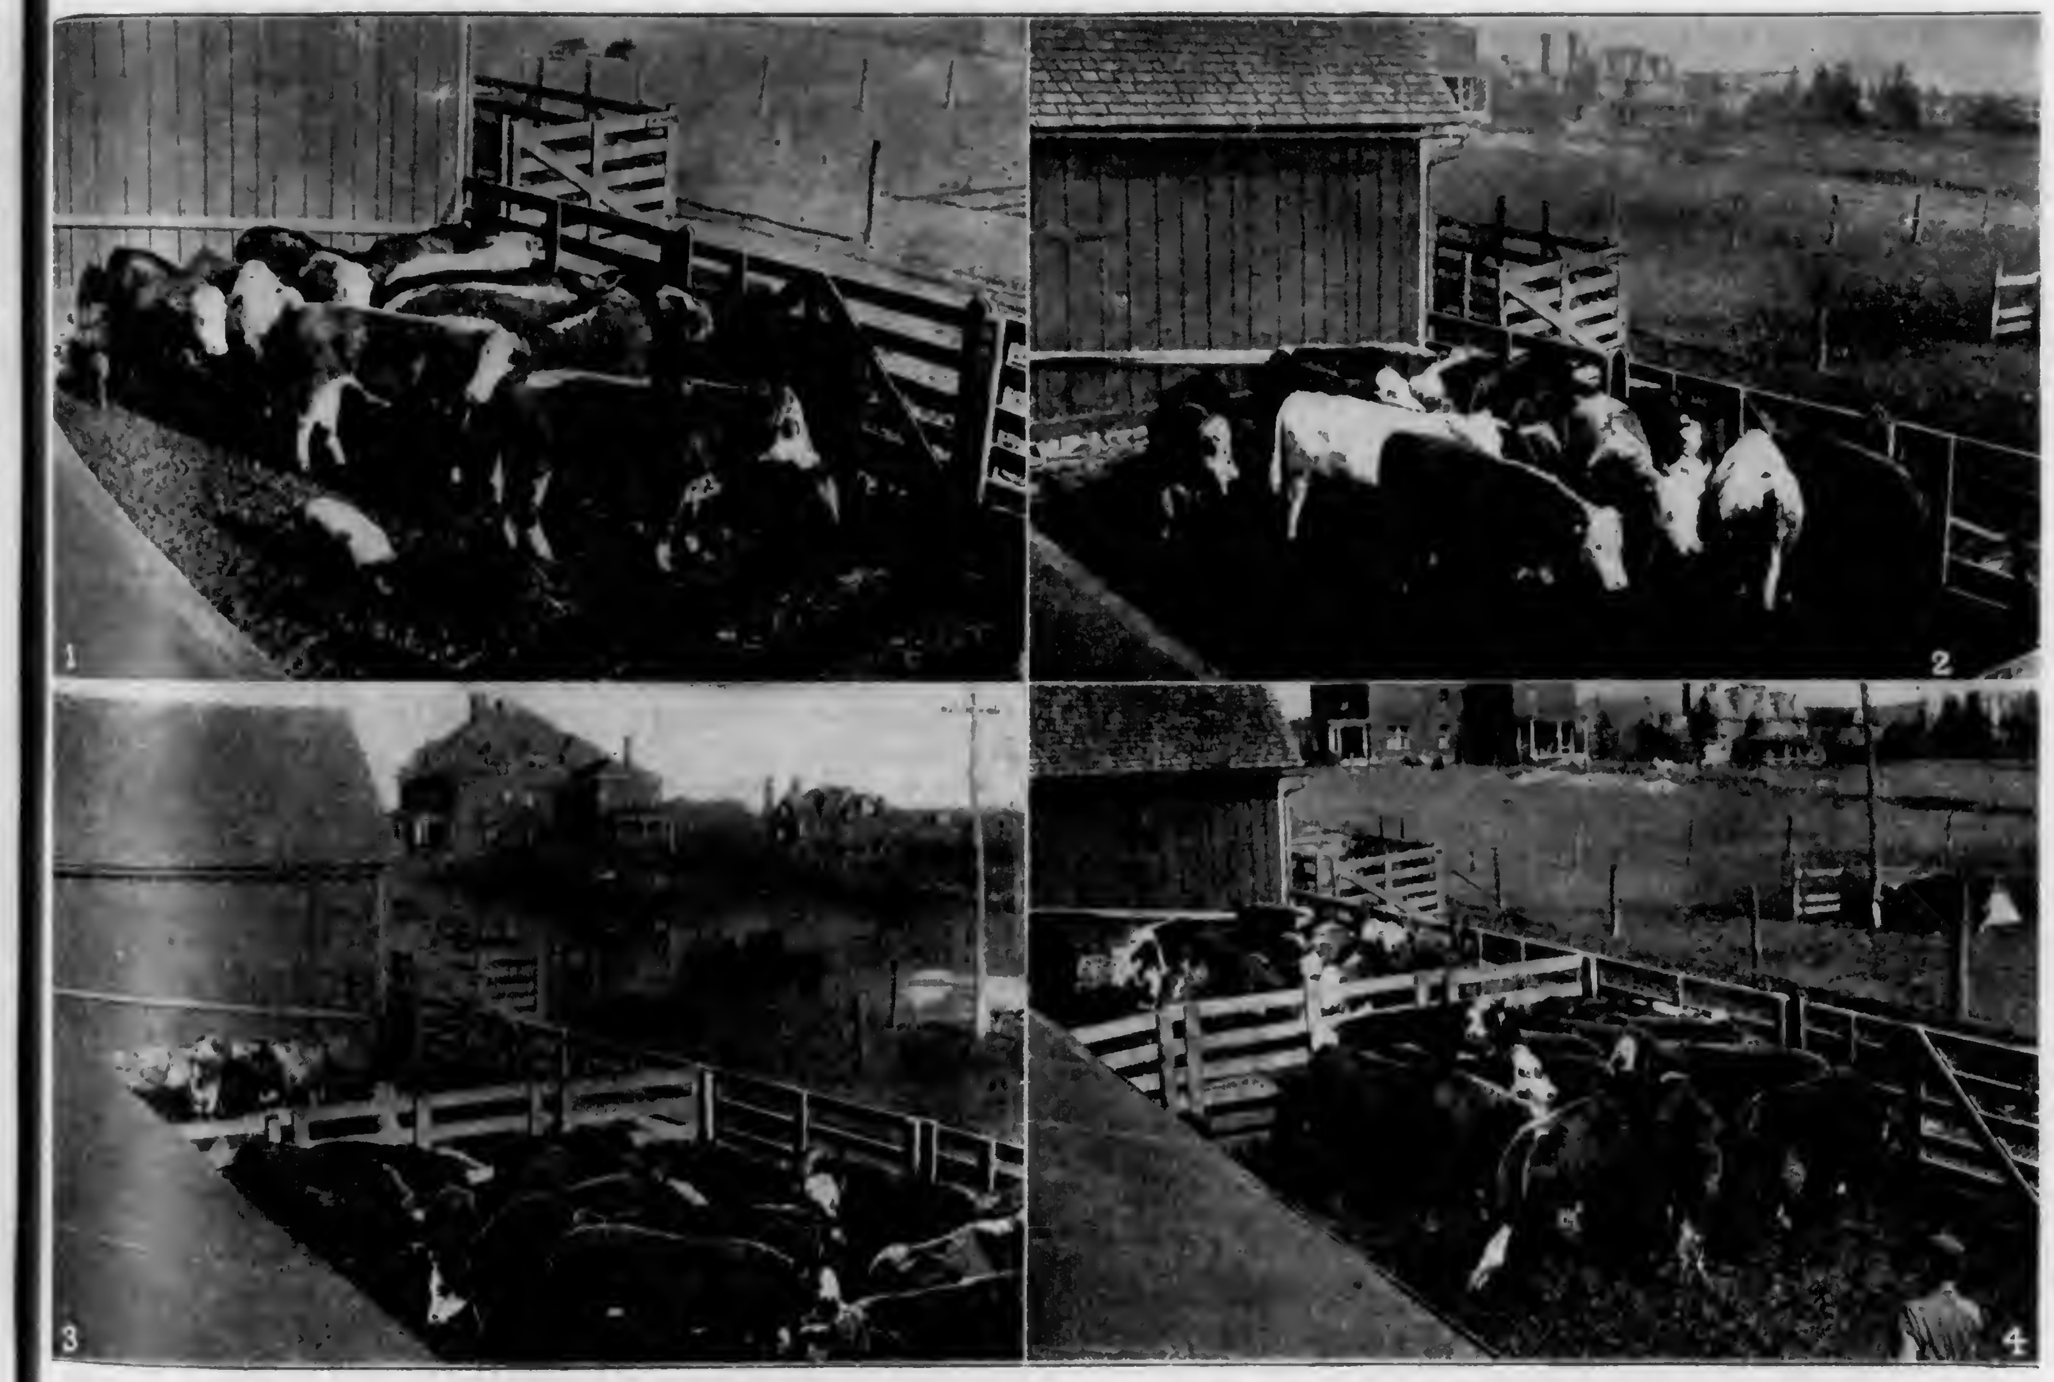
Essentials in Corn Growing--I.

By C. C. HULSART,
Monmouth Co., N. J.

When we pause long enough to think we must wonder what is the matter with our yields of corn. Our whole country is producing an average of not over 35 to 36 bushels per acre. If we consider it by states, the yield is about the same. But if we view it from small areas or consider it from individual farm standpoints, we see a vast difference. Low yields must result from lack of observing some of the essentials. There are individual growers that rarely produce less than from 80 to 100 bushels per acre. I read recently of one instance where 200 bushels was reached. When individual growers can and do produce these large yields, certainly the growers of the country who make corn growing a specialty can do much better than is being done. They must apply better methods and observe the essentials necessary in order to bring best results.

Seed. One of the first essentials in corn growing is good seed. Too often this is neglected altogether. When the farmer gets ready to plant he goes to his crib or to a neighbor's crib and helps himself to enough for his planting, regardless of breed, types or even adaptation to his soil or his conditions. He minimizes his chances at the start.



CATTLE BEFORE AND AFTER FATTENING AT PENNSYLVANIA STATE COLLEGE. SEE ARTICLE PAGE 8.

No. 1. Lot No. 1 at the beginning of the experiment. Fed on the Pennsylvania ration of corn and cob meal, wheat bran, corn stover and mixed hay.—No. 2. Lot No. 1 at the conclusion of the experiment.

No. 3. Lot No. 2 at the beginning of the experiment. Fed on silage to limit of appetite, and 2.5 pounds cottonseed meal per 1,000 pounds live weight per day for 56 days. Same ration the last 84 days with ear and shelled corn to limit of appetite.—No. 4. Lot No. 2 at the conclusion of the experiment.

Some varieties produce better on a clay soil than on a sandy soil, and vise versa. This should be understood and the grower governed accordingly. But too much corn is planted that is only corn. It has neither strain nor variety. It is only a mongrel lot with no parentage or name. Right there is where one of the greatest handicaps to heavy yield occurs. Some varieties of corn produce stalks at the expense of the ear; they grow a heavy stalk 13 to 15 feet high, with probably an ordinary ear, on an average of one to every three stalks. There are other varieties that have been bred for yield and do it on a much smaller and shorter stalk, with a far less number of barren stalks.

If a dairyman wanted a cow to produce milk in quantity he would not accept a scrub or a beef type of animal. No, he would accept only such an animal as had been bred for milk production. Breed is just as essential in the vegetable world as it is in the animal world. But where am I going to get it, is the thought that naturally arises. Well, do not send away to some foreign section because you have heard or read about some wonder. Just look at home in and around your own neighborhood. No matter how well a corn may be doing in Ohio or Iowa or any other distant state, when transported several hundred miles and planted in a different soil, in a different clime and possibly a far different atmosphere it must be acclimated before it will succeed in its new locality. This often takes three or more years, and sometimes it will never acclimate. Hence, it is far better to begin with a variety or strain obtained near home.

I said there was a preference in varieties as to kind of soil best suited. Perhaps I had better say type. For example, the large pure yellow types and some of the white ones, too, prefer a good deep clay soil. Most of the white cap yellow dent types will do as well on a good sandy loam, while the eight rowed types, let them be yellow, white or red, will produce fairly well on poor soils, either clay or sand. They will also grow farther north and at higher altitudes because of their ability to mature their crop in from ninety to a hundred days.

Selection.—In selecting seed, keep these thoughts in mind: Select corn for seed uniformity. Do not be satisfied with corn because it is corn and because it will germinate and grow. Select for a uniform product. Next take one hundred ears and number each one from one up. Do the same thing with one hundred rows. Then plant one row from each ear, reserving the balance of the ears so numbered so that they can be told when the first crop is gathered. Plant this breeding plot on the west side of the field, preferably, because the prevailing wind is from that quarter, hence less cross polination from the rest of the field. Cultivate and fertilize the whole breeding plot exactly alike. Observe the behavior of the different rows. I venture the prediction that some will grow two feet taller than others, possibly its neighbor. When the breeding plot is all matured, gather each row separately and weigh. You will find some one or more rows that have produced almost if not quite double the corn from the poorest row. Cast aside all but the high-yielding rows whether it be one or half a dozen, and use only seed from the high-yielding rows. In selecting seed, the whole plant should be taken as a unit, and not the large ear. The grower should take into consideration the height of the stalk, where the ear is placed thereon (it should not be too high up). The leaf surface should be considered, also the vigor and sturdy character of the plant together with yield. Repeat the breeding plot yearly, using the balance of the high yielding rows to plant the main crop so far as it will go. There will be a ready market for a surplus of quality.

I am aware that any advise or method advanced by agricultural writers that involves more work for the farmer during the busy season is not highly acceptable, but there is so much to be gained for the outlay in time consumed in this matter that any corn grower of any large proportion ought to consider it. I am quite sure that by adopting a breeding plot, one acre could be cut out of every five now planted and still more corn produced. In a corn section it might pay better to have one man do the breeding for a whole neighborhood and pay him for doing the work. The main thing, however, is to get the work done. In a later article I will take up cultural methods.

Farm Crop Notes

By
R. P. Kester

Counselor on Soils to the State Department of Agriculture.

Thru this department Mr. Kester will discuss queries from Pennsylvania Farmer readers on soils, field crops and general farm practice. Address all queries to Pennsylvania Farmer, Philadelphia, Pa.

THE OLD FOLKS AT HOME

What Shall They Do?

I have a letter reciting a situation that is found all too often and for which a satisfactory solution is hard to find. This farmer and wife, with the aid of their sons, have for years been conducting a dairy. Their farm, rotation, crops and equipment have been adapted to that business. They know the business and have been successful. Their three sons were sent to an Agricultural College where they graduated, and, as is very often the case, took positions elsewhere, or went into business for themselves, anyway they did not return home. The parents are past middle life and find the burden of dairying too much for them to continue. What shall they do? Hundreds of parents, similarily situated are asking the same question.

It is not sensible to blame this condition on education and condemn agricultural training as being the cause, as we often hear done. The time comes in the life of every active, energetic young man when he feels it his duty to act independently and take up the work that seems to him most promising, and where his chances for success seem brightest. This is his right and his duty. If the home farm seems to be the place, and his parents give him the encouragement and the opportunity, he will likely go back there. Too often we find the father who has been hard working and successful unwilling to share the management with his sons or to make any changes in methods in deference to younger or newer ideas, and he soon finds himself and wife stranded and alone. The writer of the letter referred to does not hint the above as the reason why the boys failed to return, and probably it is not, but whatever the cause the question, which is a common one, remains to be answered: What can they do successfully and still conduct their farm and keep their farm home?

HOME OF GEO. H. BROWN, LANCASTER CO., PA.

In the first place, I do not consider parents under any obligation to keep and maintain all the land of a big farm after they are deserted by the children. It seems foolish as well as pathetic to see an aged couple slave away trying to run and manage a big farm as they did when younger and when raising the family. Any couple with a home and simple tastes can easily make a living on a very few acres by adopting a line of farming suited to their strength and opportunities. Sell the surplus land. Property is a curse when it makes slaves of its owners.

I know of one farmer in Pennsylvania who, tiring of the dairy business, procured some good grade Shorthorn cows and crosses them with a good Aberdeen Angus bull. This cross produces a good beefy animal of the Angus type which he makes weigh about 1,000 lbs at a year old, when he disposes of them profitably. Hay, pasture and silage is the line of farming. Little or no work of milking is involved.

Another farmer has turned his land to the production of hay, with the exception of a small acreage for light farming. By the method of top-dressing he produces hay several years in succession without replowing. He applies 300 or 350 pounds per acre of a fertilizer, analyzing 6-7-5, made by mixing together 800 lbs nitrate of soda, 1,000 pounds of acid phosphate and 200 pounds of muriate of potash. Apply when grass begins to grow in spring.

Hog raising by the alfalfa route is a possible road to success. Where alfalfa will do well hogs are raised on alfalfa, water and corn. Different plots are kept growing and hogs are changed from one to another. Specializing in crops that are adapted to soil and conditions is easier than general farming and dairying.

The advice to all in the situation under discussion is, make such change in operations as will make life easier, even tho it makes a change in the customs and breaks the traditions of a life time or of generations. Get from under the load before it crushes you, as it may in spite of all your doggedness. Adopt the simple life and live it in peace that your active life may have been worth while.

Some Questions

Nixon, Pa., has a piece of clover that did not make a stand, or was hurt by dry weather, and asks best way to grass it this spring.—Sow grass seed this spring when dry enough to harrow, and harrow in with a light spike tooth harrow.

J. D. H., wants to know what value phosphate rock has for Pennsylvania soils; also how he can get information about the kinds and character of soils of the state.—Acid phosphate has a value when mixed with stable manure or other organic matter whose decay will make the phosphoric acid available. The acidulated rock, acid phosphate, is preferred by most farmers as the plant food is already made soluble. As to the soils of Pennsylvania and their character, send to the Department of Agriculture, Washington, D. C., for the map of Soil Survey naming your section of state.—R. P. K.

IMPROVING QUALITY AND INCREASING PRODUCTION OF TOBACCO.

A strip of limestone soil extends thruout southern Pennsylvania, embracing parts of Lebanon, Dauphin, Chester, York and Lancaster counties. This section is especially adapted to the growing of tobacco. The last few years have been rather unsatisfactory to tobacco growers, due to the low prices received. The growers are unorganized and the buyers and packers invariably claim light demand, slow sale, overproduction or poor quality, when buying. While such conditions exist it is up to the growers to cut down the acreage, increase the production per acre, and at the same time improve the quality. In these days of high-priced labor and high priced farms, for nearly all farms where tobacco is grown extensively are worth $100 to $250 per acre, one acre wisely cared for will bring more net income than two carelessly handled.

To George H. Brown of southern Lancaster County, belongs the honor of having grown one of the largest crops of tobacco ever raised in this section. His farm lies to the south of this limestone section where the soil is supposed to be somewhat below the standard in fertility and productivity. Yet Mr. Brown grew 16,057 pounds of tobacco on 5½ acres, averaging over 2,900 lbs. per acre, which brought the handsome sum of $1,725.80, or about $313.78 an acre. Mr. Brown starts to prepare for his tobacco crop by plowing down a good heavy sod for corn the year previous to planting to tobacco. Crimson clover seed is sown among the corn at last cultivation and by the following spring this heavy growth of green clover, and aided by a liberal application of good barnyard manure, furnishes the means for securing an abundance of humus for the following tobacco crop.

In May, after the clover has made sufficient growth, the land is plowed to a depth of 8 or 9 inches and is immediately disked once or twice to fine the ground before it has time to dry out or become hardened. The fertilizer is then applied on the top with a lime spreader. The fertilizer is mixed at home in the following proportions per acre: 100 pounds high grade sulphate of potash, 250 pounds acidulated rock and 700 to 800 pounds cottonseed meal. This is the amount applied on each acre. The ground is then harrowed with the disk until the fertilizer is thoroly mixed with the soil. Just before the last cultivation, previous to planting, 1,200 to 1,400 pounds of hydrated lime are applied per acre. The lime has a tendency to check the dying off of the leaves which so often occurs, especially during dry weather. It is doubtful if lime pays if put on soil deficient in humus. On heavy, sour soils, this amount is far too small.

Mr. Brown declares that there is nothing better for preparing tobacco ground than the double-action disk harrow. Do not make the mistake of using one larger than your team can handle to advantage, as all double-action harrows pull very hard if the ground is cut as deeply as it should be. The deep disking puts the ground in excellent condition for planting and also cuts and mixes the crimson clover sod and manure with the soil where it readily decomposes. Where crimson clover will not make a good stand, rye makes an excellent substitute, but you will need to put more nitrogen in the fertilizer and a small additional amount of lime on the ground.

Mr. Brown warns against putting off getting the bed ready for sowing the seed, as a great deal depends upon having the young plants ready to transplant at the right time. Start the preparation of the seed-bed the fall before, by digging or plowing down a good heavy coat of manure. By the following spring, after the freezing and thawing of winter has mellowed the ground, it should be in fine condition for its second digging and final preparation for the seed. A teaspoonful of seed is sown in a bed 16 feet long by 6 feet wide, and one such bed is sown for each acre planted. If all the seed grows, it does not require nearly this much space for an acre, but it always pays to sow plenty of seed as the cost of growing the plants is very small. Mixing the seed with cornmeal or bran greatly facilitates its distribution. If you get the seed too thick, thin out as a weak, overcrowded plant gives a poor account of itself in the field.

After the ground has been thoroly prepared Mr. Brown plans to transplant as soon as possible after all danger of frost has passed. With early planting one may have time to replace those killed or injured by the cutworms and still have the tobacco harvested before danger of frost in the fall. It also enables the plants to escape the ravages of the tobacco split-worm, or larva of the potato tuber moth, to a large extent, as the late broods are the most destructive.

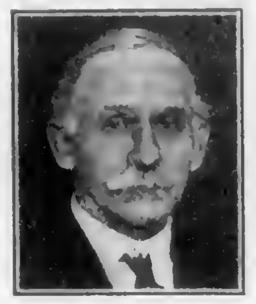
Transplanting is done with a planter. The rows are made 3 feet, 10 inches apart and the plants are planted 22½ inches apart in the rows. This is the distance usually observed for the Pennsylvania seed leaf and the large growing varieties. Mr. Brown grows the Connecticut narrow seed leaf almost exclusively; sometimes an acre or more of Havana is grown. When growing Havana tobacco and kindred types he plants 18 inches apart in rows. When planting in ground of only moderate fertility, he plants the large growing varieties 28 to 30 inches apart in the rows and small-growing varieties 22 to 24 inches apart. When planted 3 feet, 10 inches by 22½ inches apart, it requires a trifle over 6,000 plants for an acre.

As soon as the plants have started to grow, the cultivator is started and the ground is kept constantly stirred, no crust being allowed to form until the tobacco becomes too large to permit further cultivation. The ground about the plants and in the rows is also kept loose with hoes until the tobacco becomes too large. Few men agree on the right distance to top the tobacco. It should never be topped as to leave over 22 to 24 leaves to the stalk. Sixteen leaves will be nearer right than 20 for a backward season. If the tobacco is topped too high the bottom leaves will be ready to cut a great deal sooner than the top ones. An immature leaf has a poor flavor and lacks weight.

One of the principal causes of the poor yields and poor quality is the neglect to keep the suckers pulled. In looking over tobacco fields of Lancaster and Chester Counties I have often seen suckers 10 to 14 inches long. Do not let them grow over 8 inches long if you can possibly avoid it. The suckers sap the vitality of the plants just as watersprouts sap the vitality of the apple trees. One neighbor keeps the suckers all pulled out before they reach a length of 6 inches, and at selling time his tobacco weighs 300 to 400 lbs. more per acre than some others whose tobacco at cutting time looked as large if not larger, but who had let the suckers grow until they were 10 to 12 inches long. When pulling suckers do not forget to look for tobacco worms, as hand picking is the most satisfactory means of dealing with them.—George W. Conrad, Lancaster Co., Pa.

Commission Merchants and the 35-Cent Dollar---III.

By FRED W. DEAN, Susquehanna Co., Pa.



After going before the local grange with the evidence I have presented in previous chapters, I went before the Pomona grange. But I soon discovered that the grange is not organized along offensive and defensive lines. It has no money to spend and no legal advisors. I then decided to lay my evidence before a leading New York City daily paper. The paper was genuinely interested in the evidence I had to present. It was arranged that we continue our investigation the following winter. Accordingly in January and February of 1913 I rented a P. O. Box at a small near-by office under the name of Joel Bailey and opened up correspondence with various commission merchants of the city. I secured a contract with each firm to handle my eggs upon a commission of 5 percent upon gross sales. The newspaper publishers detailed a man to work the city end of the deal.

Stickers for identification were printed and glued to each crate, but it was soon discovered that these stickers were all mutilated to such an extent that indentification by them alone was almost impossible. We then put a wire around the ends as well as the middle of each crate and stapled it fast, ostensibly to hold the crate together but really to serve as identification of crates. That served the purpose and the work went on. But we soon discovered that the commission merchants were loath to sell goods to a stranger, so much so that the publisher's representative secured only a portion of the shipments. In one case he was openly accused of being a "spotter", which, of course, he vigorously denied. What few eggs we were successful in securing showed the usual shortage of about 12 to 15 percent.

It was the intention of the publisher to carry on this work for a year and follow it up in all lines, and especially on perishable fruits like berries, peaches, pears, etc., where we suspected that the shortages were much greater because of the chance to report the goods received in bad order, sold to peddlers for cash, no account kept of the names of purchasers, etc. At this time the Cole Commission Merchants' bill was pending at Albany, and it was expected to go thru with a rush. But the commission merchants got busy at Albany and the bill was delayed. It was thought best that we close our deals and present what evidence we had. This was done, and whether or not it had an effect, the bill went thru. But the commission people had succeeded in pulling nearly all the teeth out of the bill in committee.

We had evidence of graft on two counts each on four firms. We secured indictments of two counts each against three firms. One house escaped upon a technical point. I had their literature representing that they handled butter, poultry, veal, eggs, etc. But when the publisher's egg man called to buy eggs of this firm, he was told that they did not handle eggs, but was referred to a firm which we will call Mr. Blank. Mr. Blank occupied rooms in the same building. When our eggs arrived at the house of our first dealer, they went straight thru the building to Blank's place of business. Here the publisher's man purchased eggs of this "broker" at four cents a dozen above the price reported to me by the original house after commission and expressage were deducted. This, of course, added four cents per dozen to the cost of the eggs to the consumer, the broker being no nearer the consumer than the commission merchant was.

We also discovered that these commission merchants, like all others, were opposed to selling eggs in the original package, and wanted to repack the goods into another crate. One firm insisted upon this procedure and absolutely refused to sell the eggs until they had taken them to a loft directly over the salesroom and repacked them. The publisher's buyer had to content himself with purchasing another crate to divert suspicion, for which he paid 28 cents per dozen. My returns showed sales for the same day at 21 cents per dozen for the same class of goods, less 5 percent commission and expressage; thus showing a shortage of 7 cents per dozen. The morning following the indictments secured upon marked crates, the writer accompanied by the publisher's buyer took a stroll thru the produce district and we found an army of helpers busy destroying all special marks on packages and crates. Why is this necessary if honest returns are being made upon consigned goods?

We figured up the probable graft on eggs alone, based upon half the statistics of arrivals during the preceding year and half the average graft shown by the cases tested out. The total amount thus shown was $2,050,000 per year on eggs alone. I estimate that 90 percent of the farm produce going into a large city goes there upon a commission basis, and I verily believe that the producers and consumers of this country are cheated out of one million dollars a day. Give it all to the farmer or all to the consumer or divide it equally between the two and you have a saving of $500,000 daily.

Owing to the sudden death last July of the man on the publisher's staff who conducted the city end of the deal, the indictments were dropped for want of sufficient evidence. It was the most difficult case I ever had to secure evidence in, and when we got it, we were not able to make the use of it we had hoped.

NOTE.—The last article in this series will appear next week.—The Editors.

John Deere
Two Way Plow
The Sulky with the Steel Frame and Patent Auto Foot Frame Shift.

A Few Strong Features
1 All Steel and Malleable Frame—Steel Arch: Strong—Light—Durable, Alignments Permanent.
2 Patent Auto Foot Frame Shift: Perfect Control—accurate width of cut.
3 Long Malleable Beam Clamps: Beams held rigid—uniform cut.
4 Automatic Shifting Hitch: Clevis always in position. Correct line of draft.
5 Automatic Horse Lift: Pull of team raises bottoms.
6 Adjustable Jointers: Clamped to beam. Every adjustment.

160 ACRE FARMS IN WESTERN CANADA FREE

400,000 Settlers a Year

Immigration figures show that the population of Canada increased during 1913, by the addition of 400,000 new settlers from the United States and Europe. Most of these have gone on farms in Manitoba, Saskatchewan and Alberta.

Lord William Percy, an English Nobleman says:

"The possibilities and opportunities offered by the Canadian West are so infinitely greater than those which exist in England, that it seems absurd to think that people should be impeded from coming to the country where they can most easily and certainly improve their position."

New districts are being opened up, which will make accessible a great number of homesteads in districts especially adapted to mixed farming and grain raising.

For illustrated literature and reduced railway rates, apply to Superintendent of Immigration, Ottawa, Canada, or to the Canadian Government Agent,

Horticulture

HOW AND WHEN TO PRUNE SHRUBBERY

Not a little is added to the attractiveness of the farm home if the lawns and borders are well kept. The hardy plants and shrubs if allowed to grow in their own way soon become scrawny and unsymmetrical, but with a little thought and attention it is a very easy matter to keep them properly pruned and trimmed. Uniform growth and abundant bloom are the ends sought and these are largely in the control of the gardener. The chief points in successful pruning are the removal of superfluous shoots and branches, the ruthless cutting away of dead wood, and the clipping off of rampant growth to head in the bush and shape it as desired. In the main, however, it seems to the writer that Nature will take care of the shape pretty well if allowed to do so. Natural, rather than formal shapes are best unless one has in mind some definite object.

The question of when to prune depends upon the bush, that is, upon its time of flowering. Spring bloomers should not be pruned until after the blossoms have dropped. If pruning of these is done in the dormant season it is quite probable that many of the best flowering branches will be cut away. Early blooming shrubs form their buds in the fall, hence the best time to prune is in the summer. Shrubs of this class are: Lilacs, spireas, snowball, mock orange, deutzia, exochorda, forsythia, flowering almond, wisteria and rhododendron. There are many others but these are the best known and most commonly planted. Flowers are borne at the ends of terminal or lateral shoots and in order to encourage a good growth of these shoots it is well to clip the ends of the strong branches after the blossoms fall. This keeps the bush from assuming a tall straggling appearance and at the same time increases the number of flowering shoots. By doing this and keeping the dead wood out, with the occasional cutting of a branch where they grow too thickly, the spring-flowering shrubs will be kept in good form and an abundance of bloom and thick foliage assured. The object is to encourage a vigorous growth in the summer and early fall.

FIRST YEAR STRAWBERRIES UNDER CLEAN CULTIVATION.

In the case of such shrubs as the hydrangea, roses, althea, hibiscus and tamarix, pruning is best done in the late winter or early spring, before the sap starts. Some do this in the autumn after the leaves fall. As the flower buds develop on new wood of the current year's growth, the object is to encourage early and strong shoots to develop. Pruning of these is done in the same manner as the early-flowering. The difference is in the time of doing it.

The pruning of roses is more difficult than of some other shrubs, also it is of more importance to the plant. The object is to produce flowers rather than symmetry of form or beauty of foliage. To encourage strong shoots on weak-growing sorts, severe cutting-back should be practiced, while on the vigorous kinds less pruning is necessary. Note carefully the condition of the canes and cut them off just above strong buds that point outward. This will encourage the bush to spread rather than to grow closely together and more flowers will be the result. The new shoot will grow the way the bud points. Make a clean slanting cut with a sharp knife. Do this while the roses are still entirely dormant.

Some of the tenderer roses, such as the hybrids and teas, which are usually protected during the winter, must be severely pruned. Much dead wood will be found and often it will be necessary to cut quite to the ground. At any rate remove all dead canes and cut back the live ones at least one third. It is vitally necessary to these roses in a cold climate that they be pruned. A frequent cause for failure with them is the fear of cutting out partially winter-killed wood.

As a rule the climbing roses do not need much trimming but it is necessary occasionally to prune out the wood that no longer produces flowers. A rule sometimes followed is the cutting out of all except the last season's growth and training the new shoots as desired. This method is a very good one for some situations.—Charles H. Chesley, Strafford Co., N. H.

MISTAKES OF AN ONION GROWER

In a letter requesting advice on onion growing a correspondent has outlined the faulty methods which contributed to his failure with this vegetable; comments upon which may prevent others falling into the same fallacies.

Onions were grown on the same acre of land for eight years in succession. The yield the first year was about 200 bushels, reached 474 bushels the third year and gradually declined to 130 bushels in the last year. During the first five years fertilizer was used. It was then discarded and thereafter the land was treated with stable manure. In the first year a heavy application of lime was made. In the first five years the best seed obtainable was used but in the last three years a lower grade of seed was sown. During the latter period, also, planting which had previously been done much earlier, was delayed until the tenth, twelfth and fourteenth of May.

Considering what was done it is not strange that both the yield and quality of the crop declined. What effect the lime had I cannot determine but the change from fertilizer to stable man-

was a serious error. Not only was re a great decline in the yield but ggots, which had appeared the year ore the change was made, multiplied idly and in the last two years were y destructive. The quality of the declined about as much as the ld. This was partly due to the of manure and partly to the use poor seed and late planting. The p was mixed so far as varieties were cerned, and in the last seasons only out one-half of the plants formed d bulbs.

he use of stable manure on a field the year it is to produce onions highly objectionable and planting ons in land that is badly infested h maggots is almost sure to be fa- to success. When there are only few of these pests the injured plants n be pulled and burned, but when the ack is general it is best to give the d to other crops for two or three rs. There are numerous "reme- s", it is true, but I know of none t can be made profitable on a large le. Inferior seed will produce a or crop or no crop at all, and late wing is an invitation to disaster ich is seldom declined.—Elliot.

TREATING OLD STRAWBERRY PATCHES

As a rule I get more strawberries the cond year of fruiting than the first. metimes I get a fair crop the third ar. I have tried different methods treating old patches, but the follow- g one has given me the best satis- ction.

After berry picking season is over e strawberry vines are mown off th a mowing machine with the mow- g bar set rather high. After the nes get dry they are raked into indrows with a horse rake, and a fire arted at one end of the windrow om which the wind is drawing By rning the vines any plant diseases them are destroyed.

A one-horse plow is then run along ch side of the matted rows, throwing a furrow 4 or 5 inches deep into e space between the rows. Enough the matted row is turned with the o furrows to leave remaining a strip ly about 15 inches wide.

The furrows are rolled down with a ller. Afterwards a spike-tooth har- w is first run lengthwise of the fur- ws, then cornerwise and crosswise. e harrowing process is repeated until e ridges made by the double furrows ve been leveled, and until about an h or so of earth has been dragged on the portion of the strawberry row t turned with the plow. When the rk is properly done the piece does t resemble a strawberry patch, but ther a piece of ground fitted for anting.

The "secret in the job" lies in get- ng the crowns of the old strawberry ants covered with a little fresh earth, hich causes them to start new root owth. With favorable weather the owns soon send up thru the ground ew plant growth, and the patch soon esembles a new strawberry patch set the spring. This season I expect to p-dress the piece with probably about pound of complete fertilizer per re with a fertilizer sower, just be- re I finish harrowing the soil cross- se the rows.

After the rows show up again, I use one-horse cultivator to cultivate be- ween the rows. In the fall the old atch has been taken for a new one. Last season on account of scarcity f rain all summer, treatment of old rawberry patches was not so success- ul, but with more favorable weather he above method gives good results. I treat both my one and two-year old strawberry patches in this manner when the latter is to be held for the third year picking; but the two year old patches get a top-dressing of stable manure the following winter, as strawberry beds need considerable extra plant food the third year of fruiting. Manure also furnishes an excellent mulch for protection to the plants during the freezing weather, as well as conserving moisture for the plants all thru the berry season.

After the third crop of berries is picked, the patch is turned, and some late crop planted to rot up the sod well for setting the strawberries again another season. In this way it does not matter so much if there be grass or weed seeds in the manure mulch; but on all patches to be treated after berry picking for another crop of berries, nothing but clean straw is used to mulch the plants with.—C. R. Weidle, Erie Co., Pa.

CARING FOR THE LAWN

Now is the time to care for the lawn, while the ground is still soft, and the grass is beginning to form a new green carpet.

Good lawns are the basis of all artificial landscape. There is nothing which gives a house a finer setting than a good lawn. A little stretch of even, green grass will soften the harshness of a city dwelling, or change a country house into a country home. But, a poor lawn produces only a desolate air of poverty and neglect.

Contrary to general opinion, grass like everything else, must be cared for. The man who wishes a good lawn must give it attention, and a little attention right now is worth a great deal later on.

In caring for the lawn, rolling is very important. The surface is thus pressed down and leveled; roots are forced back into the soil; and the surface is made compact. In fact, heavy rolling in the spring lessens the danger of summer burning, and the necessity of frequent summer watering. A good one-man roller for this purpose should weigh about 300 pounds, covering a width of twenty inches. Rollers made in two sections are to be preferred, for they are more easily operated, and tear up the grass less than the ordinary type when turned about. Two-man or horse rollers may be used on large areas. Where horse rollers are operated, be sure to use pads on the horses' feet.

The fall is the ideal time to remove weeds, yet for the lawn which has been neglected, it is best to get rid of the offenders before they go to seed. Careful mowing will control many varieties. Such weeds as plantain, dock, and dandelions, however, should be dug out with a knife. If trouble is experienced from their growing again, a small crystal of iron sulphate dropped on each root as it is cut makes certain destruction of the plant.

Where the grass is thin it should receive additional seeding. For general purposes a mixture consisting of one part English rye, two parts Rhode Island bent, and three parts Kentucky bluegrass by measure, is very good. If the grass is not very thin one quart of the mixture to every 100 square feet should be sufficient. The use of clover in the lawn is a matter of personal choice. For those who care o use it, a small quantity will give an appearance of thickness. In shaded places, and under trees it is well to substitute crested dog's tail for a mixture. Some trees feed so near the surface that it is useless to attempt to grow grass under them. Here English ivy will cover up the bare spots.

For fertilizing the lawn nothing will be found superior to poultry manure. It is fine, and easily taken into the soil. Sheep manure may be substituted with good results. In either case the application should be light. For those who prefer a commercial fertilizer, bone meal is especially to be recommended, as it contains the elements most needed, and becomes available during an extended period.

In watering, the usual tendency is to sprinkle every evening with a hose. This method is not to be commended for it merely wets the top soil, thus drawing the roots close to the surface and weakening the plant. Water only when it is absolutely necessary. Then it is best accomplished by removing the nozzle from the hose, and allowing the water to flow on the same spot for about an hour, when the hose is shifted, and another area watered. Watering by this method may be carried on in sunshine without harmful results.

By observing these fundamentals, and by a reasonable amount of time spent in cutting, and raking the grass, and trimming the borders, the appearance of the lawn will repay the owner many times for the money and labor expended upon it.—R. P. Marshall, State College, Pa.

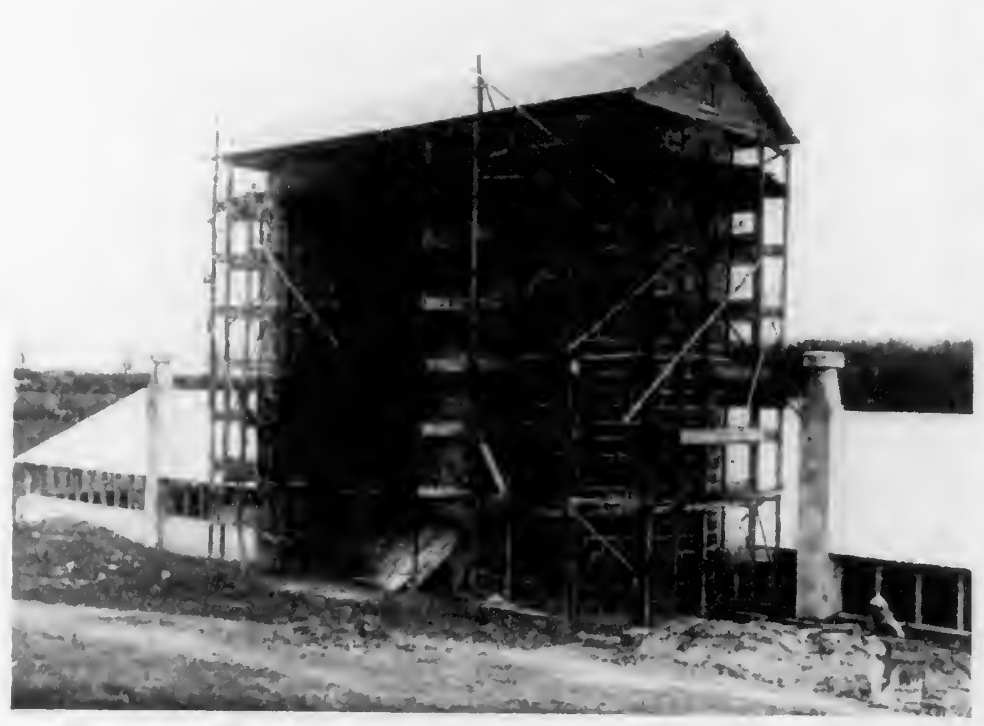
The Dairy

THE NEW SHARPLES DAIRY PLANT

I have just returned from a visit to the up-to-date Sharples dairy plant in Chester County, Pa. The plant comprises all that is new and practical with fads and frills eliminated. The dairy building comprises a good old bank barn, now supplying storage room for dry roughage and, in the basement, storage room for concentrated feeds and for box stalls for young or sick animals. The main cow stable is a wing extending to the east about 160 feet, having a capacity of 100 cows. The cows are arranged in two rows; rears to the central isle and heads to the outer walls. The floor and manger is practically one continuous concrete casting, cleverly laid. The flushing out of the manger or gutters can be done if necessary.



GLAZED TILE SILOS AT THE NEW SHARPLES DAIRY BARN, CHESTER CO., PA.
Each silo is 42 feet deep and 16 feet in diameter, holding 200 tons of silage.

A walk or driveway of about 9 feet extends between the gutters the entire length of the stable; and along this, feed, manure or absorbents are carried in cart or hanging car. At one side are the silos, modern tile structures, and on the other side is the milk and power house, with full equipment to secure the purest and best milk possible to meet the demands of a certified milk trade. The ceiling of the stable is 10 feet in the clear, and is smoothly plastered.

The ventilating system is a modification of the King method, consisting of in take transoms near the ceiling, which may be opened or closed at will, and out take flues having two vents, one near the floor and the other near the ceiling. The latter one is designed to relieve the stable of warm air near the ceiling in extremely warm weather. Light is admitted all around, except at the silos. The glass is very heavy wire glass and is very liberal in space. The stanchions are full metalic, as is also the water fountains in each stall.

The liquid manure is conducted from the gutters by gravity pipes to an out-door reservoir, from which it is pumped into a tank wagon and taken to the fields. It is the intent of the owner to concrete the barn yard where the manure will be dumped at times when it is not desirable to go direct to the field with it. We were told that here in this plant it will be demonstrated that a high quality of milk can be produced without necessarily increasing the cost of production, and a strong factor in this scheme is the instalment and constant use of a milking machine, now in daily and satisfactory use on the herd.

The herd has not been assembled for beauty or high production, but is a widely mixed lot. At a glance we recognize a sprinkling of Holstein, Jersey and Guernsey with numerous hints of scrub forbears. With a mixed herd the practicability of the milking machine can be more nearly determined, as that sort of animals more nearly represent the run of the farm stock. The herdsman and manager on the above place is Mr. Price, a short course student from Pennsylvania State College, and is wide awake and a student of dairy conditions.—D. H. Watts, Clearfield Co., Pa.

MAKING BUTTER VS. SELLING WHOLE MILK

The arguments of milk condensary agents that selling whole milk puts more money into farmers' pockets than making butter, the high cost of mill-feeds and the very low market for butter for the time of year, due to importations of foreign butter, use of oleo, or what-not, have caused many farmers to give up butter-making. The dairy farmers of Bradford County have made butter for years, have paid off mortgages and are generally prosperous. But they are quitting creameries that are making butter, and are selling their whole milk, which is the most exhaustive system of farming known except selling the crops direct from the farm.

I have hesitated in entering a discussion of this kind because, as some of your readers know, I operate a private creamery, and for that reason I may be thought to be partial to the butter side of the question. But I want to present some figures on the subject which will speak for themselves. I have held for years that a creamery ought to make butter at 2.5 cents per pounds and give an over-run of from 14 to 16 percent above the Babcock test. In 1908, I, with the aid of my brother, built and equipped a small creamery to make the butter from the two dairies. Some neighbors wished me to make their butter and I wanted to have an opportunity to prove that a man can run a creamery on the basis stated above. I believe that upon this basis it is more profitable to make butter and sell it at 25 cents per pound than to sell whole milk testing 5 percent fat at $2 per hundred pounds.

One hundred pounds of milk testing 5 percent fat would make about 5.8 pounds of butter, which, at 25 cents per pound, would sell for $1.45. If the se-

tor is set to take a 30-percent cream ch I believe to be a fair average, would have about 17 pounds of m in 100 pounds of 5 percent milk, ing 83 pounds of skim milk. The ensary agents try to tell us that milk is worth only about 22 cents cwt. I know that this value is al- ther too low. Experiments have been e to determine the feeding value skim milk when fed to pigs, and e tests show that where 2 pounds ilk are fed with one pound of mill- , the value of the skim milk is er 60 cents per cwt. Here is where y of us make a mistake. We feed much milk in proportion to the mill . When improperly fed the milk not be worth much over 22 cents cwt., but the skilfull feeder will e it worth more nearly 60 cents.

n feeding skim milk to purebred es its value is still further increas- Three years ago we sold 10 calves $75 per head. I tried to keep an rate record of milk, roughage, and short period on pasture. You who e tried to keep records on growing es know how difficult it is. But h the best records possible, I de- ined that those calves yielded me t $1.75 per cwt. on the milk fed . But let us take the 60 cents as ir value of the skim milk.

ontinuing the above calculation, 83 nds of skim milk at 60 cents per , would be worth about 49 cents. 17 pounds of cream we have 5.8 nds of butter and 11.2 pounds of er milk. Butter milk is worth as h as skim milk for pig feed; there- 11.2 pounds of butter milk would worth about 6¾ cents. In addition t agricultural chemists agree that n we sell a ton of whole milk we ove about $1.89 worth of fertility; on of skim milk, $1.99; a ton of er milk, $1.99; a ton of cream, 2 and in a ton of butter only 32 ts. The skim and butter milk tain the larger amounts of fer- y. At $1.99 per ton as the fertility e of skim milk, the 94 pounds of milk and butter milk would repre- t an additional value of about 9.3 ts.

umming up the value of the 100 nds of whole milk testing 5 percent , we have the following: Butter, 45; feeding value of skim milk, 19 ts; feeding value of butter milk, 6¾; ility value of skim and butter milk, cents. Total value, $2.09. These res prove, I belive, that it payes ter to make butter on the farm and it at 25 cents per pound than to whole milk at $2 per cwt.—Leon VanNoy, Bradford Co., Pa.

ASTEURIZING CREAMERY BY-PRODUCTS

he Pennsylvania legislature in the 3 session enacted a law requiring t: "Every owner, operator, or man- r of a creamery, cheese factory, re- ving station, or skimming station, ll, before returning to or delivering any person or persons any skimmed k or separator slop, to be used for d or feeding purposes for calves or ne, cause such skimmed milk to be roly pasteurized by heating it to least one hundred and seventy-eight rees Fahrenheit."

ircular No. 28, recently issued by Pennsylvania Livestock Sanitary ard illustrates and describes a simple inexpensive apparatus for cream- and skimming plants to heat milk products to the required tempera- e with a minimum of steam. A spe- warning is given against permitting slime and foreign matter removed the separator or clarifier from get- g into the skim-milk or into streams. should be disposed of by burning. e circular is for general distribution.

MANY MILES FROM SHIPPING POINT

Place For Dairying

In Franklin County, Pa., is a long and fertile stretch of land known as Path Valley, extending from the village of Concord in northern Franklin County to near the Maryland line. Path Valley is stretched out between the Blue Mountains on the east and the Tuscarora Mountains on the West. The farmers of this valley are a thrifty lot and have been delivering corn, wheat, hay, etc., to the railroad at distances varying from a few miles to 25 to 30 miles, and now there is an awakening that will materially change the methods of farming in the valley. In place of drawing the heavy, crude product to market many farmers see that the proper thing to do is to stock the farms and pastures of the nearby mountains with beef and dairy animals and feed the bulky roughage on the farms and sell the less bulky finished products as beef, butter, milk, etc., in the distant market. Accordingly, methods of cheap crop production are being studied and discussed and many silos are going up in the near future.

At the last evening session of farmers institute at the village of Dry Run, 15 miles from a railroad, 600 people attended. The audience was divided and taken into another room, where the subjects of poultry and organization were discussed.—D. H. Watts.

GOOD HOLSTEIN PRICES

At a public sale in Lehigh County, Pa., February 28, without special advertising, no catalog and only common farm sale posters four registered Holstein-Friesian cows sold at the following prices: Daisy De Kol of Lehigh No. 64941 H. F. H. B., for $277.50; Daisy DeKol of Lehigh 2d No. 114282, $300; Linda DeKol of Lehigh No. 64939, for $225 and Daisy Hengerveld of Lehigh No. 102793 for $235.

These were large cows, good individuals and in good condition. I consider the price very good, taking their breeding into consideration. The same prices can be obtained in any section as farmers in general are after purebred Holsteins. In my opinion this sale has been an eye-opener to a good many farmers in Lehigh County who attended the sale. It is surely foolish to breed common scrub cows when it costs no more to raise purebreds that bring big prices. There is no trouble to sell registered baby Holstein heifer calves by the car-load at $100 each.—W. M. Benninger, Northampton Co., Pa.

MILK-TESTING EQUIPMENT

I was much interested in the article in a recent issue of the Pennsylvania Farmer discussing variations in milk tests and inaccuracies in milk-testing equipment. I was sufficiently interested to have milk tested by one of the most reliable dairy laboratories in this state as a check upon our own tests. This report of that test is as follows:

"Sample of milk submitted us for butterfat determination resulted as follows: Date, March 17; sample milk; fat, 5.35 percent; total solids, 13.53 percent.

"This sample of milk was submitted us by Mr. Brownback to be tested in check with him. We used his test bottle and his pipette in check against our test bottle and our pipette. His bottle gave the result of 5.4 percent; our bottle gave the result of 5.35 percent. Very Truly, ———."

The name and address of the laboratory making this test will be supplied upon request by Pennsylvania Farmer.—G. E. Brownback, Montgomery Co., Pa.

Aryshire Breeders Organize.—An organization of Aryshire breeders has recently been formed in northern New York with Geo. H. Converse of Woodville as president and A. F. Spooner, of Richville, as secretary-treasurer. There are vice presidents from each of the four counties interested. Local clubs will be organized thruout these counties.

$15.95 AND UPWARD ON TRIAL.
AMERICAN CREAM SEPARATOR
A SOLID PROPOSITION to send fully guaranteed, a new, well made, easy running, perfect skimming separator for $15.95. Skims warm or cold milk; making heavy or light cream. The bowl is a sanitary marvel, easily cleaned.
Absolutely on Approval.
Gears thoroughly protected. Different from this picture, which illustrates our large capacity machines. Western orders filled from Western points. Whether your dairy is large or small write for our handsome free catalog. Address:

DE LAVAL CREAM SEPARATORS are the cheapest as well as the best

LOOK AHEAD!

DON'T TRY TO SAVE $10,00 TODAY if it means a loss of 25 cents a day for all the years a cream separator may last you.

THAT'S JUST WHAT YOU WILL DO IF you buy a cheap or inferior cream separator simply because its first price is a little less than that of the De Laval.

WHEN A PRUDENT MAN BUYS A cream separator he knows that what he is really paying for is not just so much iron, steel, brass and tin, whether it is called a separator or not.

WHAT HE WANTS IS A MACHINE TO perform a certain service, and he must be sure of the machine doing the work for which it is intended as thoroughly and with as little effort as possible on his part.

THOUSANDS OF BABCOCK AND other tests have proved that the De Laval skims closer than any other cream separator under any conditions, and particularly under the harder conditions always experienced at times.

JUST THINK WHAT A LOSS OF AS little as 10 cents worth of cream at each skimming means to you in a year—twice a day for 365 days—over $70.00, and with as many as ten cows the cream losses alone from an inferior separator usually amount to more than this.

CREAMERYMEN, WHO ARE DEPENDent on their separators for business success, have long since found out the difference between De Laval and other separators, with the result that De Laval factory separators are almost universally used the world over today.

DE LAVAL SEPARATORS ARE IDENtical in all sizes, for one cow or a thousand, and the differences between separators are just the same with the smallest machine and the largest. They mean as much relatively to the little as the big user.

THEN THERE IS THE SAVING IN labor because of the easier running and greater capacity of the De Laval over other machines and the less care required in cleaning and adjustment, worth at least 10 cents a day.

AND THERE IS THE INDISPUTABLE fact that a De Laval machine lasts from ten to twenty years as against an average of from two to five years in the case of other separators, or five times the average life of competitive machines.

THESE ARE THE REASONS WHY De Laval Separators are cheapest as well as best, why thousands of other machines are yearly being replaced with De Lavals and why their use is rapidly becoming as universal on the farm as in the creamery.

IT SHOULD BE REMEMBERED, moreover, that if first cost is a serious consideration a De Laval Separator may be bought on such liberal terms that it will actually save and pay for itself, as many thousands of them have done.

These are all facts every De Laval local agent is glad of the opportunity to prove to any prospective buyer. If you don't know the nearest De Laval agency simply write the nearest main office, as below.

International Special Dairy Feed
MIXED WITH CORN AND OATS COWS INCREASE ONE-THIRD
INTERNATIONAL SPECIAL MOLASSES DAIRY FEED
Mr. J. P. Goodall of Capron, Ill., writes us as follows: "I have used International Special Dairy Feed for two years, feeding 4 pounds per day mixed with ground corn and oats and by using your feed as above I have obtained an increase of one-third in milk production. My cows always keep healthy and eat with a relish."
International Special Dairy Feed costs less per ton than ground corn and oats. For each ton of International Special Dairy Feed that you will buy and use along with other grain feed you will make an extra profit of $10.00 to $15.00.
International Special Dairy Feed is also extensively used as an entire grain ration and used in this manner will produce more milk at less cost than can be obtained from any other method of feeding.
Ask your dealer for International Special Dairy Feed. If he don't keep it for sale, then send us your dealer's name and address—we will arrange with him to supply you. C-7

Cattle Feeding in Pennsylvania.

Feeders Convention.

The first Cattle Feeders' Convention ever held in Pennsylvania or the East occured at the State Experiment Station, State College, Pennsylvania, Friday, April 3rd. This meeting was attended by a number of prominent feeders and cattlemen from different parts of Pennsylvania and Maryland. The general interest and enthusiasm shown by those present proved the meeting a decided success and the undertaking of holding a convention of this kind desirable in the interest of beef cattle feeding in the East.

This meeting afforded an opportunity for the feeders to note the results of the experiment conducted at the college and an opportunity to study the results first hand, rather than wait until reports were published later in the year. The success of the meeting will mean that this convention will become an annual event and should do much to create greater interest in cattle feeding and enlighten eastern feeders on the subject of more economical production of beef.

Frank Wood, an experienced buyer in the Pittsburgh market valued the cattle in the different lots on the basis of prevailing prices on the Pittsburgh market. The object of this was to determine the difference in value of the five lots that were fed different combinations during the winter. After placing a value upon each lot he discussed his reasons, which proved of great interest to all feeders present. After the cattle were valued the audience inspected the calorimeter and nutrition work conducted at the College under the supervision of Dr. Armsby. This part of the program proved interesting because of its close relation to the practice of cattle feeding.

At 11 o'clock those present assembled in the Agricultural Building and listened to an interesting discussion by Dean Watts on the progress made in the eastern part of the United States in live stock production and its possibilities along different lines, especially that of beef cattle feeding. Professor Tomhave discussed the results of the feeding during the past winter. A summarized statement had been prepared and each member was presented with a typewritten copy showing just what each lot had done since beginning the experiment November 15th.

In the afternoon the cattle were visited in the feed lots. Here the feeding and handling of each lot was fully explained and comments made on the different combinations of feed as used. The different lots were in each case compared so that visitors might have an opportunity to see why some of the lots were rated higher in value than others. Besides this discussion the details of the feeding and handling of each lot, the best individuals of the different lots and the desirable and undesirable points of the various individuals were pointed out and explained as indicated by the following table. the lots proved so interesting that practically the entire afternoon was devoted to this work.

Some interesting results are obtained as indicated by the following table. In Lot 1 the cattle were fed a combination of feed commonly known as the Pennsylvania feeding ration. This is composed of mixed hay, corn stover, a mixture of chopped ear corn or corn meal and bran, fed in the proportion of three parts corn to one part bran. This lot of cattle made the lowest total gain, but were the most expensive in the feed lot. The cost of producing 100 pounds of gain, based upon the feed price indicated in the table, in this lot was $13.43 as compared to $11.08 on Lot 5, which was the next most expensive lot. The necessary selling value of this lot in order to pay for the feed consumed, not including the pork produced, was $8.69 per 100 pounds, or a margin of $1.24. This high cost was in part due to the bran which was fed in the ration, to the cost of grinding the grain, the lack of silage in the ration, and the feeding of grain from the beginning in place of a greater amount of roughage as was the case in the other four lots.

SUMMARY OF FEEDING EXPERIMENT

Following is a summary of the feeding experiment. Rations were as follows: Lot 1, mixed hay, corn stover, bran, corn ear and corn and cob meal. Lot 2, silage, cottonseed meal and corn. Lot 3, silage, alfalfa and corn. Lot 4 mixed hay, silage, cottonseed, meal and corn. Lot 5, silage, alfalfa, cottonseed and corn.

	Lot 1	Lot 2	Lot 3	Lot 4	Lot 5
Initial value per cwt.	$7.45	$7.45	$7.45	$7.45	$7.45
Initial weight, lbs.	10,916	11,005	11,118	11,003	10,960
Final weight, lbs.	13,772	14,088	14,008	14,185	14,058
Total gain, lbs.	2,855	3,085	2,890	3,152	3,098
Av. daily gain first 56 days, lbs.	1.71	1.88	1.5	1.62	1.66
Average daily gain 140 days, lbs.	1.69	1.83	1.72	1.87	1.84
Feed Consumed:					
Corn silage		62,270	51,936	33,047	47,668
Corn stover	3,025				
Mixed hay	16,148			11,749	
Alfalfa hay			8,213		7,750
Cottonseed meal		4,312		4,294	4,250
Corn and cob meal	19,036				
Wheat bran	6,296				
Broken ear corn		7,976	8,106	8,083	7,930
Shelled corn		4,027	4,030	4,030	4,030
Total cost of feed	$383.56	$312.37	$283.92	$333.54	$343.47
Cost of roughage	100.89	108.97	152.49	128.34	141.55
Cost of concentrates	282.67	203.40	131.43	205.20	201.92
Cost per cwt. gain first 56 days	11.82	6.52	7.02	8.64	8.23
Cost per cwt. gain 140 days	13.43	10.12	9.82	10.58	11.08
Value of pork per lot	13.22	18.43	10.17	21.20	19.98
Necessary selling value not including pork	8.69	8.03	7.93	8.13	8.25
Rated value on Pittsburgh market	8.30	8.30	8.15	8.40	8.25

Feed based upon the following prices.—Corn 70 cents bu; bran, $25.00 ton; cottonseed meal, $34.00 ton; corn and cob meal, 75 cents bu.; mixed hay, $12.00 ton; alfalfa hay, $15.00 ton; corn silage, $3.50 ton; corn stover, $2.50 ton.

The cattle in Lot 2 were valued as high as those in Lot 1, but were produced at a margin of 58 cents instead of $1.24. This lot received silage as roughage and no corn during the early part of the feeding period. The cheapest gains made were those in Lot 3, where silage and alfalfa were fed during the early part of the feeding period and corn added to the ration during the latter part of the period. This lot was fed at a margin of 48 cents, but these cattle were not valued quite as high as the other lots.

Lot 4 received mixed hay, silage and cottonseed meal during the early part of the feeding period with roughage added during the latter part. They made the greatest total gain and were valued higher than any of the other lots. The necessary margin in this lot was 68 cents out they were valued 10 cents higher than any of the other lots. These cattle seemed to have more finish than any of the others on experiment.

Lot 5 was used as a check lot for number 3. They were fed the same ration except that cottonseed meal was added in addition to the alfalfa hay. The addition of this greater amount of nitrogenous feed made the final cost greater than the other lots with the exception of Lot 1. They were valued a little higher than the lot receiving no cottonseed meal.

A clearer illustration of the advantage and desirability of using silage in the ration for the feeding of beef cattle can not be found. It not only shows that beef can be produced much cheaper when silage forms a part of the ration, but also that heavier gains are made and that greater quality is secured. Also, that less grain feeding is required than where the silage is lacking. The results of this experiment should be a further encouragement for the eastern farmer to build silos in connection with steer feeding.

CATTLE FEEDERS ASSEMBLED AT THE FEEDERS' CONVENTION AT STATE COLLEGE, APRIL 3.

How The Steers Were Handled

Sixty two-year old cattle were purchased in Roane County W. Va., in the fall of 1913. These cattle were divided into five lots of 12 head each. In making these lots the cattle were divided equally, so far as possible, in age, type, breed, weight, quality and general condition.

The object of the experiment was to secure further information concerning the methods of feeding under Pennsylvania conditions; also, to make comparisons in the cost of the different combinations fed. The common method of feeding expensive feed was to be compared to the feeding of a large amount of roughage and cheaper feeds. With the increase in production of alfalfa in the East and the constant increase in price of cottonseed meal, it was deemed advisable to compare alfalfa hay and cottonseed meal as a source of protein for feeding cattle.

The five lots were fed as follows: Lot 1 received the common Pennsylvania feeding ration composed of mixed hay and corn stover as roughage, and cornmeal and bran as concentrates. They received all the mixed hay they would consume and in addition received four pounds of shredded corn stover daily. The corn and bran were fed at the rate of 12 pounds per head daily, the mixture being 2 parts corn and 1 part bran. During the first 56 days the corn was broken into small pieces; during the last period it was ground into corn and cob meal.

Lot 2 received corn silage as a sole roughage during the entire winter. Of this they received all they would consume during the first 56 days. In addition to this they were fed cottonseed meal at the rate of 2½ pounds per 1,000 pounds live weight, daily. During the last 84 days of the feeding trial this lot received, in addition, broken ear corn at the rate of 15 pounds per 1,000 pounds live weight or shelled corn at the rate of 12 pounds per 1,000 pounds live weight.

Lot 3 received corn silage and alfalfa hay as roughage, the alfalfa hay being fed in place of cottonseed meal or some other nitrogenous feed. The alfalfa was fed at the rate of 5 pounds per 1,000 pounds live weight. This was the only feed received during the first 56 days. The balance of period corn was fed in addition at the same rate as Lot 2.

Lot 4 was fed a combination of 20 pounds of corn silage per head daily and in addition all the mixed hay they would consume as roughage. Cottonseed meal was fed at the rate of 2½ pounds per 1,000 pounds live weight daily. This combination was fed during the first period. During the second part of the feeding period this lot received in addition the same ration of corn as received by Lots 1 and 2. The object of this lot was to compare the results when mixed hay is added to the ration of silage as roughage.

Lot 5 was fed the same roughage as Lot 3 but cottonseed meal was added to determine if it is necessary or beneficial to add cottonseed meal when a part of the ration is made up of alfalfa hay. Aside from this one change the lot was handled the same as Lot 3.

Each steer was numbered at the beginning of the experiment so that an individual record could be kept as well as group records. The cattle were weighed three successive days; at the beginning of the experiment, at the end of the first 56 days and at the close of the experiment. Group weights were taken every two weeks. All the cattle were fed in an open shed where they had access to good water at all times. Hogs were put in each lot to consume the waste from cattle.

Winter Steer Feeding.—Bulletin 167 of the Indiana Experiment Station at Lafayette, Indian, is a discussion of steer feeding experiments carried on at that station under various methods of feeding. Rations are tabulated and compared and definite conclusions as to values are drawn.

Studebaker WAGONS BUGGIES HARNESS

Outdoors for forty years painted once-carries five tons today

WHEN Mr. Peter Kern, Jr. of Reese, Mich. bought a Studebaker wagon, thirty-two years ago, the wagon had been working for eight years. This means that it has now been in use forty years.

A letter from Mr. Kern says:

"I bought my Studebaker from Henry Daley thirty-two years ago. The wagon has never been housed—always out in the open air and has had but one coat of paint in the forty years.

I have used this wagon to haul sugar beets, four tons at a time, over country roads. The material in the wagon is as hard as a bone.

In 1881 I bought more land, giving me a total of 340 acres, and my old wagon with one other Studebaker I bought fifteen years ago, has done all the hauling.

I will guarantee my old Studebaker to deliver 5 tons today. I am satisfied that the Studebaker is the best farm wagon in the country."

MADE OF THE RIGHT MATERIAL

This letter proves that Studebakers use good paint on their wagons, but the real reason for the long life of Mr. Kern's wagon is the material underneath the paint. Nothing but the best of everything is used in Studebaker wagons.

You can buy today a Studebaker wagon that will last you just as long and give you just as faithful service as the wagons Mr. Kern and others describe.

You may be offered a wagon represented to be "just as good as a Studebaker"—and at a lower price. Don't be fooled. It is the life of a wagon that counts. Studebaker wagons are the cheapest in the end.

Remember Studebakers have been building wagons for over sixty years and they know how to build wagons that will last longest and give the most satisfaction.

The same thing is true of Studebaker Buggies and Harness.

TRY A BOHON "BLUE GRASS" BUGGY
30 DAYS WITH YOUR MONEY IN YOUR POCKET

I WANT you to try it on your own roads, no matter how rough they are, and if it is not satisfactory, if it does not come up to all my claims, send it back. You won't owe me a cent. If you've paid me anything I will pay it back, and I will pay the freight both ways besides. You know I could not make that kind of offer if my buggies were not RIGHT in every way. You know I wouldn't last a year in business, and the fact that I make this offer proves the QUALITY of my vehicle.

The next question is the PRICE—and the answer is easy. I sell only from my factory direct to you—cutting out all profits and expenses of jobbers, salesmen and dealers. I make the same small profit whether I sell to them or to you, but by selling to you instead of to them I save you $25 to $50. Let me send you my

Big Book of Buggy Bargains FREE

I am mighty proud of it—honestly believe it to be the finest buggy book ever issued by anybody. You will be glad to have it, and you will do me a favor if you will ask me for a copy, even if you do not expect to buy a buggy this year. It shows how "BLUE GRASS" buggies are built, with photographs and pictures of an endless variety of finished "jobs," some in actual colors. It gives you a bigger range for selection than you could find in a dozen dealers' stores. It explains the details of my free trial offer, my $30,000 guarantee bond, etc. Now don't put it off—you may forget. Send me a postal with your name and address right NOW, and the book will come to you in the first possible mail.

MORE MONEY=EASY WORK=BETTER STOCK

Get All the Wool from your sheep. You lose $1 on every six you shear by the old method. 15 to 20c more in wool from every sheep is worth considering. Why not make more money?

Horses and Mules Should be Clipped in the spring. Remove the heavy winter coat which holds the wet sweat and dirt. They will do more work for you and be better in every way.

PRICE $11.50

STEWART'S No. 9 BALL-BEARING SHEARING MACHINE will get you longer, better and more wool and take it off quickly and smoothly in one unbroken blanket. To shear with the Stewart Machine seems like play to those who have labored with hand shears in the old, hard, sweaty way. You don't have the same swollen aching wrists. You don't scar and disfigure your sheep with uneven shearing and spoil the wool with second cuts as you used to do. The Stewart saves all that and easily and quickly gets you more and better wool. Get one from your dealer, or send us $2.00 and we will ship C. O. D. for balance. Money back if not pleased.

THE STEWART BALL-BEARING CLIPPING MACHINE can be used for clipping horses, mules and cows without change. It's the easiest to turn, does the fastest work, stays sharp longer and is the most durable. Get one from your dealer, or send us $2.00 and we will ship C.O.D for the balance. Your money back if you are not well pleased.

PRICE $7.50

The Country Church

The lack of suitable diversions, amusements or associations under normal conditions in rural communities is credited with driving the younger generation away from the country out into what appears to be a world of larger opportunity and experience. Without placing the responsibility for these conditions, it would seem that the country church has a big opportunity in helping to overcome them to a large degree. The average rural church, closed as it is six days in the week and often open only for the morning service on the seventh is a monument to the coldness and the barrenness of life in its neighborhood; and it is impossible for such a church to radiate the true, helpful, brotherhood spirit or to possess the warm, congenial, social atmosphere which should characterize it. Surely the church is, or should be, the logical social center of the country community. With a little trouble and slight expense the basement or lecture room or even the assembly room may be made a place of warmth, light and social cheer, where miscellaneous or special gatherings may be held several nights a week and where those who are interested may find a meeting place to discuss their individual problems. The country minister has peculiar responsibilities in the matter of helping to banish some of the conditions which cause stagnation in the social life of the farming sections. If he be interested in farming problems, and has an understanding sympathy with the social community life he and his church can be a dynamic force in all the country. Here mothers could come with their sewing and exchange views on household problems. Invitations to the men to congregate and discuss farm and business questions should elicit favorable response. While some might hold up their hands at the mere suggestion of installing equipment for entertainment of the younger people, such things may even be a "means of grace." An occasional lecture by the farm expert or the woman canning expert at the State College would add its quota of interest. Too often can it be said of the rural church that it performs its drowsy spiritual mission in a drowsy way, that its ministers to the sick and buries its dead, but that it never touches the community it serves in any vital way. Like the proverbial closed parlor "its cold walls have never echoed back the laughter and normal gaiety of human life. These walls are so saturated with the story of man's fall and the difficulty of his redemption that they probably would not echo to the carol of real life." While no other man touches rural life at so many angles or so intimately, and no other man could lead and direct community interests more mutually helpfully than the country clergyman, he should not have to bear the whole burden of responsibility in this direction. United effort on the part of minister and people is what makes for growth and progress. Lend a hand.

Country Boulevards

The well-founded opposition to that part of the state highway law regulating the operation and licensing of traction engines raises an important question in construction of country roads. Do we need good roads for farmers in the modern interpretation of good roads, or roads good for the every-day needs of the farmers? The high-priced, smooth-surfaced roads giving the ideal conditions for automobile travel are not suitable to the practical needs of the farmers. The smooth and frequently oiled surfaces of such roads, while offering the best conditions for light driving and auto travel are entirely unsafe and impossible of heavy hauling. In wet weather they become slippery and horses are unable to gain the foothold necessary for pulling heavy loads. These conditions have raised vigorous objections from the farmers who have had to use such roads in sections of New Jersey and Maryland the past winter. In this state the law limiting the weight and regulating equipment on traction engines tends towards driving these necessary machines off the roads entirely. A recent meeting of threshermen and other engine owners at Harrisburg developed vigorous protests against the present law, and these engine owners are likely to be supported by the rank and file of farmers if it is demonstrated that the present law will bar threshing outfits from travel of our so-called improved roads. Farmers want good roads, but they want those roads good for every class of travel and not so highly "improved" as to make them useless to the most important and ever-necessary class of travel—the transportation of farm produce to market. This objection need not halt road work or the building of stone roads, but it will necessitate providing a road surface that will be suitable to all classes of farm travel, or the building of double roadways. There is every reason why the every-day business needs of the farmers' use of roads be taken care of first, which means that the greatest and most immediate need is in the improvement of our earth roads.

Eastern Live Stock

The recent cattle feeders' convention held at State College and fully reported in this issue should provide a strong impetus to the cattle feeding industry in the East. The liberal attendance and the interest manifested in methods of feeding and handling indicate the increasing attention that is being given to this branch of farm work. More and more of our eastern farmers are appreciating the fact that there is a promising future in limited cattle feeding on eastern farms, but they also realize that profits depend upon best methods of treatment. Cattle feeding does not and never will present a wide margin of profit which will permit of careless or indifferent methods. Returns depend upon small savings upon daily cost, and the largest possible return upon the lowest possible cost of maintenance. The purpose of the experiments just concluded was to demonstrate methods in securing such results, and the convention permitted the visitors to study those methods and the results obtained at first hand. This is advancing the greatest service of the experiment station. These institutions are established for the purpose of developing just such information for the use of the farmers of the state in their every-day practice, and they are doing the greatest good when they press home the results of their work in the practical way accomplished by the recent convention. It is understood that these conventions are to be continued each year. Can we not have similar events to bring before the farmers the result of experimental work in sheep and hog breeding and feeding?

MARYLAND LEGISLATIVE RECORD

How Agriculture Fared

On April 7th, the day following the adjournment of the Maryland Legislature, a Baltimore daily published a cartoon labeled "The Harvest Field." It showed a farmer with a big smile standing before a shock of grain sheaves, labeled "Penal Reform," "State Tax Commission," "Home Rule," "Reform in Legislative Procedure" and "Workingman's Compensation." The farmer of the picture was either a city man in disguise or the city editor expected the farmers of the State to rejoice over the passage of bills in which the city man rather than the farmer was interested.

Lime Bill Defeated.—Meanwhile, this same Legislature, at the instance of U. S. Senator, John Smith, had killed the Blandford lime plant bill, which provided two agricultural lime plants for the state, one to be located on the Eastern Shore and the other in Southern Maryland. The experience of Illinois, which uses convict labor to furnish its farmers lime at cost and the recent efforts of Virginia in this direction counted for nothing when it became necessary for the Senator to strengthen his fences in Western Maryland, whose lime manufacturers opposed the Blandford bill, without, however, telling how to get lime. Strange to say, the representatives of the Southern Settlement and Development Organization, which corporation has secured the services of Doctor Cyril Hopkins as its soil expert, made no effort to prevent the killing of the Blandford bill. They were interested only in the passage of Senator Campbell's bill appropriating $20,000 annually for a survey of Maryland soils, under direction of the Maryland Agricultural College. This bill was passed, altho reducing the appropriation to $10,000. The Legislature, it would seem, did not realize that the farmer's trouble is not a lack of knowledge as to what his soil needs (the Co-operative Demonstration Service will tell him that), but rather a lack of ability to get what it needs. Whether this be lime or fertilizer, both cost money.

College Bill.—The bill granting a new charter and an appropriation for the rebuilding of the Maryland Agricultural College was defeated. President Patterson asked $1,000,000 in annual instalments of $250,000 each, with adequate provision for maintenance. This was cut in committee to $350,000 with the understanding that the private stock holder interests be removed from any part in the management of the college. A Baltimore daily describes this as an effort to "republicanize" the college, forgetting that a college has as little right to be "Democratic", as "Republican," or any other brand of politics. Another paper's version of the unfortunate affair is much more in accord with the facts. It said of the final session:

"Earlier in the night the House had taken up the College bill which it had amended by eliminating private stockholder interests, and which the Senate had changed back to its original form on the protest of some of the directors, named in the original measure, but who had been eliminated. The House, refused to concur in the amendments, and a conference committee, failing to induce the Senate to recede, the bill was killed by the House. With it went a loan of $350,000 for new buildings which was contingent on the new charter bill getting thru. The scheme fell thru the stubbornness of some of the directors, who preferred that the College should go without money than to see themselves eliminated as life directors representing an interest that they had agreed to surrender."

Agricultural development in Maryland under leadership of a reorganized and properly equipped agricultural college is thus postponed for at least two years. The college, which receives only its usual meager appropriation for maintenance must try to live on a starvation diet and there is talk of leaving the institution in the hands of the stockholder interests and establishing "an agricultural college that will be such in fact as well as in name." The situation is a deplorable one and every friend of agriculture cannot but regret that the Legislature did not earlier in the session take hold of this matter with a strong hand and adjust it in the interest of the people of the State.

Roads.—The Legislature made an appropriation of $6,600,000 for the continuance of the present policy of road building by the State, without, however, studying the question from the viewpoint of the farmer who is usually much more interested in reaching a railroad or a steamboat landing than in a smooth automobile road connecting two large cities. If the question was studied at all, it was studied from the view point of the city rather than that of the farmer.

Agricultural Appropriations.—Unusually liberal appropriations for various agencies having to do with agriculture were made. It gave $10,000 per annum to the Live Stock Sanitary Board to fight hog cholera, without stating just how this money is to be used. It added $1,000 to the $3,000 appropriation now in the hands of this Board for dairy inspection. It gave the State Veterinarian $15,000 annually for the establishment of a Board of Control and for the indemnifying of farmers for the slaughtering of diseased cattle. It did not, however, ask itself if the work of these two Boards could not be advantageously combined.

It passed a seed inspection bill and gave an increased appropriation to the State Bureau of Immigration, which is now branching out as a State Agricultural Employment Bureau. It also passed a State-wide bill authorizing the County Commissioners to appropriate $1,000 of the county funds to promote the Co-operative Demonstration Service in conjunction with the United States Department of Agriculture. But it did not ask itself if it might not be possible to co-ordinate and correlate all these agencies under direction of a strong State Board of Agriculture. Nor was anything of this kind suggested by the trustees of the Maryland Agricultural College, who were made a State Board of Agriculture in 1908, without any duties whatsoever being prescribed for such a Board.

If the farmer looks at this legislative harvestfield, the smile depicted in the cartoon mentioned will soon come off. If he sits down under some shady tree to scratch his head, he will soon find that the trouble is with his own lack of organization. If he makes up his mind to cure that, he will arrange with somebody to do the chores during the legislative session of 1916, while he goes to Annapolis and crowds the suffragettes, the uplifters, the oystermen and the city politicians out of the State House corridors until he, once and for all, gets a few of these things straightened out to his own satisfaction and the state's profit.—S.

STATE CAPITAL NEWS

Taxation Ignored.—Little is being heard about the subject of equalization of taxation or some means of bringing about an adjustment in the interest of fairness of the valuations of the farm lands of the State. Except for some glittering phrases which might be interpreted more as amiable recognition of the subject than otherwise none of the political parties or candidates have given this topic the attention it merits. It has been pointed out by the State Board of Education in official reports, discussed on the floor of the legislature and time and again mentioned by the State Grange that the values of rural districts are not commensurate with those in the city, the advantage being all with the urban community, which has a thousand lines of support, to one on the farm. It is to be hoped that something will be done to make the taxation laws simple and to raise the load resting on farms.

Substantial Aid Needed.—There are signs that the next legislature will be asked to either repeal the township road bureau act of 1913 or else to quit

keying and make an appropriation ficient to enable the act to be carri- out as contemplated. The whole mat- goes back to the highway or "dirt d" bill of several years ago. This islation was enacted without very ch thought as to what it would cost d agreement made that the state uld pay to townships a bonus for lishing the work tax. When the nships began to collect the road tax cash the solons recognized the tre- ndous blunder made in passing the before they knew what it was go- to cost, but never once has an ap- priation that would meet the obliga- n been made.

Threshermen Here. — Men owning ction eng nes, threshers and other ap- ratus which must travel along the ds left no doubt in the minds of vone here that they meant business their campaign against the law regu- ing licensing of traction engines and regulations established by the State ghway department. The law was con- nned as unfair, notwithstanding some e called attention to the fact that ere was a constant tendency to in- se the weight of engines and that e were being built in excess of 26,- pounds weight and that the buildi g roads in this state had not reached rfection. As for the regulations made y were called arbitrary. There is bably something to be said on both es.

State Aid Roads.—After weeks of dying of plans the State Highway de- rtment has asked for bids for the struction of eight or ten sections of hway under the state aid plan. This the first of a lot of about thirty such tions planned if the money holds out. e fund for building highways under state aid plan of half the cost be- borne by the state and half by the nty and borough or township, as the e may be, is about the only one that State Highway department has to end upon.

Hay Rates High.—So many com- nts about charges on hay rates have e before the Public Service Com- ssion that considerable attention is ng given to such rates in the tariffs d with the commissioners under the of last year. A study is to be made ascertain whether there is any dif- rence worth mentioning between lo- ities, and a report will be made to e board. Similar action is to be taken regard to fertilizer about which there s been complaint from time to time.

Farmyard Drainage.—The State De- rtment of Health plans to issue a lletin on the subject of farm yard inage. It is believed that many farm- s are not only polluting streams, but e losing valuable fertilizer because failure to construct modern manure s. Letters sent to the Department of alth from places where farmers built crete vaults for their manure indi- te that valuable results have been ob- ned and that water which formerly ined away has been used on gardens th much satisfaction. The farm ad- ers who are now engaged in work ruout the State are giving attention questions on improvement of drain- e.

Bulletins Destroyed.—The fire which stroyed the plant of the printers en- ged in completing various state con- cts unfinished on July 1, ruined cop- s of the bulletin on beef production ued by the department of agriculture is spring. Only about one-third of the lletins had been put out and the rest re awaiting binding. Owing to the mand for bulletins of this department is likely that they will be republished. e reports of the Chestnut Tree Blight d Water Supply Commissions were o destroyed in the fire, but the copy s preserved. The copy for the study the soils of the state by counties is in e hands of another printer and will be ued later in the year.—Hamilton, rrisburg, April 13.

NEW JERSEY FARM NEWS

State College News.—Professor F. C. inkler of the department of animal sbandry and principal of the short urses in agriculture, has been engaged reorganize the city farm of Paterson. Hog raising will be one of the most im- rtant industries. Plans are being de by the faculty of the extension partment under the direction of Prof. lva Agee, for an extended trip dur- g the spring vacation by agricultural udents, the intention being to visit e Southern experiment stations and include the members of the junior ass in the party. The new $100,000 ricultural building practically is com- eted and the offices of the experiment tion will be removed there. A demonstration in apple-judging was given by a team picked from the members of the junior class of the agricultural courses. About twenty members of the senior agricultural class in charge of Prof. A. C. Stillwell, made a trip to High Bridge to study methods of pruning and spraying fruit trees. The use of an orchard there was obtained by the faculty. The students also were given an opportunity to compare recent scientific methods with older ones.

State Farmers at Frisco Exposition.—At the last meeting of the State chamber of commerce, the committee on agriculture reported steps taken to bring together representatives of each county for united effort toward making an exhibition of agricultural products at the Panama-Pacific Exposition in 1915. The State board of agriculture the State grange and the State horticultural society have united to ask for an allowance, adequate to insure a creditable display. As a great State daily puts it: "Every State in the Union will send its visitors to the Panama-Pacific Exposition, and New Jersey can, if it will, show them some mighty fine reasons for settling right here."

The State's Timber Supply.—New Jersey has still a timbered area of about 2,000,000 acres (twice the cultivated land area,) on which the timber is worth about $8,500,000 on the stump. It is mainly valuable for cord wood. Strong efforts are being made by the State Forester and State Fire Marshal to conserve all this timber. Why should not such timber land be cleared and cultivated? The soil of the forested area of North Jersey will grow apples and truck crops to perfection, while that of South Jersey's famous "Pine Barrens" will grow the finest asparagus, berries and peaches to be grown anywhere.

Heavy Snows May Help Crops.—The heavy snows of the last two months which did considerable damage to fruit trees may prove a blessing in disguise. Since the disappearance of the snow from the fields, soil conditions have been found to be ideal and crops have a better start this spring than for several years due largely no doubt to the storing up of moisture for future use of fruit and truck crops.

Orchard Demonstration Work.—The New Jersey State experiment station and the Mercer county farm bureau have arranged to make a demonstration orchard of the hill orchard of J. C. Errickson at Pennington. Mr. Errickson will develop the orchard as a commercial proposition with the assistance of the station and bureau. Prof. A. J. Farley will represent the station in outlining the work. The orchard will be pruned, sprayed, cultivated and fertilized according to the best known methods with the purpose of demonstrating that such methods are commercially profitable. Public demonstrations of the various processes will be held from time to time. Pruning demonstrations have also been given in various orchards in Sussex county.

Other New Laws.—Among new laws which have been added to the statute books of the State are these: Senate 124, permitting boroughs to improve roads and to be reimbursed for the cost thereof by the county and the State, but necessitating the approval of the State road commissioner; House 271, repealing the act of 1909 exempting county lands from municipal tax up to fifty acres; House 545, providing that municipalities may widen or straighten county roads within their limits; Senate 51, fixing a standard measure for cranberry barrels; Senate 82, permitting the payment of taxes in instalments. Assemblyman Nutting's canning bill, requiring canners of food to place on their labels the date the food was packed, was defeated. As a special committee, Senators Ackley, Gaunt and Smick have reported some amendments to Senate Bill 252 with regard to school study courses in rural districts, which provide absolute home rule to the districts in this regard.

State Closes Dairies.—Four dairies which distributed milk in Atlantic City and South Amboy were forbidden to continue business last month by the inspectors of the creamery and dairy division of the State board of health. The license of one ice cream establishment in Salem county was revoked for alleged carelessness in handling milk. All milk dealers who have apparatus for pasteurizing milk have been notified of the adoption of a rule by the board requiring the equipment of all machines with devices for holding milk for 20 minutes at a temperature of 145 degrees Fahrenheit.

Concrete Roads Economical.—Future new roads in New Jersey may be built of concrete and not of macadam, as formerly. Concrete roads, costing somewhat more than the macadam roads, have been built in the West and maintained for four years at a cost of less than $5 per mile per year. The surface of these roads, it is said, is in as good condition as when first thrown open to traffic. Thus, from the investment standpoint, solid roadbeds on main traveled highways would be much cheaper than macadam. Official reports state that in New Jersey the maintenance of macadam roads has been in excess of $900 per mile per year. This represents the investment on $18,000 at five percent. Assuming the first cost of a macadam road to be $8,000 a mile, an investment of $26,000 per mile is really represented. Under average conditions a good concrete road can be built for $12,000, and, as stated, actual experience has shown that up-keep costs are practically negligible.—D. T. Hendrickson.

BUILD WITH EVERLASTING CEMENT

Are you thinking of building a silo, cistern, water tank, fence posts or any other outdoor improvements? If so, build it economically and easily with cement--everlasting cement—which means only one cost—that of building—and no up-keep expense. Be sure though to use a cement that is ahead of the U. S. Government test and all other standard tests. That cement is

DEXTER PORTLAND CEMENT

and insist upon the dealers supplying you with **Dexter**. Don't take the "just as good."

Pick out your California Farm **this** Spring

Look into the money-making possibilities of dairying, poultry-raising and fruit-growing in the San Joaquin Valley — heart of Golden California — now. This year will see thousands of home-seekers in California. **Your** foresight should lead you to anticipate this influx.

Here is a wonderfully fertile valley whose deep, rich soil, all-the-year-'round growing climate and irrigation facilities make it a food factory that produces a great range of crops in bountiful measure. Its location gives it ready access to markets eager for all that can be produced.

It is already a well-developed country. People here get together and coöperate to save and to make money for each other.

I am here to help you to locate to advantage. I am not selling land — but I can point out the land best adapted to various crops. I can save you time and travel. I want to secure ambitious, progressive farmers to cultivate these prolific acres along the Santa Fe.

Write for our free books, "San Joaquin Valley," "Dairying" and "Poultry." Read what they tell of the **reasons why** this country is good — of people who have made successes, and how — of results which **you** can get if you have only the necessary energy and ambition.

I would like you to read what the farmers already here have to say in regard to what has been done by them to win fortune in this land of big returns.

Send coupon, or your name and address on a postal, saying "San Joaquin Valley." This will bring the books promptly and any additional information desired. Write today.

C. L. Seagraves, Genl. Colonization Agent,

Poultry

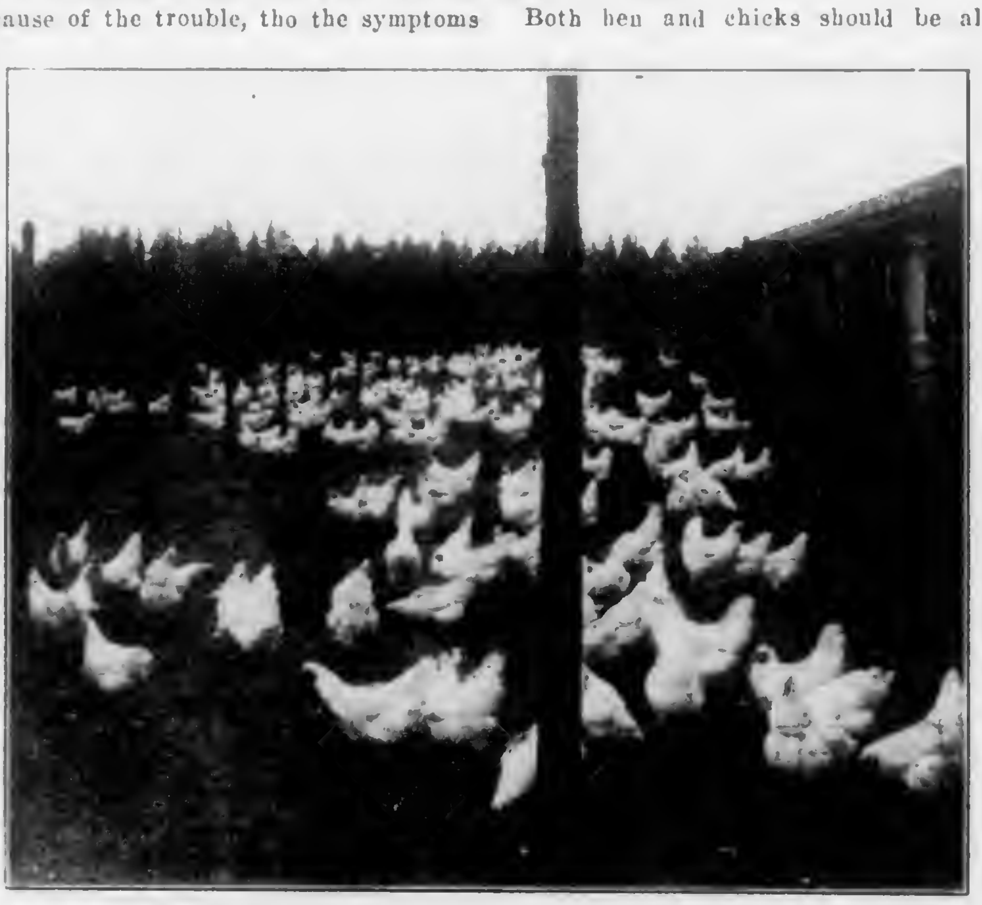
POULTRY QUERIES

Answered By J. T. Campbell.

I am writing to ask if you can tell me the cause for losing one of my hens. She had been a very poor worker, standing about most of the time, which I thought might come from overfeeding. Otherwise she appeared to be in good condition. Two days before she died she apparently lost her appetite completely, altho I had cut down considerably on the feed. This continued until the last day, when she did not come from the roost until late in the morning, huddling in one corner of the house and dying in the evening. On cutting her open I found her quite fat and the body full of water, greenish yellow and very offensive. She had a batch of eggs and apparently would have laid within a week. A number of other hens show the same symptoms.—A. K., Pikesville, Md.

It would seem that the liver was the cause of the trouble, tho the symptoms are not definite enough to enable me to more than guess at the matter. Such troubles are generally produced by improper nourishment, lack of green food, etc. It is well always to keep in mind the fact that the natural functions of the animal organism can be maintained at their best only when the animal has an opportunity to eat the foods which supply the calls of the animal system fully. Many persons do not provide for this in poultry feeding; hence the fowl is compelled to eat a large amount of something she does not need in order to get a bit of some element which the system craves. If these conditions are prolonged for a time it must result in an abnormal condition in the system and finally death. This is more apt to be the case where birds are closely confined than on the farm where free range enables the birds to satisfy their desires.

Feed the birds plenty of good, clean grain. Feed it whole. Provide a box of dry beef scrap and wheat bran for them, using equal parts of bran and dried beef scrap. Supply oystershell and crushed limestone at all times and do not forget the green stuff in the way of grass or mangels or cabbage. Go a bit slow on sprouted oats. Feed a liberal amount of charred corn once a week.



AN ENVIABLE FLOCK ON THE WOLSIFER FARM, NEW JERSEY.

BROILERS ON THE FARM

The early chick is the most profitable, yet there is profit in the late chick provided it is not too late.

In a section where there is a good demand for light-weight roasters and broilers of from two to two and a half pounds, a splendid opportunity is furnished those who wish to rear and market chicks without being obliged to house them. Hatched in May or June, they should easily weigh two or two and one-half pounds before Oct. 1. If especially well fed, they should reach that weight still earlier. This is the most favorable time to hatch and raise chickens, as the parent stock has been out of doors long enough to acquire splendid health and remarkable vigor. Eggs, if sensibly set, should hatch almost perfectly and the chicks should live and thrive.

The equipment required is very small—a good sized box or barrel, covered with waterproof paper, set in a dry sheltered place, may be used both to set the hen in and to house the brood, tho the barrel is rather unsuitable for the brood after the chicks are weaned, especially if there are many of them.

Both hen and chicks should be allowed free range after the chicks are a few days old, to pick up a large share of their living, but in addition it is a good plan to feed them at night, and to give them all they can eat, as they will grow faster and will either be marketable at an earlier age or weigh more, and consequently bring more, at a given time. Chickens of this weight, will not, it is true, bring a fortune, but it must be remembered that they cost very little to rear. The fact that the earlier they are marketed, the better the price, should not be lost sight of. For this reason, it pays to feed them a little where there is not an opportunity to pick up abundance of food.—A. C. Smith.

HATCH EARLY

Perhaps there is no branch of farming that develops so many details as poultry work. One essential of poultry keeping which is being overlooked by the average farmer is that of getting the chicks hatched early. An immature pullet will not lay eggs. It can't. Therefore, if eggs are desired in the late fall and winter it is necessary to get the chicks hatched out during the months of March and April. Then they will be matured if fed properly by November and should begin laying and keep at it all winter.—V. R. N.

RESPECT FOR THE COURTS

When the founders of this government divided it into three separate branches, legislative executive and judicial, it was intended that these three should be distinct and untrammelled in their action. But as time has passed we find that the function of the legislative branch has been transgressed upon by both the executive and judicial.

The administration has gotten to be the greatest deciding force in the legislative work of the Federal, and, indeed of many, of the state governments. This idea was largely developed by Mr. Roosevelt. Mr. Taft tried to continue it, but lacked the strong personality necessary to maintain the colusion of forces. Under the strong personalities of Mr. Wilson and Mr. Bryan it is being developed again in greater degree than ever. Yet it is absolutely wrong in principle and pernicious in practice. In the hands of men like Roosevelt and Wilson it is especially dangerous, because of their superb ability to handle and control men. While it is true that the constitution gives the President the right to take an interest in the promotion of legislation, it certainly was not intended that the legislative branch of the government should become the tool of that mixture of personality and patronage called the administration.

It seems to be taken for granted that the President is more responsible to the people than the congressmen and that, therefore, he is justified in wielding every kind of controlling influence to accomplish in legislation what he thinks best. In the hands of a man like Mr. Wilson this might work out to the good of the body politic. He seems to be a man of broad vision and honest purpose, but we are not in a position (unless we have ceased to be a democracy) to accept paternalism even from a good man.

Senators and representatives do well to fight such a policy tooth and nail. The congress was given the making of our laws, encouraged on the one hand by the messages and personal advice of the President, and restrained on the other hand by the veto power vested in the President. Any influence exerted upon congress such as the trading of federal patronage for support of certain bills is a usurpation of the legislative function which can only result in breaking down more and more the purity of our democracy. There is less excuse for this interference today than in the past, because the U. S. Senate, which has been very irresponsive to the will of the people, is now being elected directly by the people and will be more anxious to do what they were intended to do.

However the executive branch of the government has not been alone to blame in not keeping to its own business. The Judicial branch has been even more to blame. It has usurped a part of the legislative and a part of the executive branches of government and has tried to make up for this usurpation by the assumption of a dignity entirely out of place in a democratic form of government. The wearing of a particular kind of gown and the austere and haughty dignity of carriage and manner are relics of the dark ages which our courts would do well to dispense with.

Respect and reverence are things not to be asked for but must come as a recognition of desert. Men today are pleading in public speeches for respect for the courts. We are admonished not to question the integrity of courts, and other such like expressions. It is no use to make such appeals. The courts have made themselves a laughing stock to those who understand English, but who cannot fathom these word contortions and hair-splitting distinctions by which the evident intention of the language as well as the known purpose of the legislators who framed the language is made to carry a meaning in many cases exactly opposite to that which was known to be intended.

Legal interpretation has gone down from what the law means to what it might possibly be made to mean. The function of the judiciary in our form of government was to be a place where an official interpretation of the law would be made whenever any difference of opinion arose as to its meaning. But instead, we find the word "unconstitutional" is one of the biggest hindrances in the workings of our legislative branches of government. A usurpation to start with and an abuse in which the paucity of ideas is hidden in the fecundity of expression to such an extent that the very constitution itself instead of being upheld by the courts is the football of the courts for the benefit of the special interests.

The way for the courts to regain respect is to compell it by doing what they ought to do. They can give the right meaning of the law as the official one just as easily as a technical one. They can uphold the constitution as easily as to make it contradict itself. They can make law simple and easy of construction more easily than they can make it difficult and uncertain; and when they do they will not need the "ermine" to bring respect and unless they do these things all the appeals that can be made by word or costume cannot arouse those deeper feelings of the human heart which we call reverence and respect. People do not soon forget such actions as the reversal of the decision a few years ago on the income tax and the one reading into the law controlling trusts the word "reasonable." But the courts will have to learn that deeds count, not professions.—John A. McSparran.

GOOD ROADS FOR FARMERS OR ROADS GOOD FOR FARMERS

It is about time those benevolent individuals who spend so much time and energy in demanding "good roads for farmers" should change their cry to "roads good for farmers." The good roads that modern engineers are making are not good for farmers at all and, in fact, are of but little use to them. Even where the farmer has not been practically crowded off the roads by automobiles, he finds the surface of the oiled and polished macadam so slippery that he has to drive in the gutter and that at the risk of the lives and limbs of his animals and himself.

Time and again it has been demonstrated that a good macadam road can be constructed for about $4,500 a mile, where excessive grading is not required. The modern roadway is costing about $12,000 a mile with a far greater cost for up-keep than the old-time road, which, when properly cared for, was a road good enough for anybody. The rolling, sprinkling, sanding, oiling and polishing of the surface to make it acceptable to automobilists makes a most expensive highway and one that is of but little use to the people who have to pay the bulk of the bill for its construction and maintenance.

The farmer is encouraged to shout and vote for good roads. He is told that they will enable him to haul bigger loads to market and will make his land more valuable. The latter statement he finds to be true—for taxing purposes. But when he goes to market he finds the new road so smooth and slippery that he can haul no load over it, for his horses can scarcely get a toe-hold to pull an empty wagon, and he has to take some roundabout, old-time road after all.

The automobile is an enjoyable luxury —when it does not commit manslaughter—but the fact remains that fully 90 percent of its use in country districts is still for purposes of luxury solely. Take your position on any of our suburban roads on a nice afternoon and form your own estimate of what proportion of the number of machines that pass you are going on any serious purpose of business or on trips which could have been made less expensively by other means of locomotion.

But people have a right to spend their own money as they may choose. The main objection that the farmer has to the present manner of improving roads is that other people are spending his money in an extravagant way — they are making him pay for a road which is largely for purposes of sport and not for the real industrial development of the country. As a rule, the driver of the automobile doesn't want to go anywhere in particular, so the farmer should not be blamed if he suggests that speedways be built for them. Just let them have cicular tracks where they can keep on going around and around. Build the country roads in the manner of the old-time 'pikes, finished with stones the size of a hickory nut. The automobilists will find that they can use them very well, and if the surface is not so smooth maybe they will be restrained from dangerous bursts of speed, thus making the roads safer for themselves and for other travelers. Good, hard roads are very desirable, and we can not have too much of them, but the veneered surface is not an unmixed blessing by any means.

Since the world began the farmer has been its mainstay, and he always will be. And since the world began a good many people who make their living off him in one way or another have been trying to sell him gold bricks, with many variations of the game. It looks a good deal as if the modern good road, so far as he is concerned, is another one of those misleading, glittering parallelopipedons.—Union News, Towson, Md.

JUST THE PAPER HE WANTS

Enclosed find a list of subscribers to Pennsylvania Farmer for one year from January 1, 1914 to January 1, 1915. Pennsylvania Farmer is just the paper I have been looking for. About a year ago I saw mention of it in the Grange News and wrote you for a sample copy and have been a subscriber since and the enclosed list of subscribers will show you how I appreciate it.—J. H. Keilman, Barnesville, Pa.

Low 30-Day Price On Edwards STEEL Shingles
Never Rot Rust or Burn
Don't make a single move toward that new roof until you get Edwards' Special Cut-Price Proposition for April. Save $15 to $30 under best wood shingles and get a genuine leak proof, rust-proof, fire-proof and lightning-proof STEEL Shingle roof. A roof that will outlast your house or barn.
Put On With Hammer and Nails
You can lay an Edwards Steel Shingle Roof ten times as easy and ten times as quick as wood shingles. Shingles come in big sheets, 100 in a cluster. Lay them right over old roof or sheathing if you like. No painting, no extras to buy. Everything furnished.
Can't Leak — Can't Burn
Edwards "Tightcote" process (covered by patents) means dipping in melted zinc after cutting and stamping. Close-fitting overlap protects nail-holes. No place for rust to start or water to get in. Roof when laid is really all one piece. No Edwards Steel Roof ever struck by lightning. We back this statement with a $10,000 guarantee bond. You get this guarantee when you buy.
Special April Price, Freight Paid
Recently we made a most advantageous purchase of steel. So for 30 days only we are able to quote a price that will astonish you. Send for new Bargain Circular No. 4 91 and give dimension of roof if you can. Thousands are writing, so don't delay.

"Can't-Sag" Gates & Steels

Mrs. Skeptic—"Oh, go 'long, Anty Drudge! Telling me I don't need to boil nor hard-rub my clothes. Everybody I know *always* has washed clothes this way."

Anty Drudge—"No, they haven't. Some heathen places they beat them with stones to get them clean. Why don't you do that if you *like* the hardest way? But if you want the *easy* way, just use Fels-Naptha Soap."

What does washday mean to you? Standing all day, drudging over the washboard, rubbing the dirt out of your clothes, and boiling them to pieces; filling your house with steam and smell, and making yourself tired out? Or

Thirty minutes for the clothes to soak in cool or lukewarm water with Fels-Naptha Soap; a light rub with the hands, rinsing and hanging on the line in half the time, with less than half the trouble than ever before?

Fels-Naptha works for you in cool or lukewarm water.

Buy it by the carton or box. Full directions are on the Red and Green Wrapper.

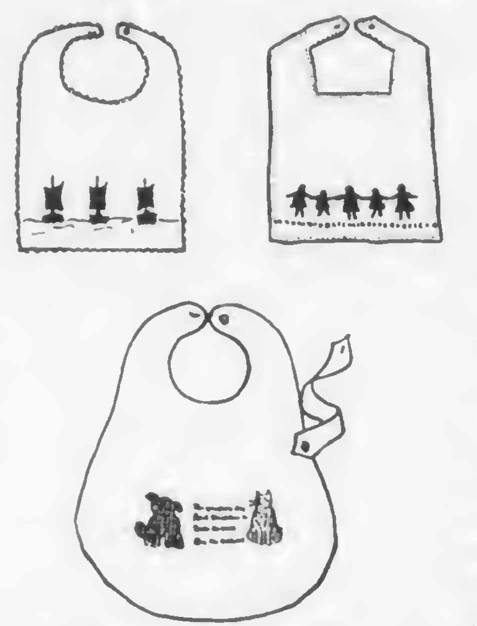
SOME THINGS FOR THE BABY
What To Give The New Baby

Perhaps it would be more to the point to say, what not to give the new baby, for probably nine young mothers out of ten receive a set of gifts whose prettiness is equalled only by their uselessness. For example, one baby was presented with two pairs of narrow-soled, pointed-toed boots, warranted to lay the foundation of corns and bunions at the outset; an expensive cradle pillow, heavily perfumed with sachet powder which puffed out whenever it was shaken, and covered with a hand-made slip all over rough little pink rosebuds that faded the first time it was washed; a pale blue cashmere jacket lined with silk, ruined the first time of wearing by an overflow of milk; a worsted jacket crocheted in open stitches thru which the infant pushed its fingers and was continually entangled like a fly in a cobweb; a bead necklace, the string of which broke immediately, scattering the beads and terrifying the mother with the fear that some had been swallowed; and so on thru a long list.

Anything intended for baby's intimate use should be washable, if its nature anywise permits. A cradle pillow is of no use, however smooth and free from dust of any kind, because a young baby's head slips down from even the smallest pillow. A plain cushion, about 16 inches square, for the carriage, with two or more slips to fit, so that there may be enough for a change, all trimmed simply with a frill of embroidery around the edge, is a really desirable gift, fitting into a place which is waiting for it. Instead of silk and cashmere jackets, two little flat sacques of the kind that are tied in shape under the arm with a ribbon, made of white or pale-tinted Scotch flannel, bound at the edge with taffeta and possibly feather-stitched to match, would be much better, and much cheaper, and they can be laundered and made as good as new when soiled. As for necklaces, any kind is dangerous for a baby, for if the cord or chain is too strong to be broken by a tug of the little hand, it may become twisted about the neck and strangle the child.

Something that fills a daily want and fills it well, that saves time and trouble, something the preservation of which is not a constant care, is the sort of gift which makes a busy woman truly grateful. One of the most continuously useful things a baby can have is a pair of blankets made of ordinary white flannel, about 40 inches square, bound around the edges with white, pink or blue taffeta binding. These are not bulky or heavy, are easily washed, and can be wrapped about the child or spread over it without catching the little fingers and toes as does a knitted or crocheted shawl. Another gift whose usefulness bears no relation to its cost is a set of homemade wash-cloths. Three yards of the finest grade of cheesecloth, costing 10 cents a yard, will make twelve, ½-yard squares. The edges are folded in the narrowest possible flat hem, and are hand run with fine stitches of No. 100 cotton, so that they will be soft. When all are done they should be boiled to sterilize them, ironed and folded, and tied up in tissue paper with narrow ribbon to make a dainty parcel. Most trained nurses prefer to use a cloth instead of a sponge for the baby, as a sponge cannot be boiled. Another thing nurses and mothers like for babies is woolen stockings instead of knit or crocheted bootees, for there is no openwork about the stockings to catch the baby's toes, and the stockings come up well above the knee and can be fastened to the underwear with safety pins.

Plain, everyday dresses are always acceptable, as a baby needs frequent changes. A petticoat with waist as well as skirt made of flannel, with armholes, and fastening with buttons and buttonholes instead of safety-pins, is sure to be welcome. Two pique carriage robes, with a frill of embroidery around the edge to match the pillow-slips, can be used summer or winter, and insure a clean, fresh aspect for the baby's turnout. In cold weather a padded quilt is tucked around the baby under the robe, and is really warmer than the fluffy knit afghan so often seen, because the latter is easily penetrated by wind while the quilt is impervious.



BABY'S FEEDERS OR BIBS.

Thumbless mittens are far more easily put on baby's fist than those with thumbs, and the baby does not know the difference while the mother does. Ease of adjustment counts for a great deal in a baby's wardrobe. The armholes of a baby's long coat ought to be made much larger in proportion than those of a grown person, as othewise it is a work of time and tears to get on the sleeves. However temptingly pretty the articles in the baby-shops may be, most of them are made to sell rather than to use. Therefore choose clothes not too good to be worn, toys without buttons or trinkets to be torn off and put in the mouth, accessories without loops or ribbon to catch. A safety strap for the carriage, a teething-ring, a feeding spoon, a box to hold the baby's toys, a crib quilt, a large Turkish towel to wrap the child in during its bath, are all gifts that the giver may be sure will be welcome, because they are really helpful.

"Feeders"—They Used To Be Bibs

One unfortunate person asked a saleswoman where she could find children's bibs and was politely but firmly told that in this particular and exclusive shop they were called "feeders". Somehow this new name does not seem to fill all the duties of a bib, but the feeders themselves surely do. They are cut by much the same pattern as an ordinary bib, generous in size and straight across the bottom.

The old nursery rhyme "I saw three ships come sailing by" was attractively illustrated on one. The three ships with large square sails and rather pointed "fore and aft", were of blue cross-stitch. This bib was button-holed around the edge in blue. What looked like a row of paper dolls danced across another bib. Everyone has made these strings of dolls holding hands out of a sheet of paper that has been folded a great many times. The dolls on the bib were cross-stitched, first a blue doll with a red belt, then a red doll with a blue belt; they were not really handsome, but it is the obvious thing that appeals to children.

Here is shown an old-fashioned bib pattern that is almost a pinafore in size, cut in one piece to go around the neck and with a strap under the arms across the back, which buttons it tightly in place. A bib of this pattern in heavy linen, bound around the edge with braid, was dedicated to Eugene Field's "Gingham Dog and Calico Cat." The animals were about 4 inches high; the dog, cut out of crossbar blue and white gingham, with button eyes and a red embroidered mouth, was gazing at the cat, cut out of blue and white figured calico, which sat opposite. They were applied to the linen with coarse buttonhole stitches, and between them this verse was written in cross-stitch,

"The gingham dog and the calico cat
Side by side on the table sat."

—Marie Royle.

CARAMEL RICE PUDDING

For the caramel: Four ounces of loaf sugar, a quarter of a pint of water. For the pudding: Three ounces of rice, one pint of milk, one tablespoonful of powdered sugar, two eggs, vanilla essence.

Boil the sugar and water till a light-brown color appears, then pour the resulting mixture into a plain mould till every part of the latter is coated with caramel. Stew the rice, add the eggs, sugar and flavoring. Pour this combination into the mould, cover with grease paper; steam for almost an hour. Serve either hot or cold.—L. I.

When Madeline Made Up Her Mind

Drawn Expressly for Montgomery Ward & Co., by Orson Lowell

The low prices quoted in Montgomery Ward and Company's Catalogue, convinced her that even small savings and earnings are sufficient to make and suitably maintain a home.

The Big Bargains and Big Values dispelled her doubts and prompted her decision—just as they have for *four decades* prompted the decisions and then *materialized* the fondest dreams of *thousands* of Madelines.

Dealing with Montgomery Ward & Co. makes money *worth* more—it increases the purchasing power of *every penny*—for every article listed in Ward's immense thousand-page catalogue is offered at profit-sharing prices.

Every buy shows a big saving; staples as well as slow sellers are supplied at remarkably reasonable prices. Life's necessities as well as luxuries are furnished at figures that make more purchases possible.

But to fully comprehend the "*bigness*" of Ward Bargains, the superior quality secured as well as the savings realized must be considered—Ward's Big Book is as famous for the excellence of its merchandise as for its small profits and money-saving prices.

Send for Montgomery Ward & Company's latest and greatest catalogue. Learn the Ward way of shopping—the method of merchandising that makes Mail buying as convenient and satisfactory as personal-purchasing. Let the Big Ward Book lighten the burden of home-building and lessen the strain and struggle of "money-making" by lowering living costs.

CHAPTER I.

The Masters

I heard about the pair first from Emeline Eldredge, “Emmie T.” we always call her. She was first mate to the cook at the Old Home House that summer. She come down to the landing one morning afore breakfast and hove alongside of where I was setting in the stern of my sloop, the Dora Bassett, untangling fish lines. She had a tin pail in her fist, indicating that her sailing orders was to go after milk. But she saw me and run down in ballast to swap yarns.

“My sakes! Mr. Pratt,” says she: “have you heard about Nate Scudder?”

“Yes,” I says. “Ever since I come to Wellmouth.”

“I mean about what him and his wife has just done,” says she. “It's the queerest thing. You'll never guess it in the world.”

“Ain't been giving his money to the poor, has he?” says I, for, generally speaking, it takes a strong man and a cold chisel to separate Nate Scudder from a cent.

“Oh! ain't you the funniest thing.” she squeals. “No indeed! He's let his house to some city folks, and——”

“Ain't that the cook calling you?” I asks. I'm a homeopath when it comes to Emmie T.; I like to take her in small doses—she agrees with me better that way.

It was the cook, and Emeline kited off after the milk, only stopping long enough to yell back: “Folks say they're dreadful rich and stylish. I'll tell you next time I see you.”

Well, I cal'lated she wouldn't—not if I saw her first—and didn't pay no more attention to the yarn, except to think that June was pretty early for city folks to be renting houses. There was only three or four boarders at the Old Home so far, and I was to take a couple of 'em over to Trumet in the sloop that very day.

But, while we was on the way over, one of the couple—sort of a high-toned edition of Emmie T. she was—she turns to her messmate, another pullet from the same coop, and says she, “Oh say!” she says. “Have you heard about the two young fellers from New York who've rented that Scudder house on the—on the—what do they call it? Oh, yes! the Neck road. I heard Nettie Brown say they were too dear for anything. Let's drive past there tomorrow: shall we?”

So there it was again, and I begun to wonder what sort of critters Nate had hooked. I judged that they must be a kind of goldfish or he wouldn't have baited for 'em. Nate ain't the man to be satisfied with a mess of sculpins.

I landed the boarders at Trumet and they went up to the village to do some shopping. Then I headed across the harbor to shake hands with the Trumet light keeper, who is a friend of mine. His wife told me he'd gone over to town, too, so I come about and run back to the landing again. And I'm blessed if there wa'n't Nate Scudder himself, setting on a mackerel keg at the end of the wharf and looking worried.

I hadn't hoisted the jib on the way down, and now I let the mainsail drop and went forward.

“Hello, Nate!” I hailed, as the Dora Bassett slid up to the wharf.

He kind of jumped, and looked at me as if he'd just woke up.

“Hello, Sol!” he says, sort of mournful. Then he turned his eyes toward the bay again and appeared to be starting in on another nap.

“Hear you got some boarders over to your home,” I says, heaving him a line as hint for him to come out of his trance and make me fast.

“Yes,” says he, paying no attention to the line.

“Come early in the season, ain't they?” says I, grabbing hold of one of the wharf spiles and bringing my boat alongside easy as I could.

“Ya-as,” says he, again. Then he fetched a long breath and opened his mouth as if he was going to go on. But he didn't; all that come out of the mouth afore it shut up was another “Yes.”

I made the Dora Bassett fast myself and climbed on to the wharf.

“Are they cal'lating to stay long?” I asks. He'd got me interested. Seemed to have the “yes” disease bad.

“Hey?” says he. “Oh—er—yes.”

I was a little mite provoked. Not that I was hankering to have Nate Scudder heave his arms around my neck and tell me he loved me, but I didn't know any reason why my pumps should suck dry every time I tried 'em.

“Humph.” I grunted, starting to walk off. “Well, be careful of yourself; look out it don't develop into nothing worse.”

“What do you mean?” he sings out, seeming to be waked up for good, at last.

“Oh,” says I; “I judged by the way you kept your mouth shut that you had sore throat and was afraid of getting cold. Good day.”

Would you believe it, he got up off that mackerel keg and chased after me.

“Hold on, Sol!” he says, kind of pleading. “Don't be in such a hurry. I wanted to talk to you.”

I had to laugh; couldn't help it. “Yes,” says I, “I kind of suspicioned that you did, from your chatty remarks. If you'd said ‘yes’ nine or ten times more I'd have been sure of it.”

“Well, I did,” he says. “I wanted to ask you—I thought I'd see what you thought—you see——”

Here he kind of faded away again, and stood still and wiped his forehead.

“Look here, Nate Scudder,” I says, “for a man that wants to talk you make the poorest fist at it of anybody ever I see. Why don't you try singing or making signs? I wouldn't wonder if you got ahead faster.”

He grinned, a feeble sort of lopsided grin and tried another tack.

“You was speaking of them boarders of mine,” he says.

“Yes; I was,” I says.

“They come day afore yesterday—early,” says he.

“Um-hum. So I heard,” I says.

He fidgeted a minute or so more. Then he took me by the arm and led me back to the keg.

“Sol,” he says, “set down. I want to ask you something. By gum! I got to ask somebody. I'm—I'm worried.”

“Yes?” I said, giving him a little of his own medicine.

“Yes. Them boarders—they worry me. Me and Huldy set up till nigh eleven o'clock last night talking about 'em. She thinks maybe they stole the money, and I don't know but they're crazy, run away from an asylum or something. You've seen more city folks than I have, being around the hotel so. See what you think.

“'Twas this way,” he went on; “I got a letter from the feller in New York that I sell cranberries to. He said a couple of friends of his wanted to come to a place in the country where 'twas quiet. Did I know of such a place round here? Well, course I wrote back that 'twas nice and quiet right at our house. There wa'n't no lie in that, was there, Sol?”

“No,” I says. “I should say 'twouldn't be shaving the truth too close if you'd said there was more quietness than anything else down on the Neck road.”

“Well,” he goes on, not noticing the sarcasm, “I wrote and never got a word back. Me and Huldy had given up hearing. And then, yesterday morning, they come—both of 'em. Nice lookin' young fellers as ever you see, they are; dressed just like the chaps in the clothes advertisements in the back of the magazines. The biggest one—they're both half as tall as that mast, seems so—he took up his hat and says, kind of lazy and grand, like a steamboat capt'n:

“‘Mr. Scudder?’ he says.

“‘That's my name,’ says I. I was kind of suspicious; there's been so many sewing-machine agents and such round town this spring. And yet I'd ought to have known he wa'n't no sewing-machine agent.

“‘Ah!’ he says. ‘You've been expecting us then. Has the luggage come?’

“What in time did I know about his ‘luggage,’ as he called it?

“‘No’ says I. ‘'Tain't.’

“‘Oh, well, never mind’ he says, just as if a ton or two of baggage didn't count anyway. ‘Can you give us two sleeping rooms, two baths, a setting room, and a room for my man?’

“‘Two baths?’ says I. ‘Can't you take a bath by yourself? You seem to be having lots of funny jokes with me. Would you mind saying what your name is and what you want?’

“He looked me over sort of odd. ‘Beg pardon,’ he said. ‘I thought you were expecting us. Here's my card.’

“I looked at it, and there was the name ‘Edward Van Brunt,’ printed on it. Then I begun to get my bearings, as you might say.

“‘Oh!’ I says. ‘I see.’

“‘So glad, I'm sure,’ he says. ‘Now can you give us the sleeping rooms, the baths, and the room for my man?’

“‘Humph!’ says I, lookin' back at the house behind me; ‘if me and Huldy bunked in the hen-house and the chore boy in the cellar, maybe we could accommodate you, that is, all but the baths. You'd have to take turns with the washtub for them,’ I says.

“He laughed. He was so everlasting cool about things that it sort of riled me up.

“‘Perhaps you'd like to hire the whole shebang?’ says I, sarcastic, pointing to the house.

“‘He looked at it. It looked sort of cheerful, with the syringa over the door and the morning-glories hiding where the whitewash was off.

“‘Good idea!’ he says. ‘I would.’

“Well, that was too many for me! I went into the house and fetched out Huldy Ann—she's my wife. There ain't many women in this town can beat her when it comes to managing and business, if I do say it.

“‘How long would you want the house for?’ says Huldy, when I told her what was going on.

“‘A month,’ says Van Brunt, turning to the other city feller. ‘Hey Martin?’ T'other chap nodded

“‘Thinks I, ‘I'll scare you, my fine feller.’ And so I says, ‘A month! Well, I don't know. Maybe, to accommodate, I might let you have it for two hundred.’ I sort of edged off then, thinking sure he'd be mad; but he wa'n't—not him.

“‘Two hundred it is,’ he says, and fished out a little blank book and one of them pocket pens.

“‘Name's Scudder?’ he asks.

“‘Yes,’ says I. ‘Nathan Scudder. One T in Nathan.’

“And I don't know as you'll believe it, Sol,” says Nate, finishing up, “but that feller made out a check for two hundred and passed it over to me like 'twas a postage stamp. What do you think of that?”

I didn't know what to think of it. On general principles I'd say that a man who wanted to board with Nate and Huldy Ann Scudder was crazy anyhow; but of course these fellers didn't know.

“It beats me, Nate,” I says. “What do you think?”

“Blessed if I know!” says Scudder, with another of them long breaths. “All I'm sure of is that they're up home, with the parlor blinds open and the carpet fading, and me and Huldy's living in the barn. She's doing the cookin' for 'em till this ‘man’ of theirs comes. Land knows what kind of a man he is, too. And that check was on a New York bank, and I've just been up to Trumet here with it and the cashier says 'twill be a week afore I know whether it's good or not. And I can't make out whether them two are thieves, or lunatics, or what. And Huldy can't neither. I never was so worried in my life.”

I kind of chuckled down inside. The idea of anybody's skinning Nate Scudder was the nighest to the biter's being bit of anything I ever come across. And just then I see my two passengers coming.

“Well, cheer up, Nate,” I says. “Maybe you'll get the reward, whether it's lunatics or thieves. Only you want to look out and not be took up as an accomplice.”

He fairly shriveled up when I said that, and I laughed to myself all the way out of Trumet harbor. One thing I was sure of: them two New Yorkers must be queer birds and I wanted to see 'em.

And the very next afternoon I did see 'em. They come down the Old Home pier together, walking as if they didn't care a whole continental whether they ever got anywheres or not. One of 'em, the smallest one—he wa'n't more'n six foot one and a ha'f—looked sort of sick, to me. He had a white face, and that kind of tired, don't-care look in his eye; and the bigger one sort of 'tended to things for him.

“Good morning,” says the big one—the Van Brunt one, I judged—cheerful enough. T'other chap said, “Good morning,” too.

“Morning,” says I.

“Can you take us out sailing?”

“Why—er—I guess so,” I says. “I don't know why I can't, if you feel like going. Course———”

I hadn't finished what I was going to say afore they was in the boat. Now, generally speaking, there's some bargaining to be done afore you take folks out for a three-dollar sail. Your naturally expect it, you know—not so much from boarders as from towners, but still, some. But not for these two—no, sir! It was this powerful suddenness of theirs that hit me betwixt wind and water, same as it had Nate. Made me feel sort of like I'd missed the train. Stirred up my suspicions again, too.

'Twas a nice day; one of them clear blue and green days that you get early

June. The water wa'n't ruggol, t just choppy enough to be pretty, d the breeze was about no'theast, vin' us a fair run down the bay.

'This is grand!” says the big fel- w, as the Dora Bassott begun to feel r oats and lay down to her work.

'Caesar! Van,” said the other one; why do you bring me down to earth e that? Grand! Bleecker next!” hollered out this last part in a kind screechy sing-song. Then they both ghed.

looked at 'em. There wa'n't no- ng to laugh at, so far as I could see, the “Bleecker” business didn't pear to have no sense in it, either. ey made two or three other speeches t sounded just as foolish. Thinks I, wonder if Scudder's right?” They n't look like lunatics, but you can't ays tell. Old man Ebenezer Doane nt to church of a Sunday morning t as sensible acting as a Second venter could be; but when he got me he fired the bean-pot at his wife, sed his children out doors with a m hoe, and they found him settin' raddle of the hen-house singing

A MORNING CALL FROM THE MINISTER.

eulah Land” to the chickens. ese fellers might be harmless loons t had been farmed out, as you might , by the asylum folks. There was t “man” that Nate said was com- . He might be their keeper.

'I understand you've got a friend ng,” says I, by way of ground t.

'Friend?” says the big one. riend? I don't understand.”

'Scudder said you had another man ing to his house,” says I.

He smiled. “Oh, I see.” Then he iled again, a queer lazy kind of a ile, like as if he was amused at him- f or his thoughts.

'I don't know that I should call a friend. Mr.—er——”

'Pratt,” says I. “Solomon Pratt.”

'Thanks. No. I wouldn't go so far to call him a friend; and yet he's t an enemy—not openly.” He smil- again, and the other chap—whose me I found out was Hartley—Mar- Hartley—smiled too.

'He's the man Van here belongs ” explained the Hartley one. They h smiled again.

I kind of jumped, I guess, when he d that. It began to look as if the ylum idea was the right one, and s feller that was coming was the eper.

'Hum,” says I, and nodded my head t as if the whole business was as in as A B C. “Do you belong to ybody?” I says to Hartley.

'I did,” says he, “but he's doing e.”

'Doing time?” says I.

'Yes,” says he, explaining, kind of patient like. “Up the river, you ow.”

I chewed over this for a minute, and I could think of was that the feller must be in a clock factory or a watchmaker's or something.

“Watches?” I asks.

Hartley seemed to be too tired of life to want to answer, but his chum did it for him.

“No,” says he. “I believe it was pearl studs on the showdown.”

Well, this was crazy talk enough for anybody. I didn't want to stir 'em up none—I've always heard that you had to be gentle with lunatics—so I went on, encouraging 'em like.

“Studs, hey?” says I.

“Yes,” says he. “He was a British beast, and Martin was all balled up in the Street at the time—away from his apartments a good real—and the B. B. annexed everything in sight.”

“Go 'long” says I, for the sake of saying something.

“Beg pardon,” says he.

“Nothing,” says I; and we stopped talking.

They seemed to enjoy the sail first rate, and acted as rational as could be, generally speaking. They didn't know a topping lift from a centreboard, so far as boat went, but that wa'n't strange; I'd seen plenty of boarders like that. But never afore had I seen two that acted or talked like them.

(To be continued)

A MORNING CALL

Yes, this is my busiest morning,
  My dishes are still in the pan;
I've churning to do and some baking,
  It's hard work to cook for a man.
Well, there, if this isn't the greatest,
  The minister's coming to call;
And of course it's my duty to ask him
  To dinner and supper and all.

Why, how do you do, Elder Junior?
  I'm so glad you came in today;
Just put down your cane on the hall-seat,
  You really and truly must stay.
We're going to have mince pie for
    dinner;
  I'm sure it will not be as nice
As those that your wife makes at your
    house,
  But I put in a handful of spice.

  No, Robert, you can't have a mouth-
    full
  I ought to have spelled p-i-e
Instead of just calling the name out;
  My sons are too little you see,
To have such rich food as a mince pie;
  But boys on a farm eat so much,
I have to keep stewing and baking
  My apples and doughnuts and such.

I beg you don't go off so early,
  You truly don't bother a bit;
My churning can wait till tomorrow,
  Come, see if our beans are not fit.
I'm afraid that the children annoy you;
  Oh, no, I am glad you can call;
Do come when you're ready to stay
    then
  To dinner and supper and all.

—Alice Annette Larkin.

Let Me Pay the Postage to You On My Big FREE Book

Do You Want to Save $25.00 TO $40.00 On Your New Buggy?

Phelps says he'll save you $25 to $40 on a genuine Split Hickory. Is it worth a postal to find out? Is it worth a postal to see the 125 styles of vehicles and complete line of harness all shown in Phelps' new book? Is it worth a postal to learn the *reasons why* nearly 200,000 *other* people bought

SPLIT HICKORY

vehicles? Phelps sells direct from his own factory—on 30 days' Free Road Test—2 years' guarantee. You keep all the middle profits—you take no risk—everything is clearly photographed and accurately described and all *guaranteed*. Why not get Phelps' book so you can compare with others? Phelps pays postage if you write him a letter or postal. Just say "Send Book."

YOU LOVE FLOWERS

THEN LET US SEND YOU THESE EIGHT BEAUTIFUL ROSES.

These are the kind that bloom every month in the growing season and possess the excellent qualities of vigorous growth, freedom of bloom, fragrance and beauty of flowers. The Collection includes one of each of the following:

CLIMBING AMERICAN BEAUTY

The realized dream of every rose grower in all its promise and glory. Just the same as the old American Beauty developed into a hardy outdoor climbing rose, an everbloomer, with a strong, sturdy habit of growth. Tough, leathery foliage which is immune to disease, insects and weather. The roses grow on sigle stems, measuring three to four inches across, vivid rosy crimson in color with the same delicious fragrance as American Beauty. Blooms the entire season with hundreds of beautiful fragrant flowers.

FRAU KARL DRUSCHI

This brilliant rose has come to be recognized as the highest type of its class—the best snow white rose ever produced. Healthy, sturdy grower with the hardiness of an oak and magnificent heavy foliage. A single plant will furnish hundreds of huge full double flowers composed of broad charmingly veined petals. Color marvelously white, positively without a suggestion of color; well deserves the name that distinguishes it as the white companion of our national red beauty.

MAMAN COCHET

A rose to excite the admiration of everyone. True outdoor rose, very hardy and rapid, vigorous grower. Blooms all the time producing immense elegantly formed flowers of a magnificent silvery pink.

ETOILE DE LYON

Grace of form, charm of color and vigor of growth are three characteristics which make this one of the finest roses ever offered. In color, a deep golden yellow, marvelously rich and pure with exquisite fragrance. Very hardy in growth and an abundant bloomer.

OLIVIA

A most gorgeous and distinct rose of deep, brilliant rosy red. It grows to perfection in any soil in all sections of the country and blooms continuously the entire season bearing lovely immense flowers. For bedding purposes it has no superior.

MAIDENS' BLUSH

An indispensable rose for bedding or decorative purposes. Vigorous, healthy grower, quickly forming a shapely bush and producing in amazing profusion large, double flowers which delicately blend rose tints in center, gradually shading into pale blush and creamy white.

ROSEMARY

A rose as beautiful as its name, absolutely hardy, always producing strong vigorous growth and leathery foliage. Flowers practically all the time, having great masses of the most beautiful fragrant roses of rich silvery pink, exquisitely shaded.

ETOILE DE FRANCE

This rose has been selected from the unlimited number of hardy roses as the acme of perfection. It is an upright, sturdy grower with beautiful, bronzy-green, insect-proof foliage and bears vast quantities of massive, deep cup-shaped flowers; color a clear, rich velvety-crimson.

HOW TO GET THIS COLLECTION OF BEAUTIFUL ROSES

We will send this entire collection postpaid for either of the following offers:

No. 1. for 2 new yearly subscriptions to Pennsylvania Farmer at 50 cents each.

No. 2 collection and 1 year's subscription to Pennsylvania Farmer for $1.00 (either new or renewal.). Collection not given as a premium with single subscriptions unless 50 cents is added to the regular subscription price.

We are certain that every one of our readers who takes advantage of this opportunity will be delighted, and the plants are guaranteed to reach destination in good condition, promptly, and exactly as represented. Send your orders to

PENNSYLVANIA FARMER, 214-18 South 12th Street, Philadelphia, Pa.

Markets

Medium cows	3.75@4.75
Thin cows	2.75@3.75

Veal calves steady.

Best calves	$10.00@11.00
Good to choice do	9.00@10.00
Medium	7.50@8.00
Common do	6.50@7.00

Sheep and Lambs.—The top grades ruled a fraction stronger, with all other stock keeping fairly steady. Arrivals were on the increase and improved conditions prevailed, the outlook being favorable.

Choice wethers	$6.00@6.25
Good do.	5.25@5.75
Common to medium	3.50@5.00
Ewes, fat	5.25@5.75
Extra lambs	8.50@8.75
Good to choice do	$8.00@8.25
Common to medium	4.50@8.00

Hogs.—Inquiry was about seasonable at the prices with demand of a seasonable character. Westerns as to size and quality $12.50@12.75.

City Dressed Stock.—Every variety of choice and prime meat commanded steady prices with trade a trifle more active. Steers, 12@14c; heifers, 10½@13c; cows, 9@11½c. Veal calves, 13@14c; country dressed calves 13@14c; extra do., 14½c. Sheep, 9@11c; extra wethers, 12c. Spring lambs 13@14c. Hogs 12¾@13c.

PITTSBURGH LIVE STOCK

Pittsburgh, Pa., April 13, 1914.

Cattle.—With a light supply on sale again 80 loads, the market ruled active and generally 10 to 15 cents per cwt. higher on all grades. The tidy fat steers of the light weigth and heavy grades were on better demand, also choice heifers and fat cows, and tidy 1,000 to 1,300 pound bulls, while stock on the bologna order was easier. Best fresh cows stronger; other grades and springers only steady. Today's supply was 90 loads. With a fair demand the market was active and stronger on all desirable grades.

Good to choice	$8.80@9.10
Good 1,300-1,400 lb	8.65@8.80
Medium to good 1,200 1,300 lb	8.25@8.50
Tidy 1,050-1,150 lb.	8.25@8.50
Fair to medium, 900-1,100 lb	6.75@8.15
Rough, half fat, 1,000-1,300 lb	5.00@7.00
Common, 700 to 900 lbs.	5.50@6.50
Common to good fat oxen	4.00@6.50
Common to good fat bulls	5.00@7.90
Common to good fat cows	4.25@6.75
Heifers	5.50@8.00
Bologna cows	3.75@4.25
Fresh cows and springer	25.00@85.00

Calves.—Supply of calves liberal all week. The close for the week was $1 per cwt. lower than Monday's prices. Today's receipts were 700 head, and the market ruled slow and 25 cents lower.

Heavy and thin calves	$5.00@ 7.00
Veal calves	7.00@10.25

Sheep and Lambs.—Sheep and lambs have ruled in fair supply, and with only a fair demand the market has ruled easier on both sheep and lambs. Choice springers in demand and sold higher, while outlook for this grade after Easter is easier. Today's receipts were 20 double-deck loads. With a fair demand the market was slow, the choice sheep sold higher, and choice lambs ruled firm. Other grades of sheep and lambs sold steady. Spring lamb receipts were light and the market ruled steady.

Prime wethers	$5.75@6.00
Good mixed	5.40@5.60
Fair mixed ewes and wethers	4.50@5.25
Culls to common	3.00@4.00
Prime lambs	6.00@7.35
Clipped lambs	5.00@7.25
Clipped sheep	5.80@6.00
Spring lambs	9.00@12.00

Hogs.—The supply during the mid-week was light and prices ruled considerably higher, top grades selling at $9.50, while with more liberal receipts the latter part of the week, the close for the week was the same as Monday's prices. Today's receipts were 50 double-deck loads. The market ruled 5 cents lower than last week.

Prime heavy	$9.20@
Heavy mixed	9.25@
Prime medium weights	9.25@
Best heavy Yorkers	9.25@
Light Yorkers	9.20@
Pigs	9.00@
Common to good roughs	7.75@8.35
Stags	7.00@7.25

BUFFALO LIVE STOCK

Buffalo, N. Y., April 13, 1914.

Cattle.—The week opened with cattle active, and firm even with liberal receipts. Choice butcher steers were in good demand thruout the week. Good feeders sold at $7@7.35. Milk cows and springers were in good demand. The close was slow. Today's receipts were 3,000 head, and the market ruled 15@25 cents higher.

Choice heavy steers	$8.85@9.40
Fair to good	8.25@8.45
Yearlings	7.75@8.65
Handy butchers	7.00@8.50
Good to choice fat cows	6.75@7.15
Good to choice heifers	7.50@7.85
Butcher bulls	6.00@7.50
Feeders	5.50@7.35
Cows and springers	30.00@85.00

Calves.—The market opened with a good demand and prices unchanged. On the close the trade was slow and of a holiday character. Today's receipts were 1,200 head, and prices ruled lower.

Choice veals	$10.00@10.25
Lights and thin	6.00@ 8.75

Sheep and Lambs.—The week opened lower with a liberal supply. The supply of yearlings was moderate and only a light demand. Clipped stock is now showing up, lambs selling on the basis of $5@7.25. There were also a few clipped sheep. On the close the demand was fair for choice stock. Yearlings were stronger. Today's supply totaled 12,000 head, and prices ruled higher.

Choice lambs	$8.75@8.85
Yearlings	7.50@8.00
Wethers	6.75@7.00
Ewes	6.25@6.50
Sheep	6.00@6.25

Hogs.—The week opened with a fair supply and active demand, while prices were a shade higher. Common hogs were easier. The week closed with a good supply, an active demand and 5@10c lower. The basis was $9.30@9.35. Common grades were in moderate demand and lower. Today's receipts were 17,600 head. Prices ruled lower.

Heavies	$9.20@9.25
Mixed and medium	9.20@9.25
Yorkers	9.20@9.25
Light Yorkers	9.20@9.25
Pigs	8.75@9.00
Roughs	8.20@8.25
Stags	7.00@7.50

Horses.—Offerings numbered about 800 head. Prices were fair at last week's figures on heavy workers. Drivers sold fairly steady. There was a fair demand for horses today.

PITTSBURGH HAY AND GRAIN MARKET

Pittsburgh, Pa., April 13, 1914.

Hay.—Receipts to this market since the beginning of the month are the lightest for the same length of time in the recollection of feeders. Reports are that shippers are unable to load as the roads are hub deep in mud. Any shippers who have consignments ready to come forward should send them immediately and take advantage of the pr strong prices, as it is feared that the ma ket will be easier later on. Sound hay almost any description can be readily p at the present moment.

No. 1 timothy	$18.00@1
No. 2 timothy	15.50@1
No. 1 light mixed	16.00@1
No. 1 clover mixed	15.00@1
No. 2 clover mixed	12.00@1
No. 1 clover	14.50@1
No. 2 clover	11.00@1

Straw.—Better demand for straw; ceipts not heavy but equal to demand. M ket steady.

No. 1 Oats	$9.00@
No. 2 Oats	8.75@
No. 1 Wheat	8.75@
No. 2 Wheat	8.50@
No. 1 Rye	9.25@
No. 2 Rye	8.50@

Ear Corn.—Market is bare of good, yellow ear corn. While the demand is cellent there is not enough coming to supp same. A few shipments of ear corn bring good prices.

No. 2 yellow	76½@
No. 3 yellow	73@7

Oats.—There is quite an active demand oats which takes care of all arrivals. ket strong.

No. 2 white	43¼@4
Standard oats	42½@43
Standard No. 3 oats	41½@42

NEW YORK HAY MARKET

New York City, April 13, 191

The market for hay rules fairly Demand is mainly for the better Timothy, No. 1, $1.05@1.10 bale; stand $1; No. 2, 95c@$1.00; No. 3, 85@9 clover, 60@95c.

The straw market remains dull. Oat st 55@60c; rye straw, 90c.

CHICAGO HORSE MARKET

Chicago, Ill., April 13, 191

Horses that graded well sold all right week with no heavy supply. A high Belgian that weighed over 1,800 po brought $365, but sales up to $300 w few, fair to good drafters being sal around $225@275. Farm geldings sold $140@200 per head and a good choice o of farm mares at $190@225. Inferior mals brought $50@100, and drivers at $100@200.—F.

NEW YORK MILK MARKET

New York City, April 13, 191

The only change in the market condi last week was an augmentation of the plus. The Jewish holidays cut down demand in a marked degree. The pas zation edict of the Department of Health teeth in it. This, a score of Jewish de have recently discovered. Most of however got off with a fine. One setenced to imprisonment for a period.

The receipts of milk and cream in 40-q cans for the week ending April 11 wer follows:

Railroad	Milk
Erie	46,625
Susquehanna	8,097
West Shore	18,502
Lackawanna	58,875
N. Y. Central (long haul)	82,042
N. Y. Central (short haul)	11,750
Ontario	37,569
Lehigh Valley	35,955
Homer Ramsdell Line	2,050
New Haven	7,889
Pennsylvania	5,599
Other sources	1,670
Totals	316,153

ELGIN BUTTER QUOTATION

Elgin, Ill., April 13, 191

The quotation committee of the Board of Trade this afternoon declared ter firm at 25@25½ cents.

TOBACCO MARKET

There was no marked change in the cal market situation during the week. few sales to packers were reported at practically the same as in past weeks. few crops were delivered to the new leaf Growers' Association this organ having held several meetings at d points during the week. Up to the p time practically two-thirds of the 1911 remains in growers' hands. Local pa seem afraid of the situation and the concerns are not in the market. The pect of an early sale of the residue of 1913 crop is not at all encouraging at time. Preparation for the crop of the ent year was further delayed by the tinuation of unseasonably cold weather cluding freezing temperature and ch rains. In some communities very few beds have been made and all prepara operations are delayed.

No large transactions were reported the general tobacco market. The situa was characterized by small offerings steady prices. The crop outlook in York is favorable to a larger acreage generally increased interest in tobacco ters. In Wisconsin the crop will be a average one. In Ohio the enforced low age of last year will, it is claimed, be fu reduced the present year, the reasons the scarcity of labor and the general that land can be planted in corn with profitable results, especially when this is fed to hogs at present prices. In section there was a good demand for cigar leaf and the home demand also up well. There will be more zimmer and Dutch and seedleaf grown the present Growers in the Ohio section are more or hindered by poorly matured seed the sult of the early freeze last fall.

That tobacco growing is a well-estab industry in this section and one dese of more profitable returns to growers evidenced by the fact that it has grown here for a hundred years or more early as 1840 Lancaster county grew pounds as shown in the census of that During the civil war the production small as so many growers were in the and those at home thought it better to the more-needed wheat and corn. In the average yield per acre was 1,409 p and the average price was $15 per cwt. estimate is recorded in which it is said growers realized an average of $295 acre with a net profit of $162. In a exceptional instance a grower sold his for $640.08 per acre with a net prof $450. A sharp contrast with the situat present'—H. E Tweed, April 13, 1914

Horse Owners Should Use

Veterinary

(Conducted by W. C. Fair, V. S.)

(Advice thru this department is free to our ubscribers. Each communication should state history and symptoms of the case in full; also the name and address of writer. Initials only will be published. We cannot make reply by mail. This is one of the most valuable columns of the paper and we invite readers to make use of it. Clippings from this column, when properly preserved and classified, would make one of the most valuable medical symposiums a farmer-stockman could obtain.)

Poll-evil.—I would like to know the cause of poll evil and treatment for same. L. S. D., Bridgeton, N. J.—The most common cause of poll-evil is a bruise; however, the disease is not now nearly as common as it was when the doors and ceilings of stables were low. An abscess may also form on the poll following an irregular attack of distemper, or blood poison. First apply hot water, then apply tincture of iodine or equal parts tincture of iodine and spirits of camphor; or put on 1 part iodine and 15 parts fresh lard. As soon as you think the swelling contains pus, it should be allowed to escape by opening it freely, then treat it as an ordinary abscess by injecting into the pocket some peroxide-hydrogen, following it with a few applications of tincture iodine. Then apply 1 part bichloride mercury and 250 parts water, or 1 part carbolic acid and 20 parts water. It is important to use the serum treatment hypodermically.

Infected Wound.—Last fall one of our horses had a fork prong run into his leg, near top of hoof. It became inflamed, formed pus and opened, but appeared all right; however, the swelling remains. I have applied nearly everything I know of with no apparent relief. At the present time it is not forming pus but is badly swollen. The swelling is low down, is very hard and foot has a foul smell. W. P. D., Quarryville, Pa.—Doubtless the foul odor comes from frog, the result of thrush. If so you had better apply hydrogen peroxide, once a day, and 1 part carbolic acid and 15 parts water, twice a day. Later apply calomel. To swollen part of leg you had better apply 1 part tincture iodine and 3 parts camphorated oil twice a day.

Horse Coughs.—We have a 4-year-old horse that usually coughs after drinking cold water. When traveling slow it does not bother him. I have noticed him hacking when driven fast. L. S. R., Stoneboro, Pa.—Give him ½ oz. powdered licorice, a tablespoonful of ground ginger and a teaspoonful of muriate of ammonia at a dose in feed, 3 times a day. The cold chill had better be taken off his drinking water and he should be fed no clover, or dusty, musty fodder.

Hogs Have Worms.—Several of my hogs are troubled with worms. Simple remedies fail to kill the worms. O. A., Lambertville, N. J.—Mix together equal parts fluid extract of spigelia and fluid extract of senna and give each of your hogs ½ oz. at a dose, 2 or 3 times a day until purging sets in. Then discontinue its use for a week or ten days. Very often you will find it necessary to treat your hogs a second time. Best results are obtained by giving vermicides when the animal is fairly empty.

Cough.—I have two colts that seem to be thriving, but both of them have a severe cough. Will you kindly prescribe for them? K. W. R., Centreville, Pa.—Mix together equal parts muriate ammonia, ginger and licorice and give a dessertspoonful at a dose in feed, 3 times a day. If their throats are swollen, apply 1 part turpentine, 1 part aqua ammonia and 3 parts olive oil, once a day for a few days.

Clipping Horses.—Many farmers used to object to clipping horses in the spring, holding that it was an interference with the natural shedding of the coat. They forgot that the horse of today is being kept under unnatural conditions. The experience of horsemen and farmers disproves the objections to clipping. Spring clipping aids condition of animals when their services are most needed and insures against spring disorders incident to breaking into hard work. Clipping machines are now within reach of all farmers and are equipped for use on horses, mules and cows. A postal card request addressed to the Chicago Flexible Shaft Co., 245 Ontario St., Chicago, Ill., will bring full particulars and information on machines and clipping.

The Democracy of "The Makings"

Environment doesn't make a man—or a "Bull" Durham smoker. There are red-blooded, self-reliant, energetic *men* in every walk of life—and these are the millions of men, of all classes and occupations, who find thorough *satisfaction* in the fresh, fragrant cigarettes they *roll for themselves* from "Bull" Durham tobacco.

The rugged millionaire sportsman and his able-bodied guide in the great North woods are at opposite ends of the false social scale; but in the true *measure of manhood* they meet on an equal footing—share the same sack of "Bull," and respect each other for being *men.*

GENUINE
"BULL" DURHAM
SMOKING TOBACCO
(Enough for forty hand-made cigarettes in each 5-cent sack)

"Bull" Durham is a *distinctive form* of tobacco enjoyment that gives lasting, healthful satisfaction to more millions of men than all other high-grade smoking tobaccos *combined!*

Ever notice that aromatic flavor, that unique savor? That's a secret "Bull" Durham process. You get it only in "Bull" Durham.

THE AMERICAN TOBACCO COMPANY

It's a Pleasure to Farm in the South

NATURE coöperates with you at every turn in the Southeast. Crop failures are hardly known.

You are favored with 200 to 300 growing days, which allow two and three crops from the same land each season.

Expensive irrigation is unnecessary, as 45 to 60 inches of rain, well distributed through the growing season, fall annually.

The assortment of crops raised in the Southeast is the greatest anywhere in America. From the tropical citrus fruits to the finest varieties of apples, peaches, pears, grapes and numerous other fruits and nearly every known variety of grains, vegetables, grasses and legumes can be produced somewhere in the Southern Railway territory.

And with all these superior advantages Southeastern land now averages less than one-half the price of farms in other parts of America.

$15 to $50 An Acre Buys Excellent Homesteads

where the climate is exceedingly agreeable and healthful, where railroad communication is of the highest order and transportation to Northern markets but 24 to 48 hours.

Life in the rural sections of the South is all that could be desired. Modern highways and telephones, the best of high and agricultural schools, good churches and trading centers—all these advantages are to be had in this growing section.

INVESTIGATE SOUTHERN CONDITIONS

Avail yourself of the low **Homeseeker's Rates.** Write for particulars.

Learn of the favorable conditions in the South. Ask for the "Southern Field" magazine, state booklets on Virginia, North or South Carolina, Georgia, Florida, Alabama, Mississippi, Tennessee and Kentucky. Let us know the state and line of farming in which you are interested.

Among Our Neighbors

With Charles Sweigart, Chester County, Penna.

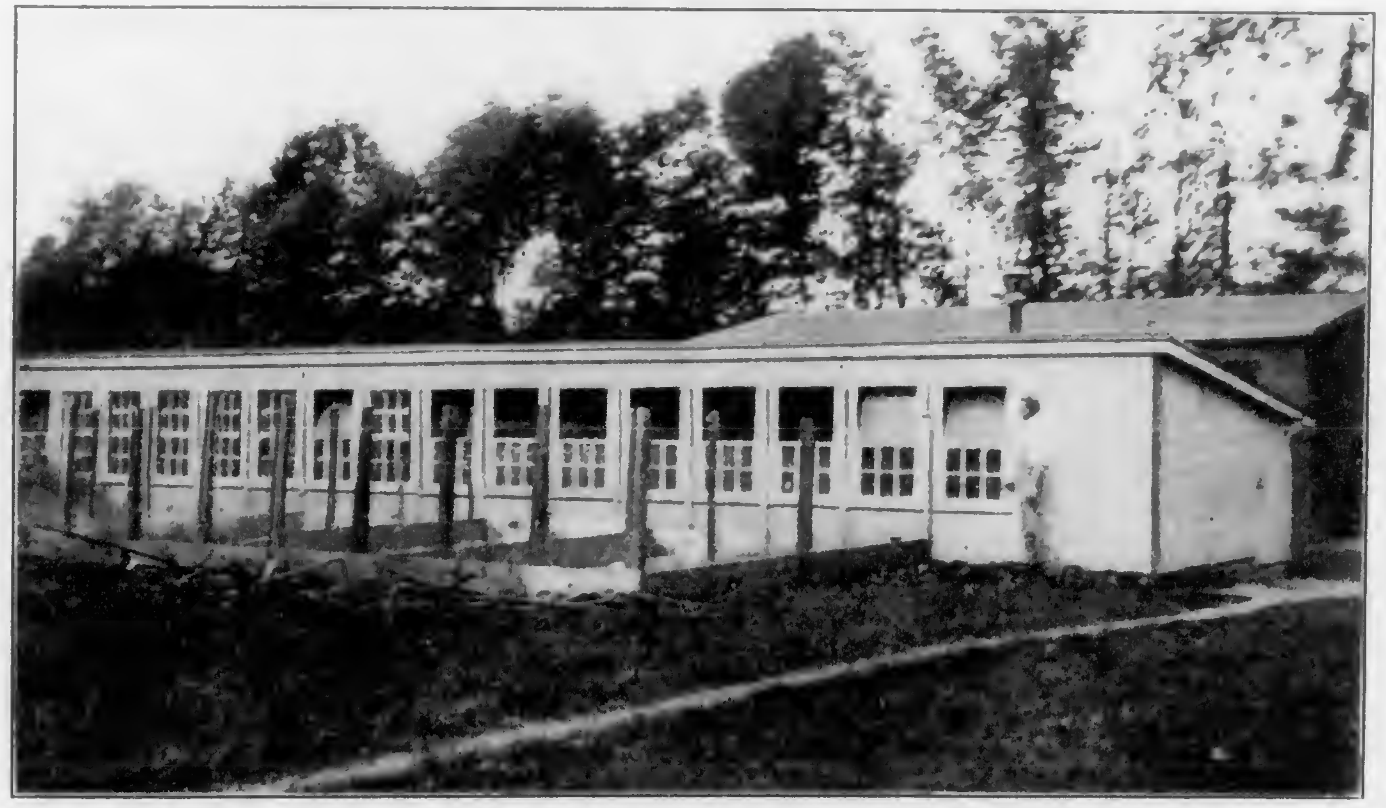
It is frequently asked of a man who has made a success in business whether the job made the man or the man made the job. If he has made a genuine success, it is usually found that the man constitutes about 90 percent of the job. This is as true in farming as in any other line of business. The job of developing a life business on about 30 acres of tillable land, and making it yield an income comparable with other professions, is one that most men would consider a right sizable undertaking. And to succeed in such an undertaking requires a right sizable man—a real 100 percent man.

This was the proposition that confronted Mr. Charles Sweigart, of Chester County, some ten years ago. Possessed of a genuine love for farming, he was able to see possibilities in the small farm belonging to his father-in-law that other and older farmers had never dreamed of. He had practically nothing but a stout heart, strong and willing hands and a clear brain to start with; but these constituted his equipment for his life work, and he chose the farm as being the best and most promising field for their use. The way in which he has applied his resources and the success that he has achieved in developing little Ivywood Farm are at once an inspiration and a guide to other young men who may be similarly situated.

Using his brain first, he laid definite plans for the development of a permanent business plant which should pay its way and increase in value and productive capacity as it matured. With but thirty acres to work with, it was obvious that he must adopt a plan that would permit the practice of intensive methods and that he must specialize in a few lines. After careful consideration he determined upon a combination of poultry and dairying. The farm buildings were not suited to either branch, so Mr. Sweigart had to start at the bottom and remodel and build as profits would permit. It has been a struggle and there is still much to be done to complete the equipment, but the end is in sight and the plant is now in position to care for its future needs.

With absolute faith in purebred live stock, Mr. Sweigart has been working toward the time when all of the stock on the place should be of pure breeding from good family lines. This was more easily reached with poultry than with his dairy herd. For this reason the poultry business has been pushed faster and has been used to carry the preliminary dairy work to some extent. In the breeding of his flock, all of which are purebred White Leghorns, and in poultry equipment, the plant is nearly completed. The two illustrations on this page show the two main poultry buildings.

THE LAYING HOUSE WHERE LAYERS ARE CONFINED THRUOUT THE YEAR.



BROODER HOUSE ON FARM OF CHAS. SWEIGART, CHESTER CO., PA.

The brooder house is a model of its kind. It is 14½ by 52 feet, substantially built thruout and equipped with a modern brooder outfit. The foundation and floors are of concrete. The interior is divided into 15 compartments, each practically 3 feet wide. Each of these compartments is divided to give a seven-foot runway for the chicks and three feet to the brooder. A four-foot feed alley runs the length of the building. The brooder outfit has a hot-water heating system which has given excellent satisfaction. The heater is as nearly automatic in its operation as is possible to secure and one man is able to keep it running smoothly even when all fifteen brooders are in use.

The general system of management in the poultry department is now pretty well established. The incubators are started the latter part of January so as to bring the first chicks about February 15. The eggs for hatching are all produced on the farm by the breeding flock especially selected for the purpose the previous fall. In 1913, the brooders were started about the middle of February, and about 2,500 birds were turned thru from 3,500 eggs. The average efficiency on the incubator last year was 70½ percent, and on the brooder (the first year it was used) 75 percent on the season's work. Mr. Sweigart says that the latter is not as good as it should be this year when he will have the benefit of a year's experience in the operation of the equipment.

As soon as the chickens are hatched out, they are brought to the brooder house where they are apportioned about 65 to a brooder, giving the building a capacity of 975, or 1,000 with a little crowding. The chicks are pushed along on a ration of cracker crumbs and rolled oats moistened with sour milk for the first 10 days, when they are gradually worked to a mash of equal parts by weight of bran, middlings, corn meal and beef scraps. This last is fed in pans from the end of the first week. Moist mash is essential for quick growth. Grains are fed in the litter from the start.

The cockerels are separated from the pullets at an early age and are put on force feed and sold as broilers as soon as they reach a weight of from one to one and a half pounds. Sales of broilers last year ranged from 65 cents to $1.10 per pair, 877 birds being disposed of in this way. The pullets are turned upon open range when ready to leave the brooder. A sufficient number is retained each year to maintain a laying flock of about 550 pullets and 100 old selected hens for the breeding flock. The surplus pullets are sold as layers at the uniform price of $1 each when 3 months old.

About September 1, of each year, the laying flock of the previous year is disposed of, last year bringing an average of a little over 75 cents each. The pullets are then brought in and placed in the laying houses. The main laying house is an open-front structure shown in the illustration on this page. It is 14 by 42 feet, two stories high. Each floor is divided into 3 compartments, each 14 by 14 feet. The birds are graded according to size.

(Continued on page six.)

Farm Crop Notes

By R. P. KESTER.

Counselor on Soils to the State Department of Agriculture.

Thru this department Mr. Kester will discuss queries from Pennsylvania Farmer readers on soils, field crops and general farm practice. Address all queries to Pennsylvania Farmer, Philadelphia, Pa.

NATURAL METHODS OF SOIL IMPROVEMENT

Cover Crops, Catch Crops and Sods.

That the common practice of agriculture has not maintained the normal amount of humus in the soil is very patent to any one who will take the trouble to compare virgin soil with that which has been under cultivation for a number of years. That the normal amount of organic matter can be maintained and increased has been exemplified many times by successful farmers who have been careful to make use of cover crops, catch crops and heavy sods. These crops take up and save the soluble plant food, prevent washing, and furnish humus-making material. These plants, when turned into the soil, improve its mechanical condition, increase its water-holding capacity, add plant food, and in the process of decay make available the plant food in the inert soil.

The practice of allowing a field that has grown a cultivated crop, such as corn or potatoes, to lie bare over winter is a most unwise one. Besides the loss from winds and erosion, the unused nitrogen, made available by cultivation and heat of summer, is very readily leached down thru the soil and lost. Except in excessively dry seasons, it is possible to prevent this by sowing a cover crop ahead of the cultivator at the last cultivation. In the neighborhood of the 40th parallel, crimson clover is at home and makes one of the best of cover crops. Like all legumes, lime and inoculation are necessary for complete success, but after persistent trials it will succeed thru self inoculation. North of the 40th degree, rye and winter vetch sown together, in the proportions of one and one-half bushels of rye and one-half bushel vetch seed make one of the best cover crops known. This crop may be sown successfully much later than crimson clover. It is often best to disk the ground after corn, potatoes or other crop is harvested and drill in the seed for this cover crop.

These two crops, crimson clover and rye and winter vetch, are most desirable because they furnish a maximum amount of both nitrogen and humus and fit in best on land that has produced a crop during the season. On soil that has not yet been brought to the condition where it will grow a legume, rye, or rape, alone should be sown as a cover crop. While these plants do not add any plant food, they will store up what would otherwise be lost, and also they add the much-needed humus.

It very frequently pays to lose the use of a field for a season in order to grow a crop of green manuring. Some of the best crops for soil improvement, in addition to those already named are cow peas (for the warmer sections) soy beans and Canada field peas and oats. The faith of the southern farmer can be pinned to the cow pea to rejuvenate the depleted south land. In fact it has performed almost the miraculous where it has been wisely used. There is plenty of evidence for believing that the soy bean will do the same thing for the northern farmer as soon as he is fully convinced that it is practical and wise to grow crops for the special purpose of soil improvement.

The Wilson variety of soy bean seems to be one of the best adapted varieties for northern latitudes. They should not be sown until warm weather is certain to follow, say after corn-planting. They may be either drilled in broadcast, or, by using the two end and the middle hoes of a grain drill, put in rows 27 or 28 inches apart and cultivated two or three times. While the latter way requires a little more work, it is a saving of seed and about as much material will be grown.

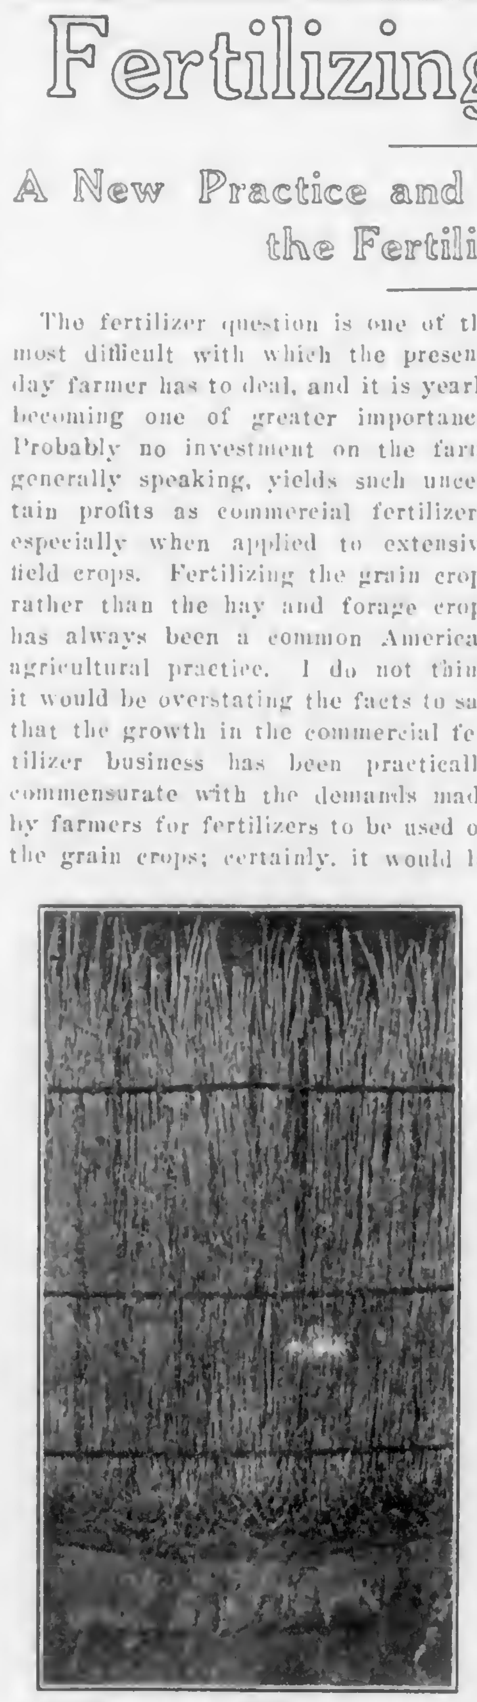
These crops make good orchard cover crops, and are used by most of our best orchardists. Market gardeners and other intensive farmers use them and to their use a great part of the productiveness of their land is due. The general farmer might make use of the same means, and I will go farther and say he must make use of some of them if he would stay in business. It is sometimes a good practice to sow oats or buckwheat between the rows of small fruits, black berries, raspberries, strawberries and the like. If the seed is sown in mid summer a good covering is secured which will die down during the winter and seed is not matured.

One of Nature's best soil coverings and providers of humus is a good grass sod. Too often the so-called sod is so thin that it does not add much material to the soil. This is because sufficient good seed has not been sown, and because the grass has not been fed. The growing of hay is not any harder on land than growing other crops if given fair treatment. The small average yield of hay, one to one and one-half tons per acre, shows that the average acre has on it a very thin sod. A field producing two to three tons of timothy hay has on it a genuine sod, one such as all fields need occasionally. This yield is possible on any fairly good land provided clover has been grown first, plenty of good seed used and the grass top-dressed with manure or fertilizer rich in nitrogen. Try it and see.—R. P. K.

Fertilizing Timothy

A New Practice and a Probable Solution of the Fertilizer Problem.

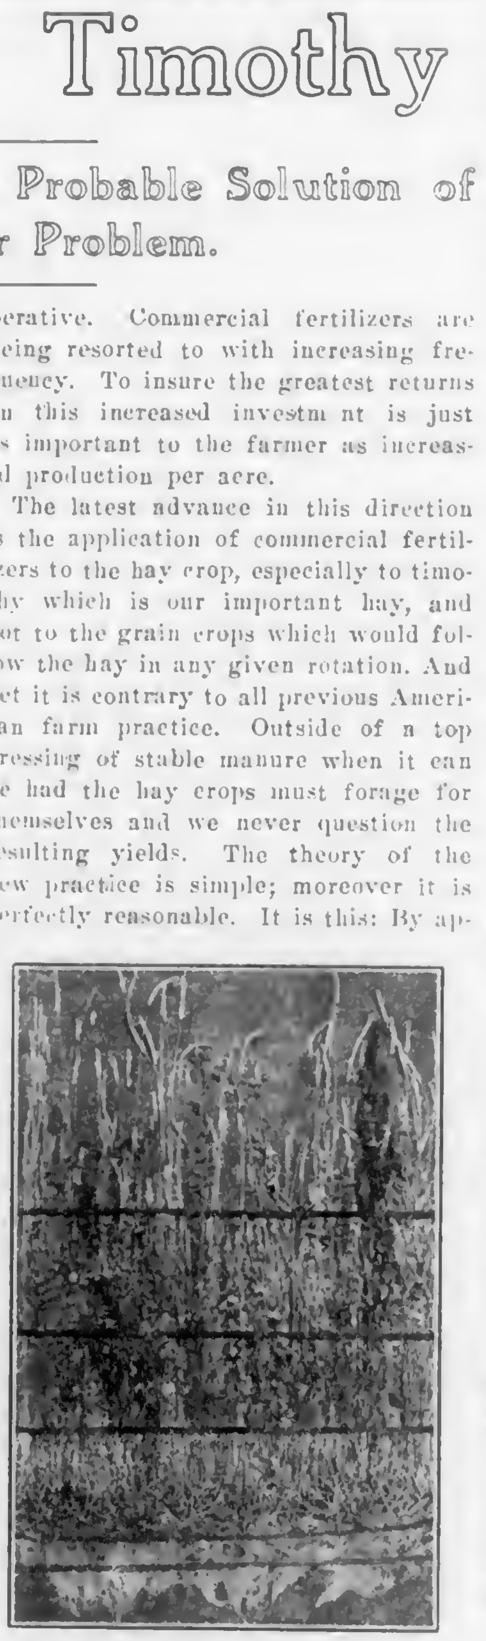
The fertilizer question is one of the most difficult with which the present-day farmer has to deal, and it is yearly becoming one of greater importance. Probably no investment on the farm, generally speaking, yields such uncertain profits as commercial fertilizers, especially when applied to extensive field crops. Fertilizing the grain crops rather than the hay and forage crops has always been a common American agricultural practice. I do not think it would be overstating the facts to say that the growth in the commercial fertilizer business has been practically commensurate with the demands made by farmers for fertilizers to be used on the grain crops; certainly, it would be true to say on all crops other than hay or forage.



TIMOTHY GROWN ON FERTILIZED PLOT.

Of the more than $114,000,000 worth of commercial fertilizers used in the United States in 1909, it is estimated that seven-eighths was used within three hundred miles of the Atlantic coast line. Pennsylvania alone spent nearly $7,000,000 or about one-seventeenth of the value of all the fertilizers used in the United States for that year. Increased production per acre under present economic conditions seems imperative. Commercial fertilizers are being resorted to with increasing frequency. To insure the greatest returns on this increased investment is just as important to the farmer as increased production per acre.

The latest advance in this direction is the application of commercial fertilizers to the hay crop, especially to timothy which is our important hay, and not to the grain crops which would follow the hay in any given rotation. And yet it is contrary to all previous American farm practice. Outside of a top dressing of stable manure when it can be had the hay crops must forage for themselves and we never question the resulting yields. The theory of the new practice is simple; moreover it is perfectly reasonable. It is this: By applying commercial fertilizers to timothy which is being cropped two or three years in succession, in a five or six-year rotation with other grains—such as corn, oats and wheat, each one year—we get the benefit of the immediate effect of the fertilizer on the timothy and the residual effect of the fertilizer on the grain crops which follow. In other words, by applying the fertilizer to the grass we get the greatest benefit of the plant food constituents applied and the maximum results on the investment.



TIMOTHY FROM UNFERTILIZED PLOT.

Photos by courtesy of Farm Crops Dept. N. Y. College of Agriculture.

But does it work out in practice! This question is answered by information and data secured from the New York State College of Agriculture, Department of Farm Crops and Practice. The illustrations here used by courtesy of the farm crops department are photographs of two displays showing fertilized and unfertilized timothy tops and roots. Note the contrast between the two photographs. The fertilized and unfertilized timothy were grown on uniform fields under identical conditions of soil and moisture. The difference is due alone to commercial fertilizers.

In the case of the fertilized timothy the hay is taller and stronger, showing more vigorous growth; the leaves are larger and more numerous; the heads are of good length, heavy and uniform; there is an entire absence of all weeds; the hay is of excellent quality; the stubble is thick and heavy and the development of roots is remarkable. These last two factors are important on account of the greater amount of organic matter to be returned to the soil when the sod is plowed under.

The unfertilized display presents almost contrary conditions. The hay is shorter, weaker, and shows less vigorous growth; the leaves are fewer in number and small; the heads are shorter, thinner and of uneven development; many weeds are present, daisies in superabundance, some dock and plantain. The quality of the hay is much inferior. The weaker and thinner stubble and the small root development mean that there is less organic matter to be added to the soil to be changed later into valuable plant food.

The effects of the fertilizer are exactly what we would expect them to be, other conditions being equal. Where fertilizers were applied root development was stimulated, more plant food was furnished to the growing plants, the green growth was increased, the weeds were crowded out and more organic matter was left on and in the ground to be plowed under and later to be used as plant food by the grain crops following. But does it pay to fertilize timothy, and where do the residual effects of the fertilizer on the grain crops enter in? Data furnished below, taken from the chart of the same Cornell exhibit, answers both questions.

A 9-Year Fertilizer Experiment

Timothy, fertilized 1905-6-7:—Value on fertilized plot, $127.86; value on check plot, $50.64. Gain, $77.22. Cost of fertilizer, $39.12. Profit, $38.10.

Corn, Oats, Wheat—not Fertilized 1908-9-10:—Value on fertilized plot, $86.31; value on check plot, $64.15. Profit, $22.16.

Timothy—Fertilized 1911-12-13:—Value on fertilized plot, $109.32; value on check plot, $34.38. Gain, $74.94. Cost of fertilizer, $39.84. Profit, $35.10.

Total Profit (actual) 9 years, $95.36. Estimated profit on grain crops 1914-15-16, due to residual effects of fertilizer applied to the timothy, $25.00. Total estimated profits, $120.36. Investment $78.96. Percent on investment, 150 per cent.

The results shown are from a nine years' fertilizer experiment, with a six years' rotation in which timothy is grown three years and fertilized each year with a commercial fertilizer; then followed by corn, oats and wheat on which no fertilizers are used. The residual effects of the fertilizers applied to the timothy are shown by the yields and profits from the grain crops. When the first-half of the rotation had been completed the profit for the first three years was $38.10, or about 100 percent on the investment. In other words, for every dollar invested about two dollars were returned. For the last

Poultry

MANAGING BROODY HENS

There are a good many ways of breaking up broody hens, but only a few ways of doing this and getting them to lay at once. The best way is by getting them to lay again as soon as possible. As soon as broody hens are discovered remove from the nest and place in a hanging wire-bottom coop in a strange location. Do not allow them to stay on the nest any length of time as it will be harder to break them of this natural desire later.

Have this wire bottom coop in a well-lighted and well-ventilated place. We have found it a good idea to place a male bird with such hens. We feed and water them as we do our laying stock and give an occasional feed of animal food, so as to encourage laying. Make sure they have every thing they need, in the form of fresh water, grit, oyster shell, charcoal and dry mash. Give a regular feeding twice a day of a forcing mash and allow them all the green food they want.

Another method is to have a large yard, with a shelter set up on posts, in the middle. Roosts should be provided in this shelter. We find that this method is even better than the former. Because the shelter is raised from the ground about 2 feet and the roosts are about 1½ feet from the ground, they must either roost on these or sit on the ground. In either case there must be a strong circulation of air around their bodies which aids them to forget their brooding desires. They come thru this method of discipline in better condition than any other we have ever tried. It is necessary that they be well fed so as to insure their laying as soon as possible.

Keep them free from vermin. Go thru all the pens often and remove all broody hens to a place by themselves. We find that the last thing at night is the best time, and all such as are still found on the nest at this time should be taken to the broody coop or yard. Feed them well. Handle them carefully and respect their desires and before long they will have forgotten their brooding instinct and will commence laying again.—F. W. Kazmeier, Ithaca, N. Y.

NATURAL SWARMING OF BEES

It is as natural for bees to swarm as it is for hens to become broody or sheep to have lambs. An abundant secretion of honey and a general prosperity of the colony with combs crowded with bees and brood, are the immediate conditions which incite a colony of bees to swarm. If a colony in prosperous condition be found when the gathering season has fairly opened, with eggs or larvae in partly finished queen cells, a swarm may be expected in a few days should the weather continue favorable. The first one from a given hive usually issues within 24 to 48 hours after the sealing of the first queen cell. In the case of strong colonies this may occur in favored situations in May.

The outward indications immediately preceding swarming are a partial cessation of field work on the part of the colonies that have been industriously gathering, and the clustering or loitering of the workers about the entrances at times when they have usually been engaged in collecting and when other colonies no more populous are at work. Apparently many are waiting the signal to migrate, while some seem not to have caught the spirit, but continue their field work. Suddenly great excitement seizes the workers that happen to be in the hive at the time. They rush forth pell-mell, accompanied by the old queen, and after circling about for some minutes cluster on some neighboring tree or bush near the apiary. It was formerly common to make a noise by beating pans or ringing bells in the belief that this causes the swarm to settle. There is no foundation for such action on the part of the beekeeper. If the bees alight on a small limb that can be spared it can be sawed off and the bees carried back to the hive and thrown on a sheet or hive cover in front of the entrance. If the limb can not be cut, the swarm can be shaken off into a box or basket on a pole and hived. If the bees light on the trunk of a tree or in some inaccessible place they can first be attracted away by a comb, preferably containing unsealed brood. In these manipulations it is not necessary to get all the bees, but if the queen is not with those which are put into the hive the bees will go into the air again and join the cluster.

When a swarm has fairly settled it is best to hive it as soon as possible, lest others coming out may join it, occasioning a loss of queens, and sometimes of bees, or much trouble in separating them. The operation of hiveing may appear very formidable to the novice and attended with great risks, but a little experience will dispel such apprehensions. The bees before swarming usually fill their sacs with honey and are quite peaceable, so that by the use of a little smoke in hiveing there is seldom any difficulty.

It very rarely happens that a swarm fails to cluster before leaving, but it may do so if it has swarmed before and returned to the hive because the queen failed to accompany it. Spraying water on the leaders or advance portion of the swarm from a force pump, firing a gun among them, or throwing the reflection from a mirror on them will disconcert the absconding swarm and nearly always cause the bees to settle, but the remedy must be at hand and applied instantly.

As soon as the swarm is fairly within the new hive the latter should be carried to its permanent stand, and well shaded and ventilated. It is better policy, however, to place the hive containing the first swarm on the stand of the parent colony at once, removing that latter to a new location. The new swarm, having the old queen, with nearly all of the flight bees, will be in prime condition for storing honey, so that supers may be placed on it as soon as it has made a fair start in its new home, that is, on the second or third day after the swarm was hived. If there are uncompleted supers on the parent colony which have been removed, they should be lifted over to the new hive on the second or third day, as the parent colony, having parted with so many of its workers, will not be able to store at once. The new swarm, placed in a clean hive with starters only, will be in shape to store in sections at once and produce the whitest combs and and honey which the source of the yield will permit.

The wide-awake farmer does not wait until his bees have swarmed and are clustered on a tree-top, before he thinks of preparing a hive for them. It will be very easy to manage a dozen or more colonies of bees if everything is set in readiness. For instance, if a swarm issues, it will only be the work of a few minutes to take a hive from the barn and hive the swarm into it, or if a honey flow bursts forth suddenly what satisfaction it will give to know that a few hundred section boxes are on hand, ready to set on the hives at once.—F. G. Herman, Bergen Co., N. J.

KANAWHA AND RED JACKET PUMPS
They Are SO EASY TO WORK SO EASY TO FIX
When you install one of these pumps you get lasting satisfactory service. For 40 years we have been building pumps fitted for wells. When we fit a pump for a well there is no guess work—It is correct.

Horticulture

COMMON FLOWERS AS MONEY GETTERS

Many a farm woman, girl, or boy who loves flowers might make of them a source of income, as well as a feature of beauty around the home, by making a few plans in advance. One of the most important plans is for masses of flowers of one kind, no matter how old fasioned they may be. Another point to consider is the amount of care different sorts require, for among busy farm-folk time is money.

What to grow, how to market them, and how to handle them to the best advantage are the three points we shall consider. As to the first the standard perennials which need little care except an annual separating of the roots (resulting in more flowers to sell) are perhaps the best of all for our purposes. Of course, the hardy bulbs like the daffodils and hyacinths come in this class and from the time they are in bloom until the brave little button "mums" bloom after the snow comes, it is possible to have flowers in abundance from the perennial class.

Shrubs, too, will furnish a wealth of blooms and these may be grown as hedges or in corners where they will make the home grounds almost park-like in beauty and, at the same time, keep up the supply of flowers for market use.

Annuals that bloom freely, and bear handling, include the sweet peas, nasturtiums, pansies, asters, and many others. In another class we find the biennials like the sweet William, which give wonderful returns. Of an altogether different type we have the free flowering gladioli and the dahlias. As a last suggestion it may be said that the artichoke patch which furnishes food for the hogs may be made, first of all to furnish many a bunch of glowing golden flowers to send to market.

Finding the market is the next step in the plan and the one who contemplates raising flowers for sale should be arranging for the market before the flowers are ready, sometimes before they are planted. Now and then a city florist is glad to arrange for an almost unlimited supply of a particular flower and, if your garden will permit, this is the easiest of all plans. The husband of one woman who has a market route and delivers vegetables, butter, and eggs to regular customers every Saturday, went to see each housewife on his route and arranged with more than half of them to send flowers every week. Another woman sells all she can take at the counter of a market-house stall, and the owner of the stall sells more garden truck because of the flowers drawing customers.

The florist usually buys by the hundred; the woman who sends hers to the homes by the market wagon arranges them in snug bunches that when separated and shaken loose make two or three, while the woman who sells from the stall keeps them standing in pans of water and sells any number called for, at dozen rates. Now that the rural delivery routes handle the parcel post mail the farm woman may send to the market-stall woman (or to anyone else) allowing a commission for selling, and so save her own time.

Having planned for our market and having our flowers ready we should know how to handle them without waste. Many flowers, and the most beautiful ones, have petals so fragile that handling them without breaking is practically impossible and to make them profitable both grower and buyer must be educated to a knowledge of the the fact that when picked while the color of the petal is just commencing to show they will open to their utmost perfection after being arranged in the vase. When so picked they grow more beautiful each hour until the flowers are fully expanded, and they will remain at this stage much longer than will flowers allowed to open on the plant, in the sunshine. Knowledge of this fact makes the buyers glad to get the half-opened flowers and it allows the grower to send in those that would be wasted before the next market day, for market purposes.

Fleur-de-lis would be absolutely worthless as a market flower unless cut and got to its destination in bud form. Roses, too, give greater satisfaction cut when but litle more than half developed. Gladioli cut when but one or two of the lower flowers are opened give the buyer full value.

Details must be worked out to fit individual conditions but there is no particular time to begin the work. Many flowers may be started yet this spring; seeds of perennials sown by June or July will give rich returns next year; shrubs may be planted either spring or fall; summer flowering bulbs of all sorts may be put into the garden at intervals of a week or two, and the hardy bulbs may be planted out in September.—Eva Ryman Gaillard, Erie County, Pa.

A TINY ASTER BULB WILL DEVELOP INTO A PERFECT FLOWER AFTER BEING CUT.

RASPBERRIES A PROFITABLE CROP

The raspberry, the first of the season's bush fruits, has become a very profitable crop to grow. Certain localities give greater success than others with this crop. There are some sections, too, where the black caps prove quite as successful as the reds, but that is the exception and not the rule. Where the black caps prove the better money maker of the two that is the kind for the farmer to grow, but in most instances I think the reds will be found most profitable.

As to varieties, I have found none so far superior to the Cuthbert. I have tried the Marlboro, the London, Miller and others, but still stick to the Cuthbert as the most reliable. It has its faults, the main one of which is, that it soon loses its bright color after ripening; hence it must be picked frequently. Another fault is that it is a little late for some markets. Aside from all this it is a money maker where there is a market for the fruit.

This crop favors the local grower because it cannot be transported very long distances and still be in good condition for sale; hence competition is not keen. Since the pure-food law went into effect this fruit has gradually risen in price from season to season. Fifteen years ago we thought we were receiving good money if our berries sold for 5 cents per oval pint and they were frequently sold for 3 and 3½ cents. Since manufacturers of fruit juices have been compelled to use pure fruit juices the price has gradually risen until at the present time raspberries bring 11 and 12 cents per oval pint, the lowest price last season being about 8 cents for good berries. Almost any farmer can grow from 5,000 to 8,000 pints per acre and have a market for them that can be reached either by train or wagon. If this appeals to you and you are favorably located, can command pickers when needed, and have the proper soil, there need be no fear of trying to grow raspberries.

In giving cultural directions, let it be understood that we refer more generally to the red varieties, particularly to the Cuthbert. I do not like old or last season's plants. I prefer the young sucker plant. The plant of the current year's growth is best. In digging these plants they must have a piece of the cross-root attached. The plant comes from a root running along a few inches under the surface and a piece of this root must be attached to the plant root making it look like the letter "T" when inverted.

Have a piece of land prepared as for any farm crop, and mark off in rows 7½ to 8 feet apart. If soil is strong 8 feet is none too far. A clay loam is the ideal soil and that so situated it will not be wet and also never suffer unduly from drouth. A very hot dry spell when the crop is ripening is very apt to do considerable damage. I have known crops to be cut in half where plantations were set on light sandy soils. After marking off the right distance with a one-horse turning plow, set plants in furrow about 30 inches apart. Use no fertilizers in row at time of planting but side-dress with a good high grade potato fertilizer as soon as plants begin to grow. Keep clean by frequent cultivation and hand hoeings all season.

A row of some low growing crop like potatoes can be planted between each row of berries the first season. Early the following spring, trim back from one-quarter to one-third of the wood growth; after trimming take half the canes in each hand (there will be about four) and tie a single or half knot with them. This helps hold them off the ground the first bearing year. After the first season they will be sufficiently strong to support themselves. When the young canes are 3 feet high top them, as this helps them to grow more stout. Every spring the dead wood must be taken out and vines trimmed to a uniform height. As soon as this is done a shallow plowing from the row is given. After giving them a good hand-hoeing side-dress with good high grade fertilizer as recommended for first year. Work the soil fine and plow back. Cultivate until picking time to keep weeds down and conserve moisture. A raspberry plantation will last from seven to nine years and if on the right soil should yield 5,000 to 8,000 pints per acre annually.—C. C. Hulsart, Monmouth County, N. J.

COMBATTING PLUM CURCULIO

All peach growers in the East are familiar with the "worm" in the peach, the larva or grub of the so-called plum curculio, or "little Turk." One of the best and perhaps most generally practiced preventive measures at the present time is the so-called jarring method. Its value depends on the fact that a sudden jar of the tree will cause the beetles to fold their legs and fall to the ground, feigning death as a means of escaping detection. Advantage is taken of this habit to collect the beetles on sheets held, or placed on the ground, under the trees. Jarring is begun in the spring as soon as the fruit is well set, and should be done preferably in the early morning or late evening, when the insects are somewhat torpid with cold and drop quickly. In large orchards it is often necessary to work during midday, tho not so many beetles are caught as they cling to the tree more tenaciously and after falling escape more quickly. During seasons when the beetles are numerous, it is best to jar the trees every day for a period of four or five weeks, until it is observed that but few beetles are being caught.

Various forms of curculio catchers have been devised, but perhaps the simplest and most suitable for work on a small scale, consists of a sheet some 12 feet square, made by sewing together strips of heavy muslin, the central seam being left open to the middle of the sheet. The canvas is placed on the ground under the tree, being centered by passing the midseam around the trunk and one margin along the seam being overlapped to entirely cover the ground. A padded pole for jarring the tree completes the outfit.

In jarring on a larger scale the work must be done more expeditiously. A form of catcher much in use in extensive eastern orchards consists of a cart on which is carried an inverted umbrella-shaped canvas on a folding frame, with an opening in front to receive the trunk of the tree. In operation the cart is pushed under the tree, which is given a sudden jar by means of a padded bumper at the base of the slit, or preferably with a padded pole. The beetles falling on the hopper-like canvas are brushed down thru the opening in the bottom into a can of kerosene fastened beneath.

In the control of the curculio, clean culture is of great importance as removing conditions favorable to insect multiplication, according to the Department of Agriculture. The numerous plum thickets to be observed in the neighborhood of orchards and along roads, particularly in the South, are constant sources of infestation of orchards, and should be destroyed wherever possible. In fighting the curculio best results will come from a combination of two or more of the several methods recommended and uniformity of action by all the orchardists of a community will bring about a great reduction of loss from this pest in that section.—Department of Agriculture Press Bulletin.

CONTROL OF CABBAGE CLUB ROOT

Each year the question of the control of club root in cabbage receives consideration and letters are already beginning to come in asking for possible methods of control of this disease.

For those whose soil is not already infected with the germ of this disease we can only advise extra precaution in avoiding it. First make sure that no plants are purchased which have been grown on affected soil. It seems that this is the most common way in which this disease is carried. Claims have been made that it is carried on seed to some extent, but these claims are not substantiated, and it is questionable if there is any great amount of danger in this direction. Then, in arranging the seed bed, make sure that that is put on a clean piece of ground.

The State Experiment Station of New York calls attention to the fact that in an effort to put the seed bed on absolutely clean ground, hedge-rows and other heretofore unused ground is often plowed up for this purpose. The results in the majority of cases are very disastrous, as club root occurs on many plants that have been allowed to grow along hedge-rows and woods and therefore these pieces of ground are more often inoculated with disease germs than in the open field, which has been carefully cultivated and weeds kept under control.

Those who have ground not infected with this disease are confronted with an entirely different problem. We have no data at hand showing the length of life of these germs in the soil even when no cabbage crop is grown on the land. It is a well known fact, however, that a heavy application of lime will reduce by a very large percentage the amount of damage done by club root and it seems that burnt lime is much the better form to use in this case. All authorities seem to agree that very little advantage can be gained in the control of club root by the application of lime during the same season in which one wishes to grow a crop of cabbage. It should be applied at least one year before. If cabbage, for instance, is to follow corn the lime should be put on after the land is plowed for corn and thoroly harrowed in. If the ground is plowed for corn the fall before, so much the better, thus giving a heavy application of quick lime a year to eighteen months to work upon the soil before the cabbage is seeded.

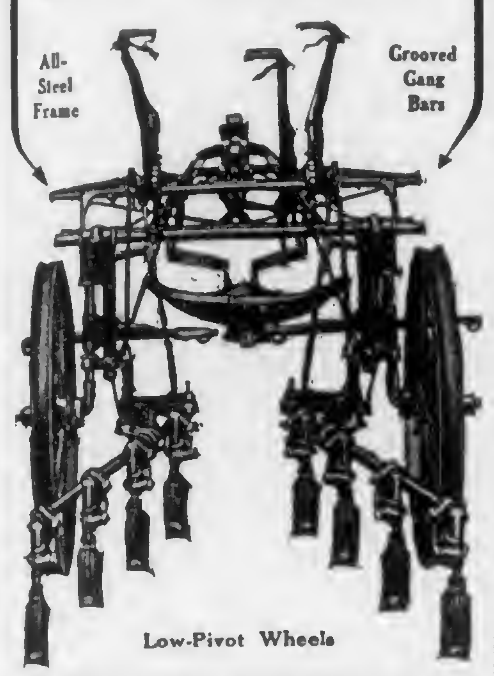
A heavy application of lime, say 1,500 to 2,000 pounds per acre, followed by a seeding of alfalfa allowed to stand for three or four years, is probably the best recommendation that can be given in ridding a field of club root.—F. R. Stevens, Agriculturist Lehigh Valley Railroad.

ORCHARD PLANTING DISTANCES

When I first planted an orchard the popular planting distance for apples was 30 feet each way so I planted mine that distance, about 8 acres in all. Naturally many people wondered why I planted so far apart. Later on I bought 60 pear trees and planted them between the rows one way, thus making the trees 15 by 30 feet.

I have grown many good crops of apples and pears, but now find the trees entirely too close, even where there are no pear trees, as the trees or branches nearly all come together and many limbs interlock. Before long the pear trees and every other apple tree will have to come out. As a rule farmers plant trees too close. When a young orchard is planted 40 by 40 feet, fillers may be used until the apple trees bear, when the fillers may be cut out.

The safest way is to plant apples by themselves; and peaches likewise. Pears, with the exception of Kieffer, Bartlett and Clapp's Favorite, cherries and plums may be mixed more or less, as they are rather short-lived.—Joseph E. Fischler, Tioga Co., Pa.



Better Cultivation
Increases the yield. It retains the moisture in the ground and permits the chemical properties of the air to get to the roots. The size of the increase depends upon the number of times you cultivate and the kind of a machine you use.
IRON AGE RIDING CULTIVATORS
Carry every possible adjustment of teeth, gangs, wheels, frame, etc., to care for all row crops in any kind of soil. They are built with high or low, pivot or fixed wheels, grooved, flat or zig-zag gang bars, for one or two rows and with many attachments for special work.
See them at your dealers and ask for booklet "100 Percent Potato Planting."

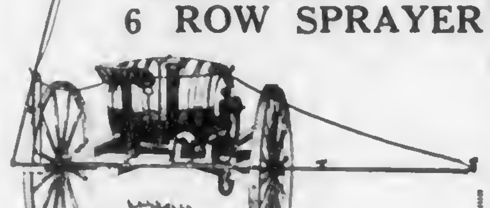
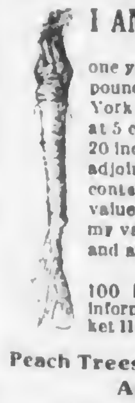
Low-Pivot Wheels



THE PERFECTION 6 ROW SPRAYER
For Trees and all Vegetables. Strong, Reliable, Durable, Simple and Practical.
We are the oldest builders of Horse-Power Sprayers. We personally test every Sprayer before it leaves our shops. We have nearly 2000 of the Perfection Sprayers in use, and every owner is a "Booster."
PRICES:
For both Trees and Potatoes - - $75.00
For Potatoes and all Vegetables - - 70.00
We also manufacture The Improved Riggs Markers, and Improved Riggs Plows.
Send for Catalogue.
THOS. PEPPLER & SON, Hightstown, N. J.



I AM A HORSE-RADISH ROOT
one year old, two feet tall and weigh six pounds. My value at wholesale in New York market is 30 cents, in quick demand at 5 cents per pound. I occupied a space of 20 inches in the row and was four feet from adjoining rows, therefore one acre would contain 6000 of my kind of wholesale cash value of $1800. During the past 20 years my value has been as low as 1c per pound, and as high as 15 cents per pound.
100 Horse Radish Root Sets with full information how to cultivate and market Horse-Radish $1
Peach Trees, 10 cts. Pear Trees, 15cts.
Apple Trees, 15 cts.
3-Year Old Grape Vines, 5 cts.
Any quantity while they last. These are large thrifty Trees and Grape Vines of best quality and varieties, now in best condition for planting. We do not wish to grow them another year, also the ground and space they occupy is required for growing Horse-Radish.
Valley Farm Co., Newburgh, N. Y.

The Dairy

WITH CHARLES SWEIGART, CHESTER COUNTY, PENNA.

(Continued from page one)

age and general development, and birds of a class are housed together in their separate compartments until all are fully developed when all on that floor are thrown together. Here the layers are kept thruout the season from September 1 until they are either sold or transferred to the breeding flock the following season. The standard laying ration consists of a mash of 2 parts bran, 1½ ground oats, 1 middlings, 1 corn meal, 1 gluten, 1 oil meal, and 1 beef scraps. This mash is fed moist with a mixture of steamed clover and cooked vegetables, during the afternoon. This is followed an hour later by grain in the litter an a basis of about 7 quarts to 100 hens. This ration, however, is varied according to the condition and production of the birds.

The floors are kept heavily bedded with clean straw and the litter is not removed until spring. All roost droppings are cleaned weekly. The hens feed from troughs, with grit, shells, etc., available at all times in self-feeding devices. The roosts, which are all on one level on each floor, with a dropping board beneath, are kept carefully white-washed and disinfected, and little difficulty has been encountered with insects. We anticipate a protest from some readers against the practice of permitting the litter to accumulate thru the winter, but Mr. Sweigart has had no difficulties with the practice and he has a uniformly vigorous and healthy flock and a balance sheet on sales of eggs that speak for themselves. Record sheets are posted on the wall of each compartment and a careful record is kept of each day's production from each lot.

As roosters are never permitted in the laying house and all layers being purebred White Leghorns, especially selected for uniformity in size and color of eggs, the product is acceptable in the fancy white, sterile-egg trade. All eggs are shipped to a New York firm that caters to a special fancy trade. This market is open to all eggs of this kind that can be produced; there are no gluts in the market of this particular class of eggs. These hens are not only winter layers. Mr. Sweigart observed incidentally that a flock of 380 hens turned him just about $40 a week during the past summer, and of that amount practically $25 was net profit.

We have said that careful records are kept of all production. Following is a complete record of the poultry department for the year and the egg record for 11 months ending November 1, 1913. It will be observed that each account is kept separate to get at actual costs and profits of each department. Thus, complete accounts are kept for layers, chicks in the brooder house up to seven weeks of age, the broilers and the pullets. These accounts are itemized as follows:

Poultry Record—Ivywood Farm

From November 1, 1912 to November 1, 1913

Nov. 1, 1912, 380 layers on hand, value $380.

Laying Flock.—October 1, 1913, eleven months' eggs, 46,255, bringing $1,013.66. Cost of feeds for layers, $102.67. Cost of labor on layers, $75. Total cost $177.67. Profit on layers, $535.99.

Raising Chicks to Seven Weeks of Age.—Eggs set, 3,505; Market value, $68.94. Oil for incubating $5. Labor for incubating, $24. (2,468 chicks hatched and 1,857 raised). Cost of labor on chicks to 7 weeks of age, $56.25. Cost of feed for 1,857 chicks raised to 7 weeks, $99. Total cost of chicks to 7 weeks of age, $253.19.

Raising Chicks and Broilers.—(877 cockerels fattened as broilers) Cost of feed from 7 weeks of age to marketing, $14.48. Cost of labor on fattening broilers, $2. (980 pullets raised for layers) Cost of feed for pullets from 7 weeks of age to November 1, 1913, $169.48. (about 60 pullets were stolen from range). Cost of labor on pullets $15. Total cost on broilers and pullets from 7 weeks of age, $200.96.

Total cost layers, chicks, broilers and pullets, $834.15.

Receipts.—Profit on 380 layers, $535.99; 877 broilers sold, dressed, $234.04; 350 pullets sold as layers, $350; 260 hens sold, $198; 100 hens on hand for breeders, $100; 571 pullets on hand for layers, 571. Total receipts $1,989.03. Profit 1913 ($1,989.03 - $834.15) $1,154.88.

In the 11 months the layers returned an average of $2.66 on eggs sold. Feed and labor per hen averaged $1.25, leaving an average profit per hen of $1.41. The 3,505 eggs set hatched 70.2 percent. The chicks cost 4 cents each when entering the brooders. A total of 1,857 or 75 percent, was raised. At the age of 7 weeks and 2 days, when leaving the brooders, the average cost per chick was 13 2-3 cents. The average cost of broilers when sold was 15 3-5 cents each. The average cost of pullets on November 1, 1913, when five months old, was 32 cents each.

"A SILO FOR SUMMER FEEDING SHOULD BE A PART OF THE EQUIPMENT OF EVERY FARM WHERE STOCK IS KEPT"

Mr. Sweigart says that this record is not what it should be, or what he hopes to make it. Many of his layers were too old for large profits and his losses in the brooder house were at least 10 percent heavier than necessary with more experience in handling it. He expects to bring his 1914 chicks to maturity with less than a 15 percent loss. His present laying stock is of the right age to make better profits and he had them primed for an average profit of $2 each for the season of 1914. He reports that their performance during the past winter months indicate that they are ashamed of last year's figures, and they are out for a record this year. A complete record for the season 1914, and we hope for many years to come, will be published in these columns.

The Dairy.—We have said that the general farm plan embraces a combination of dairying with poultry. The dairy department has not progressed as far as the poultry work but is proving a splendid adjunct in providing cheap poultry feed in the form of skim milk. The present herd consists of 15 head of purebred Holsteins, with a purebred sire, King Pietertje Walker Clothilde, a son of King of the Black and Whites, at the head. This sire was purchased last fall, in partnership with Mr. P. M. Hicks, a neighbor.

Mr. Sweigart plans to increase his herd with purebreds until it numbers 30 head. Maintaining that number of cows on 30 acres of land is a fair indication of the intensive methods practiced on this place. It is this vigorous management in making every asset of the farm yield a maximum of highest quality marketable products that is spelling success. All milk is sold to a local creamery, a large quantity of skim milk being brought back for feeding to the poultry flock. The average production of milk last year was about 8,400 pounds per cow.

The past ten years have been strenuous ones on this farm, in which labor union hours have seldom been observed. But Mr. Sweigart is still a young man and the business he has established is full of promise for the future. Some will say that he could have done better in a city position; that such energy and persistance would win larger rewards in fields of greater opportunities. Perhaps so, but he loves the farm and its environments, and this means more in the development of a life work than mere money. In working out his individual problem and building success from a meager start and with no outside help, he has given us an object lesson worthy of careful study by every ambitious boy. Moreover, he has demonstrated that in farming, as in other lines of business, the man is at least 90 percent of the job.—Arthur J. Anderson.

SOILING CROPS VS. SILAGE IN SUMMER

The relative economy of depending upon soiling crops or silage to supplement short pastures in summer is a question of importance to every dairyman. The Wisconsin Experiment Station has made a careful study of these two systems of providing summer feed, and presents some interesting information on the subject in Bulletin 235. By feeding one lot of cows in the University dairy herd soiling crops and another corn silage for three successive summers, it was found that corn silage can be used to better advantage in supplementing poor pastures and in keeping up a uniform and economical flow of milk. By the use of silage cows were kept in better condition to enter the fall and winter, and the annual profits for the year were greater.

The soiling crops grown during the three trial seasons consisted of red clover, peas and oats, green flint corn, sweet corn, and a mixture of oats, peas and dent corn. A careful record was kept of the time of sowing, amount sown, the time of cutting and the yield per acre of green material, protein and green matter. Clover proved the least palatable of the green crops fed. Sweet corn was substituted and proved highly satisfactory. When fed corn, the cows did better than when fed oats, peas and other soiling crops. The silage used was made from local strains of white and yellow dent corn.

The records of milk production for the two groupes differed very little. For the three years the cows fed soiling crops produced 195.7 pounds more milk than the silage-fed cows, but 40 pounds more solids and 35.84 pounds more butter fat were produced by the silage-fed cows. The silage-fed group received 1,740 pounds more dry matter than did the soiling crops lot, but the soiling crops cows consumed 420 pounds more protein during the trial than did the silage-fed cows. Less labor and seed was required in the production and feeding of silage than soiling crops. The same amount of cultivation was needed for both. While thickly seeded crops are more easily planted, greater ease was found in harvesting silage.

The cows were fed according to condition of pasture, the size of the cow, the stage of her lactation and her milk production. On an average the silage lot received about 30 pounds and the cows fed soiling crops 35 pounds per head daily. Each cow, in addition, received from one-fourth to one-third as many pounds of grain daily as she produced pounds of milk. This is the practice at the Wisconsin University except during the early summer, and is done to prevent loss of milk flow and body weight.

A silo for summer feeding, of smaller diameter than the average silo, should be part of the equipment of every farm where live stock is maintained. With a herd of 20 or more cows the advantages are greater. Summer feeding of dairy cattle requires care, uniformity and liberality if the production of the herd is to be maintained at normal during the period of scant pastures and dry weather. Hay and grain rations in addition to plenty of silage or soiling crops should be fed unless an abundance of good pasture is available. When rainfall is below normal and pastures are poor, the soiling crops are likewise apt to fail. The use of the silo tends to equalize the quantity of feed available from year to year, and hence insures against losses in production.

NEW JERSEY MILK LAW

Governor Fielder has affixed his signature to Senate Bill No. 182, by Dr. Ramsay, of Middlesex county, regulating the production, distribution and sale of milk and cream. This law, which had the backing of the state board of health, provides that any local board of health may pass ordinances for licensing and regulating of all persons engaged either as principals or agents in the production and sale of milk and cream, and may fix an annual license fee for the same not to exceed $2. Such ordinances may require the producer or seller of milk and cream, to set forth the locality from which they are obtained, and in case the place of supply be changed the local health board must be notified.

The law further provides that local boards of health may also ordain that no license shall be granted to sell milk from unclean or unsanitary dairies, or from cows fed on swill, or that are diseased. Every dairy must be properly ventilated and have a pure water supply. Another provision is that every proprietor of a dairy must file annually with the state board of health a certificate signed by a duly licensed veterinary surgeon, stating that the cows have passed a physical examination and are in a healthy condition. The State board of health is given power to assist local boards of health in enforcing the law.—H.

FERTILIZING TIMOTHY

(Continued from page two)

half of the rotation in the case of the three grain crops the value of the yields of the unfertilized grain, grown on the plots previously grown to timothy and fertilized, over and above the value of the yields on the check plots on which no fertilizer had been used was $22.16, which is all profit; but this profit must be added to the profit on the timothy during the first three years of the experiment because it is all due to the effects of the same set of fertilizers.

This makes a total profit of $60.26 on an investment of $39.20, or 154 percent. This may be stated by saying that for every dollar invested $2.54 was returned. For the last three years the profits on the timothy were $35.10, or about 90 percent on the investment, which means again that for every dollar invested in fertilizers $1.90 was returned. No results, of course, have been secured for the next three years but the estimates seem reasonable and would not be much different from the results for the first complete rotation given above. For the twelve years, or two rotations, about $2.50 will be returned for every dollar invested.

We can find no experimental data or other evidence to show the results where fertilizers have been used in a smaller rotation on the corn, oats and wheat instead of the hay, but from farm practice and farm experience there seems no reason to expect such results and profits. Where a complete fertilizer is used on the grain crops, as 3-8-5 for wheat or 4-9-6 for corn, for which grains more phosphoric acid and potash than nitrogen is used in the formula, the nitrogen which is chiefly required by the timothy, applied the first two or three years of the rotation, has probably been lost before the grass is ready to use it, and no organic matter of consequence has been added by the grain crops from which available nitrogen can later be obtained. Residues of phosphoric acid and potash are of rather insignificant importance because there is perhaps a very great deficiency of these elements in the soil for a good yield of timothy hay which would follow in the rotation and the expensive nitrogen would have to be added again.

Where a complete commercial fertilizer, say a 9-4-7, which is high in nitrogen and high in potash but low in acid phosphate, is added to timothy the nitrogen is used at once by the grass crop and the residue of phosphoric acid and potash accumulate in the soil until demanded by the grain crops which follow. In the meantime sufficient stubble and roots have developed and returned to the soil to supply nearly all the nitrogen that is needed by these same grain crops. As a result we get the immediate effect of the fertilizer on the timothy and their residual effects on the grain crops which follow in the remainder of the rotation. Thus the theory of timothy versus grain fertilization seems reasonable and the evidence seems conclusive as to its value in crop rotation.—John H. Reisner, Cornell University.

Revenue From Condemned Cattle.—That there has been a marked increase in revenue from the sale of cattle condemned and sold under direction of New York department of agriculture is evident from a recent report which shows an increase of more than 86 percent over the return under the previous administration. The average return from five abattoirs for the year ending April 1, 1914 is $26.40 per animal whereas for the period from April 1, 1911 to April 1, 1912, it was $11.14. Until commissioner Huson assumed office there was no revenue to the state for animals that were rejected and destroyed but under the new plan the state receives 75 cents per hundred pounds for the carcasses of such animals. The hides also bring from $4.50 to $5.50 each.

UNITED STATES Cream Separators LEAD Under Any Conditions
For the reason that:
There is as much difference in efficiency between U. S. Skimming Sections and all other skimming devices as between the Twentieth Century Limited (20 hours between Chicago and New York), and the average passenger train (25 hours).
The U. S. Bowl is a marvel of perfection because of its ability in the average dairy to save in closer skimming from $50.00 to $100.00 each year (15c to 30c each day) over all other separators, and because it can be cleaned in about one-half the time of other separators, and easily kept perfectly sanitary always.
The U. S. Separator is the only Separator having the non-rusting Nickel Silver Metal which is non-adhesive like glass or ivory, easier than other devices to clean by ordinary methods and immensely easier by the Mechanical Washer.
The 1914 Sanitary Liner for bowl chamber supplies the most sanitary equipment. Iron is quick to rust when milk touches it. This is why other separators become insanitary. Milk cannot touch the iron bowl chamber of the U. S. for the liner prevents.
The U. S. Separator separates thick cream when desired, and at the same time skims clean. This is a hard test, and under it all other separators skim poorly, and some clog. The advantages of thick cream are many.
There are many cream separators outside the class of so-called "cheap separators" which in reality, like poor cows, are "star boarders" because they have not the ability as has the U. S. to meet perfectly the variations found in every day conditions in the average dairy.
The U. S. Cream Separator is in a class by itself.
It holds the World's Record in the longest and hardest fought world's contests. This statement cannot be successfully denied for the proofs are on record.

Live Stock

THE BEGINNER IN PUREBREDS

A few years ago a business man, who was interested in the board of trade dealing in a small way, made this remark to the writer that a man ought never to put more money into anything of doubtful profit than he can afford to lose. I have thought that advice would apply to many other lines of business besides board of trade speculating, and particularly to the beginner in the purebred stock and poultry business. Somebody has said, "Experience is a dear teacher," and it usually is. It looks strange to me to see men investing headlong all they have and borrowing money besides in business that they know absolutely nothing about.

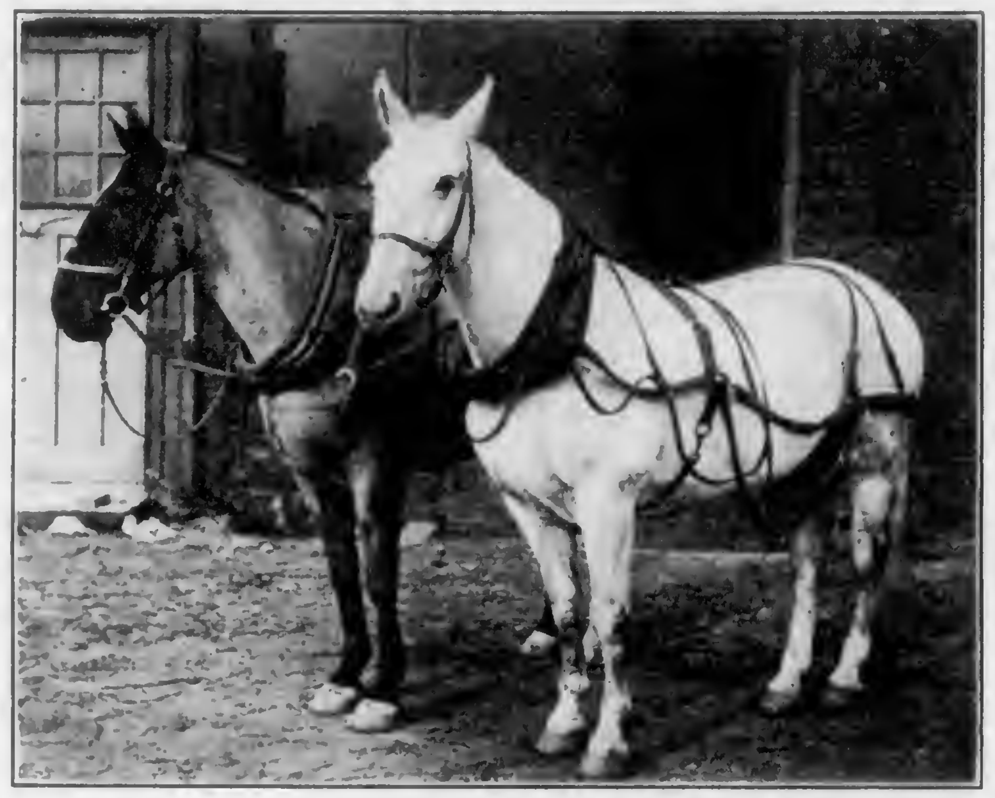
There are crooks and turns and ups and downs in every trade that nobody can become familiar with except by experience, and the purebred live stock and poultry business is no exception to the rule. The mistake too often made is to undertake to accomplish in a year or two what it has taken the follow we are trying to imitate half of his life to do. I have known fellows to buy up a lot of high-priced cattle, hogs, or sheep, then run an advertisement in two or three papers and imagine their fortunes made. I know some fellows who would not think of paying less than three to five dollars for a setting of eggs. As a general thing they pay dearly for their experience, and those who deal with them usually do the same.

To my mind there is a better way: Go slow—it is not nearly so expensive. Now I would not advocate the idea of buying anything that may be offered just because it is cheap or represented to be purebred, but I do happen to know that it is possible to buy real good stuff at a fair price by looking around a little—stuff that will do to practice on at least. In the stock business as in other lines we often pay according to the reputation of the breeder, and too often do not get any better stuff than could be bought of some less pretentious fellow. There are many breeders the country over, who have first-class stock to sell, who need money and rather than run the risk of carrying their stuff over will sell at little above market price. In several years of buying purebred stuff I have gotten good bargains of the medium priced men. Of course it is slower getting a start; we can not have a hundred pigs or five hundred chickens for sale at fancy prices in a few months, but by the time we know what is fit to sell as purebred and what is not we can generally have enough stock or eggs to supply our trade and in the meantime sell enough close home to pay expenses and then some, besides our schooling.

Better sell half a dozen first-class pigs and fatten the rest than to sell half a hundred with four out of every five culls. I want to repeat that the growing and selling of purebred live stock and poultry is a business that has to be learned, and the wise thing to do is not to make our learning too costly.

If we pay $25 for a young sow we could not lose anything if she raised only four or five pigs the first time. If we pay $60 we can not afford to have much bad luck. Now, the chances are that the cheaper hog will be as profitable to learn with as the dearer one. Another place the beginner can spend a lot of money and get little return is at the county fairs. I have found that animals that are fitted for the show ring are not the kind for the little fellow to buy. They look nice but they are not "utility" animals, and more than that, they are worth more for show purposes than for breeding. Now I do not object to showing stuff at the fairs but I never thought it paid the beginner to buy that kind. Another thing, if we start in easy and it does not pay and if for any reason we want to quit that particular breed of animals, we can turn the whole outfit into the fattening pen and come out whole with a little profit besides. Whereas if we had paid from $200 to $500 f r breeding animals there would not be much profit in it.

The scrub colt, pig or sheep and the old-fashioned hen of many colors have had their day. The purebred has become a fixture and there is a way of getting started whereby we do not have to put more money into the business than we can afford to lose; but we don't need to lose anything.—C. S., Crawford Co., Pa.



GOOD CARE AND FEED, WITH PERFECT ADJUSTMENT OF HARNESS ARE NEEDED DURING THE RUSH OF SPRING WORK.

Hog Cholera.—This is the title of bulletin No. 173 of the Indiana Experiment Station at Lafayette, Indiana, which has for its purpose "to inform farmers as to the nature of hog cholera and the methods of controlling this disease." It embraces a discussion of causes, symptoms and preventive measures in connection with the disease and takes up hog cholera serum and methods of vaccination.

CBFR LIGHTNING ROD

The Standard of Protection Since 1849

Anyone familiar with the frightful destructiveness of lightning realizes the wisdom of securing *positive* protection.

Each year the loss of *life* by lightning runs into the hundreds; and millions of dollars damage is done to property. In 1849—65 years ago, the first

Cole Bros. Franklin Rod

was put up. From that day to this *not one penny's* damage has been done by lightning to any building properly equipped with a C B F R Rod.

Here is a **record** that should guide you in your purchase of lightning protection. Not claims, not arguments, but positive **proof.** The C B F R rod is the genuine Benjamin Franklin rod, perfected by the oldest and largest rod manufacturers in the world, and guaranteed by them to wear and give perfect protection. Flimsy substitutes **cannot** offer you equal protection and equal wear.

FREE!

Here are inside facts about lightning rods, never before published. A complete, reliable treatise on the subject, brimful of illustrations in two colors. 20 pages, 9 inches by four. Don't be in the dark when you are approached about lightning rods; know what arguments are sound and what are false. Our free book tells you. Get it today. One copy free to property owners—extra copies 4c each. Write!

Grange

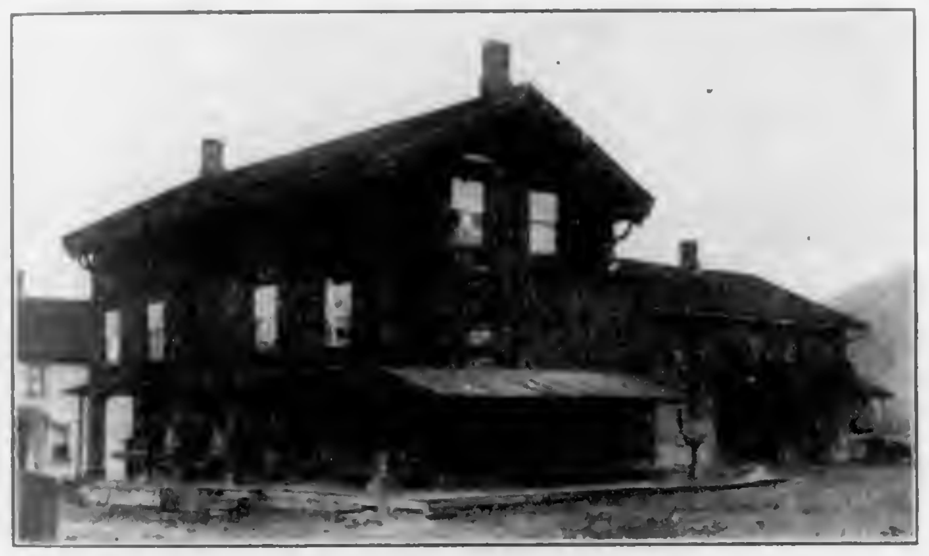
A STIRRING GRANGE CONTEST

A Busy Winter And A Rich Harvest

Sheshequin Grange No. 1363 was born December 23, 1907 with 21 charter members; Deputy Asa Stevens of Powell, Pa., being the officiating Godfather. The membership was so small that it was thought advisable not to build a hall. Accordingly meetings were held in the town hall and subsequently in the I. O. O. F. Hall, but these arrangements not proving satisfactory the grange met every two weeks at the homes of the different members until about three years ago when a school house, centrally located, was purchased from the school board; it being no longer used for school purposes. This was a very satisfactory plan and the growth of the grange has been steady from that time on, the secretary reporting 63 members at the last quarter in 1913.

L. C. BURROUGHS,
Master of Sheshequin Grange No. 1363.

At the beginning of 1914, L. C. Burroughs, a member who had just moved into the place from Towanda Valley Grange, was elected Master. As there were no sheds to accommodate the horses at the school house, and as a stormy night meant a very small attendance, it was thought best to make an effort to raise money to build sheds in the fall. Mr. Burroughs proposed a membership contest which was agreed to by all present. It was entered into and the results were far greater than any one dreamed of.



SHESHEQUIN GRANGE HALL. FORMERLY "THE VALLEY HOUSE."

Bro. D. W. Chaffee and Sister Lucy Lent were selected to lead the sides, and the members were divided into two parts, each leader choosing alternately as in the old fashioned spelling match. Every one whose name was on the roll was chosen even tho they were in arrears or out of town. Every new male member counted ten points in the final score and every new female member counted five points, and every member present at a regular meeting counted two. The side that had the least number of points at Easter was to put up a supper to the winners.

MRS. LUCY LENT,
The Defeated But Not Vanquished Leader.

D. W. CHAFFEE,
Leader of the "Reds" and Winner of Contest.

The members went to work and they certainly did well, as the names came in by the score. One night 34 were given the first two degrees; and 20 was a small class. To make a long story short, the contest closed with 119 new members, Sister Lent having brought in 22 males and 24 females while her opponent, Chaffee, had 36 males and 27 females, which, with the counts for attendance, made the final score: Lent, 1,088; Chaffee, 1,187.

After the contest had been running but a month it became evident that something radical must be done, as the little school-house-hall would soon be too small. Fortunately Bro. Chaffee originated a scheme to buy the Old Valley House, an old hotel which had been a land mark for years. The accompanying illustration shows it as it appeared when purchased. Repairs have been made and a handsome sign 16 feet long bearing the legend "Sheshequin Grange No. 1363" has been placed just above the windows.

This hotel contains 15 bed rooms in the back part, besides a kitchen, a large dining room and a parlor, which are rented to a family for $48 per year; and as our grange meets on Tuesday night we rent the barn which accommodates 24 horses to the Odd Fellows on Saturday night for $12 per year. It will be seen that our hall is thus a source of income. The front part of the hall is three stories high and contains the old bar room, which we now use as a grocery, a parlor and a hall. The second story is the old ball room, which is our present lodge room, comfortably seating an ordinary grange but now taxed to its full capacity. The third floor was used as a lodge room years ago but is now vacant. We hope some day to tear out the third floor and make one much better ventilated room out of the second and third stories.

Bro. Chaffee's scheme to buy this building met with the hearty approval of every member, and the old hall was sold and the new one bought, the first meeting being held in the new hall February 24, 1914. The long looked for feast came April 14, and was an event long to be remembered; 180 people being served with supper. The first table was served at 8 o'clock and at 10 the program began. After a few remarks by the leaders of both sides in the contest, Sister Georgia Piolett, State Pomona, read a paper on "The grange and what it stands for." Bro. A. M. Cornell, a past State Lecturer followed with a very interesting address.

In speaking of the contest, Bro. Burroughs said: "We were fortunate in securing two leaders who are very enthusiastic Patrons and who can beat or be beaten with the same grace. Most contests bring in undesirable members but we have been very fortunate in this respect. This is the second contest of the kind that I have managed, and if I were to manage another one I would make this change: Every 10 cents brought into the treasury would count one point. This would give each male member 30 points; each female, 10 points; a boy 10 points; a girl 5 points and a reinstatement 12 points. Each person attending should count 2 points."

Do not think that we have done nothing but hold this contest. We have bought about $800 worth of sugar, grass seed and other things, and have saved considerable to our members. Neither have we stopped working, for there are three applications in the secretary's hands for action at our next meeting night. We now have some of the finest timber to work with in the world. We have an orchestra of seven pieces and another one of four, besides a number of speakers, violinists, clarionetists and cornet players. We feel that the end is not yet and that great things are in store for us. We have a cow-testing association well under way, a boy's corn-growing club and a committee to arrange for a library. A picnic committee is planning to unite the five nearest granges with ours at a date in August, at which time we will be glad to see any or all of you.—An Onlooker, Bradford Co., Pa.

Colorado Strike While all the country has been stirred by the threatened war with Mexico, the struggle between striking miners and the mine owners in Colorado has resulted in greater bloodshed and more serious warfare than the engagements at Vera Cruz. The Colorado strike has continued with ever-increasing bitterness between the strikers and mine guards for the past six months. The state militia has apparently failed to stop hostilities, inasmuch as their efforts to protect property have been construed by the strikers as an effort to help the mine owners. The recent engagements have been fought with all of the intensity of actual warfare. They were not mere strike riots or street fights, but both sides were firmly intrenched and shot to kill. The loss in one recent battle was reported 45 dead and 20 wounded; many being women and children. President Wilson responded to the call for help last week and dispatched federal troops to stop the fighting. The causes of this war are similar to those which existed in the mining war in West Virginia last year and have existed in every great labor strike in recent years. The mine owners claim that the strike hinges upon the right of free men to labor for and with whom they please, and the right of employers to hire whom they please. The strikers claim that it is a question of the right of labor to organize. In pressing their side, the mine owners have pleased to hire none but non-union men, and the specific issue is the question of recognition of the union. Capital is permitted to organize. Mine owners have developed a combination of forces. Having money invested and ''property'' developed, they can call upon the state to provide protection of such property. The laboring man's capital is his capacity to labor. When he seeks to enhance the value of that capital by combining his labor capacity with that of his fellows, his union, thus formed, meets the strength of the combined employers. But the laborer has little or no property established, and the state can offer no protection for that which he does no have. The unions see an injustice in this discrimination and assuming the right to make a real contest they seize upon the available means of warfare and destroy the property of the employers and those who seek to protect that property. The struggle in Colorado is merely a repetition of the struggle at Homestead and the struggle of every labor strike since labor unions were established. Such strikes and industrial wars will undoubtedly continue until the status of the unions and the rights of labor as opposed to capital are definitely defined by federal law.

Farm Clubs A recent letter from a man prominent in agricultural work in the Northwest, in reference to farming conditions there says: ''There is a very strong tendency toward co-operative buying and selling, resulting from the organization of over 1,000 farmers' clubs in the past two years. These farmers' clubs were started, to a large extent, by the county agent movement with the idea of forming a channel thru which the county agents could come in touch with their clients, the farmers, but as soon as these farmers get together in clubs they immediately turn to co-operative marketing and buying. A second change which has been greatly hastened by the county agent and farmers' club movement is the introduction of corn, alfalfa and live stock in place of the single crop method of farming.'' Such co-operative work is the first result where farmers are brought into any sort of organization or close association. Many see the greatest possibilities for good in the county agent movement in such organization work. But counties should not expect their farm bureau men to do their organizing for them or to direct their co-operative work. The agents may bring the farmers of a county closer together and point out lines of common interest in which the farmers may well join in co-operative effort, but it must remain for the farmers themselves to push co-operation in buying and selling and in all lines in which such effort is practical and profitable. There is as much need for such work in the East as in the Northwest.

MARKET BY PARCEL POST

Philadelphia is not one of the cities designated by the Post Office Department to inaugurate a system of direct marketing by parcel post. However the Bureau of City Property of the city government is ready to undertake a similar development of direct marketing for this city. This Bureau will receive names and addresses of farmers who are in position to mail farm produce direct to city consumers. Applicants should state the kind and amount of produce which can be sent each week. The Bureau officials will then attempt to put such applicants in touch with city consumers who can take a stated amount of such produce each week, and thus open a way for direct transit of produce from producer to consumer. Address Bureau of City Property, City Hall, Philadelphia, Pa.

NEW HEAD OF HORTICUTURAL DEPARTMENT AT PENNSYLVANIA STATE COLLEGE

Professor Maurice G. Kains, for ten years associate editor of the American Agriculturist, has been appointed Professor of Horticulture at The Pennsylvania State College and will report for service August 1.

Professor Kains graduated from the Michigan Agricultural College in 1895; he spent the following two years at Cornell University, pursuing post-graduate work, and obtained at that institution the degree of Master of Science. He served three years in conducting special crops investigation for the U. S. Department of Agriculture. During this period he made a thoro study of special crop problems along the Atlantic Seaboard, and also made several trips to Bermuda to investigate problems which were being studied by the United States Government. In 1900 he accepted the Chair of Horticulture at the School of Agriculture and Horticulture at Briarcliff Manor, New York. After two years of teaching, he became horticultural, agricultural, and bontanical editor of the New International Encyclopedia, and later chief horticultural contributor to the Cyclopedia Americana.

Professor Kains' ability as a teacher, speaker, investigator and editor, together with his knowledge of eastern conditions and his acquaintance with eastern horticulturists, make him unusually well qualified to head the Department of Horticulture at The Pennsylvania State College.

PROFESSOR M. G. KAINS,
New Head of Horticultural Department at State College.

Editor's Note.—I want to add a word to this general announcement from knowledge of Professor Kains gained thru several years of personal and business acquaintance. He comes well qualified to care for the executive, technical and practical needs of the Horticultural Department. As a teacher and leader of young men he is a man of exceptional qualities. Closely sympathetic with the problems of student life and with a broad conception of the essential things in the development of character, he is especially qualified to assume the higher responsibilities of a leader of men. The students of State College will find in Professor Kains not only a capable teacher, but a wise counselor and an understanding friend. The institution and the state is to be congratulated upon securing the services of a man so keenly sensible of the responsibilities of his new position and so capable of meeting them.—Arthur J. Anderson.

THE PENNSYLVANIA TOWNSHIP ROAD LAW

The article on this subject in Pennsylvania Farmer of April 25, makes statements that need correction. It opposes the position of the grange upon vital phases of the road question. Dr. McCaskey is a good granger and has been heartily with us in our road fight all thru. He has authorized me to say that he does not seek to oppose the grange policy but wrote the article on the strength of several good points in the bill itself without reference to the place the 1913 Dirt Road bill held in the general policy of road legislation in this state.

In order to get the status of this law clearly in mind let us go back a little in the history of road legislation and note the several steps that have been taken by which the Grange has reached her present position upon this subject. The grange at one time was willing to stand for some state roads, while realizing that all roads were largely local in respect to amount of travel, yet they felt that certain roads would naturally need more care on account of the extra usage and that the state ought to be the proper agent to do this work. Experience has taught us an expensive lesson with regard to doing work thru a central state department, not only in our state but in the others that have tried the plan.

We have for years been convinced that this work must be done under a system similar to our school system where the authority is placed where the work is done. All our dirt road laws, up to this last one, allowed this local authority and the money appropriated by the state was paid to the townships. However, the plan was a failure because the state repudiated the debt and paid only a small fraction of the amount pledged. By this time the newly established highway department had shown conclusively that it could see no roads but the so-called permanent roads, and these were handled in such a way as to convince nearly every one that centralized road-building from a far-away state department was a corruption in politics, a waste of public money and a supervisory failure. That recalled the fact that such centralization was unnecessary.

Our school system had for many years been operated by local authority, even up to the highest units, and had given a good measure of satisfaction. Then as a last straw the demand for bonds and the lay-down in the legislature in giving the control of the dirt roads over to the highway department, when they were not half doing the work they already had in charge, caused a revulsion of sentiment that not only swept the state in the defeat of the bond issue but also taught many people that the whole system was wrong and that instead of getting good roads we were simply being robbed by waste, extravagance and inefficiency.

Accordingly, at the last state grange meeting the legislative committee in its annual report demanded a change in our whole road system and that policy was adopted by the state grange without a dissenting voice or vote. This part of the report follows:

''We hold that as everybody gets the benefit of good roads, everybody should help to pay for them, and because the great majority of roads are essentially local in character, the control of the roads should be vested in the local officials, and in order that the state and county might have authority over the money appropriated for road building, the roads should be systematized and classified, and the appropriation graduated according to the kind of work accomplished. A County Superintendent of roads should be elected by the people to oversee the work of each county, and to advise with the Township Supervisor relative to their work. There should be maintained at Harrisburg a Highway Department sufficient in size and ability to make out specifications for the several grades of roads, to issue from time to time, but at least annually to the County Superintendent and Supervisors, bulletins on improved plans on road building and maintenance.

''In order to inaugurate a complete system of roads, we insist that the sum of $7,000,000 be appropriated annually, and that the money be distributed to the several counties and townships. This money is available, if not under the present operations of our tax law, it can be made available under our recommendations of tax revision which we have advocated for several years.

''We dare not forget that the fight for a good system of road building and maintenance is just begun. When we realize that the control of our township roads was taken from the township by the last legislature in the passage of the 1913 Dirt Road Bill which should be repealed, we can be sure that it will mean a strong and determined effort to wrest this great public service from political domination, and restore it as a part of our system of transportation for the benefit of all the people. The need confronting us at present is for a legislature, governor and highway department who will be responsive to the just demand of good roads for everybody, and we should as grangers in all parties work continuously to accomplish this worthy end. The powers of the township could be enlarged instead of being curtailed.''

Of course, there are some good features in the 1913 Dirt Road Law. If it were a question of repealing this law and getting nothing in its place it might be a doubtful proceeding to repeal it, but it is time for Pennsylvania to get away from a system that duplicates work and offices and get a system that will be comprehensive and practical and which we may depend upon to get us good roads for everybody, just as our school system (while by no means perfect) has brought us a great many good schools.—John A. McSparran.

STATE CAPITAL NEWS

Road Matters Again.—Under the terms of an act passed by the last legislature Pennsylvania will have about 1,200 miles of road automatically added to the 8,000 or 9,000 miles embraced in the highway system established by the Sproul act of 1911. About June 1, last year there was a scramble to add routes to the system and to change some of those already established. Over 100 bills were introduced and the number allowed were voted with utter disregard for the condition of the state funds. One section of road routes is to be taken over on June 1 of this year and more next year. Owing to heavy appropriations for charity the Highway department started the fiscal year of 1913 without enough money to do the work which the act of 1911 contemplated. Added to this handicap is the snarl over the automobile license income. This now amounts to close to a million dollars, counting in what was received after July 9, 1913. This year's receipts alone aggregate over $850,000. This goes to show the lack of a proper legislative appropriation program in regard to road building and maintenance. Most of those who voted for the $50,000,000 amendment resolution which sent the proposition before the people knew that it could not pass and that the sum set aside for road building was inadequate, if the loan failed. And yet they added miles and miles of additional road to the system. The time to get a comprehensive road system is now, when men seek nominations.

Other States Interested.—Pennsylvania's methods in combatting the pests in orchards, especially the farm orchards, are the subject of considerable inquiry at the Capitol and there are prospects that half a dozen states may adopt the plan of creating demonstration orchards.

Milk Supplies Inspected.—Agents of the State Dairy and Food division have been displaying much activity lately in inspection and sampling of the milk and cream supplies for the cities and larger boroughs with the result that the number of violations of the law has been reduced. In a number of cases more water was discovered than the law allows, but no instance of use of formaldeayde or poisoning as preservatives was discovered.

Traction Engines.—The State Highway department has licensed 250 traction engines to travel on state highways and the agitation over the new law on the subject is as strong as ever. Reports are being kept as to how roads stand the strain of the traction engines and of the manner in which the bridges bear up. Meanwhile traction engine owners are planning to present their side of it to the next legislature.

Fertilizer Sampling.—Agents of the State Department of Agriculture have about finished the most extensive sampling of fertilizers ever undertaken in this state, about 3,000 samples having been taken. Many new brands have come into the state recently.

Cattle Dealers Sued.—Half a dozen cattle dealers have been prosecuted in the last month by agents of the State Live Stock sanitary board for selling cattle which had not been inspected, as required by federal and state laws. This work is being conducted jointly by United States and Pennsylvania officials.

Billboards Come Down.—Advertising billboards have been ordered removed from state lands bordering state highways by the Highway commissioner. This action is in accord with recently enacted laws.

Farm Counsellors In Demand.—Reports indicate that three times as many farm counsellors as are now at work in the state visiting farms and giving advice in the field could be used. This department is overwhelmed with requests for visits and while every effort is made to accommodate people making requests this is difficult as the advisors have been forced to travel on a schedule.

Change In Normal Schools.—Within a few weeks the State will be in possession of four of its thirteen normal schools and steps will then be taken to change the courses so that more attention can be given to instruction of teachers who will make agricultural education their specialty. The demand for such teachers is far greater than the supply. The trustees named thus far for the schools are all people in close touch with practical educational requireemnts, two women having been named for Edinboro.—Hamilton, Harrisburg, May 4.

NEW JERSEY FARM NEWS

Legislature Adjourns.—The 138th annual session of the State Legislature has come to a close. The session was marked by many achievements for the good of the people of the State. The agricultural interests were well taken care of. Among new laws which have not received previous mention are these: (A) Requiring railroads within six months after the act becomes operative to provide protection to pedestrians and the traveling public at every public road or street crossing of its tracks at grade in the form of alarm bells, safety gates or whatever other appliances are necessary as a proper safeguard; (B) Providing that all boards of education of the various school districts shall constitute a State federation of district school boards of education, each district entitled to one member as a delegate, which shall have full power to investigate subjects relating to education; (C) Providing for the appointment of a county attendance officer by the commissioner of education if the amount of his salary is not less than $900, and this amount has been subscribed or donated; (D) Changing the title of the State bureau of labor, statistics and industry, to the bureau of industrial statistics; (E) Amending the railroad act of 1903 by making railroad company in condemning property subject to the State board of utilities commission; (F) Requiring containers for fruits and vegetables to have capacity legibly marked on outside of containers. Under this statute manufacturers of baskets must mark the capacity of them before they leave the factory; (G) Placing closed season for next five years on female English, or ring-necked, pheasant, a fine of $20 to be imposed for every bird killed; (H) Authorizing township committees to pass ordinances to regulate the construction and alteration of dwelling houses and other buildings; (I) Increasing from 14 to 16 years the age at which minors desiring to begin work shall need certificates for school exemption.

Two Famous Vetoes.—The Governor has received great credit for his judicious veto of the Ackley bill, which would have taken from the State board of education all control over the building of school houses in the rural districts. It was inimical to the interests of the schools, and nothing can be said in its favor so far as the safety, cleanliness, comfort and educational welfare of the children in the country schools is concerned. The other veto was that of Senator Colgate's bill, to permit animal experimentation by the Rockefeller Research Institute.

Lawn Grass Mixtures.—The seed laboratory of the State experiment station has been making a thoro study of lawn grass mixtures. A complete analysis has been made of what is known as ''Standard Lawn Grass'' which sells for 10 cents a quart at various department stores. The analysis follows: Chaff, 38 percent; weed seeds, 4 percent, or 60,200 per quart of seed; timothy, 30 percent; red top, 11 percent; Canada blue grass, 13 percent; red and alsike clover, 4 percent.—D. T. Hendrickson.

NEW YORK LETTER

Constitutional Convention.—The recent vote on the question of holding a constitutional convention next year carried by the small majority of 1,353 in a total poll of 310,414 votes.

Rural School Day.—At a meeting of the State Board of Regents on April 30, it was decided to appoint a day next fall when the governor should be asked to summon the people of the state to meet in their local school houses to discuss local school matters and to give attention to the general education problems of the state. The health department will also be asked to join in the observance. The purpose is to focus the thought of the people on the conditions, needs and opportunities of the schools and the methods of meeting these needs and opportuniies.

Stockmen Meet.—The American Jersey Cattle club held its annual meeting in New York on May 6. On May 13, the Guernsey breeders meet in the same city and on May 14 the annual meeting of the Dutch Belted cattle association of America will occur. These are all important meetings in the interest of the respective breeds.

Various Items.—The Otsego county Farm Bureau association has a membership of over 600 and efforts will be made to increase it to 1,000. Governor Glynn has vetoed the bill which would extend the benefits of state scholarships to professional schools. The department of labor made nearly 11,000 regular and special inspections during the month of March. Governor Glynn has already signed 488 new laws and the total for the year will probably exceed 500. The season is very late especially in the eastern part of the state. At this writing scarcely any spring plowing has been done.—D.

NEW CATALOGS

Split Hickory Vehicles.—The new catalog of Split Hickory Vehicles and Ohio Tanned Harness will interest every prospective purchaser of these articles. It is a handsomely printed and illustrated booklet of 140 pages describing a full line of buggies, wagons and harness, and explaining the ''from factory direct to you'' selling plan which is saving purchasers from $25 to $40 on each purchase. For free copy address Ohio Carriage Mfg. Co., Station 416, Columbus, O.

The Sole of Steel.—Shoes that insure dry feet, health and comfort and that will outwear and outlast from 3 to 6 pairs of ordinary shoes are described in a new booklet entitled The Sole of Steel, issued by N. M. Ruthstein, Dept. 188, Racine, Wis. These shoes are proving more popular each year. They are made in all sizes and sell from $3.25 to $7 for high lace boots. The catalog is free upon request to the above address.

Stover Ensilage Cutters, Windmills and Feed Grinders.—Three attractive new catalogs are those listing and describing the three Stover specialties, including ensilage cutters ranging in capacity from 6 to 10 up to 20 and 25 tons per hour; windmills ranging from 4½ to 20 feet, and feed grinders of all practical sizes. The catalogs will be sent free upon postal card request addressed to Stover Mfg. Co., 192 Samson St., Freeport, Ill.

PLANTS

Something About Asparagus

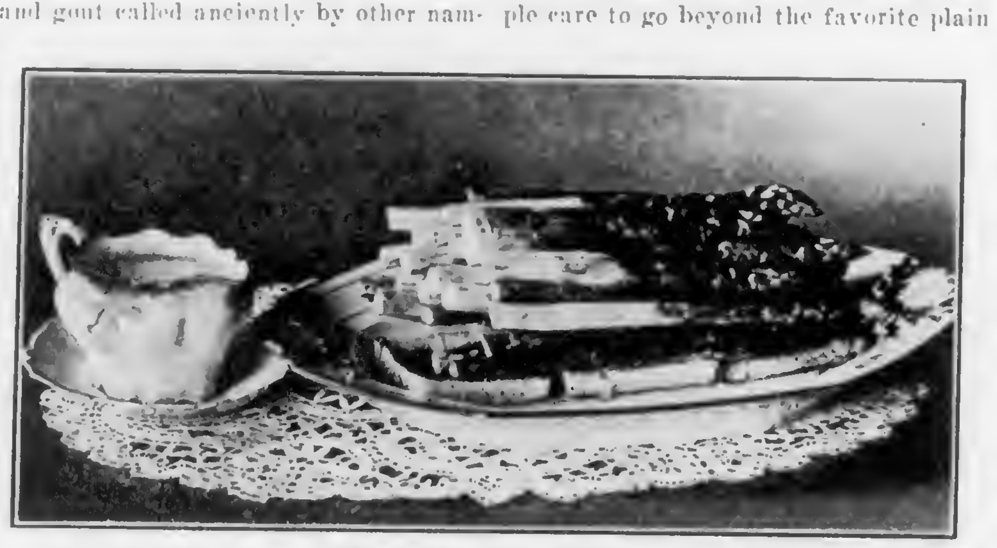
By MARY MILLER BUCHANAN.

The name of this much-esteemed lily-stalk is made to sound like "sparrow-grass" in many months. There really has been an idea in some quarters that the small birds are very fond of the juicy stalk. The word comes from the Greek, "asparagos," an edible lily that grew wild on many shores of the Grecian archipelago. The original seashore "asparagos" loved the salt sands, but grew thin and small for lack of the nourishing stuffs necessary to nurse the stalk into the thick succulent stems we know and love so well. It wanted more than salt and soda. In Russia whole steppes are carpeted with wild asparagus to this day. Cattle are sent out upon this fodder, and they thrive very well upon it.

ASPARAGUS SALAD.

Known from very remote times, this one of the liliacæ was chosen on account of its stalk for table use. Its kin lilies, the garlic, shallot, onion, were despised for their stalks and esteemed only for their underground portion, the bulbs, with their stimulating property and "sting." Asparagus was a tuber, whose only use is to send up its goodness into the stems—a sufficiently good use, too.

The Greek sea plant, asparagos, was found to have medicinal uses on account of a property it had for reducing dropsy. In cases of rheumatism and gout called anciently by other names, but just as painful as today, the plant is said to have afforded relief. The sea-salt was believed to have entered it and made the thin stems palatable. They were boiled first and the liquid thickened with all the soft portion, then this was taken as a kind of physic. But it was soon found that the pulpy part was quite nice to eat for its own sake, and from that discovery it was a short step to prepare all of it for the table.



BOILED ASPARAGUS ON TOAST.

It was not exactly the sodas or salts found in the asparagus that made it so useful as a laxative, altho, of course, these had their value. Asparagus, indeed, is a very saline article, for it holds one percent of potashes, magnesia, some iron, and various mixtures of the usual mineral materials drawn from a rich soil by the lily race. Onion and shallot are well known to contain a good variety, and to have some sulphur also. Asparagus is like its relatives, but its sulphur is not strong enough to give any "bite". However, the mingling of its salts makes a very appetizing vegetable. Not any of its salts or mineral matter is present in too keen amount.

A certain compound, asparagin, is found in pronounced form in asparagus, and therefore gives its name. It is this compound that does so much good, especially for inflammation. Asparagin is also found in several other plants, for instance in the marshmallow, so useful in ointment-making, and as a herb for coughs, colds, and all inflammatory complaints, and also in liquorice, another good laxative, the root of which makes an ingredient in many cough decoctions. The black stick liquorice is made from the expressed juice of the root, and its uses are widely known. Asparagin is found in all these physic plants. This being known, the eaters of asparagus may find very good excuse for indulging daily in their favorite delicacy.

It needs cream or butter in its sauce, or half the pleasure of partaking of it will be lost. There are various ways of cooking the juicy stems, but few people care to go beyond the favorite plain boiling with a nice cream or butter sauce to accompany it. Asparagus should be put in cold water till ready to be boiled in well-salted water that must be at a galloping boil when the vegetable is put on. Twenty minutes should cook it, but if the stems are rather old and so getting tough, half an hour will be right. When the bundles are drained and the string cut, the asparagus may be arranged on slices of toast. A nice melted butter sauce will serve if cream be lacking.

To have asparagus in perfection, that cut from the garden just before the cook wants it to put on the fire is beyond measure the best. Shop asparagus has been cut some time. After the cutting some changes occur in the substance, slight but certain, that involve a small difference in flavor. But this is so with all vegetables. A skilled gardener cuts a whole bunch exactly the same amount of white stalk attached to each stem. The white part is the portion that has grown below the soil, and the knife has to be inserted into the soil some little way, then the stem is cut with an upward turn of the knife.

The stem-portion which has reached the light at once begins to develop color bodies. Red-tipped or green-tipped, it matters not for delicacy which kind be chosen. In the green the chlorophyl cells are well developed; in the red-tipped, other color cells are in activity.

The juicy stems have reason to be soft and tender, since they contain exceedingly little fiber and are composed of about 93 percent of water, filled with the various salts mentioned. Some of its delicacy it owes to the presence of some fruit sugar; out of a hundred pounds of tender, succulent stems ready for cooking, over three pounds of pure asparagus sugar could be extracted, and the waste portion would only amount to a half of this weight of sugar, exactly.

Asparagus cream made with eggs, double cream, pepper, salt, and thickened with the soft delicate tips, is one of the daintiest known dishes.

Asparagus With Cheese. — Having carefully scraped the vegetable, boil it 20 minutes in boiling salt water. When sufficiently cooked take it up and allow it to get cold; the soft end must then be dipped into a well-made white sauce, made thus: Put 2 tablespoonfuls flour into a pan and mix over the fire; add gradually 2 large cupfuls of milk, a little salt and pepper, and stir until they boil. Cook 8 minutes, then remove from the fire and add 2 yolks of eggs. Then roll in grated cheese, and when the sauce is quite set, dip them into well-beaten egg, roll in freshly made breadcrumbs, and fry in smoking hot fat.

Asparagus Dainties.—Cut the tops off eight small dinner rolls, scoop out the soft part of the crumb, leaving only the thin shells, place them in the oven to get dry and crisp, or fry them in smoking hot fat. Boil ½ pint of asparagus tips in salted water until tender, drain; heat 1 cupful of white sauce and pour into the asparagus; season with pepper, salt and a grate of nutmeg; beat the yolk of 1 egg with a little cream, and add to the above. Stir gently over the fire long enough to bind the yolk and to make thoroly hot without boiling; lastly add just a drop or two of lemon juice; fill the rolls with this mixture, dish up on a folded napkin, garnish with a few sprigs of parsley, and serve hot.

Asparagus Omelet.—This is a good recipe for using cold boiled asparagus. Remove any sauce by pouring hot water over it, cut the tender part into inch lengths, sprinkle it with pepper, salt, and grated nutmeg, or flavor with chopped ham. Have ready 3 eggs broken in a basin, and 2 tablespoonfuls of butter, the asparagus, and a hot dish on which to serve the omelet; also a knife, tablespoon, and clean dry omelet pan. Put the butter into the pan, and while it is melting beat the eggs with a knife just enough to mix them; throw in the asparagus, quickly turn the mixture into the pan, and stir it into a thick puff shape, loosen it at the edges, turn it over to the further side to lightly brown, reverse the pan over the dish and the omelet will fall out. Be careful not to overcook it, for the inside should be quite soft.

Boiled Asparagus.—Cut the stalks of the asparagus to an even length. Tie with tape into small bundles of about 18 in each. Keep these in cold water until needed for cooking. Have ready a pan of boiling salted water and add a few drops of lemon juice. If there is not a drainer fitted to the pan, on which to lift out the bundles when cooked, it is best to wrap up each bundle in a piece of muslin, to prevent breaking off the points. Lay the bundles gently into the water, which should just cover them, leave the lid off and boil the asparagus for 20 to 30 minutes, or until tender. Lift it out carefully and drain well. Remove the tape and lay the heads neatly on a slice of dry trimmed toast laid on a folded napkin in a hot vegetable dish. Arrange the points all one way. Hand melted butter mixed with a few drops of lemon juice with them.

Asparagus And Egg Loaf.—One and a half cupfuls cooked asparagus tips, 4 hard cooked eggs cut in slices, 1 cupful thick white sauce, seasoning of salt and white pepper and a few drops of onion juice. Add to the white sauce the eggs, seasonings and the asparagus tips, and mix well together. Put in a well buttered mold and place in a pan of hot water, bake in oven until firm. Turn out and serve.

I SAY THAT the TEMPLE ENGINE is the Most Easily Moved ENGINE made—it actually weighs ⅓ to ½ less—has ⅔ less bulk—occupies ⅓ to ½ less space—than any horizontal engine of same power capacity. Look at the "Temple" Design and see for yourself that it is true. Made 2 H. P. to 50 H. P., using gasoline, kerosene, alcohol and distillate.

Why, then, pay out good money for a big, heavy, unwieldy engine, and then "blow in" some more money for a big special truck to carry it, when you can easily put the light, compact "TEMPLE" on anything having wheels, or on skids, planks, or stone boat, that one horse can haul anywhere. It can even be put on a push cart and pulled about by one man.

It's the "TEMPLE'S" (Inverted Vertical Cylinder) Design that accounts for its unequalled portability—its quiet, smooth running—its delivery of full rated power, whether MOUNTED, or STATIONARY—its small fuel consumption—its low upkeep cost—its durability, long life, etc. All this means that

The "Temple Pays for Itself"

many times over, by its clear saving of ⅓ to ½ the fuel consumed in other engine designs—to say nothing of the "TEMPLE'S" many other more serviceable and more economical features.

You may doubt my claims for the "TEMPLE'S" vastly superior all around accomplishments in farm and contracting service, but you can't doubt the facts and figures I can submit to prove them. Just a penny now for a (postcard) brings you these facts and figures, also information about engines you simply can't get from any other source, and which may be worth hundreds of dollars to you later on. Do it now.

SPOOL HOLDER FOR SEWING MACHINE DRAWER

Have you a sewing machine drawer with a jumbled lot of spools of thread of all colors and numbers so that to find the desired one is almost impossible? Or perhaps the spools have a way of wandering off, and you say as you look hurriedly thru the lot, "I thought I had some seventy white, but I can't find it."

If you have these difficulties try this simple plan: Take a smoothly planed piece of board the length of your sewing machine drawer, or shorter if you like, a little wider than two ordinary sized spools, and nearly an inch thick, and drive into it two rows of small nails until they are firm; on each of these nails place a spool of thread with the number uppermost and you will have no difficulty in locating the desired one instantly. Wooden pegs fitted into the board would be more attractive than nails, but nails will hold the spools quite as well.—L. B. B., Center Co., Pa.

Editor's Note.—I find the following arrangement very satisfactory: Two shallow narrow boxes, the length of the machine drawer and just wide enough to let a spool lie crosswise in the box, nearly fit the drawer, leaving just width enough between them for the little spools of twist. This permits one to see the exact shade of thread as the spools lie in the box. The numbers are of course, not visible, but one can readily estimate the number by the appearance of the spool. To be able to see at once and pick up the exact spool needed, as provided by this arrangement, is a great time saver for me.—Harriet Mason.)

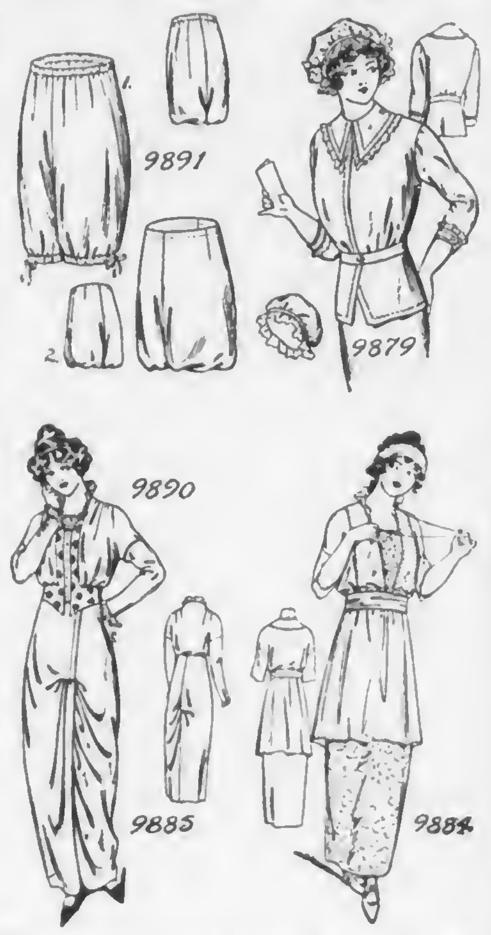
PENNSYLVANIA FARMER PATTERNS

Be sure to give the figures and letters of each pattern exactly as printed at the beginning of each description. We will not be responsible for correct filling of your orders unless you do so. Also give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 214-18 So. 12th St., Philadelphia, Pa.

9891.—Ladies' Knickerbockers and Bloomers.—Cut in 6 sizes: 22, 24, 26, 28, 30 and 32 inches waist measure. It requires 2 yards of 36-inch material for a 26-inch size. Price of pattern, 10 cents.

9879.—Ladies' Dressing Sack.—Cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches, bust measure. It requires 2⅞ yards of 36-inch material for a 36-inch size. For cap ⅞ yard 27-inch net, all over embroidery; or lawn, percale, dimity, dotted swiss and silk are suitable. Price, 10 cents.

9890 — 9885. — Ladies' Costume. — Waist, 9890, Cut in 5 sizes: 34, 36, 38, 40 and 42 inches, bust measure. Skirt, 9885, cut in 5 sizes: 22, 24, 26, 28 and 30 inches, waist measure. It requires 5¼ yards of 44-inch material for a medium size, for the entire dress. The skirt measures 1¼ yards at the foot. Two separate patterns, 10 cents for each pattern.



9884.—Costume for Misses and Small Women.—Cut in 4 sizes: 14, 16, 17 and 18 years. It requires 4 yards of 40-inch material for a 16-year size, for waist and tunic, with 2½ yards for the skirt. The skirt measures 1½ yards at lower edge in a medium size. Price 10 cents.

6485.—Ladies' Yoke Waist.—Cut in sizes 34 to 44 inches, bust measure. Size 36 requires 2½ yards of 36-inch material, with ¾ yard of 22-inch lace for the chemisette and ⅞ yard of ruffling. Price of pattern, 10 cents.

6480.—Children's Dress.—Cut in sizes 2 to 8 years. Age 4 requires 3⅜ yards of 27-inch material, with ⅜ yard of 27-inch goods for collar and cuffs and 1 yard of ribbon for belt and tie. Price, 10 cents.

SYNOPSIS OF PREVIOUS CHAPTERS

Solomon Pratt, principal character and skipper of Wellmouth, a New England seaport, becomes acquainted with two New York business men, Van Brunt and Hartley, summer boarders at the home of Nate Scudder, a grasping individual. Pratt later finds them interesting, but takes them for lunatics and their "man" for their keeper. The "twins" as the New Yorkers are dubbed after harrowing experiences with their "man" and Hannah Jane Purvis, a garrulous individual, as cooks, have asked Pratt to serve in that capacity. Pratt has jokingly suggested to Van Brunt the possibility of their vacation being curtailed by Van Brunt's marriage.

CHAPTER III (Continued)

Van, he looked hard at me for a minute. I thought first he was mad at me for putting in my oar where it wa'n't supposed to be. Then he laughed. "Sol," says he, "that young lady and I are kindred spirits. For a year I'm natural and happy, and she can nurse her Hooligans and go on charity sprees. Then—well, then we fall back on our respected parents and wedded —er—bliss. Hey, Martin?"

Hartley, in the shadow of the vines, lit another cigar and nodded. But he didn't say nothing.

For the next three or four days I chased around trying to find a house and lot where them heavenly lunatics could be natural. I located a couple of bully summer places, all trees and windmills and posy beds and hot and cold water and land knows what. But they wouldn't do; they "smelled of coupons," Van said. What they really wanted, or thought they wanted, was a state's prison in a desert, I judged.

For a week or ten days we kept the hunt up, but didn't have no luck. Whenever I'd think I'd uncovered a promising outfit the Heavenlies would turn to and dump in a cargo of objections and bury it again. After five or six funerals of this kind I got sort of tired and quit. It got to be July and their month at Nate's was 'most over. I was up the evening of the Third and I happened to ask 'em if they wanted me and the sloop for the next day. There was to be a Fourth of July celebration over at Eastwich, and some of the boarders wanted to go and see the balloon and the races and the greased pig chase, and such like. If the Twins didn't care I'd take the job, I said. But they took a notion to go themselves. Van said 'twould be an excuse for me to give 'em another chowder, if nothing more. So, on the morning of the Fourth we started, me and Van Brunt and Hartley and Lord James, in the Dora Bassett. Talk about cruises! If I'd known—and yet out of it come—But there! let me tell you about it.

CHAPTER IV

The Pig Race

I don't cal'late that I ever had a better run down the bay than I done that morning. 'Twas a fair wind, and a smooth sea, not the slick, greasy kind, but with little blue waves chasing each other and going "Spat! spat" under the Dora Bassett's quarter as she danced over 'em. And that's just what she did—dance. There wa'n't any hog-wallowing for her; she just picked up her skirts, so to speak, and tripped along—towing the little landing skiff astern of her—like a sixteen-year-old girl going to a surprise party.

An early July morning on the bay down our way is good enough for yours truly, Solomon Pratt. Take it with the wind and water like I've said; with the salt smell from the marshes drifting out from the shore, mixed up with the smell of the pitch-pines on the bluffs, and me in the stern of a good boat with the tiller in my hand and a pipe in my face—well, all right! That's my natural life; and I don't need no book to tell me so, neither.

The Heavenlies enjoyed it, and they'd ought to. 'Twas clear then, tho it got hazy over to the east'ard later on. But then, as I say, 'twas clear, and you could see the schooners strung out on the skyline, some full up, with their sails white in the sun, and others down over the edge with only their tops'ls showing. Far off, but dead ahead, just as if somebody had dipped their finger in the bluing bottle and smouched it along the bottom of the sky, was the Wapatomac shore, and away aft, right over the stern, was the Trumet lighthouse, like a white chalk mark on a yellow fence, the fence being the high sand bank behind it.

The twins laid back and soaked in the scenery. They unbuttoned their jackets and took long breaths. They actually forgot to smoke, which was a sort of miracle, as you might say, and even Hartley, who had been bluer than a spoiled mackerel all the morning, braced up and got real chipper. By and by they resurrected that book of theirs and had what you might call a Natural Life drunk. I never see printing that went to a person's head the way that book seemed to go to theirs. I judged 'twas kind of light and gassy reading and naturally riz and filled the empty places same as you'd fill a balloon.

Everybody was happy but Lord James, and I could see that he wa'n't easy in his mind. He set about midships of the cockpit and hung onto the thwart with both hands, like he was afraid 'twould bust loose and leave him adrift. If the Dora Bassett had struck a derelict or something and gone down sudden I'll bet they'd have dredged up that Hopper valet and the thwart together. And then they'd have had to pry 'em apart. His Lordship wa'n't used to water, unless 'twas to mix with something else.

By and by Hartley shoves both hands into his pockets, tilts his hat back and begins to sing. More effects of the Natural Life spree, I suppose, but 'twas bully good singing. Might have been saying most anything, calling me a short lobster for what I know, 'cause 'twas some foreigner's lingo, but the noise was all right even if I did have to take chances on the words. I cal'late to know music when I hear it.

"Good!" says Van, when his chum stopped. "Martin, you're better already. I haven't heard you sing for two years or more. The last time was at the Delanceys' 'At Home.' Do you remember the Dowager and 'My Daughter'? Heavens! and 'My Daughter's' piano playing! Agnes told the Dowager that she had never heard anything like it. You and she were together, you know. Give us another verse."

But Martin wouldn't. Shut up like a clam and reached into his pocket for a cigar.

"That was A No. 1, Mr. Hartley," says I. "I wish you could hear Solon Bassett play the fiddle; you'd appreciate it."

Van he roared and even Hartley managed to smile. As for Lord James he looked at me like I'd trod on the Queen's corns.

Blessed if I could see what there was funny about it. Solon can play like an Injun. Why, I've seen him bust two strings at a Thanksgiving ball and then play "Mrs. McLeod's Reel"—you know, "Bucksee, nanny-goat, brow bread and beans" on t'other two, till there wa'n't a still foot in the hall.

We made Eastwich Port about noon and had dinner. I cooked up a kettle of chowder—fetched the clams along with me from home—and 'twould have done you good to see the Heavenlies lay into it. Lord James he skipped around like a hopper-grass in a hot skillet, fetching glasses and laying out nine or ten different kind of forks and spoons side of each plate, and opening wine bottles, and I don't know what all. When he hove in sight of the wharf that morning he was toting a basket pretty nigh as big as he was. I asked him what it was.

"Why, the 'amper," says he.

"The which?" says I.

"The lunch 'amper, of course," he says. "The 'amper for the heatables."

Well, I wondered then what in the nation was in it, for 'twas heavier than lead. I remember that the heft of it made me ask him if he'd fetched along some of the late Hannah Jane's left-over riz biscuit. But now I see why 'twas heavy. There was enough dishes and truck for ten men and the cook in that basket. We had my chowder and four kinds of crackers with it, and chicken and asparagus, and nine sorts of pickles, and canned plum pudding with sass, and coffee and good loud healthy cheese, and red wine and champagne. When I'd hoisted in enough of everything so my hatches wouldn't shut tight, and was pulling on one of the Twins' cigars, I says to Van——

"Mr. Van Brunt," says I, "is this part of what you call the Natural Life?"

"You bet, skipper!" says he. He hadn't finished the chowder end of the layout yet.

Well, I heaved a sigh. 'Twas kind of unnatural to me, having come on me all at once; but I cal'late I could get used to it in time without shedding no tears. Didn't want to get used to it too quick, neither; I wanted the novelty to linger along, as you might say.

When the dinner was over—the Heavenlies was well enough acquainted with the family to nickname it "lunch"—I started to help his lordship wash dishes. The Twins sprawled themselves under a couple of pine trees and blew smoke rings.

"Hurry up there, messmate," says I to the valet; "I want to get thru time enough to run up to the fair grounds and see that greased pig race."

Hartley had been keeping so still I cal'lated he was dropping off to sleep, but it seems he wa'n't. He set up, stretched, and got to his feet.

"I'll go with you, skipper," says he. "Might as well do that as anything. I've never seen a greased pig race. They don't have 'em on the Street."

(To be continued)

Tuxedo—A Hit with the Hit-Makers

HUNDREDS of the snappiest ball players in the country—the clean-cut athletes who provide Americans with their greatest outdoor relaxation—enthusiastically endorse Tuxedo. This is the kind of endorsement that carries a convincing punch.

These men know that Tuxedo is a mild, pure tobacco, which can be smoked all day with pleasure. Tuxedo *cannot bite* the tongue; it burns freely and smoothly, giving a cool, sweet smoke.

Tuxedo

The Perfect Tobacco for Pipe and Cigarette

Tuxedo is made from the finest, mildest, leaves of high-grade Burley tobacco, so treated under the famous *original* "Tuxedo Process" that it burns slow and cool, with a delightful flavor and aroma.

The "Tuxedo Process" makes it impossible for this perfect tobacco to bite or sting the most delicate throat or tongue.

Tuxedo has many imitators—in outward appearance. It has *no* equal in the pipe or cigarette.

THE AMERICAN TOBACCO COMPANY
Room 1202 111 Fifth Avenue New York

FRED. CLARKE
"I'd advise every ball-player to smoke Tuxedo. I do, always. I know of no other tobacco that gives the satisfaction that Tuxedo does."

JIMMY ARCHER
"Tuxedo is my idea of a good smoke in every way—coolness, mildness, purity. Tuxedo is a winner."

JACK McINNIS
"Tuxedo gives a cool, mild smoke, and never affects the wind. Tuxedo is a tobacco that's always good."

Markets

PHILADELPHIA PRODUCE

Philadelphia, Pa., May 4, 1914.

Receipts of butter were light and supplies of all grades of good solid-packed creamery were under good control. Egg receipts were fairly liberal but demand absorbed all offerings of desirable stock. Poultry offerings were moderate but ample. Fruit and vegetables ruled steady under moderate offerings.

Butter.—Western creamery, 28c; extras, 26c; firsts to seconds, 22@24c; special prints 33@35c; near-by prints 29c.

Eggs.—Candled 24@26c dozen; extras 23c. Current receipts at $6.25 per standard case.

Poultry.—Fowls, 17½@18½c; old roosters 13@14c; chickens, 35@40c; pigeons, young 25@28c.

Dressed Poultry.—Western fowls 13@18½c; roosters, 14c; squabs $2@4.65 per doz.

Vegetables.—White potatoes, Pa., 80c@$1 bu. Onions, new $1.60@1.70 per crate. Peppers $2.00@2.25 per carrier. Eggplant $2.00@3.00 crate; lettuce 50c@$1.50 per hamp. Beets 1@6c per bch. Sweet potatoes 40@55c hamper. String beans $1.75@2.50 hamp. Squash $1.00@1.50 hamp. Cucumbers Florida, $2.00@3.00 bas. Celery $1.50@2.00 crt. Cabbage, new $1.50@2.00 bbl. crate. Asparagus $1.50@3.50 doz bunches; spinach 75c@$1.50 bbl; radishes, 2@3c bunch; carrots 2@4c bunch.

Fruits.—Apples $4.00@6.00 bbl. Pineapples crt $2.50@3.00; lemons $2.00@3.25 per box; grape fruit $2.00@4.00 per box; oranges $2.00@4.50 per box; strawberries, 12@22c per quart.

Hay and Grain.—No. 1 hay, large bales, $19.00@19.50; No. 1 medium $19.00; no grade, $10.00@12.00. Clover mixed hay, light mixed at $17.00@17.50; straw No. 1 straight rye, $17.00@17.50; No. 2 do., $16.00@16.50; No. 1 tangled rye straw new $12.50@13; No. 2 do., $11.50@12; No. 1, wheat straw, $10@10.50; No. 1 oat straw, $10.50@11; corn No. 2 yellow, new 75@75½c. Wheat No. 2 red 98½@99c; No. 1 Northern $1.03@1.04; No. 2 white oats 41½@43c; No. 3 white 42½@43c; standard white 43½@44c.

Coffee.—Rio 7s 8⅝c; Santos 4s 11½c. Mild Coffee.—Cordova 12½c.

Sugar.—Cut loaf $5.05 cwt; cubes, $4.10@4.15; powdered, $3.95@4.00; granulated, $3.85@3.90; standard granulated, $3.90@3.95; crystal A, $3.90.

Provisions.—City beef, in sets, smoked and air dried, 31@31½c. Hams cured, 13⅝@14c; skinned 14@14⅞c; smoked 17@18c. Other hams, smoked, city cured, as to brand, 17@18c. Picnic shoulders, 10⅝@10⅞c; do smoked, 13@13½c. Bellies in pickle, 13½@14¾c. Breakfast bacon, as to quality, 19@23c. Lard, refined, 11¼@11⅞c tcs; do in tubs 11⅜@12c; do kettle rendered, 11¼@11¾c. Fruit.—Apples, 20@25c ½-pk; strawberries 25@30c.

Retail Grain Market.—Wheat, $1.04 bu; corn, 88c; oats, 55c; rye, 77c; bran, $1.60 cwt; middlings, $1.60 cwt.

Wholesale Grain Market. — Wheat, 94c; corn, 74c; oats, 44c; rye, 67c.

PHILADELPHIA LIVE STOCK

Philadelphia, Pa., May 4, 1914.

Beef Cattle.—Trade was moderately fair, the market being fully supplied with Pennsylvania and Ohio cattle, the choicest steers ruling a fraction stronger. Calves and cows of the better sorts closed a trifle firmer.

	Beef Cattle	Sheep and Lambs	Hogs
Total for week	3,058	7,813	5,143
Previous week	3,245	9,000	4,696

Best steers	$8.80@8.90
Choice steers	8.60@8.70
Good do	8.25@8.40
Medium steers	7.50@8.40
Common steers	7.00@7.25
Bulls	5.00@7.00
Fat cows	5.25@7.00
Medium cows	3.75@4.75
Thin cows	2.75@3.25

Veal calves lower.

Best calves	$10.00@10.50
Good to choice do	9.00@9.50
Medium	7.00@8.00
Common do	6.00@7.00

Sheep and Lambs.—Values were well-maintained on every grade, the market closing under a fair disposal, clipped stock was coming along in a limited manner.

Choice wethers	$6.50@6.75
Good do	5.25@5.75
Common to medium	3.50@5.00
Ewes, fat	5.25@5.75
Extra lambs	8.50@8.75
Good to choice do	8.00@8.25
Common to medium	6.00@8.00

Hogs.—There was an easier range of prices predominating, altho holdings were under good control. Western, $12.00@12.25.

City Dressed Stock.—Every variety of choice and prime meat commanded steady prices, trade being about normal. Steers 12@14c; heifers 10½@13c; cows, 9@11c. Veal calves, 13@14c; country dressed calves 13@14c; extra do., 14½c. Sheep, 11@12c; extra wethers 13c. Spring lambs 14@15c. Hogs, 12¼@12½c.

PITTSBURGH LIVE STOCK

Pittsburgh, Pa., May 4, 1914.

Cattle.—With a light supply here, 75 loads compared with 125 loads a week ago, the market ruled active and generally 10 to 25c higher, while some sales were as much as a quarter higher. Light and choice weighty cattle were in the better demand. Fat cows and heifers were in light supply and sold at about the same advance as steers. Very few bulls were on sale and the market was 25 to 40 cents higher than a week ago. Best fresh cows were steady to strong; other grades and springers slow. Today's supply was 95 loads. With a fair demand, the market ruled about steady on desirable grades.

Good to choice	$8.75@9.00
Good 1,300-1,400 lb.	8.50@8.70
Medium to good 1,200-1,300 lb	8.10@8.50
Tidy 1,050-1,150 lb	8.10@8.50
Fair to medium, 900-1,100 lb.	7.50@8.00
Rough, half-fat, 1,000-1,300 lb.	5.00@7.00
Common, 700 to 900 lbs	5.75@7.00
Common to good fat oxen	4.50@7.00
Common to good fat bulls	5.50@7.75
Common to good fat cows	4.25@6.75
Heifers	5.50@8.00
Bologna cows	3.75@4.25
Fresh cows and springers	25.00@90.00

Calves.—Veal calves were in light supply and closed 50 cents per cwt. higher. Today's supply was 1,200 head, which sold lower, tho active.

Heavy and thin calves	$5.00@6.50
Veal calves	7.00@9.25

Hogs.—The supply during the week has not been liberal but with easier prices prevailing at western points the close for the week here was 25 cents below Monday's prices, and during the latter part of the week the decline was even greater, but the market was a little firmer on Saturday and a little of the loss gained. Today's receipts were 65 double-deck loads, and the market was 15 to 20 cents lower than Saturday.

Prime heavy	$8.65@
Heavy mixed	8.70@
Prime medium weights	8.75@
Best heavy Yorkers	8.75@
Light Yorkers	8.75@
Pigs	8.70@8.75
Common to good roughs	7.50@7.90
Stags	6.50@7.00

Sheep and Lambs.—The supply of sheep and lambs has been fair. Sheep have ruled steady, while there has been a good demand for lambs and the market closed 25 cents higher on choice lambs, while other grades were only steady. Today's receipts were 25 double-deck loads. The market was slow on heavy sheep, but other grades of sheep and lambs were active at steady prices. There was a fair supply of spring lambs, and with a light demand the markets went lower.

Prime wethers	$5.50@5.60
Good mixed	5.25@5.40
Fair mixed ewes and wethers	4.50@5.00
Culls to common	3.00@4.00
Culls to choice lambs	5.50@7.75
Spring lambs	8.50@12.00

BALTIMORE LIVE STOCK

Baltimore, Md., May 4, 1914.

Cattle.—Receipts for the week were 1,667 head, against 2,404 last week.

Steers	$6.25@8.35
Heifers	5.50@6.75
Cows	3.00@5.75
Bulls	5.25@6.75
Fresh cows	32.50@72.50

Sheep and Lambs.—Receipts for the week were 2,600 head against 3,442 last week. Light supply; market steady.

Wool sheep	$3.75@6.50
Clipped sheep	2.75@5.75
Wool lambs	6.00@9.00
Clipped lambs	5.00@7.80

Hogs.—Receipts for the week were 10,318 head against 11,849 last week

Light western	$9.10@
Heavy to medium	8.95@9.00
Near-by	9.00@9.10
Pigs	8.75@8.90

Calves.—Receipts for the week were 208 head again 399 head last week. Light supply, market higher at $6@10.00.

BUFFALO LIVE STOCK

Buffalo, N. Y., May 4, 1914.

Cattle.—The week opened with a large supply. The demand was good and prices firmer. For the balance of the week, the market was firm on the good grades. The close was active and prices stronger. Today's supply totaled 3,500 head, and the market ruled 15 cents higher.

Choice heavy steers	$8.85@9.15
Fair to good	8.25@8.65
Yearlings	7.75@8.65
Handy butchers	6.75@8.40
Good to choice fat cows	6.75@7.25
Good to choice heifers	7.50@8.00
Butchers bulls	4.50@7.35
Feeders	5.50@5.75
Cows and springers	30.00@90.00

Calves.—With the heaviest receipts of the season on Monday, 2,000 head, the trade was in a good position. On the close, the trade was generally good at $9@9.80 for the best. Today's receipts were 1,500 head.

Choice veals	$9.00@9.50
Lights and thin	6.00@8.75

Sheep and Lambs. — The early receipts were liberal and the trade active but lower. Wool lambs sold up to $8.50@8.75. The demand for the best clipped sheep was moderate. On the close the general trade was active and lambs mostly 20c lower. The basis on the best lambs was $7.50@7.65. Sheep were in good demand. Today's receipts were 13,000 head, and the market ruled steady.

Choice lambs	$7.65@7.85
Yearlings clipped	6.25@6.75
Wethers	5.50@5.75
Ewes	5.00@5.50

Hogs.—The liberal receipts caused a lower basis on the Monday market. Rough and common hogs were draggy. On the close, the trade was fairly active but lower. Rough and dairy hogs were easier with several decks unsold. Today's receipts aggregated 18,000 head.

Heavies	$8.75@8.80
Mixed and medium	8.75@8.80
Yorkers	8.75@8.80
Light Yorkers	8.75@8.80
Pigs	8.75@
Roughs	7.50@7.75
Stags	6.00@7.00

Horses.—There was no particular change in the trade. The offerings were 475 head, with a fairly active demand for choice workers. There was some inquiry for fancy drives.—There was a fair trade in horses today, best selling prices steady with last week.

CHICAGO HORSE MARKET

Chicago, Ill., May 4, 1914

Horses were in ample supply last week altho the receipts continued much smaller in numbers than a year ago, with a restricted general demand. Inferior animals were bad sellers around $50@100 per head, while drafters of heavy weight and superior quality were salable at $250@300 with not many going near the top price. Fair to good drivers sold around $125@175, and ordinary to good drafters sold for $185@225. Farm chunks sold at $110@210 for geldings, with few as high as $185, while good farm mares sold at $200@210. Wagon horses brought $185@240. A carload of unusually prime heavy horses was sold to a Maine buyer, the lowest-priced horse costing $300, while two pairs sold at $1,000 and $1,200.

NEW YORK LIVE STOCK

New York City, May 4, 1914

Beef Cattle.—Receipts for week 3,100 head. Market irregular.

Steers	$6.50@9.25
Bulls	5.50@7.85
Cows	3.50@6.75

Calf receipts 10,400 head. Market lower.

Choice	$6.50@9.75
Culls	5.00@6.50.

Dressed calves steady. Dressed veals 12@15c.

Sheep and lambs receipts 13,000 head. Market steady.

Sheep	$4.00@5.50
Spring lambs	7.00@7.90

Hog receipts 11,300 head. Market steady. Choice $8.80@9.00.

PITTSBURGH HAY AND GRAIN MARKET

Pittsburgh, Pa., May 4, 1914.

Hay.—The receipts of hay still continue exceedingly light but buyers are lothe to take hold at present high prices, anticipating that when the roads dry up hay will come forward freely and prices will be lower. Nevertheless, the better qualities of timothy are being placed readily at quotations. Poor grades are not wanted and are hard to dispose of except at buyers' prices.

No. 1 timothy	$18.00@19.00
No. 2 timothy	16.00@17.00
No. 1 light mixed	16.50@17.00
No. 1 clover mixed	15.50@16.00
No. 2 clover mixed	12.00@13.00
No. 1 clover	15.00@15.50
No. 2 clover	11.00@12.00

Straw.—Demand has shown quite an improvement; there has been scarcely any arriving during the last week and prices have advanced.

No. 1 Oats	$9.50@10.00
No. 2 Oats	9.25@9.50
No. 1 Wheat	9.50@9.75
No. 2 Wheat	9.00@9.25
No. 1 Rye	10.75@11.00
No. 2 Rye	9.50@10.00

Ear Corn.—Ear corn is arriving very sparingly while the demand continues and receipts are not sufficient to supply same.

No. 2 yellow	79½@80c.
No. 3 yellow	76@77½c.

Oats.—Oat market a trifle weak, the arrivals being fully equal to the supply.

No. 2 white	42½@42¾
Standard oats	41¾@42¼
Standard No. 3 oats	40@41¼

NEW YORK HAY MARKET

New York City, May 4, 1914.

Hay prices remain steady in all positions with a fair inquiry noted for the better grades. Receipts were 892 tons. Timothy No. 1, $1.12½@1.15 bale; standard, $1.07½; No. 2, $1.05; No. 3, 90@95c; clover, 60@95c.

The straw market remains steady. Receipts 30 tons. Oat straw, 55@60c; rye straw, 90c.

GRASS SEED MARKET

Toledo, O., May 4, 1914.

Cloverseed.—Prime, cash, $7.65, October, $7.85.

Alsike.—Prime, cash, $10.25.

Timothy.—Prime, cash and April, $2.27½; September, $2.35 bid.

NEW YORK MILK MARKET

New York City, May 4, 1914.

The dealers looked upon the warmer days with which May began as a godsend, for they stimulated the demand. Owing to the lateness of the season many producers have been obliged to continue feeding hay. Hay has become short and the supply of milk has fallen off. Supply and demand at the time of writing are about even.

The receipts of milk and cream in 40-quart cans for the week ending May 2, were as follows:

Railroad	Milk	Cream
Erie	45,607	2,387
Susquehanna	9,437	616
West Shore	18,592	1,701
Lackawanna	57,625	1,845
N. Y. Central (long haul)	82,710	2,342
N. Y. Central (short haul)	12,150	325
Ontario	38,094	3,804
Lehigh Valley	31,875	1,632
Homer Ramsdell Line	2,275	50
New Haven	7,986	210
Pennsylvania	5,642	117
Other sources	1,675	24
Totals	316,688	15,053

ELGIN BUTTER QUOTATION

Elgin, Ill., May 4, 1914.

The quotation committee of the Elgin Board of Trade this afternoon declared butter firm at 25 cents.

TOBACCO MARKET

The week was fraught with interest in the new Seed Leaf Tobacco Growers' Company including the delivery of some 150 to 200 acres of tobacco to the company's packing house. Part of this tobacco came in by rail. Mr. Kimbrough, the organizer and manager, and his assistants held meetings at various points, interest in which was even greater than expected. It was recently announced that among the objects of this company would be the providing of packing houses, warehouses and sales floors, the enlightment of growers as to acreage, quality etc., the establishment of trade with manufacturers thruout the world. It aims also to keep in touch with and thoroly inform each individual member of the organization.

There is considerable comment as to the probable acreage of the present year. A few years ago the annual production was some 17,000 acres but recently the production declined about 1,000 acres and now it is conservatively estimated that not more than 13,000 acres will be grown this year.

It is noted that the Burley Tobacco Society of Kentucky which attracted so much attention by its pools, cut out, sensational night rider trouble, litigation, etc., has just made a final settlement with its members and passed out of existence. The final distribution amounted to some $316,000 and Mason County, Ky., received the largest amount showing of course, that this was the leading county in the movement. This society is succeeded by the Burley Tobacco Company, a concern differing little if any from other manufacturing companies and comprising few if any growers among its members.—H. E. Tweed, May 4, 1914.

Veterinary

(Conducted by W. C. Fair, V. S.)

(Advice thru this department is free to our subscribers. Each communication should state history and symptoms of the case in full; also the name and address of writer. Initials only will be published. We cannot make reply by mail. This is one of the most valuable columns of the paper and we invite readers to make use of it. Clippings from this column, when properly preserved and classified, would make one of the most valuable medical symposiums a farmer-stockman could obtain.)

Tonic for Horses.—Regardless of cost I would like to have you give me formula of a good tonic powder for horses and cows. J. G., Penbrook, Pa.—Mix together equal parts ground nux vomica, gentian, ground "red" cinchona and sulphate of soda; give a dessert spoonful at a dose, 3 times a day. Another very good formula is made by mixing together 4 parts fluid extract gentian, 4 parts fluid extract cinchona and 2 parts fluid extract of nux vomica; give a tablespoonful at a dose 3 times a day to either horses or cattle.

Sprained Fetlock Joint.—Several years ago my horse sprained ankle joint and I would like to know what can be done for him. I recently purchased him. He shows some lameness when first taken out of stable, but soon appears to get relief. C. R. J., Schwenksville, Pa.—Clip hair off and apply 1 part turpentine 1 part oil organum, 1 part aqua ammonia, 5 parts olive oil and apply to fetlock 3 or 4 times a week.

Horse Kicks in Stall.—I have a 4-year-old horse that does light work and some road driving. He has a nasty habit of kicking when in barn and on account of this kicking has bruised fetlock joint. How can he be cured of this vice? B. H. T., Newerf, Pa.—The less work he does, the more kicking he will do. Hitching a piece of chain about 12 or 14 inches long to a strap that buckles around leg, either above or below fetlock joints, might prevent him doing much kicking. Changing him from open stall to box might produce the desired result.

Sore Shoulders.—I have a young horse that has done very little work during the winter, but since commencing our spring farm work his shoulders are some sore. I would like to know what to apply. B. K. E., Herman, Pa.—Dissolve ¼ lb. acetate of lead 3 oz. sulphate of zinc and 2 oz. of tannic acid in a gallon of water and apply to shoulders, 3 or 4 times a day. It is important that the collar fit properly and be kept clean.

Cow Bruised Knee.—I have a 3-year-old cow that seems to be perfectly healthy, but has a soft puffy swelling on knee. My cows are kept in a nice basement barn with cement floor and cement feed mangers. This cow has a habit of getting down on her knees and struggling to get hold of feed which works out of feed trough into passageway. N. E. R., Euclid, Pa.—I am afraid you have made a common mistake in building your stable. The back part of feed manger should not be less than two feet high. This would prevent feed working into aisle and causing cow to struggle to get hold of enough fodder. Correct the feed manger and apply 1 part tincture iodine and 5 parts spirits of camphor to bunch every day or two.

Nodular Disease in Sheep.—I have a few ewes that are not thriving as well as they should. One died a week ago. I opened her, found lungs, heart and liver in what I thought a healthy condition, but the bowels looked queer, having a lot of hard bunches on them, filled with a sort of dark colored substance. Have never seen anything of the same kind before and would like to know what caused death of ewe. G. S. R., Bridgeville, Pa.—Your sheep died the result of a parasitic bowel ailment which many of our American sheep have. When in the advanced stages treatment has no effect. Mix 1 part powdered sulphate iron and 9 parts salt and give each sheep a teaspoonful daily. There are good commercial remedies on the market for cure of this disease.

Lice.—My chickens are troubled with lice and simple home remedies that I have applied fail to do them much good. Will you tell me what I had better do for them? N. A. E., Harmonsburg, Pa.—You can safely apply any of the lice powders that are regularly advertised in this paper. Furthermore you should clean your roost and saturate roosting poles with kerosene or 1 part carbolic acid and 20 parts water. Also spray interior of chicken house or whitewash it with freshly made whitewash.

My Steel Soled Workshoes
Are Light--Comfortable--Waterproof
Save Your Feet, Health, Money

This is the only practical shoe ever invented for Year-Round Wear of all Out-Door Workers--

One Pair Lasts Many Seasons

No other workshoe—no leather nor rubber boot—can stand the strain of *one* spring season on the farm. One pair of my "STEELS" lasts *many* seasons—through the damp, mud, slush and water of *Spring*—the rain, dust and heat of *Summer*—the hard-baked stubble and furrow of *Autumn*—the sleet, snow, ice and cold of *Winter*.

A Million Endorsements

Six years' wear, through all kinds of weather, have proven my "STEELS" an absolute NECESSITY to to more than a million workers. Not a man or boy who has ever worn them would willingly go back to leather shoes or rubber boots.

Every wearer of my "steels" has enthusiastically recommended them to friends and neighbors. Those who know the true worth—the undoubted superiority of my "steels"—have helped to build my business—have sold thousands of pairs every year by their endorsement of my "steels."

Protect Your Feet and Health

Every outdoor worker knows that wet weather ruins leather shoes—makes them harden, crack and "draw" the feet. Shapeless shoes make corns and bunions. Rubber boots, overshoes and "arctics" sweat, scald or "parboil" the feet. Damp, gritty, cold cement floors wear and grind rubber or leather soles and chill the feet. Wet feet cause rheumatic pains and sickness — make you lose time and health.

"Steels" Give Year-Round Service

My "steels" give year-round service from year to year, because they are Absolutely WATERPROOF—light, comfortable, healthful, economical — cool in summer and warm in winter—always in shape — keep the feet powder-dry—cost less than others — outwear 3 to 6 pairs of all-leather workshoes or rubber boots — save doctor and drug bills.

Try "Steels" At My Risk

I invite every man or boy who works out-doors—every Farmer, Stock, Dairy or Creamery Worker, Fruit or Truck Grower—to see and try my "steels" at my expense and risk before they buy any workshoes. Just TRY these "steels" at MY RISK, then, if they are not the best you ever saw for YOUR work, send them back at My expense. Send me the coupon, stating style and size.

Sizes for Men, 5 to 12

Steels, 6 in. high	$3.25
Steels, 6 in. high, extra grade of leather	3.75
Steels, 9 in. high	4.25
Steels, 9 in. high, extra grade of leather, black or tan	5.00
Steels, 12 in. high, extra grade of leather, black or tan	6.00
Steels, 16 in. high, extra grade of leather, black or tan	7.00

Sizes for Boys, 1 to 4

Steels, 6 in. high	$2.50
Steels, 9 in. high, extra grade of leather, black or tan	3.50

Each style of "Steels" is worth at least twice as much as the best all leather workshoe of the same height. Shipped same day order is received by Parcel Post, prepaid, 26c extra.

My "Steels" run in same sizes as ordinary, all leather workshoes. In case of error in ordering, exchange will be made to larger or smaller size, without extra cost to you.

I Guarantee My "STEELS" to Please You and Do Not Consider the Transaction Closed Until You Are More than Satisfied By

TEN-DAY FREE TRY-ON

You Take Absolutely No Risk!

ORDER COUPON

N. M. RUTHSTEIN, The Steel Shoe Man,
Dept. 188, Racine, Wis.

Dear Sir: Please send me, by Parcel Post, one pair of "Steels" Size .... inches high. Enclosed find post office money order for $ .... It is understood if these shoes are not satisfactory and all you claim for them, I can return same and you'll return the above amount.

35 BUSHELS PER ACRE was the yield of WHEAT

160 ACRE FARMS in WESTERN CANADA FREE

on many farms in Western Canada in 1913, some yields being reported as high as 50 bushels per acre. As high as 100 bushels were recorded in some districts for oats, 50 bushels for barley and from 10 to 20 bushels for flax. J. Keys arrived in the country 5 years ago from Denmark, with very little means. He homesteaded, worked hard is now the owner of 320 acres of land. In 1913 had a crop of 200 acres, which will realize him about $4,000. His wheat weighed 68 lbs. to the bushel and averaged over 35 bushels to the acre.

Thousands of similar instances might be related of the homesteaders in Manitoba, Saskatchewan and Alberta.

The crop of 1913 was an abundant one everywhere in Western Canada.

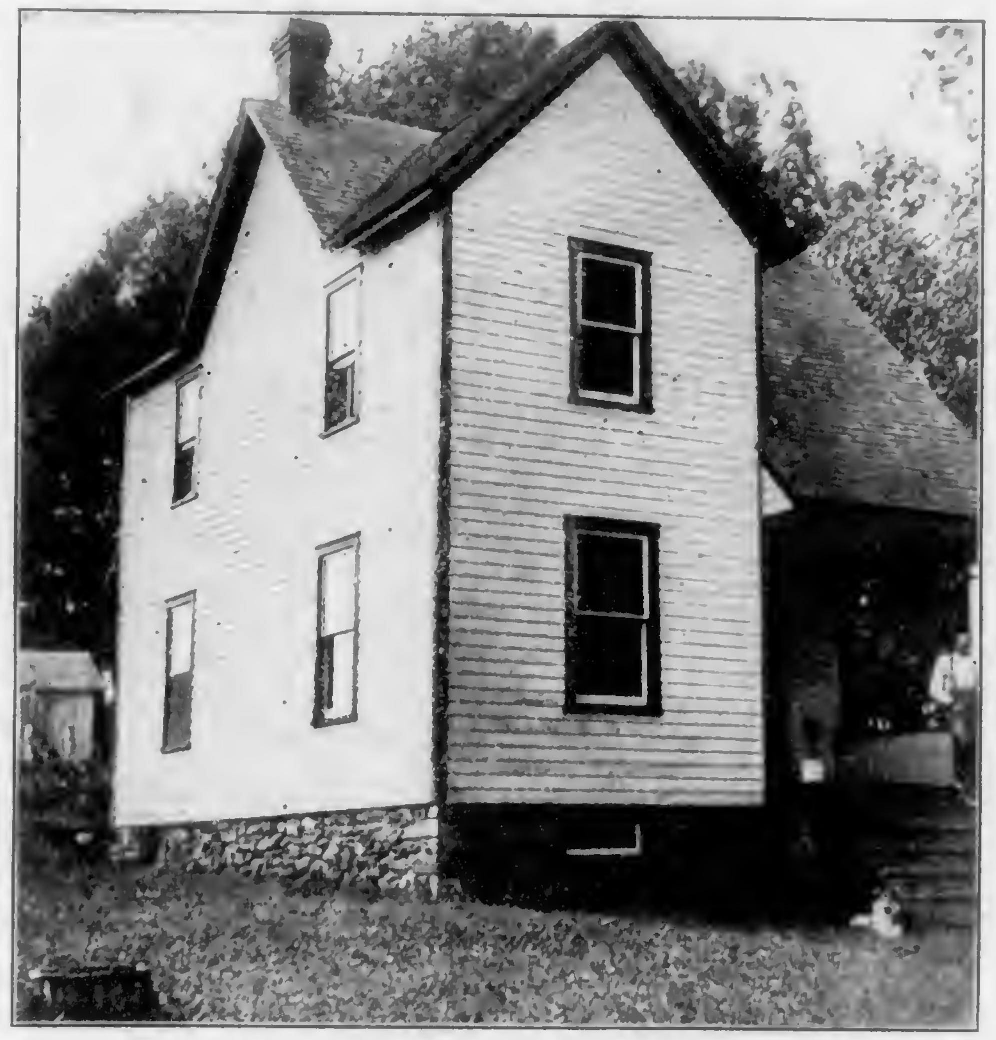
The Tenant House on the Farm

By H. M. Anderson,
York County, Pa.

Probably the most serious problem in farm life today is that of securing competent, dependable farm labor. The producer gets such a small percentage of the consumer's dollar that it is a practical impossibility for him to pay the kind of wages that the manufacturer and other employers of town and city laborers can and do pay. But since a dollar is a dollar, whether in town or country, it is becoming more and more practical for us to pay our men as largely as possible in commodities that are cheaper than money—that is, in house rent, in fire wood, cow pasture, truck patch, etc. But this is one of the less important arguments in favor of the tenant house on the farm.

The principal considerations are that we are able in this way to materially lighten the burden of the farmer's wife, and incidentally have more dependable help; for almost invariably we find married men are better satisfied and less inclined to take offense when no offense is intended. The man who has maintained his own home for a few years and is beginning to gather a family about him is usually a different sort of fellow altogether from what he was in his younger days when he had to have his driving horse and attend all the parties, dances, etc., in the community and was frequently half dead for sleep and always ready at the slightest offense to quit and go off and work for some one else. The married man who lives in your own house, and whose house-rent is a part of his wages usually finds it impossible to get up and go on short notice; he is in a position to lose as much or more than it costs his employer by so doing.

The young farmer and the young lady who considers marrying that young farmer should take into consideration the work and inconvenience of continually boarding farm help, or they probably have breakers ahead of them. I think it is the idea of turning the home into a cheap boarding house that causes many of our best young ladies to hesitate before marrying a farmer. Of course if she loves him enough she will marry him, knowing that she must board his hands, rear the children, raise the chickens, milk the cows and attend to the thousand and one other things that are necessary to keep home sweet and clean and altogether desirable; and we appreciate and bless them for it. But when it is possible and practical to lighten the burden, why is it that more of us do not have the kindness and consideration to do it? There are occasions when it is necessary that the farmer's wife should board extra help, but there certainly should be no occasion for her to board hands three meals a day and 365 days in a year; and we should not ask her to do it.



A TENANT HOUSE ON H. M. ANDERSON FARM, YORK CO., PA., BUILT FOR $1,000.

From the workman's point of view, the house on the farm is just as desirable. He does not have to walk half a mile or even a mile or more, night and morning, and only associate with his wife and family a few minutes in the evening when they are all tired. But he meets them all three times a day and knows just how things are going at home. Again it is practical for him from an economical point of view, for he can keep himself on much less than the increase allowed him because of his boarding at home, and incidentally his family will live a little better and be better in every way. His wife is also in position to add something to the family revenue if she cares to do so. I have always fed a cow for my hand's wife in consideration of her milking one for me, and while this is a very good proposition for her, as she has to go to the stable to milk her own, it is part of our bargain and it suits me as I would not ask my wife to do it and I should hate to do it myself or stop a man from his regular work twice a day to do it.

From the time I decided to ask my wife to marry me I had in mind the building of a house on the farm where the man that I needed the year round could live and board himself. For several years we had almost a surplus of help in the house and when I found that the house help was going I got busy and had a house ready for the man when the need arrived.

The house here shown was purchased from a general mail-order and builders' supply house in August, 1910, at a cost of $623 laid down at my home station. This price included every thing but the brick for the chimneys, the stone, sand and plaster. There was a surplus of material; more than sufficient to build the necessary chicken and hog house. The cost of paint, skilled labor and boarding the same brought the cost up to about $1,000, but I have a house with 7 rooms and a small porch and reception hall that is first class in every respect. This statement is proven by the fact that I have a number of inquiries from working men every fall and winter as to whether the present incumbent is going to stay; and I would always rather talk business with the man who comes to see me, particularly when there are enough of them for me to pick and choose. I think this will always be true that the better the house and surroundings are the better the available men will be.

In locating the tenant house, several things must be taken into consideration. If there is a road thru the farm it should, if possible, be on that road, for the women do like to know what is going on in the community, and then it is so much handier every way than having to cross a field to get to it.

DELAWARE COUNTY FARMERS CATCHING UP WITH WORK DELAYED BY COLD AND WET WEATHER.

Since the man must walk the distance from his house to the barn half a dozen or more times a day, it should not be far from the barn; at the same time it should not be too close to the farm house, as the chickens would probably cause trouble and it is always desirable to maintain the privacy of the home. We want, if possible, to place it on the opposite side of the barn fron the farm house.

My orchards and farm work are rapidly approaching the point where I will find it necessary to keep another man thru the winter, and I hope when the time comes to have another house ready for the man. Altogether, I consider the tenant house on the farm one of my best investments and should not try to get along without it.

PROFIT OR LOSS IN POTATOES

One of the hopeful signs of the times among agricultural workers is the evidence that there is a reaching out after more knowledge of the cost of production. To my mind there can be little hope of extensive co-operation in disposal of surplus until we get at this basic fact and know where we stand. Before me lies a letter from a reader of Pennsylvania Farmer asking "how I figure the cost of growing potatoes and where is to be found the profit,"

Unfortunately, my experimental work is being attempted on small areas and therefore the cost per acre is greater than if engaged in extensive operations. The essential principle may be there, but subject to modifications. It costs me $4 per day for man and pair of horses; $3 for man and one horse and $2 for man. Upon that basis I figure every hour's labor, not realizing why I should toil for less than I pay a helper by my side. If the crop won't pay on this basis it surely should not be considered. Year in and year out, one acre of old sod land is as much as I get plowed with one pair of horses in a day of nine hours. The furrows must be as deep as the subsoil will permit, the ridges even, the angle true, and attention here reduces area covered. I find the items as follows:

Plowing, per acre	$1.00
Preparation	5.00
Seed, 17 bu., rows 34 in. apart	17.00
Planting with machine	2.00
Cutting seed, helping on planter.	2.00
1 ton high-grade potato fertilizer	34.00
Cultivation	5.00
Spraying 5 times, man and horse.	4.00
Insecticide and fungicide	6.00
Digging, picking and storing	12.00
Interest, taxes and insurance	3.00
Depreciation of team, tools and machinery	4.00
Total	$98.00

Complete preparation of the seed bed, to the bottom of the furrow, alone makes possible a full crop. We are told that it requires 250 tons of water to grow a ton of potatoes, and this comes chiefly from the water level. To seize, hold and make available this supply, rising all the while, is the work of the grower and this calls for expense in preparation. Surely the man who marks the strong hills early in the season, watches them thru growth and digs in advance of the field, to reserve the best for seed, is entitled to the price named per bushel. In every other business every item is figured at what it would cost if purchased, which is the only safe way. If one buys reliable seed, true to name, carefully selected, the expense is greater.

Planting in rows, 34 inches, the hills 9 inches apart to control size, will call for the amount named. No man can afford to use low-priced fertilizer; neither can he reduce quantity unless planting on a clover sod. You can not afford to have your roots wasting time hunting for food. Conserve time and energy in plant labor as well as man. With the introduction of a four-row horse or two-row, wheel hand, dust sprayer, the labor item in spraying can materially be cut. With the two-row wheel sprayer, I find I can cover an acre in less than one hour, and thoroly control as well as minimize distribution.

The two items to be criticised most will be those covering taxes, insurance, interest and depreciation, but every one must be met by the grower else how will he find money to pay when the call is made. The farm, if owned, should not only support the family but return interest on the cost. Every item, and very likely others are a legitimate charge against every acre of crops grown, the amount varying according to individual cases.

If the yield be 200 bushels, the cost then will be 49 cents per bushel. If 300 bushels, but 33 cents, and if 350, the cost is reduced to 28 cents. In increasing output then we find the only way to reduce cost. If the crop be dug eighty days from planting, the yield will be far less than if left twenty days longer, provided the leaves and vines are protected, kept green and healthy and the food supply has been ample. With many varieties the yield will double between 80 and 100 days if tops are healthy. For this reason we urge the use of only such agents in spraying as will conserve and cannot injure the life of leaf and stalk. When to dig becomes then a purely mathematical problem to be determined by the individual grower and his market.

A study of chemicals, and experiments with one's own soil, will enable a grower to mix his fertilizers to cut the cost, but never to reduce its value in food elements, save as by the growth of clover one may reduce the nitrogen content.

Frequently as this problem of cost is discussed, one hears the remark—"Well, if it costs as much as that to keep a cow, or grow an acre of any crop, I might as well give up." Yet it has been costing this all the years, only the items have not been figured. Men have been giving of their time and that of their teams, the use of implements and the farm, and counting cost only by what they paid for seed, fertilizer and spray solutions, robbing themselves that they might sell cheaper in the market.

The one great question facing the farmer today is to know the real cost of production. Having this, the next step will be natural, to unite to obtain a living price for all surplus. This last seems to me hardly possible until the first is determined; hence emphasis is laid upon the items centering in the cost of potato growing.—Dr. G. M. Twitchell, Androscoggin Co., Me.

State Regulation and Control of Commission Merchants

By CLYDE LYNDON KING, Ph. D., University of Pennsylvania.

The abuses by commission men, so interestingly described by Mr. Dean in his series of articles on "Commission Merchants and The 35-Cent Dollar", are abuses that abound not alone in Pennsylvania, but in every state in the Union, and in foreign countries as well. The only difference between Pennsylvania and other American states and foreign countries is that the latter have bestirred themselves to secure remedial and corrective legislation whereby such abuses may be minimized if not eliminated entirely.

The commission men, particularly those in the organized exchanges, do not, as a rule, attempt to deny that such abuses exist. They insist rather that it is the farmer who is directly responsible for them because of dishonest packing, and misrepresentation as to quantity and quality of goods. It is to be noted, however, that these very commission men, when organizing themselves into exchanges, take great care to eliminate these abuses, in so far as they may reflect discredit on themselves or do injury to their own business, by subjecting every applicant for membership in the exchange to a thoro-going examination as to his business record and ethics.

Legislation regulating commission merchants is to be justified not only because abuses by middlemen mean lower prices to farmers thru misrepresentations as to time sold, condition in which received, price received therefor, etc., but also because (1) these abuses mean higher prices to consumers (for where standards are not reliable from the farmer to the retailer, distribution costs must necessarily be larger), and (2) because thru these abuses the trade to certain cities definitely falls off from the farmers of certain regions, because the wholesalers of that city do not have the confidence of those farmers. Moreover, the commission business and the handling of produce at wholesale are a vital and essential part of minimum distribution costs. The best elements of the wholesale business must, therefore, be retained.

To date no better method of retaining the good elements in the business has been devised than the enacting of laws such as many American states and certain foreign countries have already put upon their statute books. It is the purpose of this article to describe the essential provisions of these laws.

Fully one-half the American states now have laws on this subject. The significant fact is that practically all of these laws have been passed since 1900. The great majority of them have been passed or extended since 1906. This would seem to prove that not only is legislation of this character needed but that it is soon to be extended thruout all states.

In the development of statutory regulation of the commission merchant the first step was to provide heavy penalties for the embezzlement of farm products by commission merchants. To be sure, no specific statute was needed in order to make such embezzlement a crime, but statutes specifically defining this particular type of embezzlement, and fixing specific penalties therefor, made prosecution easier and the punishment to be affixed heavier and more definite.

Thus many of the states define embezzlement of this kind as "selling, or in any way disposing of, or applying, or converting, for one's own use, with intent to defraud, any bill of lading, custom house permit, or warehouse receipt intrusted to or in the possession of a commission merchant, or any property intrusted to or consigned to" the commission merchant. The penalties for such embezzlement are variously fixed as imprisonment of from one to five years and a fine of from $100 to $500.

But it was soon found that the statutes, to be effective had to do much more than simply define such acts as embezzlement and fix specific penalties therefor. The farmer himself reaps no returns on conviction for embezzlement, especially, as so often happens, if the middleman in question has no property upon which civil damages can be levied. Our states, therefore, are rapidly extending their statutes so as to give the state continuous administrative control over the commission business, and to give the farmer an easy and inexpensive means of seeking redress. This is done by:

(1) Requiring the commission merchant to give a bond, in order that, in case of fraudulent dealings on said commission merchant's part, the consignor may have some financial basis for redress.

(2) Requiring the commission merchant to take out a license. This binds the commission merchant to transact business legitimately, as violations of the prescribed regulations mean revocation of the license.

(3) Requiring that itemized statements be sent to all consignors as to place and time of sale, price received, etc. This minimizes the possibility of embezzling moneys properly due the farmer, and gives the farmer some check on the reliability of the returns sent him.

(4) Prescribing in detail the accounts to be kept by commission men. These accounts are open to inspection by some state official and the consignor. Thru this publicity, false quotations, misrepresentations, etc., are prevented.

(5) Continuous control by the state in order that the farmer or other consignor may have at hand an inexpensive yet effective means of getting all the facts pertaining to the sale of his goods, and a means of securing redress short of the expense of a public trial.

The first essential of all such regulatory statutes is a clear definition as to who commission men are. The statutes of some states (Nebraska, Texas, California, Arkansas, Virginia, Washington, Montana) usually define the commission merchant as "every person, firm or corporation pursuing or which shall pursue the business of selling farm, dairy, orchard, or garden produce, wares or merchandise of any kind upon consignment for a commission."

1. Bonding the Commission Man

To make sure that the commission merchant may not abscond from the state and leave no property behind that which farmers may levy for goods sent him or money due from him many states require every commission merchant before he can legally engage in business in the state, to file a bond of from $2,000 to $20,000. Thus Texas requires that the applicant give a bond in the sum of $2,000. The carrying on of such a business without filing this bond is subject to a fine of from $100 to $1,000.

2. Licensing the Middleman

Other states seek to assure reliability in their commission merchants by requiring them to take out a license. Thus among the states requiring such licenses are Virginia and, for cities of over [illegible], Illinois. In Illinois the license fee is $25. Transacting business without securing such a license is punishable by a fine of from $50 to $200. In Virginia, the license fee is $50 save when commissions exceed $1,000, when the fee is $60, and $10 for each thousand in excess of $2,000.

Many states prescribe both a bond and a license as prerequisites for carrying on the business of commission merchant. Thus Washington requires a bond of $3,000 and a license from the Commissioner of Horticulture. West Virginia provides for a bond of $1,000 and a license. Nebraska prescribes a bond of $2,000 and a license from the Food, Dairy and Drug Commissioner. In North Dakota a bond of not less than $20,000, approved by the Board of Railroad Commissioners, and a license secured from the aforementioned Board are required. In Minnesota a bond of $4,000 is demanded if the license authorizes the sale of grain; and the Railroad and Warehouse Commission may increase bond if deemed necessary whether or not grain is sold. A special license must be taken out if grain is to be handled. The fee for securing a license is $2. These states prescribe heavy penalties, usually fines of from $100 to $1,000, for attempting to do business without such bond and license.

3. Requiring Itemized Statements As To Sale

The statutes in certain states make it the duty of the commission merchant to furnish to his every consignor, immediately upon, or within a prescribed time after sale, a written statement, giving name and address of purchaser, quality and quantity of goods sold, price received, time and place of sale, freight and all other charges, etc. Such provisions are found in Ohio, Nebraska, New York, Illinois and Idaho. The penalty for making a false statement is a fine of from $10 to $100 in Ohio, and a fine of not over $300 or imprisonment of not over six months in Idaho. In Nebraska and in Illinois, failure to render such a statement is prima facie evidence that the transaction was carried on in an illegitimate manner.

The statute of the state of Washington goes still further and provides that, in his statement, the commission merchant must make mention of the fact if the goods were sold below the market price and give reason therefor. This statute also provides that, if the produce is received in damaged condition, and is unfit for sale, or if markets are overstocked, it is the duty of the commission merchant to notify the Commissioner of Horticulture or county fruit inspector and get from him a certificate that said produce is not salable and that it is necessary to destroy it. The certificate is made out in duplicate, one copy being sent to consignor. This effectively stops any fake returns that the goods were not fit for sale.

Other states provide that an itemized written statement shall be submitted by the commission merchant to the consignor only upon demand by the consignor. Michigan and Illinois so provide and make any failure to render such statement prima facie evidence that the transaction was carried on in illegitimate manner. In Delaware, if the commission merchant refuse to render statement on sale of fruit ten days after demand, he is punishable by a fine of from $20 to $100 or imprisonment not exceeding one year.

California requires that a written statement be submitted on demand of consignor, subject to proviso, however, that, unless this written demand shall be made as to each consignment prior to sale, it is sufficient for the commission merchant to set forth only so many of the items above enumerated as he may be able to obtain from the accounts usually kept by him, and that said statement shall not be requested in case the amount of cash transaction was less than $50. Violations of this provision are punishable by a fine of from $200 to $500, or imprisonment of from 10 days to 6 months, or both.

4. Prescribing Form of Books to be Kept

The Washington statute provides that every commission merchant shall keep an accurate and complete set of books containing a record of the amount and character of every consignment received, date of receipt, name of consignor, condition of shipment when received, and when same or any part is sold, name of person to whom sold, amount, date of sale, etc. Similar provisions for record keeping are found in Ohio and Illinois. (In Ohio, the books are open at all times, upon request of any consignor or his duly authorized agent.) It will be noticed that the forms prescribed require such accounts as any fairly efficient firm or merchant ought to keep anyway. The keeping of accounts in prescribed forms not only makes for uniformity but also provides a reliable record in case of suits or questions. All of our railways—state and interstate—and our telephone, gas, street railway, water and other public utilities, are now required to keep uniform accounts open to the scrutiny of specified government officials. Our long history in this field has proved that such regulations are of value not only to the public but to the companies as well; only by this method can both get the information needed for sane and well considered action.

5. Continuous Control by the State

In order to make regulation effective and in order to give to the farmer an informal and inexpensive yet effective means for securing redress, the most progressive of the statutes affecting commission merchants provide for continuous administrative control by the state.

Thus in Washington the books are open at all times and subject to the inspection by any consignor as to any shipments made by him or either on their own initiative or on complaint, by the county fruit inspector or the Commissioner of Horticulture. In Illinois, the Board of Railroad and Warehouse Commissioners has the power to prescribe the system of books and accounts to be kept and these books are open to inspection of the Board or their duly authorized agents. They may send for the books and papers at any time for examination.

Thru this right to prescribe the system of books and accounts to be kept, and to inspect them, and thru the power to grant or refuse licenses, or to revoke or suspend licenses upon the failure of commission merchants to exhibit their books (as in Illinois) the state secretary of agriculture, or some other state official or state board, is given an effective and continuous control over commission merchants—a control just as effective and as much needed as the control of the Interstate Commerce Commission or of state public service commissions over railways and other public utilities.

And what has been the effect of regulation of the commission business? Stability in trade; better standards in grading and sorting goods for under regulation the farmer does not have to engage in sharp practices in order to break even; the doing away with dissatisfaction with the middleman as such. In Washington, in Minnesota, in Texas and in other states that might be mentioned, the commission merchants have come to agree that the laws are beneficial to wholesome reliable trading. And finally, the burdened city dweller sees in such stability of trade, possibilities for lower food costs to him.

In closing, it is well to note that certain foreign countries, notably France and Germany, have made a distinct advance over the American plan of regulation by providing for city-appointed and state-licensed auctioneers for the sale of farmers' goods. The cities then provide public wholesale markets where these goods are sold direct to retailers or groups of consumers, by these licensed auctioneers, at a cost never exceeding 2 or 2½ percent of the gross amount of the sale. This is the next step that will be taken in America if regulation of the above described type does not succeed, or if the commission merchants, thru partisan channels, continue to prevent, as they have thus far in Pennsylvania, the passing and enforcement of proper statutes on the subject.

The Picture Shows What Subsoiling Did
This corn was grown on worn out land at the Experiment Farm at Brookhaven, Miss. All of it was planted and cultivated the same way, at the same time. The ground on the left was untreated; that on the right was subsoiled—blasted and broken up four feet deep and thus restored to fertility. By using
Atlas Farm Powder THE SAFEST EXPLOSIVE
you can double the productiveness of your fields. Under the top-soil is rich plant food that needs only to be opened up to give you bumper crops. You can do the blasting cheaply and easily with The Safest Explosive.
You can save time and money by using Atlas Farm Powder to blow out stumps and shatter boulders, dig ditches, plant orchards, and do many other kinds of farm work. It is made especially for farm use and sold at a low price.
Valuable "Better Farming" Book Sent FREE
You will find valuable information in our big illustrated book, "Better Farming," which tells how to raise bigger crops, clear waste land, and make the farm worth more money in many ways by using Atlas Farm Powder. Send the coupon and get it FREE.

HARVESTING ASPARAGUS

Asparagus is the earliest crop harvested by the truck farmer. It brings in money at a season of the year when money is most needed. It also causes much extra work at a season of the year when the trucker has little leisure. However, with proper methods and a little extra help the asparagus can be harvested without causing delay in planting other crops. It is the purpose of this article to discuss methods of harvesting asparagus, considering the work under five headings; viz: treatment of bed during harvest, cutting, bunching, packing and marketing.

Treatment of Bed

Preparation for asparagus harvest begins in the spring soon after the ground can be worked. The bed is thoroly disked for the purpose of the winter application of manure into the soil, and of destroying the woody stems remaining in the ground from last year's growth and also to conserve moisture and hasten early warming of the soil. We do nothing more to our asparagus beds in the way of cultivation until settled warm weather has come, about two weeks after cutting has commenced. The rows are then ridged. A two-horse plow set rather shallow can be used for this purpose; or, if the acreage is large enough to warrant the outlay, a special disk ridger costing from $30 to $35 can be used. In our beds the crowns of the asparagus plants are so deep that we can secure shoots of fair length without ridging. Ridging delays the early growth, and it is the early marketings that return the most money. For this reason we prefer to postpone ridging until the weather is so warm that the throwing up of a bank of earth over the rows will not check the growth. In many fields, however, the crowns are so near the surface that ridging is necessary before any cuttings can be made.

A one-horse weeder of sufficient width to cover two rows at a time is run over the beds during the cutting season whenever grass or weeds show signs of starting. On Saturdays the asparagus is cut closer than on other days in order that it will hold over Sundays without "blowing". Following the Saturday cutting is the best time to run the weeder if the weather is favorable. The weeder should not be used when the ground is wet, not only because it will not kill all the grass and weeds, but because the shoots of asparagus are brittle at such times and many will be broken off. The asparagus shoots are also brittle in early morning while the dew is on them. The weeder entirely does away with hand hoeing during the cutting season but it wears the ridges down considerably so that it is usually necessary to renew them once, about the middle of the cutting season.

The ridges should be almost level at the end of the cutting season. If they are not it is necessary to level them by running the acme harrow over the bed. This destroys as many shoots as two or three more cuttings would remove; hence the unwisdom of ridging just previous to the close cutting season. The middles are stirred with a five-tooth cultivator whenever grass starts, or the walking of the cutters or rain have packed the soil.

Cutting

A few years ago asparagus growers were divided into two classes. One permitted their asparagus to grow so tall that nearly the entire length, necessary for the bunch, could be secured above ground; the other class cut their asparagus just as it was coming thru the ground. The former boasted of quality, the latter of quantity. Arguments were many and good in favor of producing either the "long green" or the "white". Many of the Gloucester County growers seem to have been unable to decide which was the better method, so they "split the difference." The present tendency is to cut all shoots over three inches above the ground. This gives shoots a third or more green.

Regular asparagus knives, with square cutting edges, having blades about 8 inches long and from 1 to 1½ inches wide at the cutting end, are used. Frequent use is made of the grinding stone or file; for dull knives waste much time. The knives are held nearly perpendicular in cutting, so the chance of injuring the shoots not yet visible is lessened. The shoots are cut at such a depth under ground that they will be at least 10 inches long. One jab of the knife is sufficient to cut a shoot. All shoots are cut when of sufficient height, whether they are marketable or not. To allow the little or crooked shoots to grow is worse than permitting grass and weeds to thrive. They sap the storage roots of strength and greatly reduce the number of shoots sent up. As the asparagus is cut it is laid evenly in large hand baskets carried by the cutters. When filled, these are carried to the bunching shed. A man can cut from ten to twelve bunches of average size per hour. Italian laborers are satisfactory for cutting where the acreage is large enough to keep one or more of them busy. For well established beds the cutting season ends from June 15th to 20th. Young beds should not be cut so long.

Bunching

We have given much study to the arrangement of our bunching shed and method of bunching with the result that one man has made a record of 33 bunches per hour, including the cutting of tape, washing and packing of the bunches. Along one edge of the shed we have a table about 8 feet long and 3 feet wide. The operator faces this table. To the right of the table (the end nearest the right hand of the operator) is a box on which a basket of asparagus is set so that the top of the basket is on a level with the table. On the right end of the table two small sticks about 18 inches long, are nailed, 5 inches apart, parallel to the long edge of the table. To the left of these sticks 3 bunchers are set along the table as close together as they can be operated. A large quantity of tape, cut the proper length, is laid conveniently behind the bunchers. Two of these tapes are laid in each buncher before any asparagus is laid in them. The operator removes a large handful of asparagus from the basket, lays it on the cleats with the butts toward him, quickly sorts out the large spears, grading as "Fancy," and places them in the buncher on the right, the one nearest him. He then sorts out those grading as "Prime" and places them in the second buncher. The remainder grade as "Culls" and are placed in the third buncher. Another large handful is then removed from the basket and the operation repeated. As soon as a buncher is filled it is closed, the tapes tied tightly and the butts cut off with a sharp butcher knife leaving the bunch about 10 inches long. As the bunches are removed from the bunchers they are placed in a large tub, containing water to a depth of about 3 inches, placed conveniently behind the workman.

The bunchers we use have a diameter of 4 inches at the base rings and 3½ inches at the rings near the head-board. Repeated counting shows that our "Fancy" grade contain less than 30, the "Prime" grade from 30 to 40, and the "Culls" over 40 stalks per bunch. Some growers make a fourth grade known as "Jumbo" which should not contain more than 20 stalks per bunch.

CURRANTS MAKE A GOOD INTERCROP IN A YOUNG ORCHARD.

The use of cord or raffia for tieing the bunches has largely been supplanted by colored tape. It comes in spools containing 1,000 yards, costing about $1.65. It is somewhat expensive compared with raffia, but it shows off the the bunches of asparagus to such good advantage that the purchaser pays for it many times over. Almost all Eastern growers use the red tape; while the California growers have a preference for the blue. For rapid cutting of the tape into proper lengths, we have two spikes driven into a table at a distance apart equal to one half the desired length of the tapes. From a beam above the table the spool is suspended on a wire so that it will turn freely. A sharp knife is stuck in the spikes. The tape is wound around the two spikes so that the knife remains in the center. As soon as from a third to a half inch layer of the tape has been wound around the spikes, it is cut with the knife between the spikes, cutting from the inside outward. In this way two or three hundred lengths of tape can be cut in a short time.

Packing

Under the heading bunching we left the asparagus in a tub. As soon as this tub is almost filled, the bunches are scrubbed with a hand scrubbing brush and set on a near-by table to drain. Each grade is separated at this point. Care is taken not to wet the heads of the asparagus. If the heads are wet the water collects under the bracts, ferments, and causes a very unpleasant odor by the time the asparagus reaches the market. This is the reason why the asparagus is not washed before bunching so that all, instead of simply the spears on the outside of the bunches, would be washed. After the bunches have been scrubbed they are packed in asparagus crates holding two dozen bunches, each grade being packed in separate crates. These crates are 17½ inches wide at the bottom and 15½ inches wide at the top. They are 25½ inches long and 12½ inches high, outside measurements. The bottoms and ends are solid, the sides and top slatted. They cost about 21 cents in the flat. In making them up, the side, not top is left open in order to put the bunches of asparagus in. The bottoms of these crates are covered with a one-inch layer of sphagnum moss that has soaked over night in water. It holds enough water to keep the asparagus fresh for several days. Large bales of this moss can be bought for $2 per bale.

Marketing

We find Boston to be one of the best markets for our fancy and prime grades. The culls also find ready sale there before the Massachusetts asparagus enters the market. When this occurs the culls are sold in Chester or Philadelphia where the shipping expenses are not so great. Shipments to Boston are made by express. We use the telephone and mails, try to keep posted on the condition of the various markets, and try to sell our asparagus in the best market.

One or two growers are reporting success by packing their asparagus in crates holding but a dozen bunches and selling direct to consumers. This is a plan of marketing that needs developing and it may pay many growers to study the needs of the consumers and methods of supplying them direct.
—Harris T. Kille, Gloucester Co., N. J.

APPLE GROWING IN NEW JERSEY

At the present time New Jersey has about 1,500,000 apple trees of bearing age. Of these nearly 200,000 are in Monmouth County, with Burlington County second and Gloucester third. There are probably 500,000 trees of non-bearing age which will come into fruiting within a year or so. Had farmers of a few years since realized their opportunities, there would have been at least 5,000,000 trees in bearing.

Conditions were never more favorable for commercial apple production than they are at present. The prevailing soils found in the coastal plain region are sands and silt loams which have proven particularly conducive to the production of fruit. Just North of this plain region is a low Piedmont section. In many parts of this district apple trees grow vigorously and bear profusely.

With the markets of many large cities on either hand, it is no wonder that summer apples are proving the most profitable. There is less competition in the apple market during the summer, because many summer varieties will not stand long shipment. This fact prevents apples from being shipped from the West and South to large Philadelphia and New York markets to compete with fruit grown in New Jersey. The increasing demand for high-class fruit at the sea-shore resorts is another factor contributing to profits from summer apples grown in the State.

Despite the fact, however, that soil, climate and markets are all favorable to apple production in the State and that nearly half a million trees are soon to come into bearing, there are not as many apples produced in New Jersey as there were thirty years ago, the reason for which is not fully apparent. The competition of the great West and Northwest has had something to do with it, as has, also, the difficulty of raising apples because of scale and other diseases requiring spraying.—D. T. H.

FLOWERS

The sweet pea trench should have been dug last fall, or the soil deeply spaded, then poultry manure applied after the first freeze. As early as possible stir this well, then furrow several inches deep and plant the seed, covering between one and two inches deep. As fast as the plants grow keep the soil filled in the furrow, thus enabling them to secure a deep root growth which is very essential to a strong growth of vine and abundance of flowers. Cultivate often, but not deeply and in severe drouth, be prepared to water abundantly.

Procure dahlia tubers early and start in a spent hot bed or a cold frame. Have the bed or row deeply spaded, and well enriched. Dahlias like lots of water when buds are forming. The suds of weekly washes seem to suit them finely. Wood ashes improve the soil for dahlias. They may be grown successfully from seed, but the seed should be started early, and kept growing, else frost will get most of the buds.

Unless well prepared for starting them, it is best to procure Cannas already started. Don't have them arrive until May. While waiting for the plants, dig the bed very deeply, at least to the depth of a tile spade, and enrich the soil well with stable manure. Place the plants three feet apart, and don't ever let them suffer for water. Good drainage is necessary to a good growth of any plant, especially the tuberous-rooted sorts. Unless naturally well drained, place a layer of coarse gravel or broken tile in the bottom of the bed. For varieties of Canna use Robusta for center, Allemania, Pennsylvania, Austria, Italia and Mrs. Kate Gray for the edge if you desire plants six to eight feet tall with large orchid-like flowers. Robusta is a dark, large-leaved plant that should not be allowed to bloom, as the bloom is inconspicuous. Such a bed makes a fine display. A mulch of stable litter aids them after the growth becomes too thick to allow of cultivating.—E. Clearwater.

Brown-Tail Moth.—Recent appearance of the brown-tail moth on parts of Long Island, N. Y., has revived interest in the study of this pest. Quite timely, therefore is the Connecticut Experiment Station Bulletin No. 182, which discusses its history, its injuries, means of spread, life history, its parasites and its control measures. The Bulletin is mailed from New Haven, Conn.

The Home Vegetable Garden.—Every farmer, vegetable gardener and trucker should find Bulletin No. 10 of the Virginia Truck Experiment Station mailed from Norfolk, Va., of intense interest. This bulletin treats of soils, location, fertilizers, crop rotation, seeds, hotbeds and cold frames, sowing seed, care of seed bed, setting plants in the field and cultural directions, in connection with vegetable gardening, and is an excellent bulletin for use as a library reference.

The American Peach Orchard.—By Prof. F. A. Waugh, Professor of Horticulture, Massachusetts Agriculture College. 238 pages, 5x7½ inches. Illustrated. Published by Orange Judd Company. For sale thru Pennsylvania Farmer. Price, $1.00.
Peach growing is an art in itself. Specialization in all fruit growing has become so general that each class of fruit stands out as a separate industry. This book is essentially a sketch of the practice of peach growing in this country at the present time. It presents the thought and experience of growers in different parts of the country, and the practice and methods that have become standard in the production of highest quality fruit.

Bale Hay! Big Pay!
Can start or stop instantly. Coupled up short. Easy to turn. Great on windrows. 2½ to 3½ tons per hour.
Tons Tell The Story of Profit. Sandwich Hay Presses.
This **Free Book** tells of profits baling hay. Sandwich owners lead all others: Make $200 to $300 clear profit every month baling hay for growers in their district. "32 tons in 8 hours with a 3-man crew" writes C. W. Brown, Merrill, Michigan. Plenty more bale 20 to 30 tons daily, rain or shine. **Big Tonnage.**
SANDWICH Hay Presses
This mighty, solid steel **MOTOR BALER** supplies its own power from high grade, hopper cooled, Gas Engine, 4, 6, 8 or 10 H. P. mounted on same truck. Geared Magneto. No break downs. Another exclusive feature—full power delivered to Press by heavy steel roller chain. Turns out solid, salable bales. No dangerous belts to slip or stretch in wet weather. No other baler has this friction clutch on press, can start or stop instantly. Simple self-feeder that stands hard crowding. We make Horse and Belt power presses too.
Grasp This Golden Moment
and mail a postal for our famous "Tons Tell" catalog that shows you in actual figures the money made with the Sandwich Press and how you can pay for your press from your first year's earnings. Sent **free** postpaid. Address today.

ROOFING—95 CENTS ROLL—108 Feet. Nails. Cement. Rubber Roofing Co., 5 Cortlandt St., New York

Plowing An Acre An Hour
UNDER average conditions Chase Light Farm Tractors are plowing an acre an hour. Harvesting four acres of grain in an hour. Rolling, discing, harrowing three acres an hour.
Chase Tractors are taking the place of stationary engines on the farm. Driving farm machines requiring belt work, from wood sawing to combination threshers and wind stackers.
Chase Tractors are bought by "hard buyers" because they do the work of eight or ten horses, economically and efficiently. Your ordinary horse drawn tillage implements, harrows, double discs, etc. can be easily attached. The wheels are light rollers. Do not injure the ground by packing the soil. Total height only 55 inches, making possible efficient orchard work. Built by men of long successful experience in making farm implements. Weight only 5000 lbs. Write for full information.
Box 19, Motor Tractor Dept., Chase Motor Truck Co., Syracuse, N. Y.

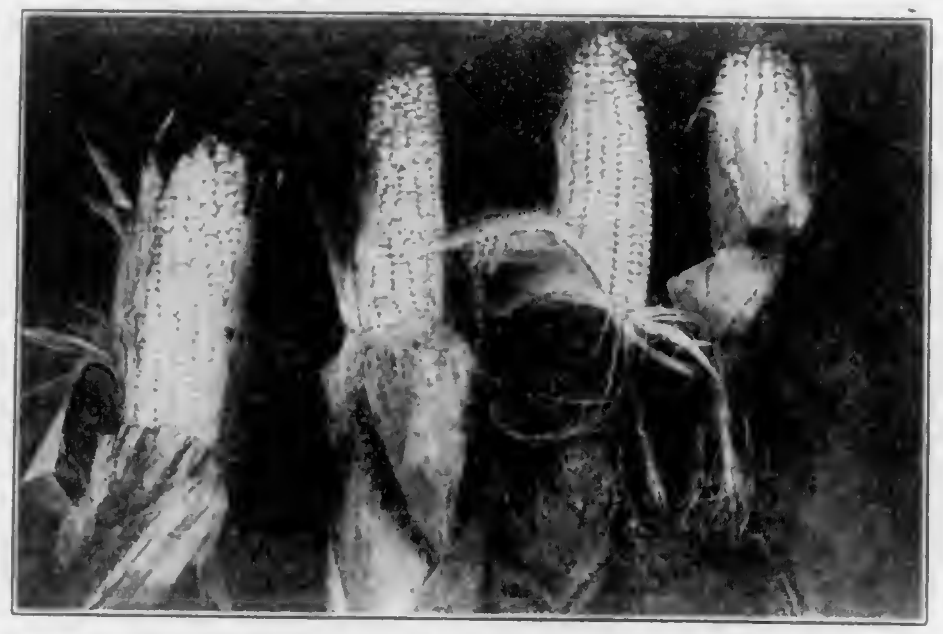
GROWING SILAGE

There are good reasons for plowing the corn ground on which manure was applied during the winter, as early in the spring as it is in condition to work. Harrow frequently, preferably with disk or cut-away harrow, until planting time. This pulverizes the sod incorporates the manure with it, and aerates and warms it by letting the air and sunshine thru it. Such a soil conserves moistures better and forwards the crop. The writer's time for planting corn is when the trees are in full leaf, and the soil feels warm to the hand. The question of early planting seems to be a matter of acclimated seed.

FIELD OF CORN AND SOY BEANS SOWN TOGETHER FOR SILAGE.

When attending a meeting of the Northern New York Corn Growers' Association, I heard this statement from a member, "I planted commercial seed corn and seed corn I had grown on my own farm, and acclimated, both at the same time, in the same field. Every kernel of the commercial seed died, and every kernel of the home-grown seed germinated and grew." The time has come when the progressive farmer must give more attention to developing his own work on his farm, strains of seeds suited to local soil and climatic conditions. In corn culture this means the maintaining of a plot of corn for growing seed. Probably on the average farm one-half acre is not too much. The kind of corn to grow on this plot for ensilage is the largest that can be depended upon to mature to the glazing stage.



EARS LIKE THESE ON ENSILAGE CORN ADD VALUE TO THE SILAGE.

It is a matter of history that in the Eastern states above the latitude of New Jersey, the earliest of the dent corns, as Pride of the North, have not reached this stage of maturity more than three years out of five, and for this reason, the largest of the flint corns, or possibly a cross between a dent and flint is safer to select for the seed plot. It should be understood that the value of ensilage consists in its digestible nutrients, and as some one has said, "It is too much work to water our cows with a bushel basket," as when feeding immature corn stalks. After getting the best variety of corn to start with, this may be improved year after year, by selection of the most perfect ears. A stimulus to such work is a local corn growers' association.

The dairy farmer should investigate the subject of soy beans, and learn about the best variety that will ripen with his variety of corn. No farmer can afford not to grow soy beans with ensilage corn, and I know that a few New York farmers grow corn and soy bean ensilage that is so nearly a balanced ration that but little grain is fed with it. In at least one case the dairyman feeds no grain with his corn and soy bean ensilage, and is getting very good results. The Medium Green soy bean is most generally grown for the silo, but information about varieties that will ripen with a particular variety of corn can be obtained of state agricultural colleges and experiment stations. The writer plants 8 quarts of seed per acre, about one-third of which is soy beans, and thins the corn where too thick to prevent the growth of the beans. The seed can be evenly mixed together and planted with a horse corn planter.

When planting corn it should be drilled in rows sufficiently far apart to admit of horse cultivation until the corn has nearly made its growth. To do this 3½ or 4 feet is not too far apart if the stalks stand perhaps one foot or so apart in row. Thoro and clean cultivation means very much. Growing corn in a rotation on the dairy farm is the only opportunity to destroy perennial weeds, as paint brush, dandelion, plantain etc. Right here is the preparation of the soil for growing alfalfa, and the writer knows absolutely, that any soil, well-drained and of fair depth, can be prepared in this way so alfalfa can be grown in it without failure if all the requirements of the plant are complied with.

As soon as the corn is planted, start the cultivator. Put the teeth down deep for the first two or three weeks, then more shallow until two or three inches of the surface soil is only stirred, leaving a finely pulverized dust mulch. This method of sub-irrigation will produce a good crop of corn in a season of severe drouth. With straight rows tho cultivator can be run close to the line of corn plants, but all weeds that cannot be so reached should be hoed out, for as has been said, this means success with alfalfa which is an end toward which all dairymen should work.

Before the last cultivation of the corn, sow between the rows a mixture of vetch, cow horn turnips, if you wish to grow the latter, and a very small proportion of rye. This with favorable conditions will make considerable growth during the fall. It will grow even in cold weather, if the ground does not freeze, and will start growing early in the spring. When a few inches high in the spring it should be plowed under, making a cheap source of humus and plant food.

The most profitable time to feed ensilage is when the pasture begins to fail, after mid-summer. Cutting soiling crops every day is not pleasant or profitable. Probably they will be immature and too watery. After planning for the winter supply of ensilage, plan for about two acres more for a dairy of 25 cows, and a special summer silo, which need not be opened until the ensilage is wanted.

AMONG THE MILK PRODUCERS

Conditions Not Promising

Farming in the dairy section of New York seems slightly at a discount just at present. It may not be more depressed than farming elsewhere, for to the best of my judgement the business is not very prosperous. Other business is considered slack also, consequently we cannot lay all the blame on farming nor on the milk dealers. For several years seasons of growing have been dry in many sections, and this has been especially true of our dairy section. One well-informed man told me not long ago that it will take two or three years of good fortune to bring up many of our farmers to the point where they were two years ago. Last season was exceptionally bad. For all that, I know many farmers who made a little profit, even last season.

Just now there seems to be quite a strife to get what hay is needed to carry out the stock to grass. I do not think there will be any necessity of bringing in hay from other quarters, but considerable hay is changing owners. Feeds are rather high, altho not so high as in some years. I would think that grain feeds are lower by 3 to 5 percent than the average year for five years. Hay is bringing its top price for several years, that is $15 a ton at the barn where sold. Milk is off fully 5 percent, and requirements as to the cost of production are rather more exacting. I do not think that there are as many dairymen being shut out of the markets, but inspection is more effective than formerly. In other days inspectors thought they had to turn down a man occasionally in order to show that they were doing something. There is some of that even now, but we seem to be nearer real inspection of an educative type than in former days. It costs money for the farmer to meet the requirements all the same, and he is not getting paid for it.

Milk is being graded in some instances, but it is done in a peculiar manner. It may be the best that can be done now altho it seems strange. A creamery shipping milk to the New York city market may take in as many grades as they are amind to, but can ship only one to the city. In some localities "A" milk is shipped while in others it is "B", or some other. If the milk is to be "A", no "B" milk can be shipped. In certain cases the dealers who want to ship "A" milk pay a bonus for temperature and for bacterial count. If milk is cooled to 58 degrees and so delivered, the dealer may pay 10 cents a hundred extra for it, and if the bacterial count is kept below 100,000 another 10 cents is paid. This plan is the right one, if carried out properly. These payments are in addition to 10 cents for 3.8 percent fat, and 10 cents for a barn score of 68 points. This 40 cents above the flat price is not so bad if the inspection is fair. That means June milk at $1.40 per hundred pounds.

Now hold on a little before you say that dairy farmers are in clover. The number that have a chance to get any such return as this is exceedingly small. Not many stations are trying to run as "A" plants. When they do it is expense to the dairyman who gets the price. I am not certain whether there is profit in "A" milk at that price. The idea is the correct one if enough is paid and not too much exacted; and if there is an opportunity to sell. It will be seen that the man who sells ordinary milk of rather low test, even when he is under inspection, gets only $1 a hundred for June milk. It strikes me that more of this milk is sold than of any other sort. That means an average of 3 cents a quart or less the year round, and that price will not pay expenses unless the production is 6,000 pounds per cow, or something like 40 percent above the average production.—H. H. Lyon, Chenango Co., N. Y.

Dairy Inspection.—A meeting of Gov. Glynn's milk commission held recently was well attended. Practically all members of the commission present approved of the plan for state wide inspection of dairies furnishing milk for city and village consumption. Dr. McMillan of New York City department of health approved the plan with the restriction that the city should control the milk stations. On the question of pasteurization there was a difference of opinion as to whether milk should be pasteurized immediately after being drawn or at large plants for the purpose in the city. It was the opinion of those present that the milk now being shipped there is of a poorer quality than formerly and that prices will have to be raised to insure keeping the standard up to the requirement of consumers.

May Rilma Beats All Records

DE LAVAL as superior to other separators as other separators are to gravity creaming

WHY STOP HALF WAY IN BUYING A CREAM SEPARATOR?

THE ABOVE HEADING SUMS UP the cream separator case, as it concerns every prospective buyer of a separator and every user of an inferior separator, in as few words as it could well be put.

OTHER SEPARATORS SKIM cleaner than is possible on the average with gravity creaming, and De Laval Separators skim as much closer still than other separators, particularly under the harder conditions of cool milk, running heavy cream or separating the milk of stripper cows.

OTHER SEPARATORS PRODUCE A cream superior to gravity creaming, and De Laval cream is smoother, less frothy and so much better than the cream of other separators that De Laval made butter always scores highest in every important contest.

OTHER SEPARATORS SAVE TIME and labor over gravity setting or creaming of milk, and De Laval Separators by reason of their easier turning, greater capacity, easier cleaning and easier handling save a great deal of time and labor over other separators.

OTHER SEPARATORS SAVE THEIR cost every year, as a rule, over gravity creaming, and De Laval Separators save their cost every year over other separators and last from ten to twenty years, or on an average five times as long as other separators.

DE LAVAL SEPARATORS COST A little more than other separators, but very little, and they soon save that small difference and go on saving it every few months, as other separators would go on wasting it, for all the years they last.

WHY THEN BUT HALF SOLVE THE problem of best results and greatest economy in dairying by the purchase of an inferior separator or go on dairying with this important problem but half solved if you are already using an inferior separator that you might so easily replace with a De Laval?

THE SEASON OF GREATEST PRODUCTION is now at hand when all these differences count for most with every user who should have a separator and is trying to get along without one. No other dairy question is of anywhere near as great dollars-and-cents importance.

WHY NOT SOLVE IT NOW IN THE only sure and safe way possible? If you haven't a separator, buy a De Laval. If you have a poor separator, replace it with a De Laval. If it is not convenient to pay cash you may buy a De Laval on such liberal terms that it will actually save and pay for itself.

Every De Laval local agent is glad of the opportunity to prove every claim here made. It will cost you nothing and may save you much to give him the opportunity. If you don't know the nearest De Laval agent simply address the nearest main office, as below.

Bed-Rock Prices on Feed!
Save $2 to $3 a Ton by Buying Now

Prices on the famous International Special Dairy Feed are at the bottom *right now*. Tomorrow they may be higher. Figure out your next season's needs and get your order in at once. It means a big saving for you. Order through your dealer or direct. Remember that using International Special Dairy Feed means *more* milk at *less* cost than from any other method of feeding. Would 2 to 3 lbs. more milk per day on each cow look good to you? Then use

International Special Dairy Feed

either as an entire ration or mixed with other grain feeds. This wonderful feed is composed of ground grains, grain products, cotton seed meal and molasses, scientifically prepared and blended. This nutritious and palatable feed runs 15% to 16% protein. Besides dairy feed we make hog, horse and poultry feed—each the best of its class—each backed by a broad guarantee of satisfaction. For "Summer Feeding" International Special Dairy Feed is the choice of thousands of wise dairymen. They *know* by experience that every pound eaten means more milk money as well as new life and energy in the dairy cows.

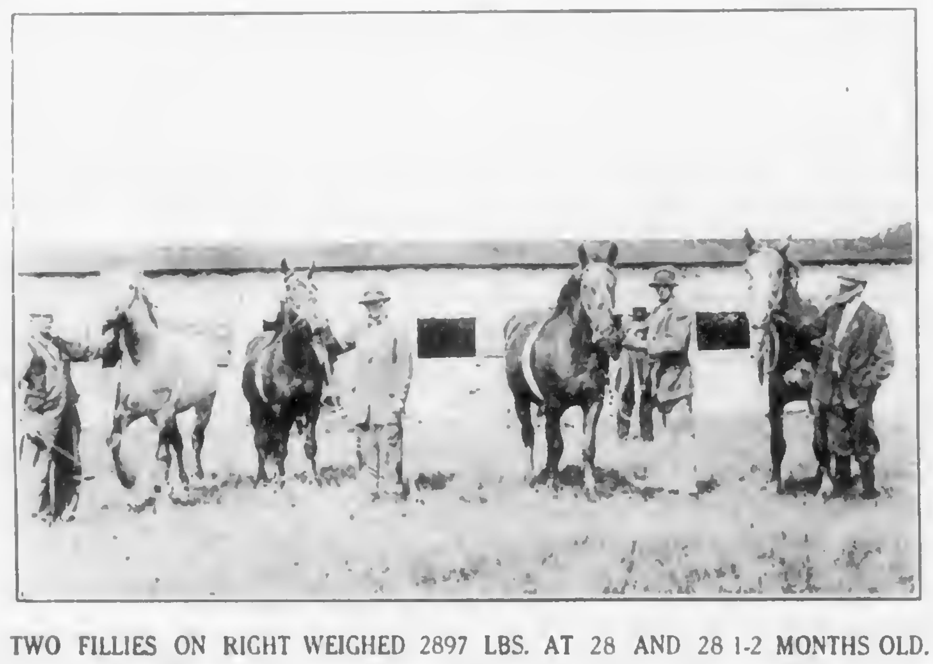
AN OBJECT LESSON IN HORSE RAISING

During our travels over Pennsylvania doing farmers' institute work we meet with some very interesting lessons. I often wish that they could be carried home to the many who need them. One that impressed me very much was the way Mr. Geo. Richards, of McKean Co., Pa., is availing himself of the high priced horse market. He is growing a good grade of colts from good quality, heavy mares and a purebred Percheron sire. He is not attempting to grow anything but good-sized, good-quality workers. Mr. Richards knows the value of feed to a growing animal and when to give it to him.

Just before we were there in February last, Mr. Richards had sold two colts, 28 months old, not as a pair but to separate buyers (farmers in his own community) for $300 a head. He thought he had done pretty well. The two weighed 2,897 lbs. and when he found he had received almost 21 cents per pound for them and only about 16 to 18 cents per pound for his poultry, colt raising looked better than ever to him. He has several more colts just as good as the two sold and will likely do as well with them. His success is the result of good judgment in selecting breeding stock for both size and quality, and then feeding and caring for the young colt at a time that insures the greatest growth and strength. There is a great difference between the result of feeding for growth and strength and merely keeping a young animal alive and praying for growth, as is too often done. I do not know how the same feed and care could have be used to so good advantage in any other way. Do you?



TWO FILLIES ON RIGHT WEIGHED 2897 LBS. AT 28 AND 28 1-2 MONTHS OLD.
Sold for $600. Their Sire Shown on Extreme Left. Owned by Geo. Richards, McKean Co., Pa.

The two colts on the right in the accompanying illustration are the ones sold for $600, and the gray horse on the extreme left is their sire. Right now is the right time to look around and select some good breeding stock and start in to raise your own horses. Stop paying [illegible] cents per pound for your work teams to some one out west to do it for you. We can raise as good horses and just as cheaply in Pennsylvania as any place in the world if we use good judgment in selection, and use nerve and common sense in feeding.—Dr. M. E. Conard, Chester Co., Pa., Farm Adviser in Dairying and Animal Husbandry.

FARROWING HOUSE FLOORS

The individual farrowing cot without a floor is just about two-thirds of a house. It ought to take but a single spring like the present one to teach any farmer this fact. Besides the warm and dry effect of the floor the house stands the wear and tear of moving much better if taken on its own runners than if tumbled upon a sled and off each time it is necessary to move.

If distant from the straw supply the bedding of these coops is very likely to be neglected. If placed directly upon the ground the bed is often damp and uncomfortable in a few hours, and often becomes thoroly wet in a day or two. Even in wet and rainy weather our small houses have often gone weeks even without fresh bedding, and at the same time remained much more comfortable than could a house with bed laid directly upon the ground. The recommendation of these small houses is their ease of movability, and this causes them often to be moved far from the supply of straw. I believe that in their original construction they should be so made as to require the least carrying of bedding and the greatest comfort to the pigs under adverse conditions.—Geo. P. Williams, Delaware Co., O.

RAISE MORE HORSES

It is better to raise two colts at a time than one, if you can let the colts run together. Feed the colt well all the time for no animal will make better use of it in growth. Give the colt a very liberal grain ration and do not try to winter him on roughage. If you do justice to the colt it will cost you as much to winter the colt as a full-grown horse. We want to raise a horse in which is a lot of surplus power. This inbred characteristic, brought out by right feeding and care, constitutes the value of the horse, both on the farm and for the market. Vitality and conformation are qualities to work for in raising the farm draft horses.

Farmers should breed only good mares if they want good colts. In fact, the quality of the mare is almost as essential as that of the stallion. Farmers should keep only mares on their farms to do their work, and sell all the geldings for other uses. Your mares will do your own farm work and earn more for you while you sleep, raising colts. Two good brood mares should return you $500 annually in colts sold. The West has reached a place where it will soon use all the horses they grow and we must expect higher prices for good horses.—S. J., Crawford Co., Pa.

MARYLAND FARMERS' DAY

The second annual Farmers' Day will be held at the Maryland Agricultural College, College Park, Md., May 30. The event will give visitors an opportunity to observe experimental work at the state experiment station and study results. A special program with many attractive features is being arranged. Special railroad rates will be given.

Flying Dutchman Hay Loader

The One-Man Loader

No Ropes
No Chains
No Cogs
No Gears
No Delays

With this Loader, one man can put on a good, even load of hay, in practically the same time that it would take two men with other loaders.

The Flying Dutchman loads hay, clover or alfalfa without "chewing it up" or threshing out the seed.

It operates with the long, easy, natural stroke of the hand rake, elevates carefully and loads it on the wagon in excellent condition.

Works on an entirely new principle that does away with all cams, drums, chains, sprockets, rope webs, gears and trouble.

Light Draft and Long Life—There's nothing to wear out or get out of order, and the extra long stroke does not pound the machine to pieces.

No Clogging—The yielding deck effectually prevents clogging. Heavy or light hay, swath or windrow can be handled without any adjustment.

All-Steel Frame—It cannot warp, sag, rot, nor get out of shape.

Many ADRIANCE Mowers In Use 40 Years

Are giving excellent service today. No other Mower has such a record because none is so well built.

Adriance Mowers have nearly 60 years of the hardest kind of service back of them.

They are the best made—simplest in construction—lightest draft—most powerful—need fewest repairs, thousands of users will testify.

Adjustable carrying springs take weight from center bar and put it on the wheels, greatly reducing draft and increasing traction.

Cutter Bar follows the ground no matter how uneven it may be.

Automatic spring draft prevents damage to machine, driver or team in case obstruction is struck.

Forward acting, natural position foot lever makes ideal foot brace in controlling fractious team.

Many other strong Adriance features explained in our FREE BOOKLET. Write for it today.

Your Flying Dutchman Dealer sells Adriance Mowers, Flying Dutchman Hay Loaders and complete line of Flying Dutchman Farming Implements. See him.

Moline Plow Co.
Dept. 152 MOLINE, ILL.

400,000 Settlers a Year

Immigration figures show that the population of Canada increased during 1913, by the addition of 400,000 new settlers from the United States and Europe. Most of these have gone on farms in Manitoba, Saskatchewan and Alberta.

Lord William Percy, an English Nobleman says:

"The possibilities and opportunities offered by the Canadian West are so infinitely greater than those which exist in England, that it seems absurd to think that people should be impeded from coming to the country where they can most easily and certainly improve their position."

New districts are being opened up, which will make accessible a great number of homesteads in districts especially adapted to mixed farming and grain raising.

For illustrated literature and reduced railway rates, apply to Superintendent of Immigration, Ottawa, Canada, or to the Canadian Government Agent.

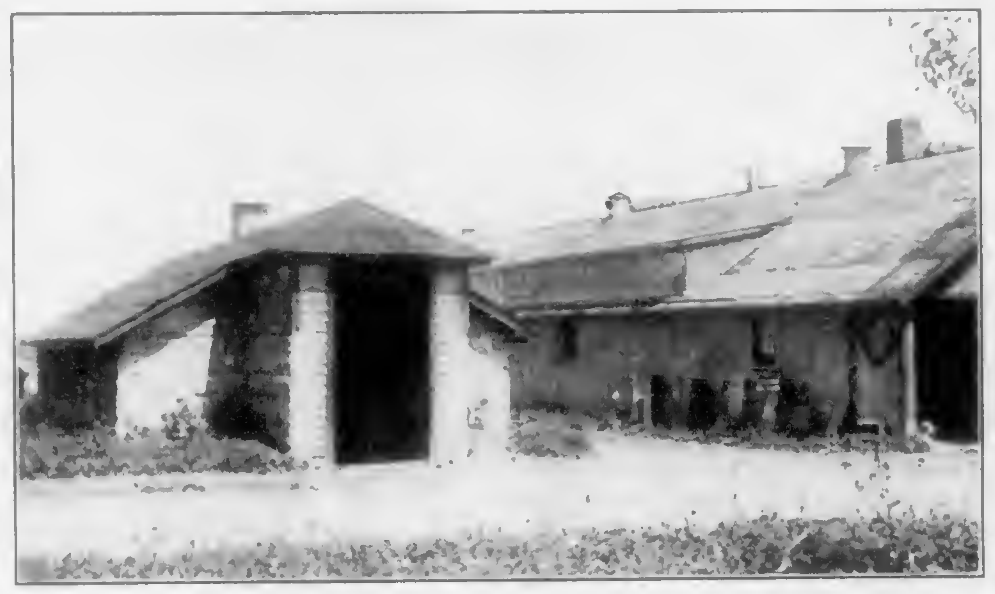
Poultry

WHAT CAUSES INFERTILE EGGS

Confinement is one of the frequent causes of infertile eggs. On a good many farms the chickens are kept in confinement. Why this is so I have never been quite able to understand. The serious part is that some farmers are trying to keep their poultry under plant or factory conditions, when there is no reason why they should do this. They have the land and all they have to do is to open the gates and doors wide. Free range breeding stock always produces a much better fertility and stronger chicks than confined stock. Another cause of infertile eggs is inbreeding, unless this be carefully practiced. By far the safest method for the farmer to follow would be to introduce unrelated stock each year thru purchasing a male bird, of known breeding and unquestionable stamina. As a rule this last factor is very much neglected on the average farm.

To show the importance free range plays in producing fertile eggs I might relate an experiment as conducted at the New York State Agricultural College. A pen which was producing eggs 10 percent fertile, in confinement, was placed on a large free range, the doors kept open, and inside of a week these same hens were producing eggs 80 percent fertile, with an increased percentage in hatchability.



HATCHING CELLAR AND HOG HOUSE ON FARM OF H. O. HOLCOMB, CRAWFORD CO., PA.
Note "Sky-light" Windows in "Hog House."

Hens worried with lice and mites, can not and do not produce fertile eggs.

Excessive feeding of wet mashes has a tendency to cause infertile eggs. Overfeeding has a tendency to make the breeders lazy and sluggish, which invariably means infertile eggs, and weak chicks.

Exercise is of paramount importance in the successful management of breeders. The more they are made to work for their living the better the eggs will be in fertility, and hatching power. Lack of exercise and overfeeding of breeders invariably causes a large percentage of infertile eggs and weak chicks.

The improper feeding of green food, either too much or not enough, is very often the cause of eggs low in fertility and those that do hatch often prove weak and unprofitable. Insufficient green food especially has a tendency to cause a large percentage of infertile eggs. Too much green food causes eggs with an excessively watery yolk and such, even tho they are fertile, seldom hatch. Breeding stock which during the winter has been forced for heavy winter egg production, does not as a rule, produce strongly fertilized eggs in the spring and those that do hatch are invariably weak and difficult to bring to maturity.

Sometimes male birds for different reasons will get in poor condition. This is another very frequent cause of infertile eggs and weak chicks, as is also the allowing of constitutionally weak male birds to head a flock of breeders. Weak breeding stock always produces eggs low in fertility, hatching power, and weak chicks. Too many females to one male may also contribute to infertility.

Fertility is not always a very reliable way of judging the value of eggs for hatching, because altho the fertility of the eggs may be good, their hatching power may be very low, thus producing a very low percentage of chicks, and the actual number of chicks is what counts.

In various experiments conducted at the New York State Agricultural College the following were some of the results obtained. Where pullets were on grass range the percent of fertile eggs was 73.60; of fertile hatched, 97.40; of number hatched to number set, 71.70; of chickens reared to number hatched, 92.60. Where pullets were on bare yard the percent of fertile eggs was, 98.50; of fertile hatched, 50.20; of number hatched to number set, 49.50; of chickens reared to number hatched, 80.80.

Diseased breeding stock of course invariably causes a great percentage of infertile eggs, as does also breeding stock which tho seemingly perfectly well at breeding time has passed thru some hard and vigor-sapping disease. For this reason it is unwise to use any such stock for breeding purposes.—F. W. Kazmeier, N. Y. State Agri. College.

NEW BOOKS

Success With Hens.—By Robert Joss, 234 pages, 5½x8 inches. Bound in cloth. Published by Forbes and Co., Chicago, Ill. Price, $1.00.

This is a clear, practical and up-to-date guide to poultry raising. The book contains 55 chapters covering in detail the various branches of farm poultry work, including incubation, feeding and housing, increasing the egg supply, cure of diseases, marketing of eggs and fowls.

Management and Breeding of Horses.—By Prof. Merrett W. Harper, professor of Animal Husbandry, College of Agriculture, Cornell University, 465 pages, 5½x8 inches. Illustrated. Bound in Cloth. Published by Orange Judd Company. Price thru Pennsylvania Farmer, $2.00

Management and Breeding of Horses is a farmers' hand book on judging, feeding, breeding, care and management of horses. It gives the history and description of each of the breeds of horses and discusses practical points in handling in a concise, readable style easily understood by any farmer horseman. Chapters on principles of horse breeding, the brood mare, the foal, fitting for farm and market, practical feeding, training horses and common ailments, make the book of value to all horse owners. The book is illustrated with 175 cuts from natural photographs.

Anti-Saloon League Year Book, 1914.—By Ernest H. Cherrington, Editor of The American Issue, 214 pages, 5x7 inches. Illustrated with charts and diagrams. Bound in paper or cloth. Price in paper, 25 cents; in cloth, 50 cents. Published by American Issue Publishing Company, Westerville, O.

This is the seventh annual edition of this publication which is an encyclopedia of up-to-date facts and figures dealing with the liquor traffic. It gives comparative statistics of manufactures, crime, pauperism, insanity, industrial conditions, etc., in prohibition and license states.

STEEL Shingles
Cheapest To Use
Get Edwards Direct-from-Factory Offer!

At even less cost than the best wood-shingles, you can now own a genuine Edwards Steel Shingle Roof that'll *outlast the house.*

Easier to put on than wood, too. Wood shingles go on one at a time. Edwards Steel Shingles are laid in big clusters—100 at a time. No extras. No special tools, no skilled workmen. No painting needed. Yet they never wear out.

Rot, Fire and Rust Proof!

Don't confuse Edwards with ordinary galvanized roofing that cracks and rusts. Each sheet of Edwards separately dipped in molten zinc by "Tightcote" Process. Rust never gets a foothold. Can't burn, rot or blister. $10,000 guarantee against lightning. Outlast *four* ordinary roofs.

1,000,000 Sq. Ft. Priced for Quick Selling

Get Prices! This is best time to lay your roof. We are making an unusually low figure right now. Send for Book No. 5391 and prices. Please give size of roof if possible. (153)

TALKS WITH OUR READERS

Pennsylvania Farmer is edited for its readers. Its circulation is concentrated in a limited area of similar conditions and similar problems. We are trying to give our readers the information, the news and the discussions that are most useful to the farmers of this circulation area. In doing so we must be guided to a large extent by the requests for special articles or discussions that come to us from readers, and by comments on subjects already taken up. We always welcome suggestions on ways and means of making the paper more useful to you; and you means every subscriber, whether old or new. If you have question on practical or technical farm practice that are troubling you, send them in and we will submit them to an authority for reply, thru our columns. That is the business of the special correspondents on our staff. If you have questions concerning the policy of our paper, the whys and wherefores of subjects discussed or subjects that ought to be discussed, send them in and we will try to answer them. That is our business in which you have a legitimate interest as a subscriber and a patron.

Service Bureau Announcement has been made of the formation of the Philadelphia Agricultural Service Bureau, with a controling committee of seven members. Among the announced duties of this committee are the following: "Work in harmony with Pennsylvania State College, the experiment stations of New Jersey, Delaware and Maryland and U. S. Department of Agriculture; supply agricultural information to growers and producers and place farmers in communication with responsible distributors; assist banks and financial institutions in development of agriculture in their particular section by arranging for meetings, supplying speakers, etc.; recommend methods of standardizing farm products from seed to packing; stimulate interest in farm bureaus and urge their establishment in all communities; provide means for exchange of information both as to supplies for the farm and produce for the Philadelphia market, and increase efficiency of the farmer, reduce cost of production and add to the size of the crops." This is a rather formidable array of "duties" and it is evident that the seven members of the committee, if they expect to fulfil these duties, will have an exceedingly busy time. Perhaps it is fortunate for the committee that some of the prescribed duties are so indefinitely defined as to mean practically nothing. Others, however, are of real vital import to both farmers and city consumers and if seriously administered will more than justify the existence of the bureau and will make it a real "service" institution. With the tardy, but nevertheless increasing, interest in direct marketing and direct purchasing of farm produce there is need of some sort of bureau to keep both producer and consumer informed on market conditions and requirements. During the past week we have had a number of inquiries from farmers who have arranged to market produce direct by parcel post, asking where current retail quotations can be obtained regularly. This information, quite necessary to a satisfactory system of direct selling, is not at present available from a thoroly reliable source. The Service Bureau may find a ready demand for its services in supplying such information thruout the territory it seeks to cover. Its recommendations on standardization of package, quality and grade of goods should also be a welcome service. Farmers are accused of fraudulent and deceptive grading and packing. The condition of goods reaching market often gives grounds for such accusations, but this condition is as often due to lack of knowledge of market requirements as to an intent to defraud. The Service Bureau may be of immense service in establishing grades and defining standards. Its value in both of these services, however, will depend upon its fairness in dealing impartially and justly with both its country and its city patrons. It must first gain the confidence of the people whom it seeks to serve, and if it does this by opening a way for a safe and unhampered transmission of produce from the farm to the place of consumption it will do more to "increase efficiency of the farmer" and "add to the size of the crops" than has yet been done. The farmers will see that production is increased when they are shown ways of making larger crops yield larger net profits.

Primary Election On May 19 the voters of this state will have their first opportunity to participate in the general primary. Theoretically, they will have the opportunity to express their choice on members of their party for candidates for the various state and federal offices. Practically, they will vote on candidates selected for them by the party leaders. It would be difficult to conceive of a more complete prostitution of the intents and purposes of the primary law than is presented in this state this spring. The politicians have made their own choice with just sufficient competition to make an election necessary, and the voters are merely asked to legalize such selections by going thru the form of voting. All parties are equally guilty and every pretense at reform has been proven false in their first move of the campaign. There is little real inducement to the voter to become a party to this fraud by attending the primaries for this election alone. But the people of the state cannot afford to admit defeat in their hope of seeing a real primary. Nothing would suit the politicians better than to have the bulk of the people stay away from this primary so that it might be declared a failure and pave the way for a return to the old convention system. The present law is all right in itself. It needs to be safeguarded from those who have so completely defeated its purpose in the present election. The only alternative is for the voters to repudiate the party leaders who are responsible for the present farce so far as possible and make a united effort for enforcement of the purpose of the law in future elections.

NEW JERSEY FARM NEWS

New Jersey Heads Prosperous States.—The statement is made on the authority of the United State Census Bureau, that New Jersey is undoubtedly the most prosperous State in the Union. "At the present time about 2.8 percent of the total population of the United States will be found in the state of New Jersey, and only 0.2 percent of the total debt is attributed to that state." The agricultural districts come in for their share of glory. Next year, the appropriations for the agricultural college and experiment station, farm demonstrator work and all other agencies contributing to agricultural success in the state should be doubled.

State College News.—Professor Alva Agee, State superintendent of farm demonstration and of the experiment station extension work lectured to the students on "The Desirable Farm." The students of the junior class planted three orchards on a large estate at Dayton, as a part of their practical work.

School Heads Meet.—The annual spring meeting of the State Board of Education with the county superintendents of the State was held at Lakewood. School legislation was under discussion. The feature of the meeting, however, was an address by Miss Jessie Field, field secretary for the promotion of rural education of the New York Y. W. C. A. The theme of Miss Field's talk centered about the correlation of school work in the rural districts to home life. She showed how in the rural schools, reading could be made of practical benefit. Model farming, poultry raising, and various other lines of work were discussed with the idea of showing how pupils and parents could be drawn closer together, how communities could be benefited and better home conditions attained thru the judicial incorporation of such subjects in the school's curriculum. Summer camps for both boys and girls, county and State contests in corn and other farm products, cooking, sewing and the like, were shown to be great agencies in the development of the pupil and the elevation of the parents.

Estimating The Peach Crop.—In Central New Jersey, the prospects appear to be favorable for another bumper crop, altho danger of frost is not yet past. Some growers have piles of brush ready to light in their orchards, in case of frost. It is reported that in several localities peach buds have been killed. This condition is found particularly true with the Crawford and Elberta varieties. In North Jersey, so far as can be learned, buds have suffered no damage whatever. New Jersey farmers have not yet learned to properly care for their orchards during all changes of weather.

Tomato Experiments.—A Jersey market gardener, set out 600 tomato plants on Saturday, April 18. Each plant is surrounded on three sides and on top with a wooden material and a glass covers the fourth opening, which faces the sun. This glass is raised or lowered as the weather conditions require, and, it is expected by these means to market the tomatoes somewhat earlier than those who grow them in the customary way. The experiment is being watched with interest by truckers for miles around, and if it does prove a success, many others will adopt it for another year.

Orchard Practice.—The recently organized Monmouth county farm bureau has already made a good start. One of the first things to which the expert gave his attention was the proper spraying of fruit trees. A series of spraying demonstrations will be carried on in the large fruit orchards of John Willey, located in the midst of a great fruit growing region. Demonstrations of advanced methods of spraying will also be carried on in other parts of the county. The following spraying schedule will be employed: For apples and pears; (1) Just before the blossom buds open, apply 5 quarts concentrated lime-sulphur solution and three pounds arsenate of lead paste to each 50 gallons of water. If the aphis (plant louse) has caused injury the use at this time of one pint of "Black Leaf 40" to every 100 gallons of the above solution will control them. (2) Just after petals fall from the bloom repeat the above mixture of arsenate of lead and lime-sulphur. (3) Repeat ten days later. (4) Repeat this application the last week in June upon fall and winter varieties. For peaches the following applications are recommended to control the plum curculio and fungus troubles: (1) Just after the petals fall apply 3 pounds arsenate of lead paste to 50 gallons of water. This controls the first curculios that come out. (2) Just as the little husk or calyx is falling off the small fruit spray with self-boiled lime-sulphur (8 pounds of stone lime, 8 pounds of sulphur to 50 gallons of water) combined with 3 pounds of arsenate of lead.

Farmer Fire Fighters.—The farmers of Atlantic township, Monmouth County, have organized a fire company. They will purchase a chemical engine at a cost of about $3,000. Of this amount, $1,000 has already been raised by subscription, while the balance, $2,000 will be raised by taxation. A fire house will also be erected at a convenient local center. At present, the township has no fire protection whatever, and the great number of barn fires has led to this action, which other agricultural communities would do well to follow. —D. T. Hendrickson.

NEW YORK LETTER

To Make Brick.—Brick for use on the roads of the state will be manufactured at the Elmira state reformatory as soon as buildings and apparatus can be erected. The governor has signed the bill appropriating $25,000 for this purpose.

Onondaga Farm Bureau.—The Onondaga farm bureau is rendering the farmers of that county a good service in supplying them with farm laborers. About 250 have applied to the bureau for work and about 40 have been placed. Three committees were appointed at the last meeting, one on marketing, one on transportation and one on legislation. The committee on marketing is to take up the question of marketing farm products in Syracuse and probably the question of public markets.

State Fair Funds.—Owing to the failure of the last legislature to appropriate the necessary funds for state fair uses the commission finds itself without much money in the treasury. About $72,000 are needed for premiums, printing and maintenance of grounds. The premium list calls for $55,000 in premiums which is the largest amount ever offered by the society, it is said. The commission has appropriated $10,000 for attractions and music.

Highway Bill Signed.—The governor has signed the bill appropriating $10,000,000 of the second referendum fund for the construction of new highways. The approval of this bill will permit the prompt advertisement of all those roads for which plans and specifications have been prepared and it will permit the engineers to design this summer the most important roads for the completion of a great trunk line in time for advertising in the fall. The end of another year ought to see the completion of all the main trunk lines.

New Law On Fruit Trees.—The governor has signed the bill which provides that every seller of fruit bearing trees grown in the state, must attach the certificate of the department of agriculture showing that the trees have been inspected by the department. Each shipment must also carry a label designating the name or variety of the trees in the shipment and if any are found not true to name the purchaser may sue for damages at any time prior to the third bearing year. It places upon the seller the burden of proving that any provision not in writing, exempting the seller from liability, was fully understood by the purchaser.

Municipal Forestry. — Fayetteville, Onondaga County, will plant the first municipal forest known. About 10,000 trees will be planted on a tract of land about the new storage reservoir of the municipal waterworks located about one mile from the village. Prof. Stephen and a party of students from the school of forestry will supervise the work of planting out the trees which will be mostly Norway spruce and white pine.

Cayuga Farm Bureau.—A county farm bureau was organized recently at Auburn with W. B. Avery of Aurora as president and Ernest Tabor, of Meridian, secretary. About 100 farmers were present to form the nucleus of the association. M. C. Burritt, state superintendent of farm bureaus, was present and addressed the meeting.

Road Graft Cases.—The grand jury of Albany county which has had under consideration the charges made against the Dix highway commission for neglect of duty, has found no indictment against the members, who were John A. Bensel, Duncan W. Peck, C. Gordon Reel and his deputy, C. F. Foley. It was alleged that they had let $3,000,000 worth of contracts in about an hour's time.

Highway Grafters.—The jury in the case against a contracting company on Long Island for conspiracy in connection with building a state road, returned a verdict against the contractors and the company was fined $500. Each of the parties found guilty was sentenced to serve eight months' imprisonment. Certificates of reasonable doubt were granted and each defendant gave $5,000 bail pending motions for a new trial.

CROP REPORT.—MAY 1.

The crop reporting board of the United States Department of Agriculture reports on conditions of crops May 1 as follows: Area of winter wheat to be harvested, 35,387,000 acres, or 3.1 percent less than sown but 11.6 percent more than harvested last year. Average conditions on May 1, 95.9 compared with 91.9 last year and 85.5 the 10-year average for May 1. Averge candition of rye was given as 93.4 percent compared with 91 percent last year and 89.1 the 10-year average. Meadows, 90.9 against 88.5 last year and 88.1 for 10 years. Spring planting was 56.4 percent completed on May 1, compared with 57 percent last year and 54.6 percent in the last ten-year period. Details for eastern states follow:

MARYLAND NOTES

Farm Labor Wanted.—The state Bureau of Immigration has recently sent more than 1,000 men and women to work on Maryland farms. There are yet many more places needing such help, but no applicants.

Cannery Prices.—There is much dissatisfaction at the price offered by the Hughesville Cannery to tomato growers viz: 18 cents a bushel basket, which is $7.47 a ton. Farmers feel that if war prevails canned goods will be in greater demand, and higher prices will be realized. Some of the Hughesville farmers are appealing to those of the state not to raise any tomatoes unless they can realize at least $9 a ton. It is anticipated that early tomatoes will be a short crop owing to the prolonged cold weather.

Fish Hatcheries Bill.—Congress has before it a bill appropriating $790,000 for the establishment of fish hatcheries in many states. Maryland fishery experiment plants will be devoted to the study of diseases and problems in connection with fish propagation. In many other states, fish hatcheries and cultural plants costing $50,000 each are also to be established.

Poultrymen Active.—Kent and Queen Anne County farmers contemplate having a poultry show in July. There are several extensive poultry farms in these counties, among which is the largest waterfowl farm in Maryland.

Strawberry Crop Good.—Strawoerry prospects on the Eastern Shore are fine, but the season will be a little later than usual owing to the cool weather of the past 10 days. In the vicinity of Ridgely, the greatest strawberry shipping point in the state, the acreage of strawberries has been considerably increased. Armour & Co. have a big preserve factory there that employs many hundred people and a great many growers sell all their strawberries at the factory. Cantaloupe acreage this season will be greater than ever, notwithstanding last season there was a louse or insect that was exceedingly destructive to the vines.

Association Buys Fair Grounds.—Dorchester County Fair Association has bought a farm located on the outskirts of Cambridge and a complete fair ground will be in evidence there in time for the fair to be held next August. —G. O. B.

ANNUAL NORMAL INSTITUTE

The spring meeting of the Farmers' Annual Normal Institute and State Board of Agriculture will be held at Stroudsburg, Pa., May 26 to 28. A program of unusual interest has been prepared, including principally the regular speakers of the Pennsylvania institute staff. Subjects are timely and of practical interest to all farmers.

HOLSTEIN-FRIESIAN ANNUAL MEETING

The 29th annual meeting of the Holstein-Friesian Association of America will be held at the Sherman House, Chicago, Ill., June 2 and 3. For full particulars address Secretary F. L. Houghton, Brattleboro, Vt.

The Farm Shop. — Every farmer knows the value of the farm shop in saving of time and expense. Many have neglected fitting out such a shop without investigating cost. A new catalog issued by Powell, Clonds & Co., 602 Arch St., Philadelphia, Pa., lists and describes blowers, forges, drills, tire benders, tire shrinkers, screw plates, taps and dies at prices that are within reach of all and at which these implements will soon pay for themselves in time and money saved. The catalog is free to our readers upon request to the above address.

COUNTY NOTES

Fayette Co., Pa., (S.W.) April 20.—Has been warm for about two weeks, with plenty of rain. Grass is growing nicely. Fruit trees almost out in leaf. Wheat is looking fine. Not much live stock changing hands at present. March pigs selling from $8 to $10 pair. Farm work generally is very late. No oats sowed yet. Some plowing done. Very few potatoes planted.—Samuel A. Harris.

Frederick Co., Md., (N.C.) April 21.—Very wet and cool; a very cool April. Live stock lower in price; feed being very scarce and high. Wheat looking fairly good. Grass good except a few fields, but very late. Garden truck not growing much, not over half of early vegetables planted and only a few potatoes. Oats have been sown. Very little spring plowing done yet. Much manure to be hauled.—H. C. Fawley.

Clinton Co., N. Y., (N.E.) April 20.—Weather fine and warm; 80 degrees in shade. Snow gone. Cows high and in good demand at $50 to $80 each. Veals, 7 cents lb., live; none sold dressed. Horses in good demand if heavy. Light horses a drug on the market at any price. No farm work done as yet. Sugar making about done. Syrup, $1 gal.; sugar, 12@14c. It has been a very good season.—Henry E. Gilbert.

Morris Co., N. J., (N.) April 29.—Very warm; frequent showers. Winter wheat and rye are looking fine. Meadows good. Live stock has wintered well. Hay, $20 ton; corn, $20 ton; wheat $1.00 bu; eggs, 22c; butter, 32c; farm horses, $175 to $200. Spring plowing has been very slow on account of wet weather. Very little oats planted.—Geo. F. Williamson.

Lancaster Co., Pa., (S.E.) May 8.—Cloudy and showery. Weather has been cool and pleasant with plenty of rain to keep the ground moist. Live stock is in healthy condition. Wheat and grass are growing rapidly and promise good crops. Wheat, 92c; corn, 74c; oats, 45c; hay, $16; straw, $8; butter, 35c; eggs, 18c. Potatoes and oats are nearly all planted. Many farmers are planting potatoes instead of tobacco. Tobacco is being bought slowly at 4 and 5 cents per pound. Farmers are very busy. Still much sod to plow, owing to a late season and frequent wet days. Very little corn planted yet. —J. Henry Haverstick.

Chester Co., Pa., (S.E.) May 4.—Cool and wet. Cows and horses have been bringing good prices. Hay, $15.50 to $16; eggs, 16c; straw, $10; potatoes 90c bu. Farmers are finishing potato planting and are busy preparing ground for corn. Oats has been sown.—Hayes C. Taylor.

York Co., Pa., (S.E.) May 7.—Warm weather with an occasional nice shower. All live stock looking well. Prices of beef cattle a little brisker. Fresh cows bringing $60 to $80; fat hogs 11½c live; potatoes 90c bu; wheat, 94c bu; corn, 74c bu; butter, 32 to 36c lb; eggs, 16c doz. Farm work is a little late. Most farmers are busy getting their corn ground ready for planting while others are planting.—Clarence D. Emig.

ATLANTIC
AUTOMOBILE
GASOLINE

Gasoline C. P.

The chemist asks for no guarantee upon his supplies other than the letters C. P., meaning "chemically pure." For gasoline, the symbol C. P. is not used, but the name *"Atlantic"* on Gasoline affords the motorist, and the farmer who owns a gas engine, just the same grounds for confidence that "C. P." does the chemist.

Forty-eighty years of experience and manufacturing resources have combined to set a distinctive quality standard for ATLANTIC AUTOMOBILE GASOLINE.

Our distribution service is the best in the State. Our tank wagons will deliver regular supplies of first quality engine fuel right to your door. Ask for it by name at any first class garage—"Atlantic Automobile Gasoline."

The Atlantic Refining Co.
Everywhere in Pennsylvania

How Flies Cause Disease.

The common house fly is a prolific carrier of typhoid fever. During the Spanish-American war only 250 men were killed by bullets to 5,000 killed by typhoid fever, cholera morbus and dysentery, and it is now positively established that the germs of these diseases were spread by the flies that came directly from the excrement pits and walked all over the food in the mess tents. Now we practically eliminate these diseases in our army camps by covering the excrement pits with lime and screens. Flies carry these diseases in their alimentary canals as well as on their feet, for biologists find typhoid and cholera germs in fly specks. As many as 100,000 disease bacteria have been found on one fly's body. Just look at the hairs on the fly's leg pictured in Fig. 4, and you will see what a large bacteria-carrying area it has. And then look at the bacteria cultures on the gelatin plate in Fig. 5, over which one fly walked.

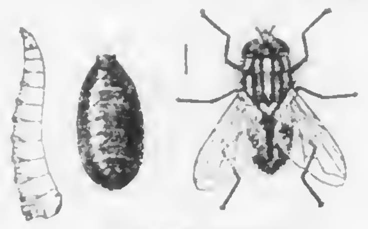

FIG. 1. COMMON HOUSE FLY.
(Larva at Left, Pupa Next.)

The House Fly

There are two kinds of house flies, the large (Fig. 1) (Musca domestica), and the small (Fig. 2) (Homalomyia brevis), but it is the large kind that is the most pestilential because it is the most prolific. The little ones are not only smaller but lighter in color, and their abdomens are more slender and pointed.

The common house fly (Fig. 1) breeds chiefly in horse manure, hence well-screened manure pits or closets for your horse barns will prevent flies from depositing eggs. Manure scattered in the fields is negligible as a source of flies because the requirement for hatching is moist manure. One fly will lay about 120 eggs at a "sitting", which will hatch into maggots in 6 to 24 hours—in warm weather in about 8 hours. The maggots or larvae continue thus about five days, then turn into pupae with hard dark brown skin or shells, which in another five days turn out full-grown flies. L. O. Howard chief entomologist of the United States Department of Agriculture, tells of counting, on one August day, 160 house fly larvae and 146 pupae in one-fourth of a pound of horse manure. This would make about 1,200 flies to the pound!

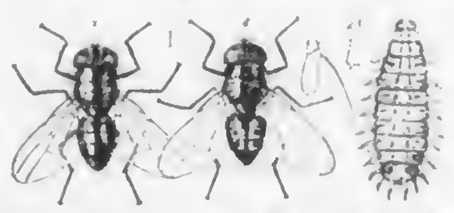

FIG. 2. SMALL HOUSE (MALE, FEMALE AND LARVA.)

One fly averages three to four crops of 120 eggs during her life period, averaging about 17 days. It is safe to estimate that half of them will be females, hence a little calculation shows us just why there are so many flies in the latter part of the summer. If one mother fly turns out 240 other mother flies, and 12 to 14 generations develop during the summer there are bound to be quintillions of them in your locality before cold weather shuts off the breeding. If one fly occupies a cubic quarter of an inch, one cubic foot would hold 200,000 flies, and by October 1 the progeny of one fly might occupy about 900,000 cubic miles if they all developed and lived.

But it is the number of disease-producing bacteria that flies bring and deposit on and in our food that concerns us most. From the cleanest one of 114 flies caught by two Connecticut biologists in sterilized nets and kept in sterilized bottles of water, there developed 550 bacteria, and the foulest one carried 6,600,000 disease germs. So you see what a fly can do to your babies thru the milk that you feed them unless you protect that milk from flies. Better not take any chances. Kill the flies now, and keep them out of their favorite breeding places as we have suggested at the beginning of this article.

The Stable Fly

The house fly never bites you; its mouth is built only for sucking. It is the stable fly (Stomoxys calcitrans, Fig. 3) that bites or stings; its proboscis is sharp so that it readily punctures the skin and then sucks your blood. It is the sting of such puncturing that so maddens stock. In the Southwest some years the stable flies are a terrible pest to stock. While these flies frequent the barns and stock they are quite apt to want to get in the house just before a rain, and they are most noticeable in the late summer. When flies bite you, remember that they must be stable flies not house flies. They are about the same size as house flies, and differ from them only in being slightly broader, with rounder abdomens, and in having slightly different thorax markings (see Figs. 1 and 3).

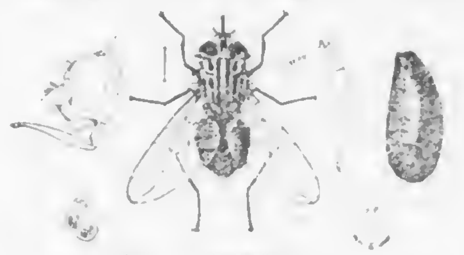

FIG. 3. STABLE FLY.
(Head with Proboscis at Left. Larva and Pupa at Right.)

Stable flies breed chiefly in moist straw stacks or in strawy manure, and they are said to prefer oat straw to wheat straw. The female lays up to 278 eggs during her average life period of 17 to 29 days, and it takes about 19 good warm days to develop a stable fly from the egg, so about five generations may develop during one summer. Because the flies cannot crawl into tight bales to lay their eggs, baling your straw will prevent their breeding to a large extent.

It has been definitely determined that the stable fly carries the germs of infantile paralysis, that dread infection that kills or paralyzes so many babies. It has also been found carrying the germs of such stock diseases as anthrax and round-worm in cattle and infectious anemia and glanders in horses. Beware of the house and stable flies as you would of poisonous serpents.—Harriet Mason.

More Testimony Against

Study of the fly and its habits substantiate that such statements as the following are all too true: "Flies kill a greater number of human beings than all the beasts of prey, with all of the poisonous serpents added. They spread diseases which slay thousands, while big, powerful beasts kill single victims." It is rather difficult for us to realize that anything which we have known so long and so intimately as the common housefly can be so dangerous, altho scientists have been warning us about them for several years. Because they could not point to specific cases and say that this man, or this child or woman is suffering from disease carried to them by flies, we have not been sufficiently impressed. But after it was proved conclusively that the mosquito does carry yellow fever, and that no mosquitoes result in no yellow fever we begin to think that maybe the house fly might be equally productive of disease.

Try to keep a fly going in a room for a few minutes. It may fly 20 feet to the one you walk but you can't wear it out. It is a wonderful flier, and it has a marvelous sense of smell, too. The odor that it seems to like the best is the one that arises from filth or decay and refuse matter. Odors of this kind will attract it from some distance.

Every one has seen flies swarming around manure heaps, garbage cans or dropping around the troughs where the pigs are fed. How many can remember seeing flies hovering around flower beds or the fragrant blossoms of fruit trees, or even the sweet aroma of perfectly ripe fruit. The fly, to be sure, does like sweet things but they are sweet tasting things and not sweet smelling. It will come and light on the very lump of sugar that you are about to put into your cup of coffee; after poising there it may dart to the lips of a sleeping child. And it may have come into your house straight from the manure pile or worse yet from the body of a typhoid patient or from the room of some one suffering from some other infectious disease.

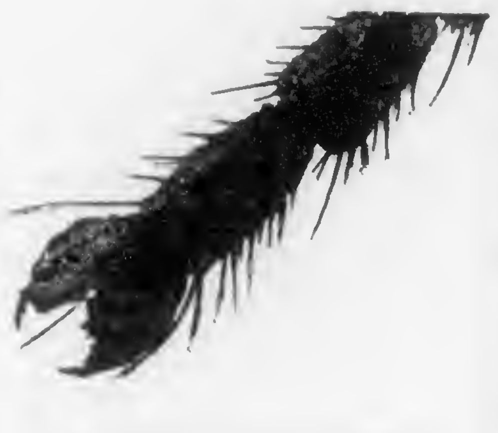

FIG. 4. ENLARGED PHOTO OF HOUSE FLY'S LEG AND FOOT.

When we think of the thousands of places where a fly may light and what it may carry on its feet to wipe off on our food, we ought to be alarmed to the point that we will try to keep flies out of our houses and away from our food. Milk should be particularly well protected, for it is one of the best mediums for developing disease germs. A fly for instance may fall into a pan of milk and leave a few germs there, and in a very short time there will be millions of bacilli which have come from the few left there by the fly. A strong well person might drink the milk and never feel any discomfort from the germs, but if the milk is taken into the system of an over worked, tired person or of a baby, in either case the power of resistance is low and the result will be disease.

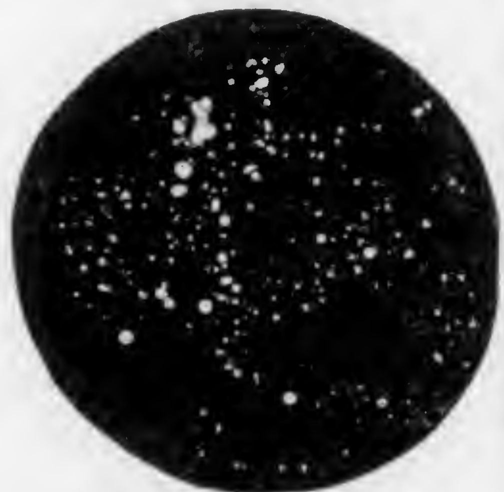

FIG. 4. BACTERIA CULTURES ON GELATIN PLATE OVER WHICH A FLY HAS WALKED. EACH DOT CONTAINS THOUSANDS OF BACTERIA.
(Photo by Stocking, Cornell Agnl. College.)

If wire screening is not available all over the house the ordinary mosquito netting costs so little that it comes within the reach of every family. And where there is a boy in the family who is skillful with tools he can make frames and buy the wire net for a little money. The 26-inch wide wire netting costs 13 cents a yard in some stores.

After screening the house see that your premises are kept clean as possible. If the refuse from the table is fed to pigs or chickens see that your garbage cans and pails are kept away from the house and that they are kept clean. Scald them out every little while, scrubbing them with a broom, then scald the broom.

If flies do get into the house in spite of the screens, kill them by using sticky fly paper, traps and wire fly "swatters." I always hesitate to use any kind of fly poison for fear children may get it.

The National Civic Association Bulletin says:

"A cheap and perfectly reliable fly poison, which is not dangerous to human life, is bichromate of potash in solution. Dissolve one dram (which can be bought at any drug store) in two ounces of water, and add a little sugar; put this in shallow dishes and distribute them about the house. To quickly clear the room where there are many flies, burn pyrethrum powder in the room. This stupifies the flies, when they may be swept up and burned."

In the early part of the summer is the time to wage war on the flies, for then they are killed before they have time to breed more, and in this way every year will see fewer flies to fight.—Mrs. Nevada D. Hitchcock.

Mrs. Youngwise—"I'm afraid John's mother's offended. She came over to help with my washing, and it was nearly done. She said I hadn't done it right because I didn't boil my clothes like she and her mother always had, and I said she didn't spin and weave any more like people used to, and then she left in a huff."

Anty Drudge—"She'll get over it when I talk to her and tell her about Fels-Naptha Soap. I'll tell her to blame me because I advised you to use it."

Every year there is some new way to lighten women's work—but never a better nor more sensible one than the Fels-Naptha way.

Fels-Naptha Soap in cool or lukewarm water will do anything that soap and water can do, in half the time it used to take with less than half the bother.

It will get your washing on the line so much earlier, and the clothes will be sweeter, cleaner and whiter than ever before. You don't have to boil them, either.

Better buy it by the box or carton. For all kinds of work every day in the year follow the directions on the Red and Green Wrapper.

Fels & Co., Philadelphia.

GOOD SOUR MILK RECIPES

Why is it that so many house keepers throw away their sour milk, which makes the most delicious cakes, doughnuts, and biscuits, and use in its stead baking powder at 50 cents a pound? Don't you think this may be one of the things that contributes to the high cost of living? A 50-cent can of baking powder will make no more or better food than the sour milk that some throw away combined with an 8-cent box of soda. Is it that housewives do not know how to use it? I almost never see a recipe calling for sour milk and soda in any of our cookbooks or magazines.

We think this is because these publications are edited by city-bred people for readers who are largely city-bred people, who seldom have enough extra milk to get sour, consequently they have never learned how to use it. We have frequently encountered city-bred housekeepers who stop helpless when perchance they find that their daily portion of milk has soured. The country-bred girl learns from childhood up how to make good use of sour milk and cream and buttermilk—in fact she misses them when none are at hand on occasions. The writer confesses to some annoyance a few days ago on starting to make cookies by her favorite recipe and finding no sour cream or buttermilk for use in them.—The Editor.)

Here are a few of the many sour milk recipes which have been used in my family and in mother's and grandmother's before me for many years.

Doughnuts.—One egg, 1 cup sugar, 1 cup sour milk, ½ teaspoonful salt, ½ teaspoonful each of ginger, nutmeg, cinnamon and soda. Dissolve the soda in 1 tablespoonful hot water. Mix in sufficient flour to handle and fry in deep hot fat. (Dissolving the soda in the hot water starts the liberation of the carbon dioxide gas, which is the leading agent of soda and baking powder, therefore it is really better not to put soda into sour milk or to dissolve it in water before it is incorporated into the batter. Instead sift it into the flour the same as you do baking powder, and beat the flour well into the liquid then put into the oven before the gas escapes, and your cake will be lighter. If you do not believe that you are losing much of the soda's leavening power by dissolving it in the hot water before putting it into the cake, try putting some soda into glasses of hot water and cold water, and see how much more quickly the gas escapes from the hot water. This will show the reason for sifting the soda into the flour. Therefore we have changed the following recipes accordingly. One level teaspoonful soda to 1 pint of sour milk is the right proportion to neutralize the sour milk acid, or ½ level teaspoonful to 1 cup, as these recipes indicate.—The Editor.)

Biscuits.—Two cups sour milk, shortening the size of an egg, ½ teaspoonful salt, 1 teaspoonful soda. Stir enough flour with the soda sifted in it into the sour milk to make it about as thick as pancake batter, add the salt, the melted shortening, and mix as soft as you can handle without having the dough floury on top.

One Egg Cake.—One cup sugar, 1 cup sour milk, 2 cups flour, 1 egg, 3 tablespoons melted butter, ½ teaspoonful soda, ½ teaspoonful salt. Place the sugar and melted butter together and stir well, then add the beaten egg and the milk, next add the flour and soda and beat vigorously. Flavor to taste.

A Fine Foundation Cake.—Two eggs, 1 cup sugar, 1-3 cup butter or 3 tablespoonfuls sour cream, ½ cup sour milk, 1¾ cups flour, 1-3 teaspoonful soda, and ½ teaspoonful salt. Cream the salt, sugar and butter, add the well beaten eggs and milk and stir in the flour and soda gradually and add flavoring. Bake in layers.

Wheat Pancakes.—Two cups sour milk, 2 cups sifted flour, 1 teaspoonful salt, 1 teaspoonful soda. Beat two minutes and fry on a hot griddle. This quantity will be enough for three or four persons.

Ginger Cookies.—One and one-half cups shortening, 1 cup molasses, 1 cup sour milk, 1½ cups sugar, 1 teaspoonful salt, 1 teaspoonful ginger, 1 heaping teaspoonful soda sifted into enough flour to mix as soft as you can handle. Roll thin.

Cookies.—Two cups sugar, 1 cup butter or shortening, 1 cup sour milk, ½ teaspoonful salt, ½ teaspoonful grated nutmeg, ½ teaspoonful soda sifted into flour sufficient to handle. Bake in a quick oven.

Corn Gems.—One-half cup sugar, 1 scant cup corn meal, 1 scant cup sifted flour, 1 cup sour milk, 1 teaspoonful salt, ½ teaspoonful soda. Stir all together thoroly. This will fill one set of gem irons holding one dozen. Heat the irons before filling.—Mrs. Jennie S. Lamson, Franklin Co., N. Y.

PENNSYLVANIA FARMER PATTERNS

Be sure to give the figures and letters of each pattern exactly as printed at the beginning of each description. We will not be responsible for correct filling of your orders unless you do so. Also give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 214 18 So. 12th St., Philadelphia, Pa.

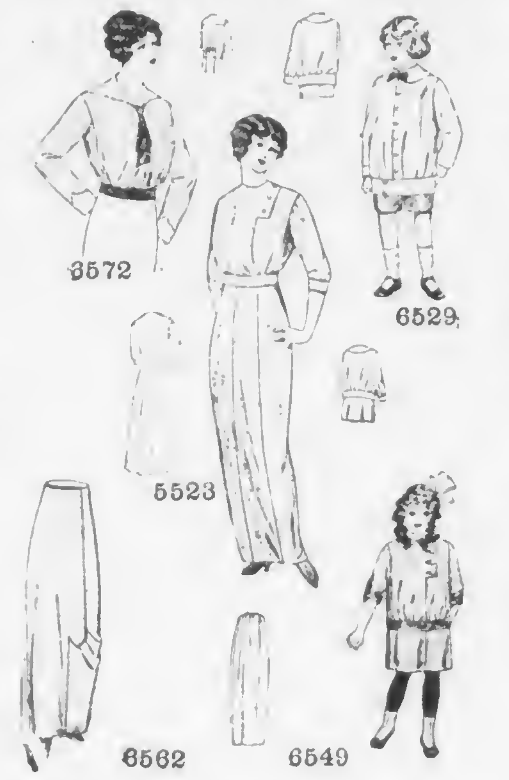
6572.—Ladies' Shirt Waist.—Cut in sizes 34 to 44 inches, bust measure. Size 36 requires 1¾ yards of 44-inch material and ⅜ yard of 27-inch contrasting material. Price of pattern, 10 cents.

6529.—Boys' Balkan or Russian Suit.—Cut in sizes 2, 4 and 6 years. Age 4 years requires 2¼ yards of 36-inch material. Price, 10 cents.

5523.—Ladies' House Dress.—Cut in sizes 32 to 44 inches, bust measure. Size 36 requires 7 yards of 27-inch material. Price, 10 cents.

6562.—Ladies' Three-Gored Skirt.—Cut in sizes 22 to 32 inches, waist measure. Size 22 requires 2¾ yards of 36-inch material. Price, 10 cents.

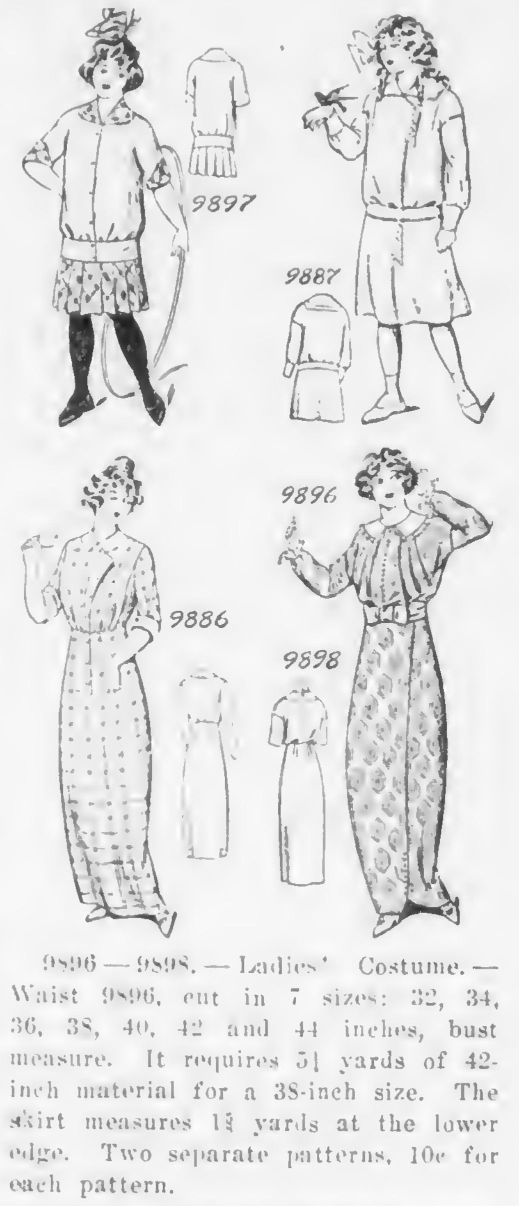
6549.—Girls' Dress.—Cut in sizes 2 to 8 years. Age 4 years requires for dress and bloomers 3 yards of 36-inch material with ¼ yard of 27-inch contrasting goods and ⅜ yard of 36-inch material for underwaist. Price, 10 cents.



9897.—Girls' Dress with Lining.—Cut in 4 sizes: 6, 8, 10 and 12 years. It requires 3½ yards of 40-inch material for an 8-year size. Price of pattern, 10 cents.

9887.—Girls' Dress with Lining.—Cut in 5 sizes: 8, 10, 12, 14 and 16 years. It requires 3¾ yards of 40-inch material for a 12-year size. Price, 10 cents.

9886.—Ladies' House Dress.—Cut in 7 sizes: 32, 34, 36, 38, 40, 42 and 44 inches, bust measure. It requires 5¼ yards of 40-inch material for a 34-inch size. The skirt measures 1¾ yard at the foot, in a medium size. Price, 10 cents.



9896—9898.—Ladies' Costume.—Waist 9896, cut in 7 sizes: 32, 34, 36, 38, 40, 42 and 44 inches, bust measure. It requires 5¼ yards of 42-inch material for a 38-inch size. The skirt measures 1¾ yards at the lower edge. Two separate patterns, 10c for each pattern.

Low Cost Washing.

The regular family washing is hard enough; but the spring housecleaning means **more** washing. The lace curtains, the woolen blankets, the heavy comforters, come in for their share. It's impossible to do them well by washboard methods. But there's no escape—they must be cleaned and it's going to cost money to do it.

THE "EASY" MODEL B WASHER

reduces cost to the lowest possible minimum. WHY? Because it washes twice as fast as hand and rubboard and does not wear out the clothes in the cleaning process. Does it better too—leaves the cotton in the quilts and the woolen in the blankets light, soft and fleecy as when new instead of rolled, wadded and hard as the rubboard does. Air pressure and suction is the secret of easy, harmless, economical washing

Ask for our new folder "EASY MONDAY" describing our latest improved washer---the Model B. Ask about our Motor Washers and Vacuum Cleaners.

MR. PRATT

By JOSEPH C. LINCOLN

Copyrighted by A. L. Burt Company.

SYNOPSIS OF PREVIOUS CHAPTERS

Two New York business men, Van Brunt and Hartley, come to Wellmouth for a vacation. Solomon Pratt, Skipper and village character, finds the "twins," as they are dubbed, interesting but takes them for lunatics and their "man" for their "keeper." The "twins" after harrowing experiences with cooks, ask Pratt to find them a secluded place of rest and act as their cook. The skipper and Hartley have just landed from the "Dora Bassett" on their road to a fair at Eastwich Port.

CHAPTER IV (Concluded)

"Chase nothing but lambs there," drawls Van Brunt, lazy, and with his eyes half shut. Then he turned over and looked at his chum.

"Great Caesar! Martin," he says, "you don't mean to tell me that you're going up into that crowd of hayseeds to hang over a fence and watch some one run, do you? Why any one on God's earth should want to run," he says, "when they can keep still, is beyond me; and why you, of all men, should want to watch 'em do it—that's worse yet. Come here and be natural and decent."

But Hartley wouldn't do it. His blue streak seemed to have struck in again and he was kicking the sand, nervous-like, with his foot.

"Come on, Van," he says. "I want the walk."

"Not much," says Van. "Walking's almost as bad as running. I'll be here when you get back." And he stretched out on the pine needles again.

It may be that Hartley did want that walk, same as he said, but he didn't seem to get much fun out of it. Went pounding along, his cigar tipped up to the visor of his cap, and his eyes staring at the ground all the time. And he never spoke two words till we got to the fair grounds.

There was a dickens of a crowd, five or six hundred folks, I should think, and more coming all the time. Everybody that could come had borrowed the horses and carryalls of them that couldn't and had brought their wives and mothers-in-law and their children's children unto the third and fourth generation. There was considerable many summer folks—not so many as there is at the cattle show in August—but a good many, just the same. I counted five automobiles, and I see the Barry folks from Trumet riding down in their four-horse coach and putting on airs enough to make 'em lop-sided.

Hartley gave one look around at the gang and his nose turned up to twelve o'clock.

"Gad!" says he, "this, or something like it, is what I've been trying to get away from. Come on, Sol. Let's go back to the boat."

But I hadn't seen so many shows as he had and I wanted to stay.

"You wait a spell, Mr. Hartley," says I. "Let's cruise round a little first."

So we went shoving along thru the crowd, getting our toes tramped on and dodging peddlers and such like every other minute. There was the "test your strength" machine and the merry-go-round and the "ossified man" in a tent: "Walk right up, gents, and cast your eyes on the greatest marvel of the age all alive and solid stone only two nickels a dime ten cents." and all the rest of it. Pretty soon we come to where the feller was selling E Pluribus Unum candy—red, white and blue, and a slab as big as a brick for a dime.

Hartley stopped and stares at it.

"For heaven's sake!" says he. "What do they do with that?"

"Do with it?" says I. "Eat it, of course."

"No?" he says. "Not really?"

"Humph!" I says. "You just wait a shake."

There was a little red-headed youngster scooting in and out among the folks' knees and I caught him by the shoulder. "Hi, Andrew Jackson!" says I. "Want some candy?"

He looked up at me as pert and sassy as a blackbird on a scarecrow's shoulder.

"Bet your natural!" says he. I jumped.

"Lord!" says I; "I cal'late he knows you."

Hartley smiled. "How do they sell that—that Portland cement?" says he. Give me some," he says, handing a half dollar to the feller behind the oilcloth counter. The man chiseled off enough for a fair-sized tombstone and handed it out. Hartley passed it to the boy. He bit off a hunk that made him look like he had the mumps all on one side, and commenced to crunch it.

"There!" says I. "That's proof enough, ain't it?"

But he wa'n't satisfied. "Wait a minute," says he. "I want to see what it does to him."

Well, it didn't do nothing, apparently, except to make the little shaver's jaw sound like a rock crusher, so we went on. By and by we come to the fence alongside of the place where they had the races. The sack race was on, half a dozen fellers hopping around tied up in meal bags, and we see that. Then Hartley was for going home again, but I managed to hold him. The greased pig was the next number on the dance order, and I wanted to see it.

Major Philander Phinney, he's chairman of the Eastwich selectmen and pretty nigh half as big as he thinks he is; he stood on the judges' stand and bellered that the greased pig contest was open to boys under fifteen, and that the one that caught the pig and hung on to it would get five dollars. In less than three shakes of a herring's hind leg there was boys enough on that field to start a reform school. They ranged all the way from little chaps who ought to have been home cutting their milk teeth to "boys" that had yellow fuzz on their chins and a plug of chewing tobacco in their pants' pocket. They fetched in the pig shut up in a box with laths over the top. He was little and black and all shining with grease. Then they stretched a rope across one end of the race field and lined up the pig chasers behind it.

"Hello!" says Hartley, "there's our Portland cement youngster. He'll never run with that marble quarry inside of him."

Sure enough, there was the boy that had tackled the candy. I could see his red head blazing like a lightning bug alongside of a six-foot infant with overalls and a promising crop of side whiskers. Next thing I knew the starter—Issachar Tiddit, 'twas—he opens the lid to the pig box and hollers "Go!"

The line dropped. That little lone pig see twenty odd pair of hands shooting twards him, and he fetched a yell like a tugboat whistle and put down the field, with the whole crew behind him. The crowd got on tiptoe and stretched their necks to see. Everybody hollered and hurrahed and "haw, hawed."

Now I've been calling the place where they had the races and so on a field. Well, twa'n't really a field, but just part of the course where they had trotting matches on cattle show days. There was a fence on each side of it and across the ends of the section they was using there was ropes stretched. Back of the fences was the crowd on foot, and back of the ropes was more of 'em, but behind these ropes likewise was lots of horses and wagons and carry-alls and such. Every wagon was piled full of people and amongst 'em I could see the Barry coach, with the four gray steppers prancing up and down in front of it and old Commodore Barry and his son on the front seat with the women folks behind.

Well, when that pig started he made a straight course for the lower end of the field, but the sight of the horses and all scared him, I guess, and he jibed and back he come again. Half a dozen of the pig chasers—them that was nearest to him when he come about —ran into each other and piled up in a heap, squirming like an eel-pot. They got up in a jiffy and started over again, meeting the gang that was coming back on the second lap.

By the time that pig had made three laps round that course he was a candidate for the hogs' lunatic asylum. Twice he'd been grabbed, once by the ears and once by a leg, but his liveliness and the grease had got him clear. About half of the boys had given up the job, and was making for harbor behind the fence; covered with sand and grease, they was, and red and ashamed. The crowd was pretty nigh as crazy as the pig, only with joy. Even Hartley was laughing out loud—first time I'd ever heard him.

That little chap with the red hair had been right up with the mourners till the third round; then he was stood on his head in the scuffle and left behind down by the ropes in front of where the Barrys was. The rest of the chasers were scattered around the other end of the field, with the pig doing the grand right and left in and out amongst their legs. One of the boys—that big lanky one whose cheeks needed mowing—made a flying jump and dove head first on top of the critter's shiny black back. In a shake he was the underpinning, so to speak, of a sort of monument of boys, all fighting like dogs over a woodchuck.

Next thing I knew the pig shot out from underneath the pile same as if he'd been fired out of a cannon. He was squealing when he lit, but his running tackle hadn't been hurt any. Down the field he went and the only one of his chasers in front of him was that little red head. He makes a grab, misses, and the pig keeps straight on, right into the crowd of men and horses and carriages.

"Look out!" yells everybody. "Let him go!" But that little shaver wa'n't built that way. Under the ropes he dives, right where the jam of wheels and hoofs was thickest. The Barry coach horses rared up and jumped and backed. You could hear wheels grinding and men yelling and women screaming.

Markets

PHILADELPHIA PRODUCE

Philadelphia, Pa., May 11, 1914.

Limited arrivals of fancy print butter were cleaned up at top prices, but the under grades continued dull and ruled in buyers' favor. The egg market was quiet but supplies of desirable stock were under pretty good control and values steadily maintained. The poultry market was quiet but steady under moderate offerings. The fruit and vegetable markets were quiet with ample offerings at revised prices.

Butter.—Western creamery, 29c; extras, 27c; firsts to seconds, 23@25c; special prints 34@36c; near-by prints 30c.

Eggs. — Candled 23@25c dozen; extras, 22c. Current receipts at $5.85 per standard case.

Poultry.—Fowls, 16½@17½c; old roosters 12@13c; chickens 30@35c; pigeons, young, 18@22c.

Dressed Poultry. — Western fowls 13@18c; roosters, 14c; squabs $2@4.65 per doz.

Vegetables.—White potatoes, Pa., 90c@$1 bu; new, $1.00@5.00 bbl; onions, new, $1.75 @2.25 per carrier; peppers $1.50@1.75 per carrier; eggplant, $2.00@3.00 per crate; lettuce, 50@$1 per hamper; homegrown, $1.00 @2.00 bbl; beets 3@5c per bunch; sweet potatoes 40@50c per hamper; string beans, $1.00@2.00 per hamper; squash $1.00@1.50 per hamper; cucumbers, $1.50@2.25 per basket; celery $1.00@2.00 per crate; cabbage, new $1.00@2.00 per bbl. crate; asparagus, 10@20c per bunch; radishes, hothouse, 1@2c per bunch; carrots, 3@5c per bunch; mushrooms, 20@30c per lb.; peas, $1.00@2.00 per hamper.

Fruits.—Apples $3.00@5.50 per bbl. Pineapples crate $2.00@3.00; lemons $2.00@3.00 per box; grape fruit $2.00@4.00 per box; oranges $2.00@4.50 per box; strawberries, 10@20c per quart.

Hay and Grain.—No. 1 hay, large bales, $19.00@19.50; No. 1 medium $19.00; no grade, $10.00@12.00. Clover mixed hay, light mixed at $17.00@17.50; straw No. 1 straight rye, $17.00; No. 2 do., $16.00@16.50; No. 1 tangled rye straw new $12.50@13; No. 2 do., $11.50@12; No. 1, wheat straw, $10@10.50; No. 1 oat straw, $10.50@11.00; corn No. 2 yellow, 77 @77½c; wheat, No. 2 red, 99@99½c; No. 1 Northern $1.03½ @ 1.04½; No. 2 white oats 45½@46c; No. 3 white 43½@44c; standard white 44½@45c.

Coffee.—Rio 7s 8¾c; Santos 4s 11⅝c. Mild Coffee.—Cordova 12½@16c.

Sugar.—Cut loaf $5.05 cwt; cubes, $4.20; powdered, $4.05; granulated, $3.95; standard granulated, 4c; crystal A, $3.95.

Provisions.—City beef, in sets, smoked and air dried, 31@31½c. Hams cured, 13⅝@14c; skinned 14@14⅞c; smoked 17@18c. Other hams, smoked, city cured, as to brand, 17@18c. Picnic shoulders, 10⅝@10⅞c; do smoked, 13@13½c. Bellies in pickle, 13½@14¾c Breakfast bacon, as to quality, 19@23c. Lard, refined, 11¼@11⅞c tcs; do in tubs 11⅜@12c; do kettle rendered, 11¼@11¾c. Tallow, prime city 6⅞c; country, 6¾c; do. dark, 5½c; do cakes, 7c.

NEW YORK PRODUCE

New York City, May 11, 1914.

Butter stock came in slowly and during the early trading receivers were short of just the class of goods most buyers wanted. Egg arrivals are fairly liberal today and the general demand is only moderate and of a selective character.

Eggs.—State and near-by hennery whites, fine to fancy 22½@23½c; gathered whites 22½c; fair to good 21¼ @ 22c; fresh gathered firsts to extras 21¼@23c; seconds to thirds 19¼@20½c; no grades 18@19½c; mixed 21@22c.

Butter.—Creamery firsts to extras 24½@27c; thirds to seconds 21 @ 24c; state dairy 18@26c; packing stock 14@17c;

Cheese.—Whole milk specials, 14@14¼c; do common to fancy, 11@13¾c; skims 4@11¼c.

Dressed Poultry.—Turkeys, dry, 16@25c; chickens 15@18c; fowls, 14@18½c; old roosters, 14c; ducks 9@15c.

Live Poultry.—Prices unsettled.

Vegetables.—Cabbage $1.00@2.00 crate; green beans, $1.00@2.00 bas; carrots $1.50 @2.25 bag; cucumbers 60c@$1.12 doz.; lettuce 25c@$1 bas; squash 25@75c basket; celery $2.50@4 standard crt; onions $2.50 @3.50 per 100-lb bag; tomatoes, $1.00@3.00 per carrier; peppers 50c@$2.75 per box; beets, $2.00@8.00 per 100 bchs; potatoes, $1.50@5.00 bbl; sweet potatoes, 65c@$1.10 bas; eggplants, $1@3 box; asparagus, 50c@$3.00 per doz bunches; radishes, 15@50c basket; rhubarb $1.00@1.50 per 100 bunches.

Fruit.—Apples, $2@6.50 bbl. Grapefruit $1 @3.50 per box; oranges, $1.50@4.50 per box; strawberries 11@14c quart.

Grain.—Wheat, No. 2 red 99½c@$1. No. 1 Northern, $1.04@1.05; corn, No. 3 yellow 75@75½c; oats, standard white 44½@45c.

WILMINGTON PRODUCE

Wilmington, Del., May 11, 1914.

Butter.—Print butter, 35@40c lb. Creamery roll, 40c.

Poultry.—Chickens, dressed, 18 @ 25c; ducks, 15@20c.

Eggs.—20@24c doz.

Vegetables.—Potatoes 10@12c ¼-pk; new 20c ¼-pk. Cabbage, new 5@15c. Sweet potatoes 10@15c pk. Onions 20@25c ¼-pk; new 20c [illegible]. Eggplants 10@15c ea. Peppers 20@40c [illegible]. Parsley, 1@5c bch. Lettuce, 8@10c bunch. Beets new 12c bunch; string beans, 20c ¼-pk; peas, 25c ¼-pk; spinach 10c ¼-pk; asparagus, 35@40c bunch; tomatoes, 15@20c quart; squash, 10c each; kale, 8c ¼-pk; parsnips, 5c bunch; cucumbers, 10@12c each; turnips, 5c ¼-pk; radishes, 5c bunch.

Fruit.—Apples, 15@25c ¼-pk. Pineapples 20@25c apiece, Oranges, California 20@30c doz. Florida, 35@40c doz. Bananas, 10@15c doz. Grape Fruit, 7@10c each; strawberries 40@50c box; lemons 12@15c doz.

YORK PRODUCE MARKET

York, Pa., May 11, 1914.

The market stalls showed a large variety of spring produce and many flowers for sale. Eggs and butter are plenty, yet continue firm. Southern produce is arriving in large quantities.

Eggs.—19@20c doz.

Butter.—Country, 28@33c; separator, 32 @35c. Milk, 5@6c quart. Cream, 10@12c per pint.

Poultry.—Hens 15@16c per pound Dressed poultry, 40@75c each.

Vegetables.—Potatoes 12@16c ½-pk; 90c @$1.10 bu; cabbage 3@8c each; lettuce, 5 @10c; beets, 3@5c bch; radishes 5c bunch; onions 2 bchs for 5c, 12@16c ½-pk; lima beans, 14@16c qt.; sweet potatoes, 14@16c per ½-pk; lard 14@16c lb.; celery 6@12c; peppers, 8@12c doz; turnips 10c per ½-pk; soup beans, 10@12c qt; sauer kraut 8c qt; apple butter 20@25c qt; asparagus, 6 @10c bch; rhubarb, 3@5c bch.

Fruit.—Apples, 25@35c ½-pk; strawberries, 17@25c.

Retail Grain Market.—Wheat, $1.06 bu.; corn, 88c; oats, 55c; rye, 77c; bran, $1.60 cwt; middlings, $1.60 cwt.

Wholesale Grain Market. — Wheat, 96c; corn, 74c; oats, 44c; rye, 67c.

PHILADELPHIA LIVE STOCK

Philadelphia, Pa., May 11, 1914.

Beef Cattle.—A better feeling between buyers and sellers, with the better class of steers held a trifle stronger, were the principal features dominating the market. Pennsylvania stock sufficient for every requirement was mainly on sale.

	Beef Cattle	Sheep and Lambs	Hogs
Total for week	3,112	8,925	4,630
Previous week	3,058	7,813	5,143

Best steers	$8.85@9.00
Choice steers	8.60@8.75
Good do	8.25@8.50
Medium steers	7.50@8.00
Common steers	7.00@7.25
Bulls	5.00@6.85
Fat cows	5.00@7.00
Medium cows	4.25@4.75
Thin cows	2.75@4.00

Veal calves steady.

Best calves	$10.00@10.50
Good to choice do	9.00@9.50
Medium	7.50@8.00
Common do	6.50@7.00

Sheep and Lambs.—The top of the market on both sheep and lambs showed an upward revision and there was a good absorption.

Choice wethers	$6.00@6.25
Good do	5.25@5.75
Common to medium	3.50@5.00
Ewes, fat	5.25@5.75
Extra lambs	8.75@9.00
Good to choice do	8.00@8.25
Common to medium	6.00@8.00

Clipped sheep $1 per 100 lbs. lower than wool stock.

Hogs.—A steady feeling prevailed with holdings under good control. Western, $12.00@12.75.

City Dressed Stock.—Every variety of choice and prime meat commanded steady prices, lamb alone closing firmer. Steers 12@14c; heifers, 10½@13c; cows, 9@11c. Veal calves, 13@14c; country dressed calves 13@14c; extra do., 14½c. Sheep, 11@12c; extra wethers, 13c. Spring lambs 15@16c. Hogs, 12¼@12½c.

PITTSBURGH LIVE STOCK

Pittsburgh, Pa., May 11, 1914.

Cattle.—With a light supply of 95 loads after last week's receipts, the market ruled active and generally 10 to 15 cents per cwt. higher, the light-weight, handy cattle having the most of the advance, the weighty grades selling only steady to strong. Heifers in light supply and sold at about the same advance as steers. Fat cows steady to strong on all grades. Bulls steady with last week. Fresh cows and springers in liberal supply and sold lower. Today's supply was 100 loads. With a fair demand the market ruled steady on desirable grades.

Good to choice	$8.75@9.15
Good 1,300-1,400 lb.	8.50@8.70
Medium to good 1,200-1,300 lb	8.10@8.60
Tidy 1,050-1,150 lb.	8.20@8.50
Fair to medium, 900-1,100 lb.	7.50@8.10
Rough, half-fat, 1,000-1,300 lb.	5.00@7.00
Common, 700 to 900 lbs	5.75@7.00
Common to good fat oxen	4.50@7.00
Common to good fat bulls	5.50@7.75
Common to good fat cows	4.25@6.75
Heifers	5.50@8.00
Bologna cows	3.75@4.25
Fresh cows and springers	25.00@90.00

Calves.—Veal calves in only fair supply and with a good demand the market closed 25c per cwt. higher. Today's receipts were 700 head, and the market was active and higher.

Heavy and thin calves	$5.00@6.50
Veal calves	8.00@10.50

Hogs.—The supply of hogs during the week has been light and with a good demand the market has ruled active and strong all week, the close for the week being 10 cents per cwt. higher on heavy hogs and 20 cents per cwt. higher on all other grades. Today's receipts were 65 double-deck loads, and the market ruled 20 cents lower than Saturday.

Prime heavy	$8.65@
Heavy mixed	8.70@
Prime medium weights	8.75@
Best heavy Yorkers	8.75@
Light Yorkers	8.75@
Pigs	8.50@
Common to good roughs	7.50@7.90
Stags	6.50@7.00

Sheep and Lambs.—Sheep and lambs in fair supply and with a good demand the market closed 15 cents per cwt. higher on sheep and 25 cents higher on lambs, while spring lambs have been very slow sale at a decline of $1 per cwt. Today's receipts were 22 double-deck loads. The market ruled higher on sheep and choice lambs, but other grades of lambs sold steady with last week. Spring lambs were lower.

Prime wethers	$5.75@6.00
Good mixed	5.25@5.50
Fair mixed ewes and wethers	4.50@5.00
Culls to common	3.00@4.00
Culls to choice lambs	6.00@8.25
Spring lambs	8.00@11.00

BUFFALO LIVE STOCK

Buffalo, N. Y., May 11, 1914.

Cattle.—The week opened with cattle active and higher on light receipts with export and shipping steers in fair demand. Medium butchers were in better demand at a 10@15c advance and so continued during the best days of the week. Mixed butchers were in liberal receipts and higher. The week's close was steady at Monday's prices and prospects good. Today's receipts were 3,000 head, and they sold steady to strong.

Choice heavy steers	$9.00@9.25
Fair to good	8.25@8.75
Yearlings	7.75@8.65
Handy butchers	7.00@8.50
Good to choice fat cows	6.75@7.50
Good to choice heifers	7.50@8.25
Butchers bulls	5.00@7.50
Feeders	6.50@8.00
Cows and springers	30.00@90.00

Calves.—The week opened with a good demand at steady prices. The close was steady to $1 higher. Today's supply totaled 1,800 head.

Choice veals	$10.00@10.50
Lights and thin	6.00@8.75

Sheep and Lambs.—The opening market followed in the line of cattle, being active and higher. Wool lambs were in light supply and firm. There was a good demand for yearlings. Handy-weight sheep were in good demand but heavy and common sheep were dull and slow. Clipped sheep were slow and easy. The week closed 15c higher on all desirable grades. Yearlings were in light supply and firm. Choice sheep were steady. Heavy sheep were slow and barely steady. The closing basis on lambs was $7.75@8. Today's sheep and lamb receipts were 12,000 head and they sold steady with last week's close.

Choice lambs	$8.15@8.25
Yearlings clipped	6.75@7.50
Wethers	6.00@6.75
Ewes	5.25@5.50
Mixed sheep	5.60@5.75

Hogs.—The liberal receipts at the opening and the moderate demand made a rather slow market but prices were 5@10c higher on desirable grades. Pigs were in good demand. On the close the market for the week was higher under good demand. Yorkers sold at $8.95@9. Common hogs were steady. Today's hog receipts were 17,000 head, and they sold 10 to 15 cents lower than Saturday.

Heavies	$8.80@
Mixed and medium	8.80@8.85
Yorkers	8.80@8.85
Light Yorkers	8.80@8.85
Pigs	8.80@8.90
Roughs	7.60@7.75
Stags	6.50@7.25

Horses. — Receipts totaled 550, with active demand for best heavy workers. Medium and common workers were in fair demand Best teams, $650 @ 750; medium, $500 @ 600; fair to good, $350@450.—S.

NEW YORK LIVE STOCK

New York City, May 11, 1914.

Beef Cattle.—Receipts for week 3,200 head. Market steady.

Steers	$6.85@9.35
Bulls	5.50@8.00
Cows	3.50@6.75

Calf receipts 8,200 head. Market active.

Choice	$8.00@11.25
Culls	5.50@7.50

Dressed calves higher. Dressed veals 14@17c.

Sheep and lamb receipts 8,600 head. Market strong.

Sheep	$5.00@6.25
Spring lambs	7.25@8.50

Hog receipts 6,000 head. Market steady.

Choice	$8.80@9.05

PITTSBURGH HAY AND GRAIN MARKET

Pittsburgh, Pa., May 11, 1914.

Hay.—Receipts of timothy hay continue extremely light. The better grades of No. 1 and No. 2 timothy find ready sale at top figures and there is not enough of these qualities arriving to supply the demand which is quite active. Lower grades are dull and hard to dispose of. No. 1 light clover mixed and No. 1 clover mixed can be placed at quotations but clover and prairie are dull.

No. 1 timothy	$18.00@18.50
No. 2 timothy	16.00@17.00
No. 1 light mixed	16.50@17.00
No. 1 clover mixed	15.50@16.00
No. 2 clover mixed	12.00@13.00
No. 1 clover	15.50@16.00
No. 2 clover	11.00@12.00

Straw.—Demand for straw good and readily takes care of what few cars are arriving.

No. 1 Oats	$9.75@10.25
No. 2 Oats	9.50@9.75
No. 1 Wheat	9.75@10.00
No. 2 Wheat	9.25@9.50
No. 1 Rye	11.00@11.25
No. 2 Rye	9.75@10.25

Ear Corn.—Ear corn still very much wanted; arrivals very scarce; everything placed at top figures.

No. 2 Yellow	81½@82c
No. 3 Yellow	78@79½c.

Oats.—Oat receipts and demand about equal; market steady.

No. 2 white	43¼@43½c
Standard oats	42½@43c.
Standard No. 3 oats	41½@42c.

ELGIN BUTTER QUOTATION

Elgin, Ill., May 11, 1914.

The quotation committee of the Elgin Board of Trade this afternoon declared butter firm at 26 cents.

NEW YORK MILK MARKET

New York City, May 11, 1914.

The market continues to be unsatisfactory to the dealers, for the surplus is growing slowly, but surely.

The receipts of milk and cream in 40-quart cans for the week ending May 9, were as follows:

Railroad	Milk	Cream
Erie	48,695	3,188
Susquehanna	8,428	394
West Shore	17,312	1,971
Lackawanna	58,150	1,950
N. Y. Central (long haul)	83,304	2,261
N. Y. Central (short haul)	12,170	330
Ontario	39,263	3,833
Lehigh Valley	35,346	1,258
Homer Ramsdell Line	2,310	51
New Haven	7,367	210
Pennsylvania	5,662	156
Other sources	1,680	25
Totals	319,687	15,627

TOBACCO MARKET

It is estimated that some 60 percent of the 1913 crop has passed from the hands of the growers, mainly at prices not at all satisfactory or profitable. Sales are being made at prices ranging from $5 to $8 per cwt. with occasional choice offerings at $9 per cwt. Much was said concerning reduction in acreage and the planting of land in potatoes and other crops but it is noted that the usual number of plant beds have been made and that very few growers will state a positive intention of a reduction. It is probable that not merely a reduction but the elimination of one or two crops and a curtailed acreage thereafter would be to the best interest of growers.

The Seed Leaf Tobacco Growers' Company has issued a statement showing that some 100,000 pounds of tobacco have been delivered to the company. Many other deliveries are promised for the near future. It is claimed that a total of one-half million pounds will soon be held. At a meeting of the members it was found that buyers are in the field procuring many crops for which they are paying advanced prices, which they are endeavoring to conceal. The company now has over 400 stockholders. Explanatory meetings were held at various points in the section. It is unfortunate that local banks seem to be unfavorable to the new company. This is, of course, on account of their affiliation with packers and others who oppose the movement. To cover this adverse feature it is probable that growers will establish a new bank to take care of their business. Attention is called to the fact that the movement for this bank emanates from a spirit of necessity and not of antagonism.—H. E. Tweed, May 11, 1914.

Veterinary

(Conducted by W. C. Fair, V. S.)

(Advice thru this department is free to our subscribers. Each communication should state history and symptoms of the case in full; also the name and address of writer. Initials only will be published. We cannot make reply by mail. This is one of the most valuable columns of the paper and we invite readers to make use of it. Clippings from this column, when properly preserved and classified, would make one of the most valuable medical symposiums a farmer-stockman could obtain.)

Serous Abscess.—Have a young mare which has undoubtedly bruised her breast when reaching for hay over manger. Trouble was first noticed about 3 weeks ago in shape of a large soft swelling which, when opened, contained nothing but water. As soon as water is out, lump is almost gone, but fills up again as big as ever in a day or so. Can you advise me what to do to stop water from forming? B. B. L., Great Meadows, N. J.—Make opening large enough to drain properly and inject 1 part carbolic acid and 30 parts water, twice a day. Apply iodoform to wound each time it is opened.

Rheumatism—Fistula of Withers.—I have a horse, 6 years old, that goes stiff in shoulders. This soreness seems as if it might be rheumatism as his lameness or soreness is much more severe at one time than another. I have another horse that I believe has fistula at top of shoulder blade. This sore was almost healed two weeks ago, but is now quite sore. A. S. D., Silverdale, Pa.—Give your first horse 2 dr. salicylate of soda and 1 dr. powdered nitrate of potash at a dose in feed, 3 times a day. Rub his shoulders with spirits of camphor, twice a day. Are you sure that the whole trouble is not in his fore feet? If you believe he is hoof-bound, apply lanolin once a day. Apply equal parts tincture iodine and camphorated oil to bunch on withers of second horse every day or two.

Tender Shoulders.—I have a work horse that has what I believe is a good fitting collar to work in, with sweat pad underneath, yet he is troubled with galled shoulders. G. H. Q., York, Pa.—Dissolve ¼ lb. acetate of lead, 3 oz. sulphate of zinc and 2 oz. of tannic acid in a gallon of water and apply to shoulders, 4 times a day. Also apply 1 part carbolic acid and 30 parts water to sweat pad and face of collar once a day. It is important to keep collar clean.

Sore Neck—Knee Sprung.—I have a horse, about 10 years old, that is continually troubled with sore neck. The remedies I have applied do not help him. He is also very weak in his knees. Is there anything that I can apply that will help? N. T. S., Navarre, Pa.—Dissolve ¼ lb. acetate lead, 3 oz. sulphate of zinc and 2 oz. carbolic acid in one gallon of water and apply to sore shoulders and neck, 3 times a day. Keep the collar and sweat pads perfectly clean. Apply alcohol to weak knees twice a day; or blister tendon with cerate of cantharides.

Vertigo.—I have a heifer, 7 months old, that acts queer when let out to water. She holds her head to one side and runs until she bumps against some object and falls. In about five minutes it is all over until she has another spell, which may come on in a few days or a week or two. A. K. S., Wazall, Pa.—If her bowels are costive, give 4 or 5 oz. of epsom salts every 4 hours until her bowels act freely. Then give ½ dr. bromide of potash and ½ dr. potassium iodide at a dose, 3 times a day.

Stringy Milk.—One of my cows gives stringy milk, but appears to be in perfect health. S. A. C., Mifflintown, Pa.—Give her a dessert spoonful of powdered nitrate of potash and 2 tablespoonfuls bicarbonate soda at a dose in feed, 3 times a day. Hand rub udder and milk her clean 2 or 3 times a day.

FREE
This Handsome 14K
Gold Plated "Bull" Watch Charm
To Every Man Sending 5c for a Sack of "Bull" Durham Tobacco

This Watch Charm is unusually attractive in appearance and design. It is *14K gold plated*, and will prove a decided ornament to any Watch Fob or Watch Chain. We are making this unusual Free Offer in order to induce more smokers to try "rolling their own" fresh, fragrant, hand-made cigarettes from world famous

GENUINE
"BULL" DURHAM
SMOKING TOBACCO
(*Enough for forty hand-made cigarettes in each 5-cent sack*)

As many cigarettes are rolled with "Bull" Durham in a year as *all* brands of ready-made cigarettes in this country combined. There is a unique, delightful aroma to "Bull" Durham that is not found in any other tobacco. It is produced by an exclusive process, known only to the makers of "Bull" Durham.

Once you have learned this delicious, distinctive flavor, your taste will always call for it, and you will always recognize "Bull" Durham anywhere by its savory aroma. There is nothing else like it in the world.

Ask for FREE book of "papers" with each 5c sack

FREE Send 5 cents and we will mail you prepaid, anywhere in U. S., a 5-cent sack of "Bull" Durham, a Book of cigarette papers, and this 14K gold plated "Bull" Watch Charm, *Free*. We will also send you an illustrated booklet showing how to "roll your own" cigarettes with "Bull" Durham tobacco. In writing, please mention name and address of your tobacco dealer. Address "Bull" Durham, Durham, N. C. Room

Profitable Summer Pasture for the Pigs

The farmer who makes a specialty of pork production has long since learned by comparison, if not thru the keeping or accurate accounts, that he can grow his pig crop to maturity much cheaper where fed on suitable pasture than where confined in a small area and fed altogether on a grain ration or in a poor and insufficient blue grass pasture. This class of farmers has learned from experience that if suitable forage is not available in the crops already growing upon the farm, it will pay to sow supplementary forage crops to provide summer pasture for the pigs. The farmer who does not make much of a specialty of pork production has not, in a great many cases, learned these important lessons, and does not appreciate the fact that even tho not many hogs are produced on the farm, it will pay to provide these conditions, even if supplementary forage crops must be sown to provide them.

As previously noted, accurate cost accounts in the matter of production are lacking on the great majority of farms. In a great many lines of production, this lack of cost figures cannot be well supplied from outside sources, but fortunately on this particular proposition of providing summer pasture for the pigs, accurately kept cost accounts are available thru carefully conducted experiments at different experiment stations thruout the country. Perhaps the latest and most complete of available records of this kind is that made public last year by the Iowa Experiment Station, and the results shown by these records will be sufficient for the purpose of this article, which is to demonstrate the profit of providing suitable summer pasture for the spring pig crop.

Alfalfa the Best Pig Pasture

Undoubtedly, where it is available, alfalfa is the best possible summer pasture for the spring pig crop. This was found to be the case in the experiments above mentioned, the low record cost of gain being made upon alfalfa pasture where the alfalfa was not stocked so heavily but that hay was cut from the same and credited at current prices. Under these conditions the low record cost of gains made on alfalfa pasture was $2.88 per hundred pounds of gain with corn figured at 50 cents per bushel, or $3.46 per hundred with corn figured at 60 cents per bushel. The same relative cost for a previous trial in which the pasture was not credited with the hay cut from same as compared with the figures just given, was respectively, $3.96 and $4.60 per cwt., with corn figured at the two prices above given. The average of production costs for the two years was $3.42 per cwt., with corn at 50 cents per bushel, and $4.03 per cwt. with corn at 60 cents per bushel. The average net profit derived from an acre of alfalfa pasture, estimating corn at 50 cents per bushel and hogs at $6 per cwt, was $71.74. Figured in another way, the average price per bushel which the hogs paid for corn consumed, with hogs at $6 per cwt., deducting cost of alfalfa pasture, including rent of land, was 93 cents per bushel.

RAPE MAY BE SOWN IN DRILLS AND CULTIVATED WHERE THE HOG LOT IS SMALL.

June Clover a Good Second

Medium red clover is a fairly close second to alfalfa in results with growing pigs. With corn figured at 50 cents per bushel, the average cost per hundred pounds of gain in an average of four trials on red clover pasture was $3.99 per cwt., and with corn at 60 cents per bushel, $4.35 per cwt., while the average value of an acre of clover pasture with corn at 50 cents per bushel and hogs at $6 per cwt., was $57.21. Figured in the price returned per bushel of corn, after payment of cost of clover pasture, including rent of land at $6 per acre, on an average for four trials the price received for corn fed on clover pasture was 87.6 cents per bushel.

June Grass and Timothy Pasture

Where alfalfa or clover pasture is not available, as it is not conveniently available for the pigs upon many farms, the question arises as to whether it would be more profitable to pasture the pigs on an old June grass or timothy sod, such as is usually found in the hog lot, or sow some special crop for summer forage. In the Iowa trials it was demonstrated that blue grass or timothy pasture was not as economical forage for pigs as the other pasture crops mentioned, the cost of gains on such pasture being $4.09 per cwt. with corn at 50 cents per bushel, and $4.77 per cwt., with corn at 60 cents per bushel, in comparison with the figures above given for alfalfa and clover, but even this pasture had a value of $31.85 per acre above rental value with corn at 50 cents per bushel and hogs at $6 per cwt.

Dwarf Essex Rape for Pigs

Where special crops must be grown for hog pasture, rape is undoubtedly the most suitable single

(Continued on page 8)

PEAS AND OATS MAKE EXCELLENT PASTURE FOR THE GROWING PIGS. A BUSHEL OF EACH WITH TWO OR THREE POUNDS OF RAPE MAKES A GOOD COMBINATION.

Farm Crop Notes

By R. P. KESTER.

Counselor on Soils to the State Department of Agriculture.

Thru this department Mr. Kester will discuss queries from Pennsylvania Farmer readers on soils, fertilizers and general farm practice. Address all queries to Pennsylvania Farmer, Philadelphia, Pa.

THE HIGHEST SATISFACTION

Part of the enjoyment of life comes from the entertainment and amusement furnished by others. We enjoy the singing, the acting, the sermons of others. They often thrill and inspire. Our appreciation is engaged and we enjoy the experience. We enjoy travel, reading, playing. But the highest enjoyment and the feeling of greatest satisfaction is experienced when we behold the result of successful effort. Those feelings are the most valuable rewards of life. It is then we hear the Divine approval, "well done." There is no keener enjoyment, no greater satisfaction. To realize that we are successful partners in the work of creation makes life worth living.

The thrill with which the housewife views her light, fluffy bread, her nicely-browned pies, her well-cooked meals overbalances the drudgery of housekeeping, especially when there is added to this the spoken appreciation of husband. The farmer receives more enjoyment than the dollars will buy as he walks about in the evening, or on a Sunday, and views the success of his labors. If we fail to realize this, we are unsuccessful farmers, no matter how much profit in money we make.

Across from my writing room window is the garden of a neighbor. He has a well-kept, modest home. He works hard all day and every day. His evenings are spent working in the garden. There he plants and weeds and waters that he may rest and glow with the satisfaction of seeing things grow and develop. As he stands there now in the twilight, viewing the splendid lettuce and onions and other promising plants, I know he is at peace with himself and all the world. He has the feelings and broad view of a creator, and he will go to his bed with a feeling of satisfaction that many, many will not have tonight.

A writer in a contemporary journal well expresses these sentiments in the following extract from a talk to a son:

"Once in a while, in every real man's life—not so often as to let him get used to it—something happens to fill him with honest gladness. I've known such times. Once at my marriage; again when you were born; yet again when I brought you and mother to this farm and set about making our own home. And here's another thrill of the same sort. My son is to be a farmer.

"I'm genuinely glad, thru and thru. I don't say this merely because I believe farming to be a good business. The soundest of all arguments in favor of farming as a life work goes far deeper than the question of making a living and growing rich out of surplus earnings. It isn't a matter of poetic sentiment, either. It's what you might call practical sentiment—applied sentiment, rooted in reason and sustained by experience.

"If any man on earth today is entitled to hold up his head and stick out his chest it's the farmer, who, with his own hands and on his own land, has brought a good crop thru to the harvest. There's a solid satisfaction in that—greater than any man may guess who hasn't done it himself. The satisfaction isn't in the reward that's to come; it's in the actual performance. To look out across an October cornfield in the shock and to say to myself, 'Eighty good bushels to the acre!'—there's the satisfaction I mean, and not the stolid feeling that comes when the surplus grain is sold and the money put in bank.

"I've made good money out of "deals" at odd times—trading in cattle and horses, or taking a profit out of a piece of land I've bought and sold, or something of that sort—but the pleasure I've got from those profits hasn't amounted to much. I've never put any brains into my trading beyond a little shrewdness, a little cold, calculating cleverness. Those trades of mine haven't added one penny to the world's wealth. They've created nothing. They've merely shifted dollars from some other man's pockets to mine. The world isn't any better off, in any way, on account of them.

"The dollars I'm proud of are those I've made by growing my crops. There's no three-shell business about that. That's creation. There's nothing mean in it. When I've planted a bushel and a half of wheat on a well-prepared acre and have made it give me 35 or 40 bushels of increase, I've done something. I'm not ashamed of owning the dollars that are earned in that way. I'm proud of them. The long and short of it is that I'd rather own one dollar made by crop growing on my farm than $10 made out of a shrewd trade. Does that sound to you like a piece of crazy sentiment? All right, but that's just exactly the way I feel about it.

"To put it in plain words, David, I take my greatest comfort in farming because I feel that my harvests, wrought with my own hands, have divine approval. I've never been able to feel so about my land speculations or my horse trades. I've managed these on my own hook; but the hand of God is in the increase of the fields. That's frank speech. I shouldn't wonder if it reveals me to you in an unfamiliar light. You've never had particular reason for thinking of me as a devout man. I don't believe you've heard me pray aloud in all your life. And I know I've never been able to talk about religion as some men can, explaining and defining their faith in a glib, cocksure way. Mine has no definitions, no forms, no rules; but it's in me just the same.

"Often and often, when we've been sitting around the fire at home on a winter's night, you've seen me put down my book toward bedtime, exchange my slippers for boots, button my coat around me and go out for a last look at things. I've done it for years, till mother has come to make a jest of it as a fussy old man's habit. But it isn't that. I've never told her or anyone else what that simple little nightly ceremony means to me. I think it's fit to be called a religious observance. It's just my way of saying my prayers.

"I go into the big barn and stand listening to the sleek horses nosing the hay in the mangers, to the deep breathing of the contented cattle on their clean straw beds, to the low bleating of the sheep in their snug sheds—every beast of them well fed, comfortable, friendly. If the night happens to be cold, with a driving storm blowing, so much the better for my state of mind. Overhead are the full mows; around me are the full cribs and bins—plenty, plenty!

"Going back to the house, I've been used to stealing a look thru the living-room window at you and Mother sitting in the glow of the firelight. And then comes a quick thought of the full cellars and storeroom and pantry—plenty! A stickler might find a savor of selfishness in the "Thank God!" I've been used to saying under my breath at such times, but it's been the fervent expression of a feeling as devout as any man may ever know in this life. And I'm not beholden to any man or to any lucky circumstance for this rich abundance. Nothing intervenes between me and the fact. I've brought it about myself, with no obligation to any but God.

"That's the great feeling, David, to reward a man for his year's work. I'm glad that you're to do this work, so that you may have your own share in the feeling. I can't wish for you any profounder satisfaction. For myself, if I had life to begin all over again, with my lifetime of experience to guide me, I'd stick to farming, tho rewards were cut in half and the hardships were doubled. On my word, I would!"—R. P. K.

APPLYING FERTILIZER TO CORN

There are several different methods of applying commercial fertilizer to the corn crop practiced, and most, if not all of them are open to some objections. The method of applying it to the hill only seems to be the most objectionable one of all. The corn plant if given a chance will send roots out in every direction from the hill much farther than is generally supposed. This is necessary in order that the plant have sufficient feeding ground to obtain both water and plant food sufficient for the proper development of the corn plant. If the fertilizer is all put in the hill a proper root development is discouraged. Then if a sudden dry spell sets in there is not sufficient space covered by the roots to furnish moisture, so the crop is burning up.

If the fertilizer is distributed all thru the soil, root development is encouraged. The plant has a much larger space from which to draw moisture and we have no trouble with the fertilizer burning the corn. Then again, if a high grade fertilizer comes in direct contact with the seed there is danger of the fertilizer killing the germ of the corn.

A few years I tried different fertilizers on a few small plots with the fertilizer applied to the hill. The same seed was used as was planted all around these plots. There was almost a perfect stand in the field while there was not a half stand where the fertilizer was applied to the hill. The corn that did come up grew much faster where the fertilizer was applied to the hill for the first few weeks but by the time the ears began to form the blades on these plots were dead nearly to the ear, while the surrounding corn had green blades nearly to the ground.

The most successful plan that I have used is to apply the fertilizer all over the ground before planting the corn. I use a common wheat drill to distribute the fertilizer and apply about 200 pounds per acre. If manure is also applied or if it is a sod land I use a 16 percent acid phosphate alone and get as good results from this cheap fertilizer as I do when I use a complete fertilizer, and at a much less cost.

I have distributed fertilizer after the corn is planted a few times but it has always been a failure. I did not get pay for my fertilizer in increase of crop. If the fertilizer is put in the soil there is little danger of the corn roots not finding it.—A. J. Legg.

FERTILIZING TIMOTHY

The only time to apply commercial fertilizer to timothy is in the Spring, when green growth has started and the moisture condition of the soil is good. The fertilizer may be broadcast or drilled, the practice not seeming to make any difference in the results.

There are, in general, three conditions which should be met before fertilizers are likely to be profitably applied: First, there must be sufficient plants on the area, or a root development great enough, to respond to the application. It doesn't pay to apply fertilizers if there is practically no or very little timothy on the field; fertilizers will not make new plants where there were none before. Second the yield should at least be from three-fourths to one ton per acre before the treatment. A smaller yield indicates the presence of many weeds crowding the grass, or too few plants to occupy the land even with increased growth. Third, the soil should be productive. Fertilizer applied on poorly drained soil or soil otherwise in a poor physical condition, causing low productivity, will not likely be a profitable practice either when used as hay or any other crop. Stating these three conditions affirmatively we should say that fertilizer applied to grass may be expected to pay when there is a sufficient number of plants on the ground, when the yield is at least three-fourths to one ton of hay per acre, and when the soil is fairly productive.

The fertilizer recommended for general use is one that is high in nitrogen. If the land is well supplied with phosphoric acid and potash, nitrogen alone, applied to best advantage in the form of nitrate of soda, will probably give best results; otherwise a complete fertilizer should be used. The formula already cited in Pennsylvania Farmer of May 9, which was 9:4:7, may be best made up at home by using the following proportions; 200 lbs of nitrate of soda, 100 lbs. of acid phosphate (P_2O_5) and 50 lbs. of muriate of potash making 350 lbs. of a complete fertilizer to be applied per acre. Where the nitrate of soda is used alone, the quantity used may vary from 100 to 200 lbs. according to conditions of soil and meadow. The complete fertilizer should not cost more than $6.50 per acre, and where the nitrate of soda alone is used, the cost will be correspondingly less. Where the practice is carried on for the first year, applications should be made at different rates and in different proportions to determine, at least in a general way, which combination will give the best results.—John H. Reisner, N. Y. College of Agriculture.

WEIGHT OF HAY IN MOW

A short time ago I bought some hay in the mow and I am having a controversy as to how many cubic feet should be allowed for a ton. The hay was timothy and clover mixed, and in the bottom of a well-settled mow, 18 by 36 feet. How many cubic feet is it usual to allow for a ton of well-settled hay? Are beams and joists usually figured out in making the computation? R. H., Almond, N. J.

The quantity of hay in a mow can only be approximately ascertained by measurement. It is not a satisfactory basis upon which to buy or sell hay, but when used the rule of measurement should be definitely understood by both parties when the deal is being made. The old rule is as follows: Good timothy hay, well settled, 350 cubic feet per ton; partly settled, 400 to 450 cubic feet per ton. The conditions named above should call for an estimate of 350 cubic feet per ton.

Fruit Growers Organize.—The Germantown Co-operative Fruit Growers', Inc. is the legal title of an organization of fruit growers recently perfected at Germantown, N. Y., by Marc W. Cole, of the department of agriculture.

Poultry

MAY IN THE APIARY

It matters not whether bees are kept for the honey they may secure, for their use as pollenizers or for recreation or study, a prosperous condition in the hive is desirable. To secure this condition there must be no lack of food for the young bees and the queen must be allowed all the empty comb she can possibly use for eggs. These, when housed in a good hive, will usually be all the bees need provided there is no disease present.

The baby bee disease, foul brood, has aside from neglect, done more to reduce the number and efficiency of bees in New Jersey than anything else. While this is true of New Jersey it is none the less true of very many other states. While both forms (European and American) of foul brood are found in New Jersey, the European form is by far the most widespread. Usually in May when the bees are using large quantities of old stores for feeding the young and rapidly reducing the amount of honey stored in the hive, foul brood attains its maximum height because of the large amount of infected honey being fed to the brood. This is the time when the beekeeper must give close attention to the brood in order that he may detect the first appearance of this dread malady and check it before it has occasioned great loss.

It is unnecessary to discuss the symptoms and treatment of this disease here as a request to the Bureau of Entomology at Washington will bring Farmers' Bulletin 442, "The Treatment Of Brood Diseases Of Bees" which contains a thoro discussion of this subject. Let it suffice here to state that foul brood is very contagious in bees, the contagion being carried from hive to hive by the bees of stronger colonies robbing the infected honey from the colony which has been weakened by disease.

A number of states have provided for an inspector who examines the bees, advises the owner if any disease is present and the best method to eradicate it. Any beekeeper in New Jersey can have the services of the inspector without cost by making a request of Dr. T. J. Headlee, State Entomologist, New Brunswick.

When the bees have attained the prosperous condition mentioned at the beginning of this article, swarming is the next thing in order. At one time swarms were hailed with delight, as it meant another stand of bees, but swarming has no place in modern beekeeping. Investigations show that in many if not all cases swarming means a great reduction of the surplus honey crop. Swarming may be allowed to the extent of one swarm from each old colony, and if the old and new colonies are handled properly the surplus crop will not be greatly reduced, but swarms other than the first from a colony are always unprofitable.

In hiving swarms the common custom is to put the hive with the swarm on a new place, leaving the old hive alone. Under this manipulation the old hive may cast one or two more swarms. These afterswarms are never profitable. They very rarely are able to survive the winter and they so reduce the strength of the old colony that it is not able to [illegible] surplus.

Fortunately there is a very simple method of preventing afterswarms, which is to place the hive containing the new swarm where the old hive stood which cast the swarm, first moving the old hive to a new stand. This draws off the field bees from the old colony, which fielders return to the old stand, so reducing the old colony that it will have no further idea of swarming. As the fielders join the new swarm it is thereby strengthened so it will produce a maximum crop. All efforts are directed towards getting the surplus honey from the new swarms, when swarming is allowed, as the old colony will not produce a surplus except where there is a heavy fall flow of nectar.

Not infrequently the swarm issues unobserved and the owner does not know from which hive it came. To determine this so the proper manipulation can be given the old colony, put a small teaspoonful of flour into a cup and fill the cup half full of bees from the clustered swarm and after shaking the bees in the cup to get them well floured throw them in the air. Now watch the entrances of the colonies. The hive before which most floured bees are seen fanning is the hive which cast the swarm.—E. G. Carr, N. J. Deputy Bee Inspector.

SOME HELPFUL POULTRY POINTS

In the past quarter of a century, during which time we have been on our present farm home, some things in the care and keeping of poultry have been pretty thoroly impressed upon us. We began with 25 common hens. Now we have not far from 500 well-bred hens.

One of the things we have learned, is that it pays to have good stock. Fifteen or twenty years ago we had what we looked upon as pretty fair hens; in fact they did lay very well. My wife was at that time taking care of the birds. She kept an accurate account every day of the number of eggs taken from the house, feeding the best she knew and recording the dozens sold, with the price in each instance. We knew then that there was money in hens; but it was after we began to change the mixed stock for birds that were better bred that we really came to know the advantage of putting money into choice stock. Our present hens are of the best strain of laying stock, and they have laid generously for the past two years. It is one of our regrets that we lost so much time with the mongrel hens.

We are learning things about feeding also. We used to feed mostly mashes in the morning. No more mashes for our folks. The hopper system has full sway for most purposes. Corn and wheat and perhaps buckwheat may be scattered about in the litter, but the rest must go thru the hopper. While on the feed question let me say that we do not intend to feed any but the best and the purest feed we can get. It is a mistake to think that a hen will eat anything. So she may, but what will be the result and what kind of eggs will poor food make! I have no doubt that the flavor of an egg may be greatly modified by the kind and quality of the feed given the hen. When we think how many eggs are used as food for the sick, the importance of feeding superior foods is obvious. Then, too, the health of the hen depends largely upon what she has to eat. Poor food will affect a hen quite as readily as it will a person. You can buy poor stuff cheaply, but it is costly in the long run.

Again, one of our best lessons bears on the home of the birds. No more "tumble-down shed" roosting for us! Our houses are the best we can give the birds. Cement floors, large windows and as good a ventilating system as we know how to devise, together with lots of floor space, for crowding is one of the worst things possible! these are some of the features of the houses we are using now. Two years ago we built the first really up-to-date house and a year later another, both 30 feet long. As soon as possible we shall put up another of the same size, as well as a cement incubator house.

But there is still another point and that is the range for the birds. We have given the birds all the room they wanted to travel over. A good share of our success may well be attributed to this one fact. I believe now that if a man has a thousand dollars to lay out in setting up a poultry business he had better spend a good share of it for land and work up his flock gradually as he can. For a couple of years we have had a big piece of corn right near the hen houses. The birds run thru this and get no end of good out of it. It is shady, too, and that counts for a good deal.—E. L. Vincent, Broome Co., N. Y.

POULTRY QUERY

My hens look fine. Have large range and are well-fed, but I noticed one of them breathing hard, as if choking, and then gaping. It was fat and laying. I gave lamp oil also rubbed it on head and neck, but it soon died. A second one I isolated, fed warm feed and gave castor oil and carbolic acid in water to drink. She lived over a week, gaping and breathing harshly, and grew weaker, so I killed her. Found a third one which I killed immediately. This one would dress about 9 lbs. Droppings looked O. K. Liver might be trifle pale and darker at edges, but can see nothing else wrong. Can you tell me what is the trouble and what to do. Have a large flock of barred rocks and have used carbolic acid in all water since above trouble.—Mrs. J. W. G., Sharon, Pa.

I am not able to determine from the symptoms given what ails your hens. In a case of this kind the observer nearly always fails to note the really important symptoms. In the first place you should examine the windpipe and lungs and see that there is no fatty enlargement that is pressing on the windpipe or breathing organs at any place. If there is any swelling or any obstruction in the throat it might be a case of diphtheria, but your examination will have to determine that. I think it will be just as well to discontinue all drugging. Drugging poultry of any kind is bad practice at any time and especially so when the drugging is done on general principles without any knowledge of what you are drugging for. Drugs often kill fowls that might otherwise recover.

Note if the ailing fowls breath thru the mouth. If they do and you find the throat in good condition it is possibly a case of pip. This is partially a digestive disorder. Give the flock a liberal feeding of well parched or charred corn twice a week and if not already available see that the fowls are getting plenty of green grass and do not forget to give a bit of beef scrap and wheat bran mixed dry in a box where they can help themselves. If you find it is a case of diphtheria, kill all ailing birds and burn or bury deeply.—J. T. Campbell, Crawford County, Pa.

The Marketing Problem.---Is it the Commission Man?

Several years ago I was standing in a commission house in Philadelphia, pretty much surrounded by barrels of apples that had been shipped from the section in which I live. A customer entered, was shown some Winesap apples, priced them and was told that they were worth $3.20 a barrel. At the same time the commission man, in a rather dejected way, called his attention to a label pasted on the barrels, stating that the apples were the "same size from top to bottom of the barrel." The customer grinned, said nothing, but finally bought 10 barrels and had them sent to another part of the city.

Now, it so happened that I had been present when those barrels were filled, had seen the excellent grading work and the care taken to reject culls, and I wanted to have a talk with that buyer and get information from him if I could. So, a day or two afterwards, I went to his place and priced the apples, then being sold, and found by rapid calculation that they were being retailed at $9.60 a barrel. Quite a difference that. Then I told the retailer that I had seen the apples packed, and asked what he thought of them. He was enthusiatic about the fruit as it turned out, but plainly said that he didn't believe the label when he read it. "If I had thought that label true," said he, "I would have been willing to pay $5 a barrel."

That was food for thought; and I resolved again to do some investigating. So I wandered around among grocers in that section, and then took a car and found another section, and so on. For several days, I visited retailers to get their point of view on the apple question. With one voice the retailers told me that it was impossible to find a barrel of "straight packed" apples in the open market; that after you get below the second layer the balance of the barrel is composed of ungraded apples, largely of culls, often of apples that are partly decayed,—stuff that should never see the inside of a barrel. Several men opened barrels to show me, dug into the middles and invariably there was the same shameful story,—a handsome front and a rotten filler, the first two rows specious enough, the balance any old thing that happened to be within reach when the packing was done. Sometimes you had to dig below the second row to get facts but not usually.

Then I went back to the commission men and talked with a good many of them, and got the same story. The most hopeful of the lot put the good packing at 5 percent and the dishonest packing at 95 percent; others would not admit such a high proportion of honesty. I hold no brief for the commission man; but, were I in his place, I think I would also be inclined to hurry over the job of selling such stuff and would feel little sympathy for the woes of the shipper. The retailers told me that they would gladly pay from $1 to $1.50 a barrel more for straight-packed apples rather than take their chances "on the street." The commission men told me that growers who put their names and addresses on their barrels and consistently packed sound fruit, of a uniform size, very soon put their fruit in a class by itself, and got fancy prices.

Nor, after mature consideration, did it seem to me that the retailer is so blameworthy as he seems to be at first blush. There is a big difference between that $3.20 we got and the $9.60 the retailer got; but suppose our apples had been of the usual character of packing. He would have received at the rate of $9.60 a barrel for the first two layers; and from that time on he might have had a hard time to make a reasonable profit, by culling, throwing out and regrading.

Last year I had a chance to watch the sale of apples at retail where, side by side, well graded, sound apples were offered at 40 cents a half peck, and ungraded, bulk apples of the same kind, were offered at 25 cents. It was highly illuminating to see the housewives pass by the ungraded and unattractive stock and pay the higher price for the better stock. The difference was 15 cents a half peck. The grocer figures on 11 pecks in retailing a 3 bushel barrel; so he was getting $3.30 more a barrel for the fine stock than for an equal amount of the poor stock, which paid him a handsome profit above the extra cost of the good fruit.

The ungraded stock was full of runty apples, many were wormy, some badly specked and many blotched with the mildew that attacks uncared for Baldwin trees. Now, as a matter of fact, the housewife was getting a larger net quantity of apple meat from the good apples at the higher price than she would have gotten from the same amount of money spent for the poorer apples, and she was getting meat of high quality, capable of being made into tasty pies and sauce, instead of getting meat from partly decayed, wormy and mildewed stock. And I rather think she was aware of the fact. At any rate, it was highly educational to me to see how uniformly the poor fruit was passed by and the good taken and it was equally enlightening to the grocer. For I had placed the barrels with him on an agreement that he make this side by side test, at the prices named, and promised I would take back all apples he did not want. Of course, instead of turning back apples, he laid in a larger supply.

The whole business of marketing fruit is suffering from the common practice of those marketing it; and it is high time that in this country, as in Canada, all dishonesty be made a punishable offense, or at least some method be determined for the protection of fruit honestly packed and graded in its competition with that which is intended to deceive the retailer and the consumer.—Abram Bunn, Bedford Co., Pa.

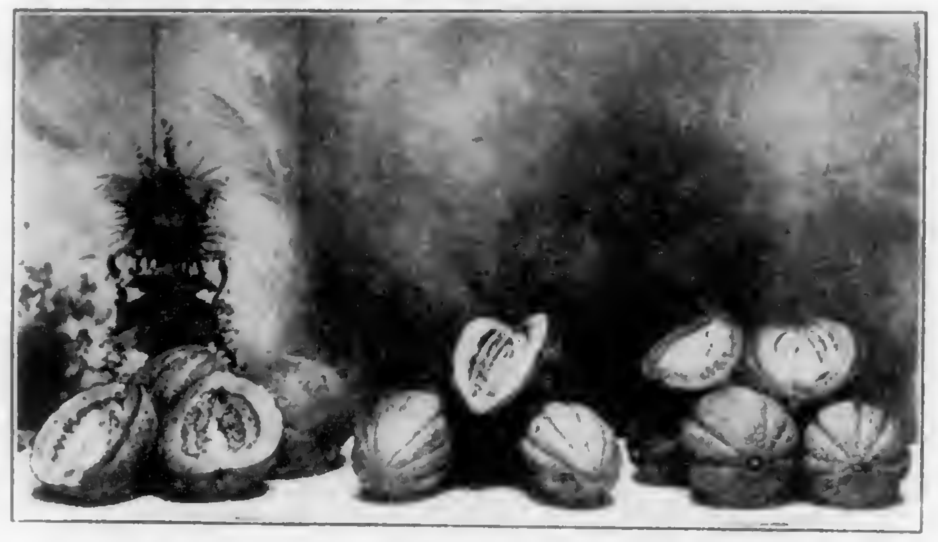
CANTALOUPE GROWING

Many who try to produce cantaloupes lose sight of the factors that must be considered in order to grow melons of good quality and high flavor. Briefly, these include a good variety and tested or pedigreed seed and soil of proper constituency. Sandy loam soil with a well drained or porous subsoil is essential for the best results. The soil should be fairly deep and well filled with humus making material and a southern or southeastern exposure is best. The cantaloupe is a hot weather plant and will not do its best when located where cold winds sweep over it or where heavy cold rains saturate the soil shutting out air and warmth. The soil, too, must not be acid in any degree. It must be neutral or slightly alkaline; hence if there is any doubt in that direction lime should be used when preparing for this crop.

Sunlight is a prime factor in producing high quality fruit. The only reason that the cantaloupe grown in Colorado or Arizona is of better flavor is because of abundance of sunshine and absolute control of water supply. When it is remembered that sunshine is a prime factor in the formation of starch and sugar its beneficial effect can readily be understood.

In the humid climate of the east we do not have continuous sunshine, hence the grower must make conditions as near ideal as possible. This can be done largely by feeding.

The plant does a great part of its work thru the leaf with the aid of the sunlight. The eastern grower should strive for a large leaf surface so that the plant can do more work in the way of manufacturing sugars and succulence with the amount of sunshine that is available. This can be accomplished almost any season by feeding.



UNIFORMITY OF SIZE, SHAPE AND QUALITY SPELLS PROFITS IN CANTALOUPE GROWING.

After selecting the site for the cantaloupe planting broadcast the area with composted stable manure before plowing, preferably a month or six weeks before, so that the late frost and spring rains can separate it. If there is no cover crop growing on this site it is good practice to run the disc or cutaway harrow over the ground and thus mix and incorporate the manure with the soil. It helps keep the soil loose and aids it in retaining moisture. The plowing, harrowing, etc., should be thoroly done. Mark out rows from east to west unless the check row system is to be used; but in either case the row at planting time should run from east to west. After having placed some high grade fertilizer in the hill or row, make up rows by plowing two furrows together like a pitch roof of a building.

Soak about half the amount of seed necessary for a field in warm water for 12 hours. Drain off the water and keep the seed moist and warm for 24 hours longer when most of them will begin to open. Now add an equal number of dry seed and mix the whole together. In sowing, insert the foot with toe pointing upward into the south side of the furrow, being careful not to break thru the back or north side. Press lightly and remove the foot, then sprinkle in about a dozen seeds. Half of these seeds are dry and half are ready to sprout. Cover with about 1 inch of soil. In this way there are two plantings with one operation on the south side of a little ridge and at an angle if done correctly. Now when the sun shines it is warmer where those seeds are than if they were planted in a flat opening because the rays of the sun strike the earth at almost right angles. Furthermore if heavy rains occur most of the water runs off in the furrow. We have known melons planted in this way to come up perfectly after going thru a two days' heavy rain, while if these same seed had been planted level they would have rotted. We have also seen the ground frozen on the north side of these ridges after seeds were planted without the vitality of the seed being affected.

About 400 lbs. of fertilizers rich in nitrogen, say a 5-8-5 formula, should be used and the seed mixed well with the soil before planting. At the time of thinning the plants, which should be done as soon as natural leaves appear, make an application of nitrate of soda and hoe in, using about 100 lbs. per acre. This is to stimulate vine growth and make the vine vigorous. About the time the plants begin to make runners side dress with a fertilizer analyzing about 2-10-8 using 400 or 500 lbs. per acre and work it well into the soil. This is to furnish the mineral matter the plant will need a little later. At the last cultivation side dress again; using at the time two forms of nitrogen preferably nitrate of soda and ground fish scrap or blood. We prefer to use 2 lbs. of the soda to 3 of the organic material, whether it be fish or blood. In the absence of both fish and blood a high grade tankage will do.

Cultivation should begin as soon as plants are thru the ground and sometimes before; that is, when plants are slow in coming up. It should be continued every week until runners are 3 feet long and fruit set. This last cultivation must be shallow and the side dressing discussed above applied and worked into the soil. A good hand hoeing should follow the horse work at this time and the vine should be handled with care.

There has been a tendency among growers of late years since the Rocky Ford cantaloupe became so popular to plant that strain or variety. This is a mistake. It is not the variety that makes the Rocky Ford melon famous for its flavor, it is environment. As mentioned elsewhere in this article it is perpetual sunshine with control of the water supply. When seeds from the original Rocky Ford locality are planted here in a humid climate they fail sometimes the first season and never later than the second. That has been our own experience and also that of many growers with whom we have conversed. It is far better to stick to the type of melon and varieties that have proven a success in the east or along the Atlantic coast.

Where a large melon is desired the old "Hackensack" or "Long Island Beauty" are among the best. Among the medium sized melons that are desirable are the "Shippers Delight" and various strains of that type of melon. The Fordhook is a very good variety originating in Southern New Jersey. This is one of the salmon fleshed sorts very popular with some people and in some markets. There are other varieties not mentioned, probably just as good.

The accompanying illustration from a photograph taken of a group of hybrid cantaloupes grown on the writer's farm shows quite clearly what has been done and also indicates what can be done with the cantaloupe when the breeder goes to work. This melon is a cross between the Montreal Market and a French variety. The melons shown in the picture are the first generation after the cross. Those in the group to the left resemble the Montreal parent. Those to the right resemble the French parent. Those in centre are true mongrels as they appear and yet a good melon may be bred from some of them. The group to the left are the poorest of the lot. Notice what a large centre or seed cavity they have and how thin the flesh is. Now observe the group at the right with their uniform shape, thick flesh, small seed cavity and we can truly say of equisite flavor.—C. C. Hulsart, Monmouth Co., N. J.

TRELLIS SUPPORT FOR PEAS AND BEANS

We have found after several years of experimenting that all ordinary field and garden peas, except some of the dwarf varieties, bear or produce from one half to double the amount of peas if they are trained while young to some kind of a support made and designed for this particular purpose. As peas untrained usually grow, they will very soon sprawl out in a dense, matted mass, crossing and intervining, until no sunlight or air can freely penetrate the tangled mass. Where these conditions exist no crop of any importance can be grown, as sunlight and free circulation of air in and around vines are two vital necessities in producing crops. When deprived of both sunlight and air, the vines like potatoes, in a dark, warm, cellar will grow an abnormal amount of stems or vines to the exclusion of blooms, consequently we do not get nearly so many peas. These same conditions will also apply to many varieties of pole beans that have a thick, dense growth, and should be guarded against.

While sticks and brush to a certain extent will answer the purpose, we have found this method of support very unhandy and an old out-of-date method of training the vines as compared with some of the later methods. We find the ordinary woven wire 2x2 inch mesh, poultry netting from 36 to 40 inches in width is the best thing we have ever used. Directly over the center of the planted row of peas, this is pulled tightly and fastened to small but rigid stakes driven in the ground along the row, about 3 rods apart. This netting can be fastened to the stakes so that a free space of about 8 or 9 inches intervenes between it and the row directly underneath the netting. The peas soon grow and take hold of this netting. Peas and beans do best if drilled or planted in rows running east and west, as then more or less sunlight strikes both sides of the vines all thru the day. After they have ripened and have been picked, the netting is taken down and as all the vines hang to it, we simply run a small stick or a bar of iron thru the roll, suspend it over a quick blaze, when the vines if in a dry condition as they should be, will quickly burn from it. The heat being of short duration does not spoil the wire. The netting is then rolled up and is clean for next season's use.

This method will be found very convenient where one raises peas and beans on small plots of ground and in the garden for home consumption.—Mrs. H. W. Swope, Montour Co., Pa.

The Effects Of Fertilizers In A Cultivated Orchard.—That "the investigations which have been conducted up to the present time on the problem of maintaining soil fertility in the apple orchard, lead to but one general conclusion, viz: That it may or may not be necessary to use commercial fertilizers," is established by New Hampshire Experiment Station bulletin 168 from Durham, N. H., which makes interesting comparisons.

Better Cultivation

Increases the yield. It retains the moisture in the ground and permits the chemical properties of the air to get to the roots. The size of the increase depends upon the number of times you cultivate and the kind of a machine you use.

IRON AGE

RIDING CULTIVATORS

Carry every possible adjustment of teeth, gangs, wheels, frame, etc., to care for all row crops in any kind of soil. They are built with high or low, pivot or fixed wheels, grooved, flat or zig-zag gang bars, for one or two rows and with many attachments for special work.

See them at your dealers and ask for booklet "100 Percent Potato Planting."

Don't Let Smut Ruin Your Crops

when you can prevent it by a simple method of treating the seed. Don't let disease rob you of a valuable horse or cow when a simple remedy applied in time will save it.

Learn how other farmers have stopped these little losses that make big holes in the year's profits. What they have done YOU can do.

THE I.C.S. FARMER'S HANDBOOK contains 380 pages of money-making ideas and pointers gathered from the experience of the most successful farmers in the country. A few of the subjects treated are:

Soil; Drainage; Fertilizers; Farm Crops; Fruit Culture; Sprays; Gardening; Truck Farming; Vegetable Crops; Livestock; Feeding; Diseases; Judging; Dairying; Bacteria; Absorption of Odors; Testing and Keeping the Records; Bee Keeping; Implements and Machinery; Agricultural Tables; Seed Required per acre; etc.

THE I.C.S. POULTRY HANDBOOK is another valuable book you should have. It contains 313 pages and 95 illustrations and treats of House Construction; Feeding; Incubation; Breeding for Eggs, Market, and Show Purposes, Enemies and Diseases; Judging; etc.

SPECIAL OFFER. These books bound in cloth, 3¾×5¼ in. in size, sell for $1.25. But, for a limited time, we offer to those mailing the coupon below *either* of these $1.25 books for only **50c**

The Dairy

ROUGHAGE FOR THE DAIRY FARM

The amount of roughage a farmer has in the fall determines the number of animals he can winter. He is an improvident farmer who has to buy large amounts of roughage because one of his objects of keeping cows is to make a home market for his crops. It is only on specialized "Dairy Farms" where breeding is one of the chief aims that it pays to buy hay or other roughage.

The average dairy farm should produce all the roughage and half of the grain consumed by the animals. To do this it is necessary to grow special crops or have the crops arranged in such a rotation that they will give the largest amount of rougaage. There is no one rotation that can be recommended indiscriminately to the dairy farmer of Pennsylvania, for his locality, elevation and soil may not be adapted to growing one or more crops in any rotation that would be given. But notwithstanding this there are several crops which are indispensible to the dairyman, namely corn and clover.

Corn is King in Pennsylvania for there is no locality in the state so cold that if corn is given the right cultural treatment it will not out-yield any other forage crop; and with a silo to put it in, no crop has a higher energy value for feeding. The many uses to which the corn plant can be put commends it to the dairyman as the first and best roughage crop. It can be cut green for soiling, almost mature for silage, mature for grain, and the stover used for feeding or bedding purposes.

Clover is a roughage that supplies large amounts of first class feed rich in protein (an element of great value to the dairyman), and the farm that can not show a clover sod had better look for two things: Poor drainage or acid soil. In many districts of the state more alsike clover is planted than formerly. Why? Alsike clover will stand more acid in the soil and also a wetter soil. Most of our farm land needs one ton of burnt lime or two of stone lime every three or four years, to sweeten the soil and assist in nitrification.

Alfalfa is a better roughage than clover and will grow any place in Pennsylvania that is not too wet or dry to grow other crops and conditions are made right for it. These conditions are well-drained, fertile soil limed, inoculated, made free from weeds, and given good seed.

Oats and peas are also a good roughage. They have the advantage of growing on our lighter soils and the peas, like all legumes, are nitrogen gatherers, having a beneficial effect upon the soil. They are usually sown at the rate of 2 bushels of oats and 1 bushel of Canadian peas per acre.

Soy Beans as a roughage have just began to receive consideration. They, like other legumes, are rich in protein besides their beneficial effect upon the soil. While they do not enter largely into our rotations as a roughage, they certainly have a place on every farm that has a silo. In many instances they are planted with the silage corn and cut with the harvester, or they can be planted in a separate field and cut with a mowing machine; then in filling the silo use two loads of corn to one load of soy beans. As hay they have not been much of a success as they are hard to cure.

In the northern part of the state much rye is planted in the corn at last cultivation, or harrowed in after potatoes. It is cut for hay or grain the following summer. Its feeding value is low and would be much increased if winter vetch were sown with it, using ¾ bushel of rye to 1 bushel of vetch. There are only about 3 days in the life of rye when it is fit to be put in the silo; that is just when the heads show. For that reason rye can not be recommended for that use.

If after haying the farmer thinks he will be short of roughage some ground can be put in millet, cutting before any severe frost. Flat turnips can be sown in the last cultivation of the corn and several tons of good dairy food secured. They must always be fed after milking. A rotation of corn and clover is followed on some farms. In the last cultivation of the corn, clover seed is sown. Then in the spring, when the ground is frozen, drag a plank or iron rail over the field to break off the stubs. This rotation has several advantages. It secures the largest possible yield of roughage and at the same time cultivates the ground often, with the added advantage of having the ground covered at all times with some crop, one of which is a nitrogen gatherer.—L. C. Tompkins, State College, Pa.

AMERICAN JERSEY CATTLE CLUB

The American Jersey Cattle Club has registered the pedigrees of 430,400 animals, about 133,000 of which are now on the farms of the United States. The club has 532 members out of the 12,000 owners of Jersey cattle in this country. Of these members about 100 assembled at the club's headquarters in New York City on May 6, for the annual meeting. E. A. Darling, president of the club reported conditions as most favorable for the Jersey breed and commented on their growing popularity. Registrations increased last year 3,655, transfers 4,777, revenues $9,325. Likewise there was an increase in membership. But to an onlooker it appears that something is hampering the growth in membership. Mr. Sisson, of New York, one of the clearest-headed members of the association, voiced what seems to us to be the policy that should be adopted, namely, to start a campaign for 5,000 new members. "Interest these breeders," said he, "and let us not be too conservative." It would seem that a membership of a little more than 500 out of a total of 12,000 owners of Jerseys, is too meagre. If the club possesses advantages for 500, why not for 5,000?

SOY BEAN GROWTH IN BRADFORD CO., PA.

The report of the committee on fees and revenues was discussed and voted upon. The committee had reported in favor of increasing the fees for registration on males "as too many poor ones are now being registered." Last year's registration shows 8,074 native bulls to 17,233 native cows. It was proposed by the committee to make that fee $5 instead of $1 to members and $2 to non-members. This was approved (to be summitted to mail vote) "in all cases where record of birth had not been filed and in all cases where the animal is over two years old at date of application." But in case the date of birth and other required particulars had been filed the fees were made $1 to members and $2 to non-members. The same fees apply to females. Also in regard to transfers the committee recommended a fee of 50 cents while maintaining the $1 penalty fee to encourage prompt record. This was approved. Duplicate certificates will cost 25 cents each.

A proposed amendment to the effect that fees on importations from the Island of Jersey should be $10 for all animals that had met the required registry of merit tests, and $25 for all others failed to carry. The Board of Directors will investigate conditions with reference to the feasibility of placing a fee on such importations based on the test records made by cows on the Island.

The following proposed amendments to the By-Laws will go to members for mail vote: Permitting the change of names of animals which have not been printed in the Herd Register providing application to make the change has been made to the secretary within a year and a fee of $5 has been paid; concerning the use of numerals in names which must be used in sequence with the dates of birth; refusing to register animals under names that are misleading or profane; requiring that twins be registered at the same time "unless one of the twins is dead and the death has been reported to the club"; empowering the Executive committee to instruct the secretary to register an animal in case of the refusal of the owner of the sire or of the breeder of an animal to sign an application for registration, etc; requiring the seller of an animal to furnish a certificate of transfer on forms provided by the secretary without cost; permitting agricultural colleges and experiment stations to enter herds of Jersey cattle at the same rates as paid by members; providing that animals owned but not bred in Canada may be entered in the A. J. C. C. Herd Register if they were imported from the United States, the Island of Jersey or Great Britain, and animals bred, or both bred and owned in Canada, to be eligible to entry here must be the progeny of animals already entered, or being already entered in the Canadian records, must trace an unbroken line of registration either to ancestry in the A. J. C. C. Herd Register or to animals entered in the Island of Jersey Herd Book; abolishing the requirement that the letters "A. J. C. C." be tattooed in the ear of each imported animal; empowering the Executive committee to appoint a representative to visit any herd for the purpose of inspecting the records kept.

The more important suggested amendments to the Constitution that were approved, were as follows: Providing for the holding of special meetings of the club outside the state of New York; permitting the voting of proxies by members of the club only; requiring that applicant for membership in the club shall be an owner of Jersey cattle, and if "five of the total votes cast (in an election to membership) are negative, the candidate shall not be admitted to membership, except by the unanimous vote of the Board of Directors."

The following officers were chosen for the ensuing year: E. A. Darling, president; H. S. Redfield, vice-president; John P. Hudson, treasurer; B. M. Gow, secretary. At the banquet held at the Manhattan hotel on the evening previous to the annual meeting addresses were delivered by Dr. W. O. Thompson, of Ohio; Dr. L. H. Bailey, of Ithaca, and Prof. F. C. Minkler, or New Jersey.—D.

WHEN GRASS SEEDING FAILS

Recently a number of inquiries have come to me relative to new seeding that did not catch well. It is now rather late to answer these thru the paper in time to do much good for this season, but discussion of such points stay with us best when we have the disappointment on hand. In one case the seeding is so very poor that it is hardly worth while to try to save what is left. Something will grow, but not enough good grasses to make it very good feed. I advised the farmer to plow up the field, fertilize, and sow to oats and peas. This he said he could not do as he was engaged in work that required all his time, and he could not afford to hire it done. The next thing might be to harrow just as soon as it is possible and not cause the soil to lump, sow lightly to oats or barley, using some fertilize, and sow to oats and peas. top, alsike and red clover. The question was asked whether it might not pay to sow on grass seed early without a crop. I have done this just as the frost was coming out of the ground or early just before a rain, and have it do fairly well; but that was where there was a fair stand of plants already present. There were so many that there would have been a fair crop any way. In the case of the farmer mentioned I do not think I would advise the plan.

Another case is of a lot that I'll not make a better showing, but where the field was well manured last season. Here the owner thinks he will harrow and seed with grass but with no crop. I fear that in this case he will get too many weeds, so I advised him to harrow thoroly use the oats and grass seed, and if he feels so disposed, apply 300 lbs. of fertilizer to the acre. I would use a complete fertilizer, but some are getting good results with nothing but acid phosphate. It is possible that where lime has been used the acid phosphate might give better results than where lime has been omitted.

There is one older field that I know where the soil is fair, but where some of the plants have killed out, leaving almost bare spots. My idea is to sow seed and go over with the spike tooth harrow. The field has been top dressed and it is not desired to plow it for a while. I find that a stand of grass can be maintained in good ground for some time by top dressing and seeding early so as to allow the storms and the frost, in some cases, to work the seed into the ground. It is also something of a help to harrow in seed under favorable conditions. All this is for the large class of farmers who desire to keep a long rotation and not plow so much as is commonly advised. For a farm using a short rotation this may as well be disregarded. The short rotation however is not the common practice, but rather the exception.—H. H. Lyon, Chenango Co., N. Y.

NEW YEARLING CHAMPION

Lucky Farce, a Jersey yearling owned and bred by the International Correspondence Schools' Demonstration Farm at Dalton, Pa., recently completed a year's test for production in which she broke the world's yearling record for the Jersey breed. In twelve months Lucky Farce produced 14,260 pounds of milk and 634.45 pounds of butter fat—the equivalent of 745 pounds and 6.7 ounces of butter, estimated on a basis of 85 percent of fat. The test was authenticated by the Pennsylvania State College, for the American Jersey Cattle Club.

The little wonder began her work on March 1, 1913, and finished it for the year on February 28, 1914. When the test began, she was 1 year and 11 months old. She was bred on August 29, 1913—so she carried a calf during six months of her test.

Lucky Farce made an authenticated weekly test of 10.216 pounds of fat—the equivalent of 12.02 pounds of butter—for the last week of her year's test. Her year's record of 14,260 pounds of milk and 746 pounds 6.7 ounces of butter is easily the world's yearling record for the Jersey breed.

LUCKY FARCE, CHAMPION YEARLING.

She is exceeded for milk production under authenticated club test by just one Jersey under 3½ years of age—and this cow's record exceeds Farce's by but 253 pounds 2 ounces. In butter production, Lucky Farce has been excelled by just 3 Jersey cows under 3½ years of age.

Lucky Farce was milked 3 times a day during her test—otherwise she had exactly the same treatment as the other members of the herd. She had no box stall to run in, but was fastened to a stanchion thruout the year. Her feed was a grain mixture consisting chiefly of beet pulp, hominy, gluten, distiller's grains, cottonseed and linseed meals, with alfalfa hay, ensilage, and green peas and oats for roughage. She was not pastured at all during her test.

Lucky Farce is an intensely line-bred Jersey. She is a remarkable exemplification of the law that like breeds like. Her sire and dam are respectively grandson and granddaughter of Golden Rachel's Prince, 60386, the sire of Rachel Cute, 202,500, whose record was 15,162 pounds of milk and 815.2 pounds of butter. She traces 50 times to the great cow Coomassie, premier dam of the Jersey breed; 17 times to Eurotas, a noted dam and the first cow to make a record of over 700 pounds of butter in a year—her year's record being 778 pounds 1 ounce of churned butter; 10 times to Golden Lad, the greatest sire the island of Jersey has ever produced.

BEST FEEDING CROPS

Every dairy farmer should grow as much of his own feed as possible. In our section we can grow nearly all the feeds necessary if we give care to selection, but it is safe to say two-thirds of our farmers buy nearly all of their concentrates. I have found by experience that the following crops do well with us and save much on grain bills.

Corn naturally leads. We always plant enough to fill and refill our silos. If any is left over it is shredded and the stover used as dry feed. The corn is ground on the cob and saves on the feed bill. Canada field peas and oats make a fine combination, when sown at the rate of one bushel of peas to two bushels of oats. We drill in the peas about 4 inches deep, and a week or ten days later we sow the oats about two inches deep.

During the past two years we have used Canada field peas, oats, barley and buckwheat. When these grains are ground and fed in conjunction with silage and clover hay, at the rate of one pound of grain to 3 to 4 pounds of milk produced, there is little need of buying concentrated feeds. Cow peas and soy beans sown together in equal quantities some time in June do fairly well here. We cut this mixture with a grain binder and put one load of the combination with each two loads of corn into the silo. The resulting silage is very good. I am also trying to grow alfalfa but have not succeeded yet. Will try again this year on about 8 or 9 acres.—Joseph Fischler, Tioga Co., Pa.

Testing Milk And Cream For Butter Fat.—Circular No. 42 of the Indiana Experiment Station, mailed free upon request from Lafayette, Ind., has for its purpose the supplying to the milk and cream producers accurate, concise and understandable directions for testing milk and cream in accordance with the most approved and practical methods of using the Babcock test. This circular should be invaluable alike to the large or small dairy operator.

The Storage And Use Of Soil Moisture.—The Nebraska Experiment Station has just issued Bulletin No. 140 on "The Storage And Use Of Soil Moisturo." It treats of the possibilities of storing water in the soil during certain periods by summer tillage, disking, plowing and mulching, these various methods being compared. The bulletin is mailed from Lincoln, Nebraska.

DAIRY CATTLE

Meridale Jerseys

Meridale Jerseys are increasingly attracting the attention of discriminating breeders—the men who like good-looking cows, but who also put emphasis on production. The Meridale herd comprises several families of just such cows.

A new issue of our little booklet, entitled "Meridale Jerseys," describes them and their progeny quit fully. It will be sent on request. Address

PROFITABLE SUMMER PASTURE FOR THE PIGS

(Continued from page 1.)

plant for this purpose which can be sown on eastern farms. In the Iowa experiments to which reference is made, rape made a very satisfactory showing in comparison with other pastures. In figuring on the cost of gains made, the cost of growing the forage crops was estimated as accurately as possible. The cost of growing an acre of rape, for instance, was estimated at $9.02 where sown broadcast, which includes $6 per acre for rent of land or $10.35 per acre where sown in drills, with the same allowance for rent of land, the amount of seed sown being five pounds per acre in the one case and 2.5 pounds in the other. With this estimate placed upon the cost of an acre of rape pasture, it was found in an average of four trials that the total cost of 100 pounds of gain in spring pigs pastured on rape and fed a supplementary ration of corn and meat meal was $3.82 per hundred weight with corn at 50 cents per bushel, and $4.41 per hundred weight with corn at 60 cents per bushel. On this basis the average value of an acre of rape pasture for four years was estimated at $81.29, or figured in the price received per bushel of corn, the return for corn fed on rape pasture was 87 cents per bushel with hogs at $6 per cwt.

FINE FORAGE IN DWARF ESSEX RAPE

Oats, Peas and Rape a Good Combination

If it is desired to sow a combination of plants, oats, peas and rape sown at the rate of a bushel of oats, a bushel of peas and three pounds of rape seed per acre will make a good mixture. The average results secured from this combination in the experiments above referred to indicate a cost of $3.92 per hundred pounds of gain with corn at 50 cents per bushel, and $4.51 per hundred pounds of gain with corn at 60 cents per bushel. While this is a somewhat higher cost of gain than for the other pastures mentioned, the per acre value of the pasture was greater, being estimated at $86.56 per acre with corn at 50 cents per bushel and hogs at $6 per cwt., while the average price returned per bushel of corn on this pasture crop was 84.9 cents per bushel.

Cost of Gains without Pasture

Now, to appreciate the advantages of growing pigs on pasture crops, it is not only necessary to have figures with regard to the cost of production under these circumstances, but also the relative cost of pigs fed without pasture under similar conditions. The average cost of gains in two check lots which were fed without pasture in this experiment was $5.17 per hundred pounds of gain with corn at 50 cents per bushel and $5.94 per hundred pounds of gain with corn at 60 cents per bushel. It will thus be seen that while a small profit might result from the production of pork with hogs at $6 per cwt., and corn at 60 cents per bushel under ordinary feeding conditions, that this profit can be increased materially by providing suitable summer pasture crops for the growing pigs, and that the land devoted to this purpose will return, aside from its rental value and the cost of the crop, a handsome profit, which will probably be far greater than the average per acre profit derived from the balance of the farm which is devoted to the regular crop rotation.

The average number of pigs per acre pastured on the different crops in the experiments above mentioned, varied according to the crop used and age of the pigs, from 12 to 30. Experiments were made with various other crops, but the results were best in those above given. It was found, however, that rye was a valuable forage crops for pigs in early spring or late fall and can be used to advantage in connection with other supplementary pasture crops for early and late pasture.

Pasturing of Older Hogs Not So Profitable

It is interesting to note that in this series of experiments it was found that no such economy in gains was secured from the feeding of older hogs on pasture crops, the average economy in gains not being sufficient to pay for the cost of the forage crops in the feeding of fall pigs of the previous year. It may thus be concluded that it will pay a very good profit on the investment to provide a suitable summer pasture crop for the spring pigs, to be supplemented with a suitable grain ration but that the fall pigs which are being fattened should be confined to a more limited pasture range or be fed in a dry lot with a suitable variety of grain feeds supplemented with a little alfalfa or clover hay if available.

The illustrations accompanying this article show the thrifty appearance of pigs pasturing on rape and peas and oats. By a judicious combination of suitable pasture crops and a properly selected grain ration, the pigs can be kept growing thriftily from the start, and will make their owners more money than if such provision is not made for them. The crop used for pasture and the method of growing it should depend upon local conditions. Ordinarily, rape sown broadcast, or peas and oats sown alone or in combination with rape will prove most valuable, or if only a small area is available for a considerable number of hogs, then it will pay to grow rape in drills and cultivate as illustrated herewith. In any event, it will pay to provide a suitable pasture crop for the pigs in a conveniently located hog lot, if they cannot be run on a clover or alfalfa pasture or in fields of clover or alfalfa which will be cut for hay.

The trouble with your roof disappears and doesn't come back when you lay Genasco roofing. Genasco doesn't crack, rot, crumble, or leak from the fiercest assault of any weather.

Earth Road Problems

THE POST OFFICE AND GOOD ROAD MAKING

At the present time, when the national government is doing so much to protect the country from the evils that are causing destruction, why can not the people who are advocating good roads also have the help of the federal government? Over $4,000,000 have been spent fighting the brown-tail and gipsy moths. Five millions is the cost of fighting the boll weevil in the cotton belt, and over $2,000,000 have been spent trying to eradicate the cattle tick. This money has been well spent, but it does not reach such a large constituency as the road problem.

The vote of the people of Pennsylvania clearly shows that they do not trust the highway officials and will not put $50,000,000 in their hands to be spent on roads. The Governor of New York is holding up the work of road building in that state until it is proven what is the best and in the long run the most economical road to build. But while we are waiting for the "best road" to be developed, why can we not have now the best road possible under existing circumstances? The Pennsylvania Farmer has consistently advocated the use of the King road drag. Where it has ben intelligently used it has produced good results. But in many parts of Pennsylvania it has not been used at all.

In some parts of the state roads built by the state at great expense have proven most unsatisfactory. One reason has been because the state road has followed an old highway which ran across the hills instead of following a uniform grade by going around them. The load a farmer can take to town is determined by the hardest hill on the haul. When the improved road is made with an asphalt surface, it becomes so difficult for the horses to get hold that there is little or no improvement over a dirt road. In many instances if the dirt road was properly dragged it would be better than the "State road."

Just at this time we are suffering from undragged roads. The state has taken over the roads and in some instances has told the townships to keep "hands off." The state does not drag the road and so it happens that at this time of the year, when the road should be in good condition, it is almost impassible. The rural mail carrier has difficulty in getting over his route, because of mud and holes. The township roads are no better and for the same reason. There is one department of the federal government which has it in its power to give us good country roads the year around except when the frost is coming out of the ground in the spring, and that is the Post Office Department. If the head of the Post Office Department should rule that the rural mail should not be delivered more than once or twice a week except over such routes as are properly dragged, it would have a magical effect on our road question.

The people have become so attached to the rural delivery that if they did not have a daily mail they would soon know why. They would demand that the roads be properly cared for and when this was done they would be surprised that they had ever been satisfied with any other. It would be like the soda makers of England who allowed the muriatic acid which was produced in making soda go up the chimney and escaping into the atmosphere kill all surrounding vegetation. The government compelled them to abate the nuisance and when they passed it into water it became a valuable product for which there was a ready market. In the same way the government could help the farmers improve their condition by withholding the mail until the community showed that they appreciated the government's efforts by providing good roads. Roads are and must always be a community proposition. State laws may regulate, but it is the local community spirit that influences standard of local road work.—W. G. O., Union Co., Pa.

WATER ON OUR EARTH ROADS

To maintain a good dirt road two things are necessary: First, to keep the water off the road in order to maintain the hardness of the ground and, second, to form the road so as to make a smooth track. In olden times the whole stress was laid upon the former proposition. Side drains were shoveled out to carry the water that accumulated, and at short intervals, especially where there was grade, turnoffs or breaks were made to prevent the water from following the wheel tracks. The smoothness of the road was a minor consideration. The dirt was thrown out roughly and unevenly, to be worn down by the teams that used the road. The breaks were made with an almost perpendicular front not because that was a good way to make a track for a vehicle but because it would turn water.

While that plan of dirt road building cannot be defended, it cannot be denied that it did keep the materials for making a good road in place. Any one who has observed the large amount of erosion that has taken place since the adoption of improved road machinery must realize that one of the beauties of riding thru the country is being lost because our roads are getting deeper and deeper very rapidly, so that on the grades, especially, they are often as high as the body of the carriage. It is not hard to see how this state of affairs came about. Years ago when the road scraper first came into general use, it was so easy to cut thru the break, in fact it was hard to keep from doing so, and as a consequence a smoother road was obtained but one that was more subject to the ravages of flood.

It is a well-known law of human thought that in a concert of opinion especially, men's ideas go from one extreme to the other. This general law has not been broken in regard to dirt road making. Once almost the whole attention was given to the control of the water on the road, and the contour of the road got little thought; next thing all the care is centered on the form of the road and the water is allowed to not only destroy the form of the road but also to carry away the very materials out of which the road is made. So far have we gone in this direction that our state legislature has passed a law against these turnouts in the roads.

That brings up the question as to whether this is a proper development in dirt-road economy. We all know that the question of controling the water on our roads is one of the greatest problems in connection with the whole subject. One thing is sure, we do not want to go back to the "thank-you-mams" of the old style of road construction. Neither do we want to continue to be subject to the tremendous expense that follows every large flood and the while to see our highways become gullies in which the out-cropping bed rock makes a condition second only in meanness to a corduroy road. We do not want any sweet potato rows thrown across the road to turn the water out of the wheel tracks, neither do we want to continue the process of filling in trenches down the middle of the track with horses' feet or wagon tires.

There is a sensible middle course in this case as in most others. We simply have to get back to the natural laws that control these matters. In the first place the public highways were never intended to be the water courses of the community. It stands to reason that the public road, always bare, will naturally wear away faster than the fields adjoining, where there is, most of the time, an abundance of roots to prevent its being carried away. It is essential that the water be taken not only off the track but away from the road entirely. Sometimes this water will damage a field but that is no reason why the public should carry it, and if good judgment is used in turning it into the fields there would be little or no damage.

Then on the grades the turn-outs must be maintained; not the old fashioned break with a square front but simply a raise in the surface of the road high enough to cause any water that runs down the wheel track to be turned out into the side drain. Theoretically roads are not to have wheel marks in them, but practically they all do when a continued wet spell makes the surface work up under the wear of traffic. If these turnouts are made with a long inclined plane at each side they will not interefere with any kind of traffic, and they will keep the materials there out of which to make a good road. A King drag even is not much use where everything is washed away but the bed rock and the larger gravel. The legislature would have shown a better understanding of the laws of running water and of erosion if, instead of passing laws against turnouts, they had passed a law compelling supervisors to turn the running water off the roads. Supervisors would be glad of such a law as it would relieve them of the ill will they often get where they do use their judgment and turn the water into a man's field against his will.—John A. McSparran.

"For the land's sake, use Bowker's Fertilizers; they enrich the earth and those who till it."—Adv.

PURE PAINT
90c a Gallon and Up
Paints for all purposes. Made from finest ingredients obtainable. Marked at prices that show you a tremendous saving. Backed by strongest, most liberal paint guarantee ever given by a firm that makes its guarantees *good.* Guaranteed 100% pure; to be all that paint *should be,* in the can and on your buildings. Beautifully illustrated new Paint Book, shows house, barn, inside, carriage, wagon and floor paints in actual colors. Lists stains, enamels, kalsomines, oils, varnishes, brushes, tools, etc. Quotes new reduced prices. Gives helpful hints and valuable information for paint buyers. Send for it. It's *free.* Cut your painting costs. Secure positive paint protection.

WALL PAPERS
5c and up Per Double Roll
The most attractive designs and colors you can imagine. Different. More desirable. The best products of some of the world's best mills. Offered in our 1914 sample book at prices ⅓ and ½ lower than are usually asked for papers of equal quality.
Send for this big Free Sample Book. See the actual samples. Save ⅓ to ½ on your paper bill, or paper 3 rooms at the cost of 2. Learn how to make suitable selections. How to measure rooms, to make the best paste, to do your own papering easily and quickly. The Free Book explains all. Send now.

Groceries One-Third Less
Always at from one-fifth to one-third less when ordered from our cost cutting grocery list. *Often* at even a greater saving. Many rare bargains in this home grocery book. 33⅓c sayed on every $1—more than $3 on every $10. Think what this means on articles you *must* buy—sugar, teas, coffees, canned goods, everything used on your table. Means more than mere money saving. You secure absolutely pure, wholesome foods. Send for the latest Grocery list. Compare prices with those you have been accustomed to paying. Place a trial order. Do this at our risk. Every cent of your money refunded if not thoroughly satisfied. So send now for catalogue. Save ⅓ on living expenses.

Penrose and State College It is not our policy to discuss political issues or candidates except as they affect agricultural conditions or institutions. The publicity given to the activities of the football coach at the Pennsylvania State College in the interest of Senator Penrose in the primary campaign just concluded is directing considerable unjust criticism against the leading agricultural institution in the state. It is a splendid tribute to the efficiency and usefulness of the School of Agriculture in the state institution that the farmers of the state have come to look upon the entire college as their school, their particular branch of the educational equipment of the state. Feeling thus it is quite natural that the farmers should be jealous of the record of the institution and quick to resent any action which may compromise or misrepresent it in any way. The appeal sent by Coach Hollenback to the alumni of the State College to support Senator Penrose in the primary election because of what he has done for that institution met with prompt and vigorous protest. It was not only an insincere appeal for unworthy support, but it carried an insidious reflection upon the position of the institution which the great majority of the loyal alumni were quick to detect and prompt to resent. It must be admitted that any support which Mr. Penrose has accorded State College has been only such as any deserving state institution has a right to expect from its public officials; and if service was rendered for the purpose or with the intention of being capitalized to gain support to gratify his own personal ambitions, as the Hollenback letter would indicate, the sooner the college and all other state institutions are relieved of that kind of support, the better. But the chief concern is in the propriety of an attachee of a state institution using his position for such a purpose. It is extremely unfortunate that the college authorities could not have had the time or found it possible to make it plain at once that they were in no way responsible for the actions of their coach in this matter. In a recent letter to an alumnus, President Sparks says: "Mr. Hollenback is neither in the employ of the college nor under the control of the trustees. During a part of the year he has been employed by a committee of the alumni as football coach. * * * Mr. Hollenback used a published list of the college alumni which is open to anyone and I do not see how we could have prevented the action however much its wisdom was or is questioned." It is to be regretted that this position of the college could not have been made perfectly clear to everyone interested before the election was held. We are glad to give publicity to Dr. Spark's letter at this late date. It is further unfortunate that Mr. Hollenback's sense of loyalty to the institution which thus indirectly employs him was not keen enough to prevent him from taking such advantage of his peculiar connection with it.

Parcel Post Selling One of the first questions to come up to a farmer proposing to sell poultry, eggs or vegetables by parcel post is that of price adjustment. We have had inquiry from readers asking how they can keep posted on the current retail prices on such commodities. There are no regular avenues thru which such quotations can be obtained regularly. But it is doubtful if the retail price can ever be used as a satisfactory basis by which to regulate direct selling prices. In the first place, the retail prices fluctuate too much and are influenced too much by superficial conditions. Again the seller cannot hope to realize full retail prices from products sold in this way. The only hope for any satisfactory system of direct selling is mutual participation in advantages by producer and consumer. If the city purchaser must pay as much for products thus purchased as he would at his retail store or when buying of the dealer who delivers at his door, he will not buy. The price must be gauged to yield a saving to the buyer as well as to the producer; if the system is to succeed. This can be done by making something like an equal division of the margin now existing between the price which the producer receives in selling thru the ordinary channels and the price which the consumer has to pay when buying in the regular markets. This margin is wide enough to yield an attractive profit to both. In arriving at such a division, it would seem that the wholesale price would serve as a much more stable and satisfactory basis than the retail price. Butter fat has long been sold upon the basis of Elgin or New York quotations, and the arrangement has proved satisfactory to all parties. It would seem that a similar arrangement would serve with other commodities.

Contentment of Labor We make a departure from our regular policy in giving space to a lengthy quotation from a contemporary publication in the Farm Crops Department on the second page of this issue. We wish that every farmer might read and catch the spirit of that article. The satisfaction derived from the results of successful effort, as here portrayed, is a part of the compensation of every farmer whose heart is in his work. Many other lines of business offer greater financial returns and attract those whose chief ambition is to accumulate money—to merely shift dollars from the other fellow's pocket into their own. There are not big profits in farming as compared with returns from many other business enterprises, but there is plenty of opportunity for that honest pride and contentment arising from the possession of a dollar made in creative effort rather than $10 made out of a trade and shrewd manipulation. It is the contentment of labor honestly and conscientiously performed and the satisfaction of possession of things actually created, too often ignored or unappreciated, that makes for breadth of character and richness of living in farm folks not found in any other class of people. Contact with the world and its people adds polish, but interested and understanding contact with Nature in rearing the products of the soil gives a conception of the essential things in life and molds character that does not require external polish to give it solid worth.

STATE HORTICULTURAL MEETING

The Summer Meeting of the State Horticultural Association of Pennsylvania will be held at State College, Pa., June 17 and 18. The Association will be the guests of the Department of Horticulture and Experimental Pomology. At that time the experimental plots on the College farms will be in splendid shape and will afford interesting studies to all who are interested in experimental fertilizer work. The cover-crop and fertilizer work in the College Experimental Orchard will at that time show up the growth which each treatment is producing. A trip over the entire plant of the College will be arranged.

Dean Watts, M. G. Kains, Professor Elect of Horticulture, Dr. J. P. Stewart and Professor H. A. Surface of the State Department of Agriculture, and others will speak at the meetings. Routine business of the Association of interest to all members will be transacted at this meeting.

STATE CAPITAL NEWS

Forestry Work.—State forestry authorities are giving practical instruction in the methods of reforestation and care for timber adopted in this State, and also in removing stumps from pasture land. This work is being conducted at the State reserves in counties where people have been asking for instruction. Work in the Juniata valley has been commended by people who have observed the manner in which the state handles its lands.

Slim Road Prospects.—Prospects that about a million dollars paid in by owners of automobiles, etc., will remain tied up all of this year instead of being expended on the state highways are excellent at this writing. A series of lawsuits has been dragging along in the Dauphin county court and some remarkable examples of legal quibbling furnished. The Governor has sharply criticised the course of the auditor general and declared that the blame for the poor condition of roads is due to the man who holds up the funds with which to imporve them. Three mandamus suits have been brought to compel payment. The governor, attorney general and highway commissioner contend that the automobile license act makes it the duty of the auditor general and state treasurer to pay to the highway commissioner money realized from licenses. The auditor general and state treasurer contend that the act clashes with previous laws, but state treasurer is in the more favorable position of the two as he has interposed fewer objections to the carrying of the point at issue to the higher courts. An appeal to the supreme court is certain and a decision is not likely before fall. Meanwhile, the 9,000 miles of main highway go unrepaired. The whole miserable situation is due to the failure of the legislature to be explicit in its work. Perhaps the meeting of the State Board of Agriculture and Institute people at Stroudsburg can suggest some way out of the difficulty.

Traction Engine Rules.—The State Highway Department has decided to let the next legislature wrestle with the problem of regulation of the traction engines. Traction engines which were barred from the roads can now be licensed upon application in which it must be shown that they are being used for agricultural purposes. Just what will happen to the roads will be observed by state road engineers and township supervisors and reported to the legislature. The whole subject is one which should be given earnest consideration and the next general assembly should give the proper consideration to the subject instead of allowing it to drag thru the session.

Fertilizer Surprises.—It is said that the analyses of the samples of fertilizers taken by state agents and now in progress at the agricultural experiment station at State College will show some surprises not down on the cards and that people will get some first-hand information. The greatest handicap has been inability of the state to go to the source of the ingredients. This has been overcome to a certain extent by the work of some of the chemists and the reports will be awaited with interest.

Demonstrations Resumed.—The demonstrations of spraying for codling moth and other orchard pests have been resumed under the personal direction of State Zoologist Surface and his field force. The plan is to run the demonstrations until well into June. The results this year will be made the subject of a series of reports which Dr. Surface will make up on the effect of the treatment on orchards of different varieties and in different soils and sections of the state. Dr. Surface has commenced a card index of all orchards and their yields and the information this year will be added to it.

May Primary Date.—Every change in methods of holding elections, primary as well as general, brings complaint, but there appears to be more reason for the objections to the date of the May primary than ordinary. It appears that in a number of sections the late season has so far retarded farming that many could not spare the time to go to the polling places. The total vote cast is expected to be considerably below the total of enrollment. When the primary law is overhauled, as it will be, next winter, it will be worth while to keep this matter in mind and to pick an earlier date. A primary at this date virtually disfranchises a busy farmer unless he happens to live near the poling place.

Hunters' License Success.—From reports made by officers of the state game commission the operation of the hunters' license law is considered to be a success, altho the revenue derived from the sale of licenses can not be made available until reappropriated by the legislature. Less complaint than was expected was made and comparatively few letters from farmers were received at the office of the commission. Of course, there are some who oppose the law with its system of licenses, but it would appear from letters that by furnishing a means of identification the license law has been a benefit.

State Forestry Work.—State forestry authorities are planning to ask the next legislature for an appropriation to enable them to give practical aid in farm forestry, especially the care of woodlots and woodlands on farms which have long been cultivated. An item of $5,000 was carried in the last general appropriation bill, but went down in the crash. So many calls for advice have been made that a bureau for instruction in tree planting and care in agricultural regions will be advocated. —Hamilton, Harrisburg, May 18.

NEW JERSEY FARM NEWS

Gypsy Moth Menacing.—The report that the gypsy moth has appeared in Westchester County, N. Y., on the border line of New Jersey, has led State Entomologist T. J. Headlee and State Forester Gaskill to redouble their vigilance to prevent the invasion of this state. These two officers are giving special attention to the northeasterly border to see that the moth does not get a foothold in the woods of that section. The state entomologist is doing all he can to enforce the law against bringing infected nursery stock into the state. He is required by law to inspect all incoming plants. If any one has the slightest intimation of the presence of a single gypsy moth, or the eggs of this insect, anywhere in the state, it is his duty to report immediately to the Forester or the Entomologist. There is law enough, and if the proper watchfulness and preventive measures are exercised, New Jersey should not be endangered by the insect.

Cranberry Experiments. — Professor John H. Voorhees, of the State experiment station is engaged at the well-known Buckalew cranberry bogs, making notes of the progress made on the experimental plots. A series of fertilizer tests are being made. The cranberry crop in New Jersey last year was 110,000 barrels or 361,000 bushels, less than half a crop. The average price was $6.25 a barrel, or nearly $700,000 for the entire yield. The American growers have also started a campaign for further introduction of the cranberry in Europe, and during the past year a larger shipment of the berry has been made than ever in its history. This is especially true of the Buckalow berry owing to their peculiar flavor. These bogs have been running continuously for 40 years and for the past six years have been under the management of Mr. Vohmann.

Corn and Tomato Contests.—The corn and tomato contests have extended to nearly all of the 21 counties of New Jersey. Mercer county is taking a leading part. There the contests are conducted by the public schools in co-operation with the farm bureau. Any boy or girl between the ages of 10 and 18 may enter the corn-growing contest, and any girl between the same ages may compete for the prizes in tomato growing and canning. They need not be enrolled in a school. For the winners there are to be diplomas and trips to Washington, and prizes to the value of $50 for others in each class. All who finish the contest and hand in their reports to the county superintendent of schools at the close of the season will be given an excursion to the state farms and experiment stations at New Brunswick, during Farmer's Week, which in itself furnishes a liberal course in agricultural science. Sussex County is also to the fore, and over $200 is offered as prizes, together with an additional prize of $25 to every boy or girl who raises more than 100 bushels of corn to the acre. Girls in their tomato growing and canning contests share equally with boys in the distribution of the $200 prize money.

Forest Fires.—Forest fires and brush fires have been doing considerable damage all over the state this spring. No one has a right, under the state law, to burn brush or trash without first obtaining a permit, and then not in any place that endangers a woods or neighboring buildings. The penalty for violating this law is from $20 to $200. Especial care should be taken at this season to guard against such fires.

Oiled Pools Kill Birds.—Because it is contended that the oiling of pools has resulted in the killing of many nesting birds, some objection is made to this part of the work being done by the Union County Mosquito Extermination Commission. The contention is that the birds go to the oiled pools for drink, causing them to die in large numbers.

Princeton Farm Drops Summer Work. — The Princeton University farm, founded to help needy students by providing work for them, has decided to give up practically all of its summer work. The new $650,000 stadium takes up a large part of the land, and, it was found last year that the market is too limited for large quantities of garden truck. Next fall, new arrangements will be made and work offered all the year round to a limited number of students. This will supplement the agricultural courses in the University.—D. T. Hendrickson.

NEW YORK LETTER

Impeachment Bills.—The natural sequence to the impeachment proceedings of former Governor Sulzer is payment of the costs. According to a report recently made by the attorney-general these costs were over $225,000. Some people are asking the pertinent question, was it worth it?

Barge Canal Vessels.—Announcement is made of the pending incorporation of a company for $3,500,000 to operate a line of electrically-driven freight vessels on the barge canal when it is completed. The proposed line will have a fleet of 30 vessels which will be of two classes, express boats and slower freight boats. The former will make stops at only the larger cities between Albany and Buffalo, altho they will run between New York and the later city. The slower boats will stop at all the cities along the way, about 30 in all. The fast vessels will cover the distance between New York and Buffalo in about three days and the others will make it in about 120 hours. It is announced that the rates will be about 20 percent lower than by rail. The boats will cost $6,500 each.

Onondaga Farm Bureau.—Arrangements have been made by the Onondaga county Farm Bureau for 130 co-operative tests in planting and other phases of agriculture designed to improve agricultural conditions in the county. There will be tests on eight farms in the raising of winter vetch. Experiments will be made on 80 acres, divided among several farms, to determine if the dent varieties of field corn can be profitably grown, and demonstrations of the effectiveness of soy beans as a silo material. In six large orchards the problems of orchard management will be tested out. Raw rock and phosphate tests will be made to determine whether the farmer can get along with phosphoric acid alone, thus effecting economies in comparison with the use of complete fertilizers. This spring 15 cars of alfalfa have been sold thru the Bureau, valued at $4,500.

Cheating the State.—W. A. Mallery, Jr., fiscal supervisor of the state charities, states that over $30,000 a year have been used for the support of persons in no way connected with the charitable institutions of the state, but living on institutional grounds, by the careless interpretation of the law relative to maintenance of employees. At one institution about 100 such persons were found. This custom has been going on for years.

After Tent Caterpillar. — Commissioner Huson has decreed that every farmer who fails to clear his trees of the nests of the tent caterpillar before June 1 will be prosecuted accordingly.

Highway Matters. — The attorney general seeks to recover thousands of dollars from contractors and their bondsmen for violating contracts in highway construction. Under the highway law the contractors are bonded for 50 percent of their contracts and several of these bonds are still held by the state.

The Legislature.—The legislature did not adjourn the week of its coming together as some thought it would. There was too much partisanship injected into the financial legislation and little progress was made outside committees. Probably two or three days more will be required to get things adjusted. If the primary bills or amendments come up, another week is likely to be consumed. The changes of primary day from September 29 to September 23, will be recommended and the change will doubtless be adopted. This is on account of the Jewish voters whose important fast day, atonement day, falls on the former date

COUNTY NOTES

Venango Co., Pa., (N.W.) May 4.—April cold and wet; three frosts in May. Live stock not doing well; no pasture and stock is worrying. Crops not doing well because of cold weather. Apples show for fruit. Eggs, 20c doz; butter, 30c lb; potatoes, $1 bu; hay, $16 ton; straw, $9 ton. Farm work 30 days late. Very few oats sown and not all oat ground plowed. Acreage will be below normal. General conditions much below normal.—W. J. Pringle.

Potter Co., Pa., (N. C.) May 15.—Lots of rain the past week. Cattle are all turned out in pasture now and looking good. Rye and wheat looking good. Not much oats sowed yet on account of wet weather. Farmers are busy plowing and getting soil ready for the seed.—Louis J. Zundel.

Bedford Co., Pa., (S.C.) May 11.—Weather warm, and very wet. Horses and cattle in no demand and prices low. Wheat selling at 90c per bu; oats, 50c bu. Best prospects for fruit crop in many years. Codling-moth spraying about to begin. Spring seeding late, due to very wet weather.—N. F. Richards.

Armstrong Co., Pa., (S.W.) May 10.—Moderate temperature; abundance of rain. Straw, $10 ton; chickens, live, 19c and 20c lb; wheat, $1 to $1.10 bu; oats, 55 to 60c bu; beets, (old) 75c bu; butter, 32c lb; eggs, 20c doz; rhubarb, 5c lb; onions, green, 5c bunch. The majority of farmers have very litle oats sowed because of unfavorable weather. Hired help $1 per day and board.—Arthur R. Allshouse.

Chautauqua Co., N. Y., (S.W.) May 11.—Wet and warm. Live stock in pasture and looking well. Prices high: Cows, $75 to $100; horses, $225 to $300; pigs, $4; shoats to kill, 10½c; veals, 7½ to 8c; chickens, 16c live; eggs, 18c; corn at mill, 82c; oats, 52c; bran, $1.45; shorts, $1.64; meal, $1.53. Farm work backward; very little grain sown on account of weather. Truck looking well except peaches which are practically all killed.—I. L. Barber.

Wayne Co., Pa., (N.E.) May 11.—Clear with frequent showers. Live stock mostly in pasture. The ground has been so wet not many crops have been put in. Prices good on an average. About all farm work done is repair of fences. General conditions of this locality good.—E. W. Carl.

NEW FREE CATALOGS

Valuable Germicide and Horse Liniment.—Mr. H. M. Whitmer, Omaha, Neb., writes: "I bought my first bottle of Absorbine just 20 years ago and I want to say that I have never found anything to equal it when used for a leg brace or to steam a sore horse with." Absorbine has been in use by horse trainers all over the country. Full information is obtainable at any good drug store or may be obtained from W. F. Young, P. D. F. 154 Temple St., Springfield, Mass.

What is a Lightning Rod?—This is an oft-repeated question. The methods used in selling lightning rods some 20 and 25 years ago created a prejudice against rods and discredited them as a protective device which has seriously interefered with their general use. All authorities agree that rods do protect when properly installed. A new booklet issued by Cole Bros. Lightning Rod Co., 328 So. 7th St., St. Louis, Mo., tells what lightning rods are and gives much valuable information on how to install them. It is free upon request.

Blasting Stumps.—The Atlas Powder Company, Wilmington, Del., issues a valuable 64-page book, profusely illustrated, telling how to blast stumps, make holes for tree planting, break up subsoil and otherwise profitably employ explosives on the farm. A postal card request addressed to the company will bring the book free to any of our readers.

Are You Going To Paint?—Every owner of buildings is interested in paint. It protects the property and gives finish in appearance. In buying paint, quality and direct buying are two points of economy. A new booklet called the "Paint Book," issued by O. W. Ingersoll, 249 Plymouth St., Brooklyn, N. Y., describes paint of quality and tells how it may be purchased and save middleman's profit. The book is mailed free from the address given.

Easy Inoculation. — Many farmers have spent time and money on preparation of seed bed for a leguminous crop and for good seed, only to have the crop fail because of lack of inoculation of soil or seed. Knowledge of the need of inoculation for the clovers, alfalfa, peas, beans, vetches, etc., has been dearly purchased, but it has brought out cheaper, easier and improved methods of inoculating. One of the best of these is by use of Farmogerm, advertised on page 5 of this issue. A free book and other literature telling all about Farmogerm and its uses will be sent free upon request to Earp-Thomas Farmogerm Co., Bloomfield, N. J. Ask for Booklet 100.

Mitchell Automobiles.—The Mitchell for 1914 is completely illustrated and described in new catalogs just issued by the Mitchell-Lewis Motor Co., Racine, Wis. These catalogs are certain to be of immense interest to all automobile owners and prospective purchasers. They describe the four and six cylinder models in detail and give the plan of selling with all equipment and accessories. The catalogs are free upon request to the above address if you say you are a reader of Pennsylvania Farmer.

LIME!
For Land and Every Other Use
Perhaps the most important element in the preparation of the soil is lime. It furnishes a very vital element to the success of the plant. Lime acts as a corrective for the acidity of the soil, setting free the poisonous gases, and making the soil sweet and wholesome. It also liberates much plant food that would otherwise be unavailable and lost. Lime aids materially in retaining the moisture in dry weather, a very important factor. Most growers prefer to apply lime long before ready to plant seed.
We are the largest producers in quality, and value, which means most to the buyer.
Lime and Limestone in every form for every use.

Frills, Neck Fixings and Edgings.

Ideas From Our New York Correspondent.

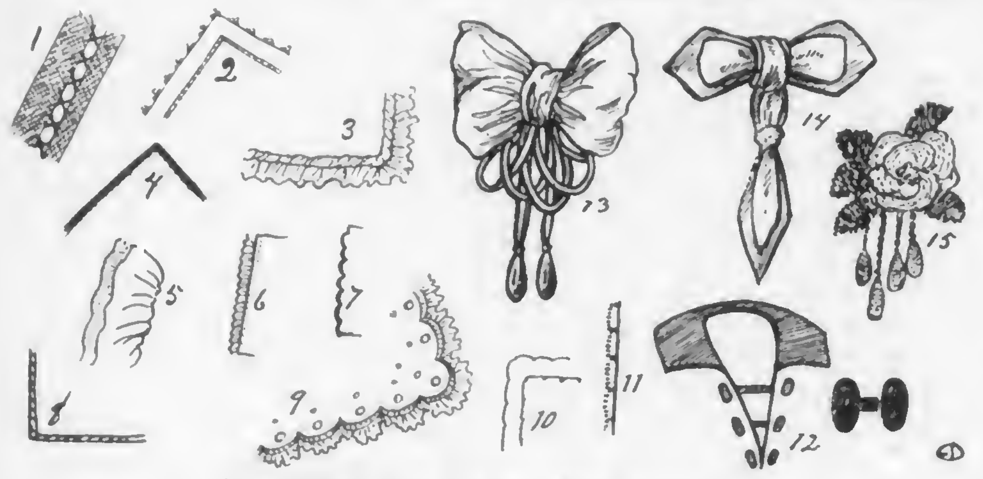
The materials for the summer frills are not expensive and the whole effect of them depends upon their finish. It is the supreme opportunity for the woman who can spend a little hand work on her clothes. Very thin muslin, net or silk is generally used. I have selected the following as the very best of the different ideas for finishing that I have seen this season.

No. 1 shows a method of trimming a cream net waist with black footing in two widths. They are sewed flat to the waist and connected with cross stitches of coarse silk.

No. 2 is a dainty finish for muslin collars and revers. The inside line is crocheted footing, but it could as well be double hem-stitching. The narrow edge was crocheted to the cloth itself in a simple pattern often used to finish Irish crochet edges.

No. 3 trimmed a thin china silk waist. It was a heavy cord, over which the silk had been gathered very tightly. The inch-wide lace frill on the edge could be omitted if desired.

A narrow binding of color was used in No. 4, and tiny buttons, covered with the same color, finished the front of the blouse.



SUGGESTIONS FOR EDGINGS AND FINISHES.

A china silk ruffle, edged with a narrow footing sewed on plain, as shown in No. 5, was very effective instead of revers on a china silk blouse.

A narrow knife plaiting of colored material, as shown in No. 6, is a popular finish for muslin, as is also a fine buttonholed scallop, No. 7, which is sometimes done in color but is most effective in plain white.

Many of the frills or collars are of but one thickness of net or muslin, so they are very often finished with a rolled edge, and oftimes a colored thread is used to confine it, as in No. 8. A hem is too wide at best for the finish of a chiffon or net frill.

One of my favorites among the wide revers and collars, was the one shown in No. 9. The muslin, sometimes even linen, is scalloped, and buttonholed about the edge, then two rows of dots are embroidered inside of them, and the whole is edged with a frill of inch-wide valenciennes.

No. 10 is very aristocratic looking. The flat, soft scallops are really but a line of buttonholed loops, such as we used to make for hooks before flat eyes became popular. These loops are a little longer than the old useful loop, and are always used in a double line, one line occasionally being on the extreme edge of the goods. They are especially pretty on crepe, which they should match in color.

A novel little finish for a low-necked guimp worn with a blue blouse, is shown in No. 11. It is made of blue irridescent beads.

The V-necked middy blouse will be a delight both for mothers and children this summer. My attention has been attracted to some new ones with colored linen collars. Fig. 12 shows a new method of fastening them which is more decorative than the old lacing. Button molds are covered with linen, the color of the collar and sewed to strips of the linen, of graduated lengths. These buttons are slipped thru buttonholes at the side of the blouse opening. The sleeves are slit up a few inches, and provided with the same kind of linked-buttons. And thus it is not so dreadful if you do loose your sleeve buttons!

The V-necked blouses often require something to finish the end of the opening. A large pin, if one has one, is more appropriate here than any other place we have had for it for years, but better still are some pretty silk arrangements like 13, 14 and 15. A knot of soft satin (13) is finished with loops of milliners' folds made of the same material, and the ends terminate in two pendant-shaped beads. No. 14 is made of a combinntion of silk and velvet of the same color, the velvet being used for the upper, smaller loops.

The colored flower (15) is made of leaves crocheted out of silk, and is very expensive, in the stores, but is very easily contrived with some heavy silk and a few hours to spend upon it. —Ellen Den.

WHY I DO MY OWN WORK

At least ninety percent of the women help employed in homes in the large farming area with which I am familiar are negroes. The best workers of this class go to the city, and we have left with us a shiftless, careless set, who as they demand more wages do less work. When I first started housekeeping, a good woman could be employed for $2 per week, and was willing to do anything asked of her. Now the most indifferent careless workers want $2, while those considered good receive $3 to $4 per week, and these women positively refuse to do any work outside the kitchen, except to place the food on the dining table and clear the table.

My experience with help has not in my opinion been unusual. I have had all grades and really have found very little difference. I know women who think themselves experts in managing help, because several years ago they could tell the girl to do and she did. So could I then, but times have changed. Were these women dealing with labor today they could no more get the stairs swept or chicken coops cleaned than I can.

I believe the woman should have some stated work, but we farmers' wives do not want cooks so much as general helpers. I have never yet found a woman who could do everything to suit me, so while I take her place in the kitchen I expect her to sweep, dust or do some other task for me, and this seems a fair arrangement.

This negro help is without education or ideals. Their plane of life, their thoughts and habits are low. So are their pleasures, and I consider the contact they have with my children anything but inspiring to these little minds. My little boy frequently asks questions about things he hears in the kitchen, altho I am very careful about his being around the help.

It is rare that a negro is careful of her own property, and certainly when she does not value her own possessions she will not value mine. We frequently hear a housewife boast of how she does not allow her help to waste anything, because she never gives them an opportunity to steal. I often wonder if she is really sincere in that statement or ignorant of their ways. I never allow help to go to the supplies. I give out each day's allowance, but when I give them sugar to make a dessert I know they may slip out a spoonful or two. I have had them take an egg, a small piece of butter, a little flour, and thus rob the cooking of just a little of each ingredient every day. At the end of the week a nice little supply had accumulated to carry home.

Perhaps the woman is honest, but wastes food by careless cooking—sour bread, or bread not allowed to lighten before baking; food scorched or burned. Also think of the wear on the cooking utensils they try to clean by scraping and digging, for very few will take the safe method of rubbing with ashes or commercial cleaning powder.

Our cooking utensils are mainly of iron, agate or enamel ware. How long will such ware last with repeated burnings, diggings and bangings and droppings. They drop many things thinking that no harm is done so long as the article is not immediately reduced to atoms! They can not see how each dig or blow chips the enamel or bends the ware, producing in times rust and holes, and shortening its term of usefulness.

I once had a woman, considered an extra good one. Her kitchen was always in order, she was neat, but, oh, the struggle I had to have the dark corners of cupboards and pantry kept clean. She would shirk washing some disagreeable pot or pan, and put it in the darkest corner of the cupboard. I have never had one I could fully trust to do honest work. And when their guilt is brought to light, how carefully the case must be handled, that is, if you really want to keep help, for they are very independent.

The nerves are kept constantly strained to manage the help. An unexpected load of company arrives right at dinner time. The result, nine times out of ten, is the "maid of the kitchen" growling and muttering. Ordinarily we are very punctual, but if by some unlooked for accident a meal is delayed, there is the same muttering, frowning and black looks. The physical strain of doing my work is nothing compared with the strain of trying to keep a woman pleased.

Many women object to the long hours on the farm. They are really the healthiest. By rising early much can be accomplished before the debilitating heat of the day, and by proper management one can have time for rest and recreation.

I never have been, nor do I now claim to be a model housekeeper. My house is a home, and I try not to lose sight of my duty to make it and myself attractive to my husband, my children and our friends. I will let some task wait over rather than lose my daily rest. I would rather have cobwebs in my cellar coal bin than in my brain. My ideals are higher than the scrub

brush or dust cloth, and I find in my work the reward of service rendered.

I have had in my kitchen some of the foreign white help, but they are not contented with the isolation of the farm. They feel that we are not their own kindred, and there is no companionship for them on the large farms of hundreds of acres. In the city they visit over the back fence or across the alley. At the canneries they come in groups. And I fear it would not be wise to have all our labor of this element for their unions would no doubt cause us trouble when our crops were in perishable condition.

I am not an expert cook, but we all enjoy my cooking more than we do that of any woman we have ever had. I once heard a man say that he never ate any cooking that suited him so well as his wife's, but that he hated to have her tied down to cook for so much help, so they always kept a cook. But I never feel tied down. If I want to go away I can arrange to go and to stay as long as I planned.

But the poor woman who "hates housework and cooking." How I pity her! I am so interested in my home that I have brought myself to "hate" no part of the labor attached to it. Cooking offers such a wide field for brain work. It requires brains to "create something out of nothing." and that situation frequently confronts us in all departments of the work. To cope with the situation tests our ability.—Country Housekeeper, New Castle Co., Del.

LET'S HUNT FOR DANDELIONS.

GOURDS FOR DECORATION AND USE

Gourds belong to the same order of plants as the pumpkin, squash, watermelon, muskmelon and cucumber. The gourds are as tender as any of their relatives and should not be planted until the ground is warm and danger from frost is over. I know of no plant that makes such rampant growth, and few that are so graceful. The beautiful green of the leaves, the gauzy white flowers, and the curious fruits hanging from the vines, scattered over garden fences, add novelty and attractiveness to any place. They must be trained on some support such as arbors, fences, trellis or even a brush heap, and trained so the gourds will hang clear. Some of the large kinds will need supports underneath the fruit, as their weight when nearly mature will be greater than the vine can sustain.

When a young gourd is once scratched the blemish will always remain no matter how small the blemish or the gourd. Advantage is often taken of this peculiarity to do engraving while the shell is yet soft and easily carved. The long-handled dipper gourds may have their handles given any curve or shape desired if trained while young and pliable. Last summer I saw a garden enclosed with a stout wire fence, along three sides of which were growing long-handled dipper gourds. When I saw the garden in September gourds of all sizes were hanging thick along the fence, and the vines were blooming as if they had just commenced business —very ornamental.

With a little ingenuity many ornamental as well as useful things can be made from gourds. Dipper gourds can be used as the name suggests. As bird houses, gourds are very satisfactory; cut a little round hole in the side large enough for the prospective tenant, clean out the inside, bore two or three small holes in the bottom for the escape of water that may collect during rain, nail a twig or stick beneath the hole for the bird to alight on before entering her new home, and your work is done; martins, phoebe birds, bluebirds, wrens and all the "hollow tree haunters" delight in these nests. We have one hanging under the eaves of the kitchen, in which a mother wren has raised one, and sometimes two, broods for five successive summers.

The big round, bulbous-shaped gourds of the sugar-trough variety make nice jardinieres. They are dark brown in color and take a good polish. This is a color that contrasts prettily with the foliage of growing plants. This variety is often used for hanging baskets and will last two or three years. In early times they were used to catch the maple sap in sugar making time. The necks or handles, which are very short, were cut off, and all pith and seeds cleaned out, and the hard woody shell well scraped.

Nest eggs so natural that they deceive old biddy herself are grown with the smaller varieties. Hercules' club, with its pure white blossoms, is very pleasing; if grown properly the "clubs" will be from three to five feet long; the vine grows to a great length with a host of side shoots bearing beautiful foliage and flowers.—Mrs. M. E. S. Charles, Henry Co., Ind.

Soft Ginger Cake.—One-half cup sugar, 1 cup shortening, 1 cup molasses. Stir together and warm on the stove. Add 1 egg, 1 cup sour milk, 1 teaspoonful ginger, and 3 cups flour with I heaping teaspoonful soda sifted in. Beat well, and bake in a moderately hot oven. (Note that this recipe calls for a heaping teaspoonful of soda instead of a level teaspoonful. That is because the molasses is acid, as well as the sour milk, hence more soda than the ½ teaspoonful to the cup of sour milk is needed to neutralize also the acid of the molasses.—The Editor.)

Asparagus Salad.—Take some freshly boiled or canned asparagus, drain it and cut it up into lengths of about one inch, season with olive oil, strained lemon juice, salt, and finely chopped onion. Dish up in a pile on a salad dish, sprinkle all over it some finely chopped chicken, and pour over the whole some mayonnaise sauce.

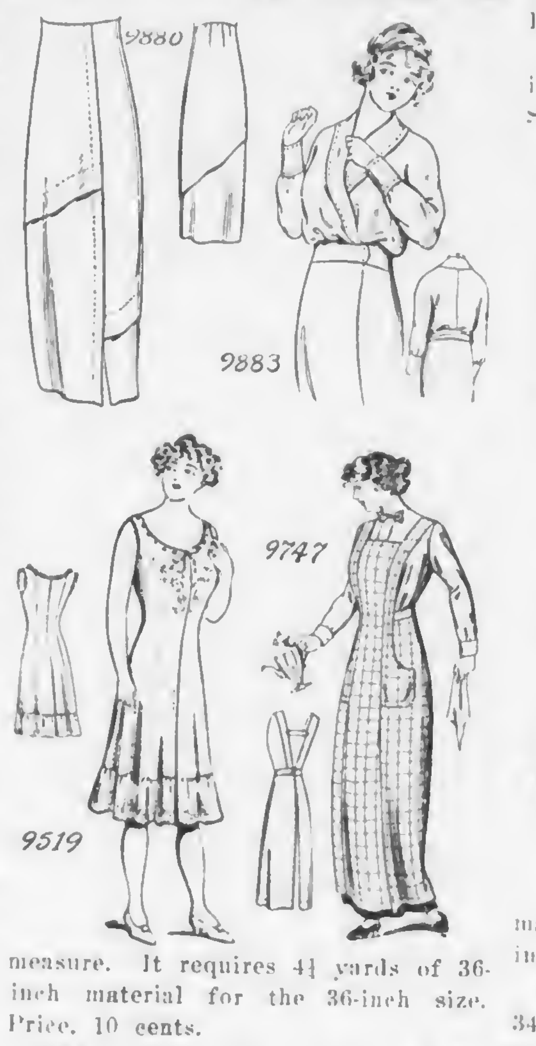
PENNSYLVANIA FARMER PATTERNS

Be sure to give the figures and letters of each pattern exactly as printed at the beginning of each description. We will not be responsible for correct filling of your orders unless you do so. Also give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 214-18 So. 12th St., Philadelphia, Pa.

9880.—Ladies' Skirt.—Cut in 5 sizes: 22, 24, 26, 28, and 30 inches, waist measure. It requires 2⅝ yards of 50-inch material for the 24-inch size, which measures about 1⅞ yards at the foot. Price of pattern, 10 cents.

9883.—Ladies' Kimono Waist.—Cut in 6 sizes: 32, 34, 36, 38, 40 and 42 inches, bust measure. It requires 2¾ yards of 44-inch material for a 36-inch size. Price, 10 cents.

9519.—Ladies' Combination Corset Cover and Drawers.—Cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches, bust measure. It requires 4¼ yards of 36-inch material for the 36-inch size. Price, 10 cents.



9747.—Ladies Apron.—Cut in 3 sizes: Small, medium and large. It requires 4⅞ yards of 27-inch material for the medium size. Price, 10 cents.

SYNOPSIS OF PREVIOUS CHAPTERS

Two New York business men, Van Brunt and Hartley, come to Wellmouth for a vacation. Solomon Pratt, Skipper and village character, finds the "twins," as they are dubbed, interesting but takes them for lunatics and their "man" for their "keeper." The "twins" after harrowing experiences with cooks, ask Pratt to find them a secluded place of rest and act as their cook. The skipper and Hartley have just landed from the "Dora Bassett" on their road to a fair at Eastwich Port witness a greased pig race, and have just seen a red-headed youngster become entangled in a network of horses and wheels in his attempts to obtain the elusive animal.

CHAPTER IV (Concluded)

I was one of the first over that fence, but quick as I was, that Hartley invalid was quicker. As a general thing he moved like 'twas hardly worth while to drag one foot after the other; but now he flew. I could see his big shoulders shoving folks like they was ninepins. Under the ropes he went and in where the tangle was the worst. And then it closed up into a screeching kicking whirlpool like. Down he went and I lost sight of him.

Everybody on the grounds was crazy, but I cal'late I was the worst Bedlamite of the lot. Somehow I felt responsible. 'Twas me that told about the Fourth of July doings first and got him over there. 'Twas me that coaxed him into staying for the consarned pig business. And I kind of felt that I was his guardian, as you might say, now that Van Brunt wa'n't along. Yes, and by ginger, I liked him! Course I thought of the poor little boy, too, but I'm free to say 'twas Hartley that I thought of most.

For the doings of the next two or three minutes you'll have to ask somebody else. All's I remember real well is catching hold of Issachar Tidditt's Sunday cutaway and ripping it from main truck to keelson. You see, Issachar was trying to back out of the tangle and I was diving in. Next thing I'm sure of is hanging onto the bridle of one of the Barry horses and playing snap the whip with my feet, up and down and over and under.

She cleared up some finally and there was a ring of folks jamming and pushing and climbing between wheels and under wagon bodies, and in the middle of the ring was Hartley, kneeling on the ground and looking pretty middling white and sick, with a dripping cut over his eye, and with that little shaver's red head in his lap. And old Doc Bailey was there, but how or when he come I don't know. Yes, me and the pig was there, too, but the critter was out of commission, being dead, and I was too busy to think where I was.

"How is he, doctor?" asked Hartley anxious.

The Doc didn't answer for a minute or so; he was bending over the boy, sponging and swabbing like all possessed. Poor little chap; he looked white and pitiful enough, stretched out there amongst that crowd of strangers and not a soul of his own folks around to look out for him. And he was such a gritty little mite. I looked at him; chalk white he was, and still, with his eyes shut and his breath coming kind of short and jerky. And—well, my breath got jerky, too.

"How is he?" says Hartley again. Just as he said it the boy stirs and begins to breathe more regular. The doctor seemed to feel better.

"He'll come round all right now," says the Doc. "'Twas the kick that knocked him out. The pig got the worst of it and that saved him. There are no bones broken. But he'd have been trampled to death afterwards if it hadn't been for you, sir. Better let me fix up that cut."

But the Twin shook his head kind of impatient. "'Tend to the boy," he says. So the doctor went on with his sponging and swabbing and pretty soon the youngster opens his eyes.

"Did I get him?" says he.

"What's that?" asked the Doc, stooping over.

"Did I get the pig? Is the fiver comin' to me?"

Well, you'd ought to have heard the crowd laugh. Somebody sings out, "Three cheers for the kid," and they give 'em with a whoop.

"What's the matter with youse?" says the youngster, setting up and looking around, dizzy like. "Aw, cut it out!" he says, when they begun to holler some more. "Did I get the pig?"

"You bet you did," says the doctor, laughing. "You're a spunky little rooster. Whose boy are you, anyway? Belong in Eastwich?"

"Naw," says the little feller, like he was plumb disgusted. "N'York."

Hartley smiled. "A brother out east," says he, looking up at me.

Major Phinney had been shoving thru the crowd and now he was in the front rank, where, so they tell me, he used to be in war time—after the fighting was over.

"He's one of the Fresh Air boys," says the Major, puffing, but pompous. "There's a summer school of 'em been started just outside the town here. Couple of New York women brought the tribe down last week. This one's one."

Little red head turned to Hartley. "Say," says he, "don't you tell her."

"Tell who?" says Martin.

"The teacher. Miss Agony."

"Miss which?"

And just then here comes Issachar, his cutaway hanging graceful and ornamental from the collar, and piloting a mighty pretty and stylish young woman to the front. She breaks loose from him and runs for'ard and flops down on her knees.

"Why, Dennis! Why, Dennis!" she says. "How could you run away and behave like this? Are you hurt? Is he—"

She looks up at Hartley as she begins to ask the last question. And he was staring as white as a sheet of paper.

"Why, Agnes!" he says. And she went white, too, and then red. "Oh!" says she. And then "Oh" again. "Oh, Martin!"

CHAPTER V

The Cruise of the "Dora Bassett"

After that there was a kind of tableau, same as them they have at church sociables. Here was Hartley staring at the young woman, and the young woman staring at him, and the boy staring at both of 'em, and me staring at the three, and the crowd around doing grand double-back-action staring at the whole of us. Then the party broke up, as you might say.

Hartley, red as a beet now, got up and bowed. The young woman got up too and held out her hand in a doubting sort of way. But afore he could take it, she seemed to remember something, or changed her mind, for she dropped the hand and turned to the boy, who was on his feet by this time looking down at the relics of his clothes. And between grease and sand and dirt and rags they made a ruin that was worth looking at—made you think of a rubbish pile with a red danger lantern on top.

"You naughty boy!" says she. "How could you do so? If you knew how frightened Miss Talford and I have been. Are you hurt, dear?"

"Naw," says the dear, brisk and disgusted. "Sure I ain't."

The young woman fidgeted around him, petting and "pooring" him and pinning him together, so to speak. Hartley fidgeted too, not seeming to have his bearings at all. He acted to me like he wished he was ten thousand miles away; and yet I cal'late he didn't really wish it neither. The doctor and Major Phinney were fussing around and the crowd kept getting bigger and closing in.

"If you'll excuse me, Miss," says I, interfering as usual where 'twas none of my affairs. "I think perhaps 'twould be a good idea if we went somewheres where 'twan't so popular. Maybe we might go into one of the rooms at the hall or somewheres."

"Why, of course!" says Hartley, grabbing at the notion like 'twas a rope I'd thrown out to him. "We'll go to the hall. Ag—Miss Page, let me present my friend, Mr. Solomon Pratt."

So 'twas the Page girl, after all. I'd guessed as much, tho how she come to be in Eastwich when she'd ought to have been in Europe was more'n I could make out. She looked up at me and reached out her little hand with a kid glove on it. Likewise she smiled—not with her mouth alone, same as an undertaker meeting the relatives of the departed, but with her eyes too. 'Twas the right kind of a smile. I'm vaccinated and not subject to woman folks as a rule, but I'd have done considerable to get a deckload of them smiles.

"I'm very glad to know you, Mr. Pratt," says she, just as tho she meant it. And we shook hands—really shook 'em.

Afore I could get over that shake and smile enough to be sensible, Major Philander shoved her arm into his and headed for the hall. Drat his figurehead! You never could beat that old image when there was a pretty woman around. Hartley looked kind of set back like. Then he takes the boy by the hand and falls into the Major's wake. Me and the doctor trailed along behind.

The Doc kept talking about what a brave thing the Twin's diving under the horses was, but I didn't hear more than half of it. I was watching the Page girl's hat and thinking how much prettier 'twas than the ones them boarder girls at the hotel wore. And yet there wa'n't a quarter so many feathers and ribbons and doodads on it.

The little chap was chirping up to Hartley all the way. What worried him was when he was going to get his five dollars. Martin told him he'd get it all right. He'd advance it himself and collect it afterwards.

"What's your name, son?" says he to the youngster.

"Denny," says the boy.

"Denny? Dennis, you mean? Dennis what?"

"Aw, I don't know. Plain Denny, I guess."

"Where do you live in New York?"

"Over around Cherry Street most of the time. Me and the old man used to hang out in the back room of Mike Donahue's place on Mott Street till he got sent up. Then I got to sellin' papers and doin' shines and things. Sometimes I'd take a shy at the Newboys' Home nights. That's where Miss Agony—Miss Page, I mean—found me. I'm one of the Fresh Air kids over to her place."

"Many more like you over there?"

"Sure! nine or ten of us; girls and all. We been here a week now. I skinned out of the window this mornin' and hoofed it over here. Wanted to see the show. Gee! what a gang of jays! You're the guy what put up the candy for me, ain't you?"

"Shouldn't wonder. Do you like your teacher?"

"Bet your life. She's a peach. So's the other one; Miss Talford her name is."

"Humph! What do they call you over on the East Side when you're at home?"

"Redny," says the little shaver.

Hartley looked down at him and smiled one of his quiet grins.

"Bully for you, Redny!" says he. "You're a brick."

We got thru the crowd and into the hall finally. Shutting the door was a job. The folks outside seemed to think they'd been cheated. I'd like to have got rid of Philander, but you couldn't do that without a block and tackle; he stuck to Miss Page like a kedge anchor to mud bottom. The doctor was putting a strip of sticking plaster on Hartley's forehead. The cut wa'n't nothing but a scratch, I'm glad to say.

After a spell I see my chance and I cornered the Major and commenced to talk politics. He was hankering for the county representative nomination and I knew his soft spot. Hartley and the Page girl got together then, but they didn't seem to know what to say.

I heard her explaining that she hadn't gone to Europe at all. Her ma had been took sick; nothing to speak of, I judge, spell of "nerves" or the like of that. So Agnes and her chum, this Margaret Talford, had seen the chance they'd been waiting for and had got their poor children tribe together and come down and took the Lathrop place at South Eastwich. Seems Miss Talford had hired it afore, intending to go the Fresh Air v'yage alone, long's she couldn't get Agnes to go it with her.

"But how is it that you're here?" says she. "I thought you were at the mountains."

Hartley explained that, at the last moment he had decided to try the seashore. He was at Wellmouth for the present, he said.

"But you should have known I was here," she says. "I wrote to—to Ed, of course—before I left the city. Oh, I see! I sent the letter to your Adirondack address. But it should have been forwarded."

Hartley stammered a little, but he said quiet that he was afraid, perhaps, Van Brunt hadn't thought to send word to have his mail forwarded.

"I see," she says. "That's like Ed."

Martin seemed to think 'twas too, but all he said was, "He's written you very faithfully. His letters, of course, have gone to Liverpool."

Well, that was about all. We had to be going. I said good-by and we started for the door. Miss Page came over and held out her hand.

"Mr. Hartley," says she, "I want to thank you for saving Dennis; Major Phinney told me about it. It was brave. And I'm glad that you're not hurt."

She was pretty nervous, but a good deal less flustered than he was when he took her hand.

(To be continued.)

Markets

PHILADELPHIA PRODUCE

Philadelphia, Pa., May 18, 1914.

The butter market is quiet. Receipts of desirable stock are light and prices show little change. Fresh eggs are moving readily at firm prices. Seasonable vegetables are in liberal supply and moving easily at steady prices. Trade in poultry is slow.

Butter.—Western creamery, 28½c; extras, 26½c; firsts to seconds, 22@24½c; special prints 34@36c; near-by prints 30c.

Eggs.—Candled 24@26c dozen; extras, 23c. Current receipts at $6.15 per standard case.

Poultry.—Fowls, 18@19c; old roosters 12@13c; chickens 27@32c; pigeons, young, 18@22c.

Dressed Poultry.—Western fowls 13@18c; roosters, 14c; squabs $2@4.65 per doz.

Vegetables.—White potatoes, Pa., 85@88c bu., new, $4.00@5.00 bbl; onions, new, $2@2.25 per carrier; peppers $2.25@3.00 per carrier; eggplant, $2.00@3.00 per crate; lettuce, 50@$1 per hamper; homegrown, $1.00@2.00 bbl; beets 3@5c per bunch; sweet potatoes 40@50c per hamper; string beans, $1.00@2.00 per hamper; squash $1.00@1.50 per hamper; cucumbers, $1.50@2.50 per basket; celery 25@40c per bunch; cabbage, new $1.25@1.50 per bbl crate; asparagus, 10@25c per bunch; radishes, hothouse, 25@50c per hamp; carrots, 3@5c per bunch, mushrooms, 20@30c per lb.; peas, $1.00@2.00 per hamper.

Fruits.—Apples $3.00@5.50 per bbl. Pineapples crate $2.00@3.00; lemons $2.50@3.50 per box; grape fruit $1.50@3.00 per box; oranges $2.00@4.50 per box; strawberries, 9@15c per quart.

Hay and Grain.—No. 1 hay, large bales, $19.00@19.50; No. 1 medium $19.00; no grade, $10.00@12.00. Clover mixed hay, light mixed at $17.00@17.50; straw No. 1 straight rye, $17.00; No. 2 do., $15.50@16.00; No. 1 tangled rye straw new $12.50@13; No 2 do. $11.50@12; No 1, wheat straw, $10@10.50; No. 1 oat straw, $10.50@11.00; corn No 2 yellow, 80½ [illegible]; wheat, No. 2 red $1.01@1.01½; No. 1 Northern $1.04½@1.05½; No. 2 white oats 46@46½; No 3 white 44@44½c standard white 45@45½c.

Feed.—The feed market ruled firm under small supplies, but trade was quiet. We quote car lots, including sacks: Winter bran, in 100-pound sacks, per ton, $29.50@30.00; spring bran, in 100-pound sacks, per ton, $28.00@28.50.

Coffee.—Rio 7s 8¾c; Santos 4s 11⅝c. Mild Coffee.—Cordova 12½@16c.

Sugar.—Cut loaf $5.05 cwt; cubes, $4.25; powdered, $4.10; granulated, $4.00; standard granulated, $4.05; crystal A, $4.00.

Provisions.—City beef, in sets, smoked and air dried, 31@31½c. Hams cured, 13⅝@14c; skinned 14@14⅞c; smoked 17@18c. Other hams, smoked, city cured, as to brand, 17@18c. Picnic shoulders, 10¾@10⅞c; do smoked, 13@13½c. Bellies in pickle, 13½@14¾c. Breakfast bacon, as to quality, 19@23c. Lard refined, 11¼@11⅞c tcs; do in tubs 11⅜@12c; do kettle rendered 11¼@11¾c. Tallow, prime city 6⅞c, country, 6⅝c; do. dark, 5⅜c; do. cakes, 6⅞c.

Philadelphia Retail

Vegetables.—Onions 15c ¼-pk Peppers 3 for 10c, eggplants 10@25c apiece; cabbage 5@10c head; lettuce 5@10c; beets new 10c bch. 3 for 25c. Sweet potatoes, 40c ½-pk; white potatoes, new, 20c ¼-pk; string beans 25c ¼-pk; tomatoes 25c per quart; squash 5@10c apiece; cauliflower 25@50c apiece; mushrooms 40c per lb; asparagus 20@40c bunch; cucumbers, 5@10c apiece; celery $1 doz. bunches; radishes 5c bunch; carrots 5c bunch; peas, 50c ½-pk.

Fruit.—Apples 20c per ¼-pk; pineapples 20@25c apiece; grapefruit 2@3 for 25c; oranges 25@50c per dozen; lemons, 15c per dozen strawberries, 25c per quart.

NEW YORK PRODUCE

New York City, May 18, 1914.

Offerings of fresh eggs are in excess of demand and market is weaker on lower grades, which are plentiful. Butter is weak and unsettled with stock in excess of demand. Dressed poultry is strong owing to lighter receipts. Trading in live poultry is very slow at nominal prices. Fruits and vegetables are active on seasonable sorts and prices held firm.

Eggs.—Fresh gathered firsts to extras 21@[illegible]; seconds to thirds, 18½@19¾c; no grades 18@19½c; mixed 21@22c.

Butter.—Creamery firsts to extras 21@26½c; [illegible] firsts to seconds 21@23½c; state dairy [illegible]@25½c; packing stock 15@17½c.

Cheese.—Whole milk specials, 13¾@14c; do common to fancy, 11@13½c; skims 4@11½c.

Dressed Poultry.—Turkeys, dry, 20c lb; broilers [illegible] 45c lb; fowls, 15@19c; old roosters 11½c; ducks spring, 21c.

Live Poultry.—Prices unsettled.

Vegetables.—Cabbage $1.00@2.00 crate; string beans, $1.00@1.75 bas; carrots $1.50@2.25 [illegible]; cucumbers 40@$1.25 bas; lettuce [illegible]@75c bas; squash 25@75c basket; [illegible] 50@4 standard crt; onions $3.00 [illegible] per 100-lb bag; tomatoes, $1.50@[illegible] carrier; peppers $2.00@3.25 box; beets [illegible]@6.00 per 100 bchs; potatoes, $1.50@[illegible] bbl; sweet potatoes, 65c@$1.10 basket; [illegible] $1@3 box; asparagus, 50c@[illegible] dozen bunches; radishes, 10@25c basket; [illegible] 75c@$1.25 per 100 bunches.

Fruit.—Apples, $2@6 bbl. Grapefruit $1@3.50 per box; oranges, $1.50@4.50 per box; strawberries 8@11c quart.

Grain.—Wheat, No. 2 red $1.06¾. No. 1 Northern $1.01¾; corn, No. 3 yellow 73¼; oats, standard white 45½@46c.

BALTIMORE PRODUCE

Baltimore, Md., May 18, 1914.

Butter.—Creamery, fancy 28@28½c; do choice [illegible]@27c; prints, 28@30c; blocks, 27@[illegible]. Maryland and Penna. rolls 16@18c; process [illegible]@22c.

Eggs.—Near-by firsts, 19c; western, 19c; southern 18c.

Live Poultry.—Hens 17½c; chickens, 20@22c; old roosters 11c; ducks 13c.

Best steers	$8.85@9.00
Choice steers	8.60@8.75
Good do	8.25@8.50
Medium steers	7.50@8.00
Common steers	7.00@7.25
Bulls	5.00@6.85
Fat cows	5.00@7.00
Medium cows	4.25@4.75
Thin cows	2.75@4.00

Veal calves steady.

Best calves	$10.00@11.00
Good to choice do	9.00@10.00
Medium	8.00@9.00
Common do	6.00@7.00

The sheep market cleans up readily, altho supplies are increasing. Receipts are all of clipped stock. Prices are steady to firm.

Choice wethers	$6.00@6.25
Good do	5.25@5.75
Common to medium	3.50@5.00
Ewes fat	5.00@5.50
Extra lambs	8.25@8.75
Good to choice do	7.50@8.00
Common to medium	5.00@7.00
Early spring lambs, apiece	4.50@6.50

Hogs.—A steady feeling prevailed with holdings under good control. Western, $12.00@12.25.

City Dressed Stock.—Every variety of choice and prime meat commanded steady prices under normal demand. Steers 12@14c; heifers, 10½@13c; cows, 9@11c. Veal calves, 13@14c; country dressed calves 13@14c; extra do, 14½c. Sheep, 11@12c; extra wethers, 13c. Spring lambs 15@16c. Hogs, 12¼@12½c.

PITTSBURGH LIVE STOCK

Pittsburgh, Pa., May 18, 1914.

Cattle.—With a supply of 100 loads compared with 95 loads the week before our market ruled active and stronger on the lower-priced grades, that is, $7.75@8.10 kinds, while the $8.15@8.50 sold about 10 cents lower and the $8.60 and up were about steady. The class of cattle on sale this week was the best that has been here for quite a while. Fat cows and heifers in light supply and sold steady to strong. Bologna cows sold $4.00@4.25. Bulls in good demand and sold $6.50@7.75. Best fresh cows steady; other grades and springers slow. Today's receipts were 55 loads, and the market ruled active and steady on medium steers but lighter weights sold higher.

Good to choice	$8.85@9.15
Good 1,300-1,400 lb.	8.50@8.75
Medium to good 1,200-1,300 lb	8.10@8.60
Tidy 1,050-1,150 lb.	8.20@8.50
Fair to medium, 900-1,100 lb.	7.50@8.10
Rough, half-fat, 1,000-1,300 lb.	5.00@7.00
Common, 700 to 900 lbs	5.75@7.00
Common to good fat oxen	4.50@7.00
Common to good fat bulls	5.50@7.85
Common to good fat cows	4.25@7.00
Heifers	5.50@8.00
Bologna cows	3.75@4.25
Fresh cows and springers	25.00@90.00

Calves.—Veal calves active and closed 50c per cwt higher. Today's receipts were 900 head, and the market ruled steady.

Heavy and thin calves	$5.00@7.00
Veal calves	8.00@11.00

Hogs.—The supply during the week has been light and with a good demand market ruled active and higher on all except pigs, which have been a little slow, the close for the week being 20 to 25 cents per cwt. above Monday's prices. Today's supply was 35 double-deck loads, and the market ruled about 5 cents higher than Saturday.

Prime heavy	$8.85@
Heavy mixed	8.90@
Prime medium weights	8.95@
Best heavy Yorkers	8.95@
Light Yorkers	8.95@
Pigs	8.70@8.85
Common to good roughs	7.50@7.90
Stags	6.50@7.00

Sheep and Lambs.—The demand for both sheep and lambs has been good and market ruled higher on choice grades. Sheep closed 15c above Monday's prices, while lambs closed 25 cents higher. Spring lambs in poor demand and closed slow. Today's receipts were 25 double-deck loads, and the market was fairly active at steady prices on choice lambs, but other grades of lambs and sheep were lower. Spring lambs sold steady with last week's close.

Prime wethers	$5.90@6.10
Good mixed	5.75@5.90
Fair mixed ewes and wethers	5.00@5.60
Culls to common	3.00@4.50
Culls to choice lambs	5.50@8.65
Spring lambs	8.00@11.00

BUFFALO LIVE STOCK

Buffalo, N. Y., May 18, 1914.

Cattle.—The general tone of the market was stronger on desirable grades. Medium and mixed butcher steers were in active demand at firm prices. The week closed full steady on butcher grades. Feeders were in good demand by country buyers, selling on the basis of 7@8c. Today's receipts were 4,500 head. Heavy grades sold 15 to 25 cents lower, and butcher stock 10 cents lower.

Choice heavy steers	$9.00@9.15
Fair to good	8.25@8.80
Yearlings	7.75@8.65
Handy butchers	7.25@8.50
Good to choice fat cows	6.50@7.25
Good to choice heifers	7.50@8.15
Butcher bulls	5.00@7.25
Feeders	6.50@8.00
Cows and springers	30.00@90.00

Calves.—Altho the week's opening supply was large, the demand was active and the market 50c higher, sales being at $10.25@10.50. Today's receipts were 1,700 head, and the market was lower.

Choice veals	$10.00@10.50
Lights and thin	6.00@8.75

Sheep and Lambs.—The week opened with a light supply and a good demand from all sides. The basis was 10 cents higher. Yearlings were in light supply and higher. Sheep were in good demand. On the close, the trade was steady on all desirable grades of sheep and lambs. Today's receipts of sheep were 12,000 head, and the market ruled lower.

Choice lambs	$8.50@8.60
Yearlings	7.25@7.75
Wethers	6.25@6.50
Ewes	5.50@8.00
Mixed sheep	5.60@5.75

Hogs.—The week opened with large receipts, an active demand but with prices 10@20c lower. Light weight hogs were in active demand at $8.80@8.90. Medium and heavy grades were easier. Rough and common hogs were easier. Today's receipts were 1,800 head, and the market ruled slow on all grades.

Heavies	$8.85@8.90
Mixed and medium	8.85@8.90
Yorkers	8.85@8.90
Light Yorkers	8.85@8.90
Pigs	8.90@9.00
Roughs	7.50@7.65
Stags	6.50@7.25

Horses.—Receipts for sale, 450. Good demand for choice heavy teams, which were quotable at $700@750; medium pairs, $700; drivers, $125@200.

NEW YORK LIVE STOCK

New York City, May 18, 1914.

Beef Cattle.—Receipts today, 3,000 head. Market steady.

Steers	$8.00@9.25
Bulls	6.00@7.85
Cows	3.50@6.75

Calf receipts 800 head. Market firm.

Choice	$9.00@11.50
Culls	5.50@7.50

Dressed calves higher. Dressed veals 15½@18c.

Sheep and lamb receipts 13,600 head. Market firm.

Sheep	$5.00@6.50
Spring lambs	9.50@10.50

Hog receipts 8,500 head. Market steady.

Choice	$8.90@9.00
Roughs	7.60@7.75

BALTIMORE LIVE STOCK

Baltimore, Md., May 18, 1914.

Cattle.—Receipts for the week were 1,632 head, against 1,161 last week.

Steers	$6.25@8.35
Heifers	5.50@6.75
Cows	3.00@5.75
Bulls	5.25@6.75
Fresh cows	32.50@72.50

Sheep and Lambs.—Receipts for the week were 4,414 head against 3,619 last week. Fair supply; market higher.

Wool sheep	$3.50@6.50
Clipped sheep	2.50@5.75
Wool lambs	7.00@9.75
Clipped lambs	5.50@8.65
Spring lambs	8.00@10.25

Hogs.—Receipts for the week were 9,804 head against 14,521 last week.

Light western	$9.15@9.20
Heavy to medium	9.00@9.25
Near-by	9.00@9.15
Pigs	9.00@9.05
Roughs	7.00@8.00

Calves.—Receipts for the week were 474 head against 375 head last week. Light supply, market steady at $6.50@11.00.

CHICAGO HORSE MARKET

Chicago, Ill., May 18, 1914.

Horses were not in large supply last week and yet they were largely $5@15 per head lower, strictly prime ones excepted, for the latter were comparatively few. Buyers did not want many horses, and sales were likely to drag, with good drafters salable around $225@250 and better ones quoted up to $275@300. Light chunks brought $185@220, with heavier ones taken at $230@250. Pairs of good farm horses brought $300@350, and quite a number of farm mares sold singly around $180@185.—F.

PITTSBURGH HAY AND GRAIN MARKET

Pittsburgh, Pa., May 18, 1914.

Receipts of hay continue light. Market fair. The demand is only for the better grades of timothy and light clover mixed. Grades below No. 2 are hard to dispose of at anything like satisfactory prices.

No. 1 timothy	$18.50@19.00
No. 2 timothy	16.00@17.00
No. 1 light mixed	16.50@17.00
No. 1 clover mixed	15.50@16.00
No. 2 clover mixed	12.00@13.00
No. 1 clover	15.50@16.00
No. 2 clover	11.00@12.00

The straw market is a little quiet; receipts and demand are about equal.

No. 1 Oats	$9.75@10.25
No. 2 Oats	9.50@9.75
No. 1 Wheat	9.75@10.00
No. 2 Wheat	9.25@9.50
No. 1 Rye	11.00@11.25
No. 2 Rye	9.75@10.25

Ear Corn.—Ear corn continues urgent for good No. 2 yellow, with very few arrivals. Prices steady.

No. 2 Yellow	83½@84c.
No. 3 Yellow	80@81½c
No. 1 High mixed	82@83c.
No. 2 mixed	80@81c.

Oats.—Oat receipts are a little above the average but an active demand takes care of all arrivals at quotations.

No 2 White	44@44¼c
Standard oats	43¼@43¾c
No. 3 white	42¼@42¾c.
No. 4 white	40¾@41¾c.

NEW YORK HAY MARKET

New York City, May 18, 1914.

The market for hay displays quite a steady tone with a fair demand noticed. Receipts Saturday were 1,111 tons. Prime timothy, $1.15 bale; No 1, $1.10; No. 2 do., $1.00@1.05; No. 3, 85@90c; clover, 60@95c.

The straw market remains steady. Receipts 50 tons. Oat straw, 55@60c; rye straw, 85@90c.

GRASS SEED MARKET

Toledo, O., May 18, 1914.

Clover Seed.—Prime cash, $7.60; October, $7.95.

Timothy.—Prime cash, $2.38½; September, $2.37½.

VISIBLE GRAIN SUPPLY

New York City, May 18, 1914.

Visible supply of grain:

Wheat decreased 4,812,000 bushels; in bond increased 37,000 bushels.

Corn decreased 1,781,000 bushels.

Oats decreased 651,000 bushels; in bond increased 290,000 bushels.

Rye decreased 319,000 bushels.

Barley decreased 376,000 bushels; in bond increased 21,000 bushels.

NEW YORK MILK MARKET

New York City, May 18, 1914.

The dealers blessed the weather at the end of the week because in addition to stimulating production it also stimulated the demand. The flush season is coming on more slowly this year than usual, owing to the superabundance of cool weather.

The receipts of milk and cream in 40-quart cans for the week ending May 16, were as follows:

Railroad	Milk	Cream
Erie	49,817	3,410
Susquehanna	8,766	372
West Shore	16,759	2,132
Lackawanna	58,650	2,775
N. Y. Central (long haul)	85,554	3,086
N. Y. Central (short haul)	12,340	225
Ontario	39,255	5,358
Lehigh Valley	36,480	1,715
Homer Ramsdell Line	2,725	53
New Haven	7,125	210
Pennsylvania	6,476	238
Other sources	1,675	27
Totals	325,622	19,601

ELGIN BUTTER QUOTATION

Elgin, Ill., May 18, 1914.

The quotation committee of the Elgin Board of Trade this afternoon declared butter steady at 25½c.

TOBACCO MARKET

The continued dullness was the main characteristic of the Pennsylvania tobacco market. It is thought that this condition emanates from a series of causes including overproduction, lack of marketing facilities and tariff reduction. However it is estimated that some two-thirds of the crop has been sold, but at prices generally unsatisfactory and unprofitable to growers. The general market, too, was dull and the volume of business small. An encouraging feature is the falling off in importations which are far short of the average.

It is thought that the acreage will be greatly reduced the present year. The prospect for plants is fairly good but continued cool weather favored the work of certain plant-eating insects and also retarded growth.—H. E. Tweed, May 18, 1914.

I SAY THAT The TEMPLE ENGINE is the Most Easily Moved ENGINE made—it actually weighs 1/3 to 1/2 less—has 2/3 less bulk—occupies 1/3 to 1/2 less space—than any horizontal engine of same power capacity. Look at the "Temple" Design and see for yourself that it is true. Made 2 H. P. to 50 H. P., using gasoline, kerosene, alcohol and distillate.

Why, then, pay out good money for a big, heavy, unwieldy engine, and then "blow in" some more money for a big special truck to carry it, when you can easily put the light, compact "TEMPLE" on anything having wheels; or on skids, planks, or stone boat, that one horse can haul anywhere. It can even be put on a push cart and pulled about by one man.

It's the "TEMPLE'S" (Inverted Vertical Cylinder) Design that accounts for its unequalled portability—its quiet, smooth running—its delivery of full rated power, whether MOUNTED, or STATIONARY—its small fuel consumption—its low upkeep cost—its durability, long life, etc. All this means that

The "Temple Pays for Itself"

many times over, by its clear saving of 1/3 to 1/2 the fuel consumed in other engine designs—to say nothing of the "TEMPLE'S" many other more serviceable and more economical features.

You may doubt my claims for the "TEMPLE'S" vastly superior all around accomplishments in farm and contracting service, but you can't doubt the facts and figures I can submit to prove them. Just a penny now for a (postcard) brings you these facts and figures, also information about engines you simply can't get from any other source, and which may be worth hundreds of dollars to you later on. Do it now.

Veterinary

(Conducted by W. C. Fair, V. S.)

(Advice thru this department is free to our subscribers. Each communication should state history and symptoms of the case in full; also the name and address of writer. Initials only will be published. We cannot make reply by mail. This is one of the most valuable columns of the paper and we invite readers to make use of it. Clippings from this column, when properly preserved and classified, would make one of the most valuable medical symposiums a farmer-stockman could obtain.)

Rheumatism.—One of my hogs appears to be stiff and can hardly move about, besides he seems to have lost his appetite. I have given him wood ashes and salt, but this does not seem to correct the trouble. M. E. T., Herman, Pa.—Give your hog 15 grains ground nux vomica, 20 grains sodium salicylate and 20 grains powdered nitrate of potash, 3 times a day. Give either castor oil or epsom salts to open bowels when necessary. Feed your hog less corn, more pasture, tankage and roots and he will soon show improvement.

Crooked Tail.—I have a mare that carries tail to one side when traveling faster than a walk. I would like to know if anything can be done to make her carry her tail straight. J. E., Selina Grove, Pa.—A surgical operation which is simple and consists in dividing the muscles on the side tail crooks helps. The one set of muscles is usually shorter than opposite and for this reason tail pulls to one side. After the muscles are cut, the tail should be tied to surcingle on opposite side in order to keep ends of muscles apart until granulations are thrown out on the end of divided muscles, which, if accomplished, will lengthen this short set of muscles, obliging horse to carry a straight tail. There is another way to operate which consists of removing a section of long muscles, then pulling tail in a position to allow cut muscles to unite. It usually requires 10 days or two weeks to perfect this work.

Halter Puller.—I have a three-year-old colt that has habit of pulling halter and breaking loose. I find it very unsafe to use this colt on account of this vice. H. W. T., Oil City, Pa.—Usually colts and horses contract the habit of halter pulling by being hitched with frail, easily-broken halters or neck ropes. Therefore, a tricky colt or horse should be hitched to something substantial and a halter or neck strap applied that they cannot break. Tie a rope around body, either back of shoulder or in front of hind legs, passing end thru a neck strap or halter and fasten it securely to a post or manger. In this way he will not attempt to break loose more than a time or two, but be sure and always hitch him securely. There are many other ways that he might be fastened, but those I have suggested are simple and no danger of him hurting himself.

Rough Coated Horses.—Five of my six work horses are shaggy and rough coated. When doing light work they seem to perspire far too much and are growing thin. What can I give them to make them shed their old hair? W. C. K., Meadville, Pa.—Every one of five horses should be clipped. As soon as it is done they will commence to lay on flesh. Mix equal parts ground gentian, ginger, bicarbonate of soda and salt and give each horse a tablespoonful or two at a dose in feed, 2 or 3 times a day. Perhaps you should increase their food supply.

Colts are Lousy.—We have two colts that are troubled with lice, they rub so much that skin is raw in patches. I would like to know what to apply. A. H. N., Troy, Pa.—Killing lice on colts will not rid your horses of lice, but will help. Put 1 oz carbolic acid and 1 oz. glycerine in 3 pints water and apply to lousy colts, twice a week; also spray this same preparation on stall walls. Wet the curry comb and brush and keep after the lice until you are sure they are killed. If colts have long coats you will make headway by first clipping them before treatment is commenced.

Sow Has Mange.—We have a sow that has skin disease which causes her to rub. I am sure it causes an itchiness and sow is growing thin. She had nice litter of pigs, 8 weeks ago, and as they are now weaned I would like to have her cured. T. H. W., Syracuse, N. Y.—Apply 1 part chinosol and 250 parts water daily, or apply 1 part sulphur and 3 parts fresh lard to sore, itchy parts of body, 3 times a week. Give her 20 drops Fowler's solution at a dose in feed, 2 or 3 times a day. Feed grass and keep her in clean pen.

ATLANTIC AUTOMOBILE GASOLINE

Let Our Tank Wagon Service Supply You

Our delivery service of Atlantic Automobile Gasoline is saving money, time and worry for any number of Pennsylvania farmers. Our tank wagons will deliver it right at your door. In this way you are sure of regular supplies of high-grade, uniform fuel.

ATLANTIC AUTOMOBILE GASOLINE will give you freedom from engine troubles and a maximum power per gallon. With it your car starts quickly, and you don't have the bother of frequent carbureter adjustments.

Atlantic Automobile Gasoline is made by a perfected refining process, which equals, though on a much larger scale, the careful accuracy of the chemist's balance.

The result is a uniform fuel, which always acts the same under all conditions. Ask for it by name—"Atlantic Automobile Gasoline."

Farm Crop Notes.

Hay-Making

The hay harvest season will soon be on, one of the most strenuous yet delightful seasons of the year. No other business has coupled together so much of prose and poetry as has hay-making. Every real country dweller breathes the poetic spirit at this season even in the midst of hard work. The ring of the scythe, the rattle of the mower, the sweet scented air, the restful peace of the evening after the hay is in cock or barn, turn the long, heated hours into a play-time. I write this knowing full well that sordid natures will sneer at it, but it is not to such I am writing.

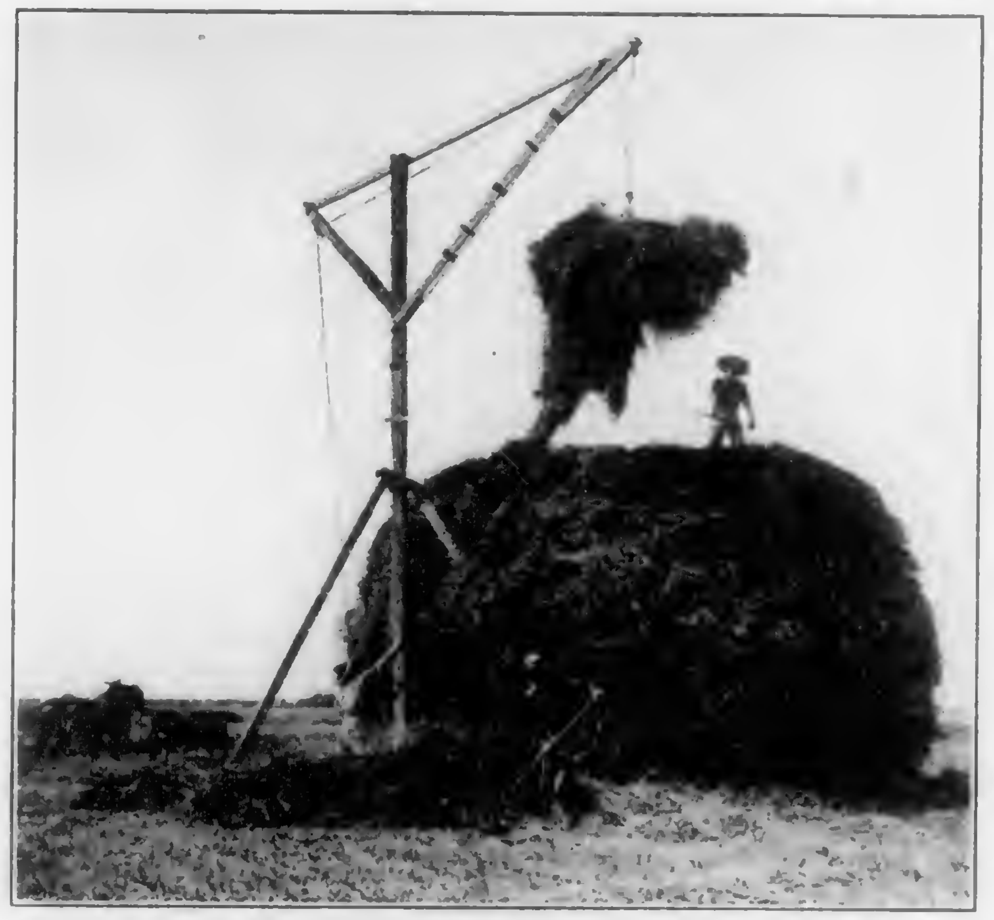
There is no part of farm work that calls for better judgment or a more critical eye on the part of the farmer than hay-making. He must know when the grass has reached the proper stage of development to make the most nutritious hay; he must have a good "weather-eye" so he can read the signs and know when and how much to cut; he needs a calm mind enabling him to "possess his soul in peace" even when pushing the work to the limit without anxiety and killing excitement.

This kind of man does not have spoiled hay from leaching, bleaching and over-ripening. I have known neighbors with equal harvests to have just opposite "luck" in putting up their hay in a showery season; one would get his harvest in in good condition, the other would have much spoiled hay. "Luck" is always on the side of intelligence and good judgment.

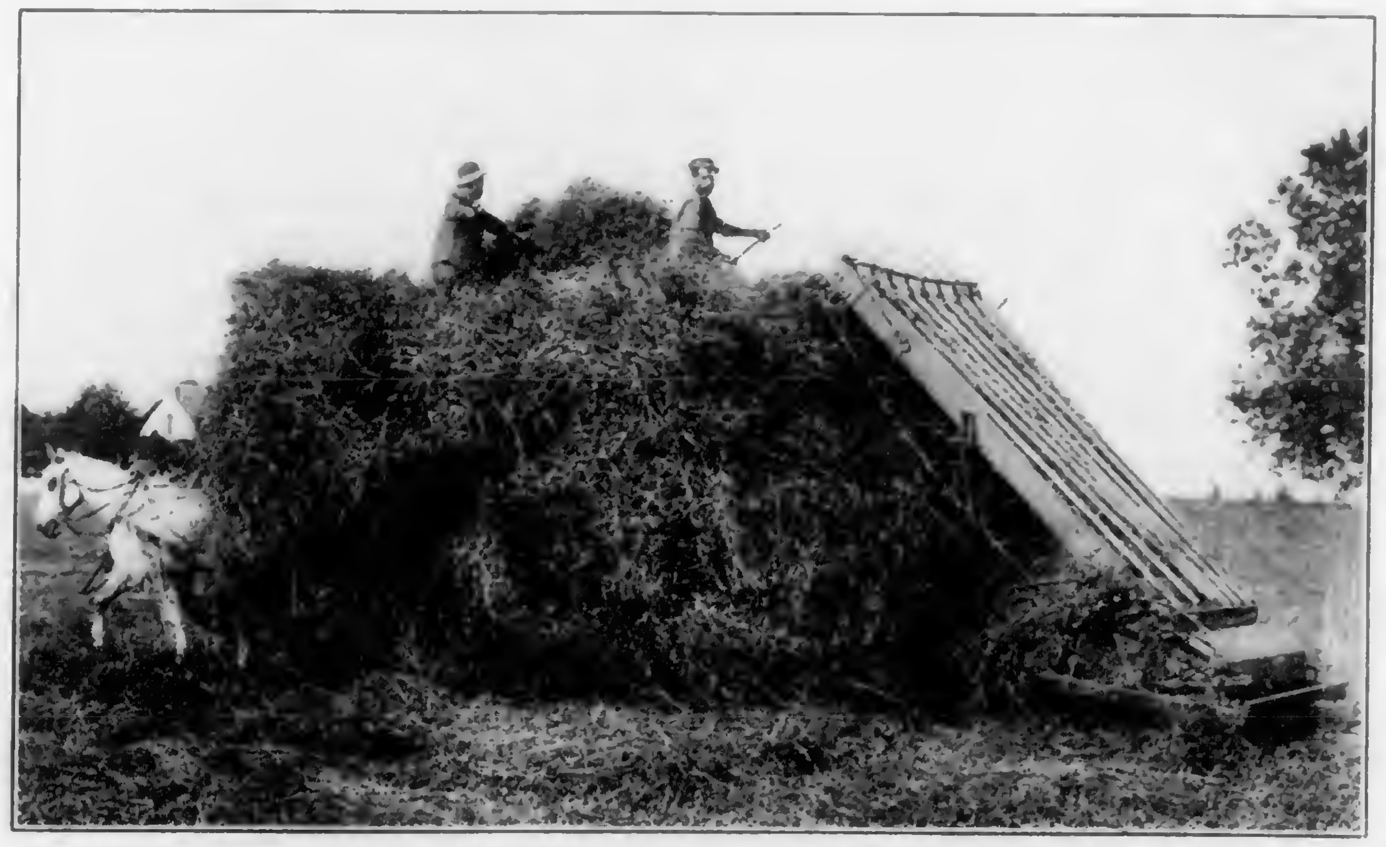
Soil "Stimulants"

The following is one of the rules laid down by a central Pennsylvania bank president for the guidance of contestants in a boys' corn-growing contest, for which the bank is offering premiums: "Any fertilizer which will enrich the soil may be used, but such chemicals or compositions as only stimulate this year's crop and do not enrich the soil may not be used."

Just what the bankers had in mind as stimulants is hard to understand. To stimulate is to arouse to action; hence a stimulant is anything that will bring into use or activity dormant properties. By a liberal interpretation, lime might be considered a stimulant, and it is about the only thing that farmers buy and apply that may be so considered. Surely, the bankers would not discourage the use of lime in moderate quantities.



A STYLE OF DERRICK MUCH USED WHERE HAY HAS TO BE STACKED OR RICKED



THE LOADER SAVES TIME AND MAN LABOR, AND SAVES HAY WHEN A STORM IS COMING.

Nearly all farm lands are liberally supplied with most plant foods but they are often in an insoluble form and hence are valueless to the farmer until made available by some kind of "stimulant." Cultivation, sunshine and stable manure aid in this work and hence may be termed "stimulants." There has been a whole lot of fear and fool talk about nitrate of soda, acid phosphate and potash salts being nothing but stimulants, whereas they are plain elements of plant food in the same sense as milk, soup, eggs, or beef steak are human foods. It is all right for the bankers to "stimulate" interest in better farming, but they should leave the technique to the farmer. The success of the contest will be more certain and lasting. Let the shoemaker stick to his last.

Boys' Contests

We believe in crop-growing contests for boys and girls so long as they are conducted in a sane manner. They arouse interest and beget knowledge. They cause, not only the young people but the parents as well to think and plan for best results, and as long as the prize or the adulation is not the main object, much good may result.

The foolish part of the business in the past has been the "odious comparisons" drawn by the penny-a-liners between the young people and the old folks. It would seem that "Everybody works but father," from some of the reports. It is pointed out that if father did as well as the boy or girl the corn or potato crop of the country would be doubled and the cost of living correspondingly reduced. But, they say, "father will not learn. He is joined to his idols."

It is not mentioned that, usually, father has picked out the best spot of ground on the farm, and that very often it has been his best judgment regarding fertilizers and cultivation that brings results. Of course it is done cheerfully and when the award is given the parents of the successful ones are just as proud and happy as the young folk and are perfectly willing that all the glory shall go to the boy, or girl. But is it fair to the young people, let alone parent? Let's be temperate in eulogizing. Father would do as well on every acre if he could, but he can't.—R. P. Kester.

Convenience of a Hay Tedder.

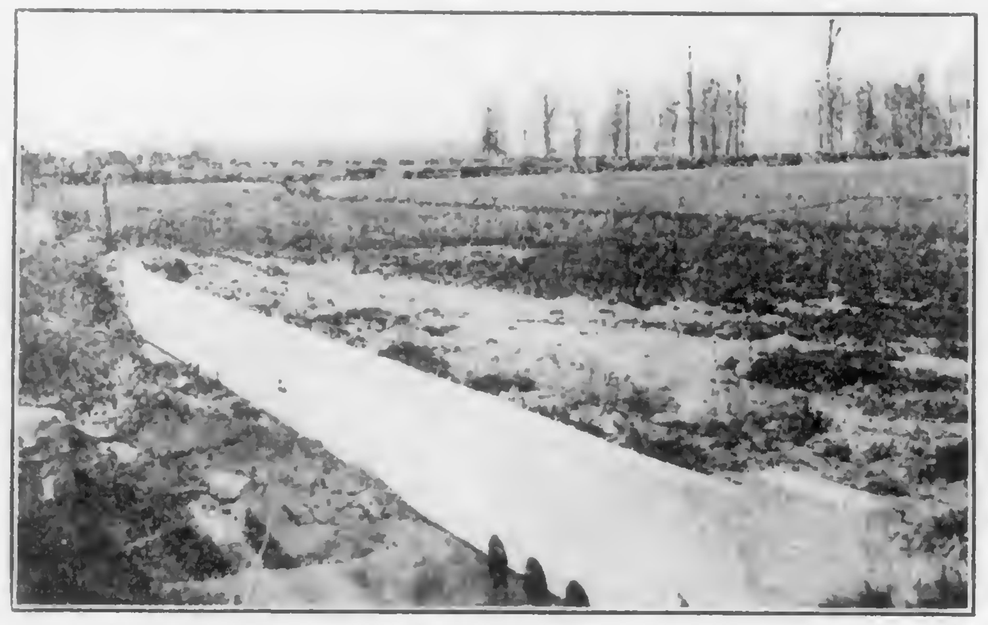
A good hay tedder has a very important place among haying tools. Since applications of lime are making heavy crops of clover, the tedder is especially convenient in properly curing the crop. With the aid of a good tedder it is possible to cut clover in the afternoon or evening, when the dew of the following night will not injure the clover on account of not being cured enough. The following forenoon, by thoroly tedding the hay once or twice, it will not only be evenly cured, but can either be put in shape for drawing in the afternoon or at least for raking into windrows before being wet with the second dew.

In this way very choice clover hay can be put up. Large quantities of clover hay are badly damaged every season by allowing it to lie in the swath for the second dew to blacken, for lack of the service of a tedder in hastening the curing process. Clover hay when allowed to color with a second dew dries very rapidly, and as a rule is not only damaged in being badly colored but becomes over-cured before it can be gotten away. Such hay is unpleasant to handle, and generally comes out of the mow brittle, dirty and dusty.

Choice clover hay should come out of the mow bright and green, and with some elastic feeling to it—not dry as powder. For best results clover hay must be cured as rapidly and evenly as possible and hurried into the barn while there is still enough moisture in it for proper mow curing. Here the use of a good tedder will be found indispensable in gaining this point.

Another advantage gained by the use of a tedder is in making hay during rainy periods. Hay that has been wet by rain can be very quickly dried by tedding once or twice as soon as the weather changes. Even hay wet in the windrow can be shaken up, and quickly dried with a two-horse tedder by driving astride the windrows and going over them a couple of times. I had much rather have hay get wet in the windrow than in the swath, as it colors but very little with once wetting in the windrow.

At times I have even hurried the hay into windrows before being cured when rain was certain, to prevent it being badly colored in the swath; then after the rain "kick up" the windrows with the tedder. In this way a large amount of hay can be shaken up in a short while, and it is surprising how fast such hay will cure after getting wet if the weather is favorable. The hay will not be scattered so much but that a hay loader will pick it up, but if the hay is to be pitched by hand a horse-rake run lengthwise of the windrow will bunch the hay for the pitching in a short while.



CONCRETE ABUTMENT AT TILE DRAIN OPENING.

A tedder should be purchased which will accommodate two full swaths from the mower, no matter if a 5 or 6 foot mower is used; otherwise it makes unpleasant tedding. The tedder should be properly geared to shake up the hay in good order, and the kicker forks arranged with some good spring pattern to withstand the shock from jabbing into uneven ground without breaking and causing annoyance. A tedder should always be equipped with a tongue instead of shafts as it is much more conveniently used with two horses.—C. R. Weidle, Erie Co., Pa.

ACID PHOSPHATES

Upon reading J. H.'s inquiry about fertilizers and A. B.'s reply in recent issues of Pennsylvania Farmer, I took up a West Virginia bulletin on fertilizers and counted 18 different brands of 16-percent guaranteed acid phosphates which showed by the official analysis above the guaranteed analysis. Some of them showed more than 18 percent of available phosphoric acid. The highest analysis of acid phosphate derived from phosphate rock was 18.62 available phosphoric acid. One guaranteed 14 percent South Carolina rock phosphate showed 15.7 percent available acid phosphate. I have repeatedly seen it stated that we can not depend upon a higher percent of plant food than the lowest guarantee mentioned. While this is true, I note that nearly all of the fertilizers sold in our state show a higher percent of plant food than the minimum guarantee.—A. J. Legg, Nicholas Co., W. Va.

RETAINING WALLS AT TILE OUTLETS

Many an otherwise efficient and properly executed system of tile drainage is neglected at its outlet. We have known more than one large county ditch at the outlet of which many tiles had been displaced, shattered by frost, and rooted full of mud by hogs. No system of this kind is complete and in condition for easy maintenance until its outlet is properly safeguarded by some kind of permanent structure designed to keep the tile open, in place, and properly covered at all times. Formerly stone has been used for this purpose with satisfactory results; but now concrete is found better adapted to this kind of work.

At the rear end of our farm we have a system delivering water into a large open ditch that formerly crossed thru our place from end to end. Considerable flood water from two other farms crosses ours and goes into the open ditch at the same point. Another ditch comes down the highway to the same point, making it more difficult to keep an earth mole in place. Formerly a number of hewn logs had been placed in the form of a dam, and re-enforced with earth behind; but floods often displaced the timbers, washed the earth thru the cracks and around the ends, and wrought such havoc that almost every year the hauling of a good deal of dirt was necessary in order to repair the fill so that crops could be planted or harvested in that part of the field immediately adjoining the outlet of the tile. When we first came to the farm a gully had been washed out so far back that quite an area had to be abandoned temporarily until the fill could be repaired, which at that time required several rods of new tile, and four days work of two men and teams.

Last fall we set about it to get a permanent retaining wall built in the dry season. The wall constructed is shown in the photograph. We excavated for the foundation two feet deep and the same in width, (also allowing 6 inches for the front forms) the proposed wall to be 55 feet in length and about 5 feet high from the bottom of the foundation to the top of the wall. In the illustration the wall appears higher than it really is, the tiles passing thru being 12 inch, and the wall being little more than 30 inches above the tops of the tiles. Being anxious to do a permanent job, we possibly constructed a longer wall than is absolutely necessary; however the washing around the end of such a wall would go far towards rendering it useless. From the illustration it may be seen that at each end of the wall it is made 6 inches higher and the earth raised flush with this higher level, which forces the water to pass over the wall instead of allowing it to pass around the ends.

Such a wall should have a base at least two-fifths as thick as the total height of the wall. A 5-foot height should have a 2-foot base. In addition a "toe" should be allowed to project in front and rear to permit of a greater resting surface on the ground. Our wall is two feet thick for the lower two feet, and is sloped on the rear side to an eight-inch face on top. The front forms were constructed in seven foot sections, of best matched barn siding nailed with as few small nails as possible and lowered into the trench when complete; they rested on stakes driven into the bottom of the trench and were held in front at the bottom by stakes and wedges against the earth front. At the tops they were braced strongly from stakes driven six feet in front of the forms.

This form stuff was all cut in 7-foot lengths and when taken out was immediately used in constructing two A-shaped hog cots. In the rear the earth composed the form for the first two feet, and above this old boards were used, except the top board, which was a smooth one. The rear form was spaced from the front by lath passing across above the top of the wall. The rear form may be constructed only as the work progresses; in case front forms are scarce, pull down the first section in two or three days and use it further down the wall. The making and "truing" of the forms on a wall of this length and location is a work requiring considerable care and precision.

We were advised by a competent engineer that re-enforcement for such a gravity wall was unnecessary; as a result of neglecting this we have one small crack about the middle of the wall (the part where the tiles pass thru having been re-enforced). Wherever the bottom of the trench is damp, crushed or small stones should be thoro ly tamped in to render the foundation more firm. The crack in this wall is a settlement crack due to insufficient attention to the tamping. Such walls may well be constructed in sections of 20 to 25 feet to prevent contraction cracks, as joints are more sightly. We used a 1:2:5 mixture; that is, we used a 1:5 of bank gravel. The cement was mixed in a flat sled made for the purpose and drawn by a horse along the trench, and thrown with scoopshovels immediately in place. We mixed sloppy, and prefer that way. Keep a lath for running back and forth over the front face so as to keep the pebbles back and give a fine front surface.

Such a wall will cost, including all material, forms, labor,—in fact everything—about $2 per foot of length; lower walls cost much less, being correspondingly less thick. We expect to find it necessary, or at least advisable, to provide a riprap of field stones in front of this wall to keep the falling water from undermining the wall.—Geo. P. Williams, Delaware Co., O.

"For the land's sake, use Bowker's Fertilizers; they enrich the earth and those who till it."—Adv.

35 BUSHELS PER ACRE
was the yield of WHEAT

160 ACRE FARMS IN WESTERN CANADA FREE

on many farms in Western Canada in 1913, some yields being reported as high as 50 bushels per acre. As high as 100 bushels were recorded in some districts for oats, 50 bushels for barley and from 10 to 20 bushels for flax. J. Keys arrived in the country 5 years ago from Denmark, with very little means. He homesteaded, worked hard, is now the owner of 320 acres of land. In 1913 had a crop of 200 acres, which will realize him about $4,000. His wheat weighed 68 lbs. to the bushel and averaged over 35 bushels to the acre.

Thousands of similar instances might be related of the homesteaders in Manitoba, Saskatchewan and Alberta.

The crop of 1913 was an abundant one everywhere in Western Canada.

Poultry

CARE OF BROOD DURING WET WEATHER

A little neglect during a rainy period may result in the loss of whole broods of chicks. We like to keep chicks growing rapidly and this is easy to do in favorable weather; but when a prolonged rainy spell strikes us we are satisfied if we can only keep the chicks alive and healthy.

Cleanliness and dryness in brood coops are important factors and so difficult to secure during a prolonged rainy period. The hens with small broods will go thru a wet spell with less attention than the ones with big families.

Turning broods loose in the wet lowers vitality and invites gapes, so we must keep the chicks confined to coops and brooders much of the time. We find the hens are less restless and hover their chicks better when given a little outing once a day, no matter how bad the weather is. We give the hens and chicks their liberty a little while in the evening. They won't go far enough to hurt the chicks at this time and while they are out we have a good chance to give the coops the daily cleaning they must have in wet weather. A covering of dry chaff makes the floor dry and warm for the little chilled feet on a cool rainy night.

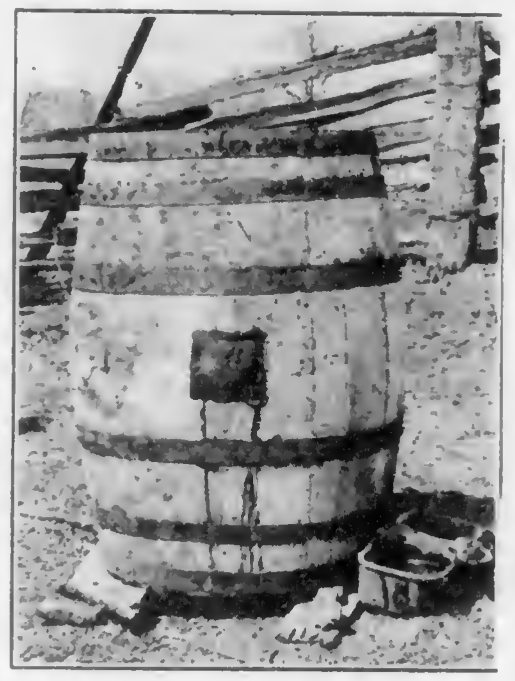
One spring when we had over a week of cool rainy weather the last of May we moved several hens with large broods to the barn. We kept hens in coops and let the chicks out on the barn floor where they had a merry time in the dry. When the weather cleared up we moved the whole outfit back to the poultry yard. This was some trouble but we got the chicks all thru the wet weather safely and others did not fare so well, altho we gave them every attention. We find a box stall in the barn is a splendid place to keep an old turkey hen and her young during a wet period. An outdoor brooder is all right out in the open when the weather is nice, but in bad weather it is so much easier for the caretaker and better for the chicks to have the brooder located where wind and rain cannot strike it.

It takes courage on the part of the farmer's wife to wade thru the wet after the chickens, sometimes going right out in a shower. We need short skirts for this work, water proof shoes and a wrap always handy. Our own health is worth more than the chicken crop. Keeping the grass short about the coops makes it better for the one who cares for the chicks and healthier besides for the chicks.—Fannie M. Wood, Wayne County, Ind.

WHEN TO PUT SUPERS ON THE HIVES

There is no subject of more importance to the bee-keeper, nor is there one that gives him more pleasure than the study of the honey-producing flora of his locality. No matter whether they bloom in the garden, the field or forest, or perchance along the roadside; if bees gather nectar from them they at once become an object of interest and investigation. The question of bee forage is one that every one engaged in bee-keeping should investigate, for upon the amount and duration of the honey-producing plants and trees in the vicinity of the apiary depends the success or failure of the enterprise. The results depend quite a good deal upon the skill and management of the bee-keeper. A good deal of work must be done if the best results are to be gained. First, the colony to do the work should be strong in bees, and I think, the stronger the better; if not so naturally, it should be made so by feeding, or by supplying bees from some other colony. Many talk about the swarming impulse, but I prefer the business impulse, and if there is not honey enough coming in to make this impulse, you must secure it by means of feed.

The time to put on supers, whether for extracting or for comb honey, is just before the beginning of the real harvest, or at its very inception. When the harvest is about to begin, or is beginning, the least delay is injurious, as the possible lack of room may cause preparations for swarming on the part of the strongest colonies, and it must be borne in mind that these colonies are the ones upon which we should depend for the best of the crop. The first signs of a beginning of the crop are detected by the whitening of the combs by the bees. The harvesting of a little honey prompts them to repair the combs that have been cut down by the unsealing of the cells that contained the previous crop, and they hasten to repair these and add fresh wax to them, just as soon as they feel that there is enough surplus produced to justify them in using a part of it in that way. Even the blackest and oldest combs are usually refreshened, and at the first signs of this evident encouragement one should lose no time in putting supers on all hives that show it. The fresh honey itself might be detected even a day or two sooner if the combs are lifted out, for it drips out just like water, being thin and unripe.



POULTRY-WATERING DEVICE.

Putting on sections early seems to keep the swarming fever down more than anything else we ever tried. Put them on as soon as it can be done without chilling the brood and retarding brood-rearing. One year, in our early experience, we put on the supers, but gave only a few sections in each super, intending to put them on as soon as was needed; but the bees became crowded suddenly, and swarming was fearful. They swarmed over and over again giving us no time to get supers filled with so many swarms to care for. So we have learned also to have supers all filled, for a super can as easily be put on as only a one pound section. Bait combs are of such importance in a weak flow, and with the weaker colonies, that I would use them even if the honey had to be extracted, the combs being dark or otherwise off-grade.

I have found it desirable to use drawn comb and full sheets of foundation in the same super, as the bees will fill and complete the sections containing comb before commencing work on the foundation. The first supers we select with one section of drawn comb in each corner, the rest of the sections being filled with full sheets of foundation. These combs at the corners start the bees to work the corners first and that means that they will work the sections altogether, thus causing all the sections to be sealed at nearly the same time. The usual way of putting one bait-comb in the center causes this part of the super to be finished, sealed, and, perhaps, travel-stained, before the outside sections are sealed, and ready to come off. With our super arranged with drawn combs in the corners, and full sheets of foundation in the balance of the sections they are all finished at the same time, before there is a particle of travel stain, thus doing away with the only objection there is to leaving the super on until all the sections are finished.

When nectar is abundant in the fields, and your bees hesitate about starting work in the sections but crowd the brood nest with it, try the following plan. When the combs are sealed at the top in the broood chambers, mash these cells at the top of the brood frames with a table fork; shut up the hive, put the sections on, and then rap on the hive. Do this just before dusk, and you will find the bees nicely at work there the next morning. Of course, it must be during the honey flow. It is not difficult to persuade any colony of bees, of proper strength, to work in the section, but do it by rapping on the hive and driving them up. They fill themselves with honey and go up there and work. You have perhaps sacrificed enough cells so that they will have no cells except those to put honey in. The honey will have to be taken out by the bees. It is a forcing process, but it secures the result.—F. G. Herman, Bergen Co., N. J.

POULTRY WATERING DEVICE

The photograph is taken from one of the automatic water fountains used in supplying the colonies with water when the birds are out on the range. These automatic fountains are purchased of a mail order house, and attached to large barrels. We use tar barrels for this purpose. We can get these barrels at our hardware dealers at 25 cents each. One head is removed and the barrels cleaned by burning out the tar and scraping off the remaining charcoal. A burlap sack is nailed over the top to keep out foreign matter and strain the water, so nothing gets under the valve and prevents its working. We fill the barrels as frequently as required, hauling the water out on a stone boat.—J. T. Campbell, Crawford Co., Pa.

Domestic Birds.—By John Henry Robinson, editor of Farm Poultry. 309 pages, 5 by 7½ inches. Profusely illustrated. Bound in cloth. Published by Ginn and Company. For sale thru Pennsylvania Farmer. Price, $1.35.

Our Domestic Birds presents the A. B. C. of poultry culture. It is intended for text-book use in agricultural high school work. It gives a brief history of each kind of domesticated birds, discusses place of each in nature and the qualities that makes it of value as a domesticated fowl, and gives comprehensive notes on best methods of management and care. As a text book it will fill a real want, and as a reference book for beginners in poultry work it is sure to be of value.

A Neglected Asset---The Farm Orchard

By W. MILTON KELLY, Erie County, N. Y.

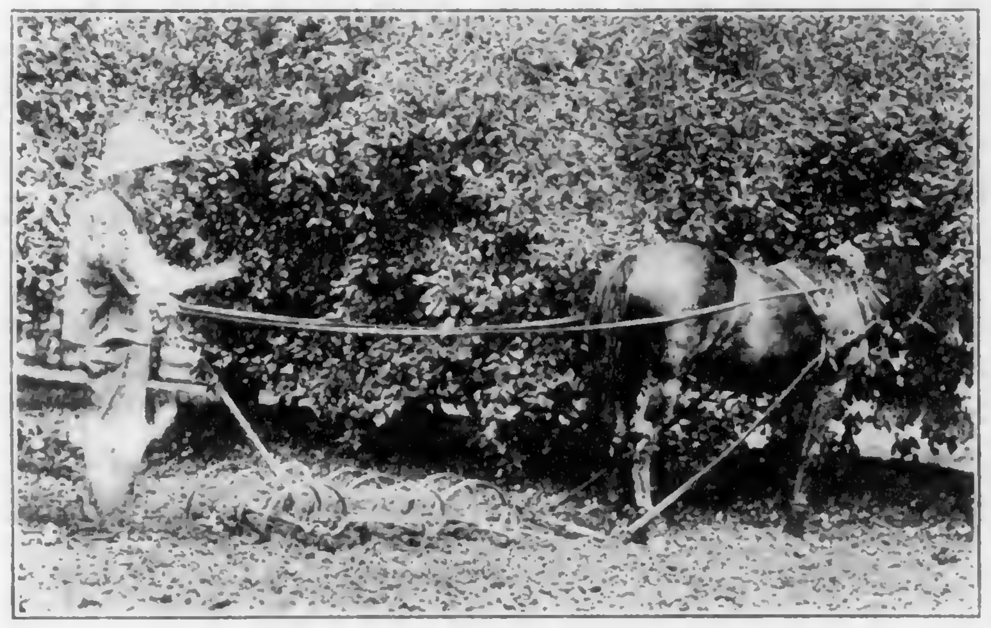
One of the first problems the purchaser of an eastern farm has to face is that of renovating an old orchard. The question of the profitableness of the undertaking is not always of first consideration, for every farm should have enough fruit trees to provide an abundance of fruit for home use. If the trees are old and infested with insects and diseases there is, of course, no use in attempting to bring them to life again. If they are partially sound and have only suffered thru neglect and uncongenial soil conditions it is comparatively easy to shape a course of management that will restore them to a healthy, productive condition within a few years. On the other hand, if the trees are mostly dead, if there are large limbs broken down and split, and if there are large decayed cavities in the trunks the cost of getting them into condition will vastly exceed the value of the few crops of fruit that they will produce.

From a commercial point of view the trees should be fairly uniform and complete. If only a few of the trees remain, it may be considered a very doubtful expediency to invest the labor and plant food necessary to put them in shape to produce crops of fruit. If the land is cheap, or situated so that it may be utilized conveniently for poultry, sheep or hog runs, it may be profitable to bring the few remaining trees back to life and depend upon the twofold use of the land for a few years until young trees can be started on other parts of the farm. On one of the writer's farms an old orchard that had been neglected by the former owner was restored to a productive condition by giving the trees a thoro pruning and scraping during the winter and spring and utilizing it as night pasture for dairy cattle. After seeding with clover and timothy this six acre orchard afforded considerable grazing and the droppings from the cattle helped to supply the plant food needed by the trees. The varieties were Greenings, Baldwins and Northern Spies. For several years these trees have produced a net profit of more than $100. altho more than one-half of the original planting were missing and others in a serious stage of neglect.

In order to make the work profitable the trees must be of standard varieties. One can not afford to invest labor and lose the use of the land in attempting to restore trees that will produce nothing but worthless fruit after they have been renovated. Of course, healthy trees may be top-worked to desirable varieties, but at the same time this is hard work and presents many risks and difficulties, so that the orchard must be in pretty good condition in other ways in order to make the work profitable from a commercial point of view. Trees situated near the buildings and in out of the way places about the farm should be grafted to varieties suitable for family uses.

Before starting any systematic plan of renovating an old orchard one should make a careful examination of the trees and determine to what extent they have been attacked by insects and disease. Among the important enemies of the orchard are San Jose scale, oyster-shell louse and apple-tree canker. All of these can be held in control, but to get rid of them requires considerable labor and expense. It is, therefore, better not to undertake the work unless one is thoroly convinced that it will ultimately return fair profits.

The first step toward accomplishing the desired results consists in giving the trees a thoro pruning. The first work should consist of removing the larger broken limbs along the wood that is diseased and actually dead. After the work is completed and the trees have regained their normal condition all interfering branches and those that render the tree unsymmetrical may be removed. In remodeling old trees special pains should be taken to shorten the heads. In order to keep the bearing surface within range of the spraying machine, heading-in is often desirable. This part of the work should be accomplished with care, and unless one has a knowledge of the principles which underlie the work he had better employ an expert to assist him. Better results will usually follow if the work is distributed so that the trees will be brought to the desired shape and condition in two or three years. In some instances the desired results have been accomplished in a single year, but it is my opinion that the safer course to pursue is to give the trees time to gradually regain their normal condition by the time the last work is performed.



USING THE HARROW IN ORCHARD CULTIVATION.

After the first pruning the trunk and main branches should be thoroly scraped. This work can be performed efficiently with an old hoe, or with a special scraper, which can be bought for about twenty-five cents. Removing the old broken bark and burning it promptly does away with a large number of fungus spores; besides it is a favorite lodging place for all kinds of orchard pests. In this way we not only destroy the pests, but their hiding places are obliterated also at the one operation.

Decayed cavities in the trunks and on the large limbs are caused by mechanical injuries, by careless pruning, or by failure to protect the wounds after pruning. If the orchard has been properly cared for there will be but few cavities to fill. If, however, the orchard has suffered neglect the lives of the remaining trees may be prolonged for years if their cavities are cleaned and filled. This work consists of cleaning out the decayed matter, thoroly sterilizing the cavity with a solution of copper sulphate at the rate of one pound to fifteen gallons of water, filling with cement, and leaving the surface in such a condition that the bark will readily heal over the edge of the cement. Care should be taken to level off the cement so that the bark will heal over the edge of the wound, sealing up the cavity as closely as possible.

If the trees are to be top-worked with new varieties this work should be started early in the spring after the first pruning so that it may be distributed along with the pruning during the two or three years. As the grafting will require the removal of a certain number of branches it should be done before all of the pruning is performed in order that one may intelligently select the best positions for the grafts.

The best all-round treatment for San Jose scale and oyster-shell louse consists of spraying the trees early during the first spring with a thoro application of the lime-sulphur wash applied in as warm a state as possible. Canker may then be taken care of more effectively by the spring applications of Bordeaux mixture. In the control of scale, thoroness is the important thing, and it is necessary to leave a film of the spray mixture over the entire surface of the bark, especially at the ends of the branches. Severe pruning facilitates spraying, and the work is extremely simple where the trees have been severely cut back.

In the management of the soil the first step toward renovating an old orchard consists of plowing the ground and getting it into condition to grow cover and fertilizing crops. The usual way of plowing around fruit trees is more injurious than not plowing at all for it is ruinous to the growth of the trees and cuts off nearly all of the important roots. These roots that grow close to the surface of the soil are the great absorbents of nourishment, whether they are roots of trees, plants or shrubs that yield fruit. This is a habit common to plants and trees to throw out a system of roots near the surface of the soil, where they will take up and readily appropriate the fertilizing elements with which they come in contact, to the purpose of developing the stems, or fruit of the growing plant.

If we will examine the surface soil around any tree where the ground has not been plowed or disturbed for a few years, we will find that a system of roots has been formed close to the surface of the soil. If these roots are all cut off another set will be formed in their place in a few years, or if the soil is worked up to the trees and left there a set of roots will start out about so far from the surface; then if more dirt is worked around the tree another set of surface roots will start out except in the case of extremely old trees. We have worked soil up around grape vines and in one year a new set of surface roots have formed that would measure more than two feet long.

Some trees that are set too deep will not thrive for a few years, or until they have put out another set of feeding roots, yet as soon as a new system of roots is formed they will make a very rapid growth and produce an abundance of fruit. These facts are sufficient to prove that roots close to the surface are essential to the growth of trees and plants, or nature would not be so prompt to reproduce a new set as soon as one set is injured. This system of surface roots is not confined alone to trees, but wheat, corn and other grains if the seed is buried deep, will immediately send out a system of surface roots, and if the soil be piled around the stems before the blossoms appear, another set of surface roots will be sent out just below the surface of the soil.

From these facts we can see at once that if we plow an old orchard we must plow very shallow for a number of feet away from the tree row. With a plow properly set and a good, steady team, it is not a difficult piece of work to plow an orchard and when up to within a few feet of the tree row the plow should be adjusted so that it will cut off not more than two or three inches of the surface soil and not disturb the roots. When an orchard is plowed every year or two from the time it is set out the surface roots will be kept down to a depth where they will not be injured by the plow.

After the orchard has been plowed, the next problem is that of growing fertilizing and cover crops. This work must be governed largely by the condition of the trees and the amount of available plant food in the soil. As a rule it is better to grow leguminous crops as much as possible in order to gather the supply of nitrogen from the atmosphere instead of buying it from the fertilizer works. To bring the soil up to a condition to grow nitrogen-gathering crops frequently requires the plowing under of other green-crops to establish a base of humus to work with, and the liberal use of lime to correct soil acidity caused by plowing under the green manure. By the intelligent use of green manure crops and the application of lime and cheap mineral plant foods it is possible to get the soil in shape to grow these fertilizing crops. After this advantage is once gained it is a comparatively easy matter to adopt a system of cover and fertilizing crops that will furnish about all of the nitrogen the trees can economically utilize, and by applying purchased phosphorus and potassium the trees can be kept in a productive condition, so far as plant food is concerned, at a greatly reduced cost.

NOTES FROM A MARYLAND GARDEN

Cold and wet weather early and cold and drouth later, have made the garden unusually backward. The early tomato plants have been out since the first of May, but they seem to stand still. The old stand-by varieties, Beauty and Success are my reliance for the main crop, while the Langdon Earliana has been the earliest. This season I am trying the John Baer which is claimed to be the best and earliest, costing me $1.00 for a paper of the seed. Then I have the Brimmer, Enormous, Ponderosa, Globe and Magnus. For our hot, sunny climate and sandy soil the Magnus is very good because of its heavy foliage, which protects the tomatoes from sunscald. The fault of all the early tomatoes is the thin foliage.

I usually make the first planting of garden corn in March, but this spring it was well into April before any planting could be done, and the plants now (May 20) are not half as tall as usual, and two other plantings are above ground. For the first corn planting I do not use a sugar corn, but the Early Norfolk Market, an improvement on the old Adams, a very early and good corn. Then I plant the Country Gentleman, for none of the extra early sugar corns are worth the space they take in this soil and climate. Golden Bantam is fine, what you get of it, but it makes ears about as long as one's finger and few of them here, and I cannot afford it room. Country Gentleman and Stowell both do finely and give us good ears. I shall keep making new plantings until August, so that we can have a succession until frost.

Our earliest green onions, the Norfolk Queen, from fall-planted sets have now been used up, and for green onions we are pulling the offsets of the Yellow potato onion. These clean perfectly white, and make a good succession to the Queen. The Norfolk Queen onion is not the Queen of the Northern catalogs, but a larger onion, more like the Pearl, but better than Pearl. I grow my own sets, which are now up and growing, and will be ripened and re-planted in September, and the Potato onions are planted at the same time. The pulling of the green offsets from the Potato onions I think has a good effect on the main bulb and causes it to grow larger, and the same plantation gives us green onions and ripe ones.

Lettuce I have in the frames all winter, and make only one sowing in the open ground. For this late crop I use the Wonderful, a variety similar if not identical with the New York. It makes a very large head and stands the sun better than Big Boston, which bolts to bloom with the first warm weather. May King heads earlier than the wonderful, and this spring I have an unnamed variety sent me by a correspondent in Michigan, which is heading with the May King. Then I have the Cos or Romaine which, held together with rubber snappers, makes very brittle and fine salad.

In the flower garden my plantation of over 2,000 Gladioli, mainly America, have now tops over a foot high and some are forming their flower shoots. Candidum lilies are sending up blooming stems and making buds, and the peony buds are showing color. One of the most interesting among the hardy herbaceous perennials is the Oriental Poppy. These are now throwing their gaudy blooms and their foliage too is handsome. Later they will apparently die down, and in the fall a few green leaves will appear to carry the plants thru the winter. My poppy bed is now three years old, and grows stronger every year. It is easy to grow them if the seeds are sown where the plants are to remain, for it is almost impossible to make them live where transplanted.

The New Cardinal Climber is one of the best of all climbing plants. It is a cross between the Cypress vine and the scarlet Morning Glory, but differs from either in the fact that it makes very few seed, and one has to watch very closely to get any. Last year I started some in the greenhouse and established them in pots, but when I planted them out they seemed to stop growing, and seed planted later in the open ground beat them in growth. These climbed fully 30 feet to the eaves of my office building crossing over the porch and catching on telephone and electric light wires. They bloomed all summer. This spring I have planted the seed along a wire fence.

The beds of Vulcan Begonia, the best of all bedding Begonias have now put on their crimson bronze foliage. In the greenhouse the leaves keep green, but as soon as exposed to the open air they turn to a rich bronze almost crimson, and as they are perpetually covered with their scarlet flowers they make a very pretty bed. I get a great abundance of plants by keeping one or two large plants in the greenhouse. The seeds fall on the sand of the bench and soon I have plenty of young plants to pot.—W. F. Massey, Wicomico Co., Md.

STEEL Shingles or Wood???

Will you buy wood shingles, which burn and rot, or Edwards Steel Shingles, which are absolutely rot-proof and fire-proof?
Will you buy wood shingles, that have to be nailed on, one at a time, or Edwards Steel Shingles, that go on in clusters of 100 or more?
Will you buy wood shingles at a big price or Edwards Steel Shingles at low prices, direct from the maker?
The time to decide is now—before you have invested your good money.

Edwards Steel Shingles
Factory Prices—Freight Paid

Don't judge Edwards Steel Shingles by common galvanized roofing—which always rusts. We have a method that absolutely prevents rust from getting a foot-hold, as 125,000 people have found. It's the famous Edwards Tightcote Process.
No painting, no extras, no tools, no expert workmen needed. Hired man can do it with hammer and nails. Put 'em on right over old roof or on sheathing. Outlast four ordinary roofs. No dealer's profit to pay. Sold direct from factory to user. And we now pay the freight!

WRITE Get off a postal tonight and our Special Price Offer and Roof Book No. 6391 will come by return mail. Then judge. Then decide "which is which"—Edwards Steel Shingles or wood shingles. Give size of roof, if you can. (132)

Study Your Wheat Before You Harvest It

If the stand and quality are bad you must do better. If they are good it will pay you to make them better. A better fertilizer will do it. The usual wheat fertilizers do not contain enough available

POTASH

See, too, whether your wheat is lodging. Potash stiffens the straw. If there's clover in the wheat, is the stand all you could wish? Many progressive farmers use Potash heavily on wheat followed by clover.

Study Your Wheat at Thrashing Time

If the ratio of grain to straw is too low, if the kernels are shrunken, your ground lacks Potash. Potash makes long heads well filled with plump, hardy grains.

Use a fertilizer with 6 to 8 per cent. available Potash, instead of 1 to 2, and balance the phosphoric acid of the bone or phosphate.

Tell your dealer now that you want such a fertilizer this fall. Write us today for our free book, "Fall Fertilizers." Ask us for prices on Potash Salts. We will sell you any amount from one 200-lb. bag up.

Results of Systematic Cow Testing.

By HUGH FERGUS. Tester in Laurel Hill Association, Bradford Co., Pa.

The Laurel Hill Cow-Testing Association of Bradford County was organized during the spring of 1913, with a membership of 29 members. It was not until about September 1 that the work of the official tester was begun. The duties of a cow tester have been stated before in the columns of this paper, but I will briefly enumerate them again.

About the same date each month every member of the association is visited. Weights of the night's and the morning's milk are recorded and a composite sample of the two milkings is taken. From this the percent of butterfat is determined by means of the Babcock test. From the one day's milking and test the pounds of butterfat each cow yields per month is computed. Its value is computed at the price received from the creamery. Also, the weight of both grain and roughage fed each cow, and its value for a month, is determined by charging for it at prices fixed upon by members of the association. By comparing the value of the butterfat with the value of the feed, the profit or loss is found each month and in the course of a year the farmer finds out which are his best cows and which are his boarders.

"PLEASANT PASTURES" IN DELAWARE CO., PA.

Since such a wide area had to be covered to organize the association for its first year's work only the more progressive men are in the association. Hence not many of the so-called "boarder" cows are being found, and quite a few of these are already sold. Also, with only one or two exceptions, the 29 herds are either pure-breds or grades headed by a purebred sire. Therefore this year's testing work will be more to show each member which are his poorest cows and which are his best ones, so that he may know when he increases his herd, what cows to sell and what cows to raise heifer calves from. Another point in regard to the breeding is that by having their cows tested, where they have a cow and her daughter both being tested, the farmer can note the effect of his sire. This has been shown already several times where the daughter is better than her mother; but unluckily the sire was sold for beef before the association started. It was only by testing that this difference was noted.

The statement is frequently heard that a one day's test is not a fair criterion by which to judge one month's work. One man uses the same kind of scales I do and milks regularly. Each milking of every cow in his herd is weighed and recorded. One month when his 24 cows were at about the best part of their lactation period, I compared my one day's average with his total for the month and the greatest variation of any of the cows giving 600 to 1,000 pounds of milk in one month was 25 pounds; some of his cows giving a little above and some a little below my figures. Also in regard to the pounds of butterfat: Another farmer keeps an accurate account of how much milk he uses daily for his family. Taking the total pounds of milk he uses in a month and multiplying it by his average test, then subtracting these pounds of butterfat from the estimated total, I estimated his production. Figuring 30 days from a one day's test there was less than 2 percent variation from the pounds his creamery paid him for.

Some farmers not in a cow-testing association have a cow tested once or twice in her lactation period, or perhaps only once or twice in her life, and then tell their neighbors that this cow tests so much or so much. But this may be far from what a cow's real average is in a year. For instance, the most variable cow in the association, while giving over 20 pounds of milk per day, varied in her test from 3.1 to 6.1 percent. This is the greatest variation I have observed but it shows how unreliable one test is.

I have found that a "boarder" cow is often a boarder not because she does not have the ability to produce the milk or butterfat to pay for her keep, but because of the man who feeds her. She may be fed a proper amount of roughage but is skimped in her grain, thus not bringing the best out of her that she has in her. Or, she may get too much grain, which is out of proportion to the amount of milk she gives. The roughage in Bradford County this past winter was practically all timothy hay and corn silage, with little grain in it, and that frosted before being put into the silo. With such feed for the cow to do her best with from month to month, it has required from 3 to 4 pounds of grain (depending on the yield of milk, kind of grain and kind of cow) to produce a pound of milk.

The most economical producers of milk in the association are the Holsteins and Ayrshires, while the cows that produced a pound of butterfat cheapest are the Jerseys and Guernseys. Also, the cows that are producing either milk or butterfat cheapest and bringing in the greatest profit to their owners are those producing the largest amounts. A cow producing 10 pounds of milk per day requires practically as much roughage as one of the same size producing three times as much. It takes the same amount of milk or butterfat from either to pay for this roughage, hence the cow producing the most has that much left over and above that of the 10 pounds per day cow to pay for her grain and yield a profit.

In a comparison of the roughages, clover and alfalfa hay have required the least amount of grain to be fed with them. However, there was one exception. One farmer had excellent oat and pea hay. He fed good clover hay most of the winter and when he changed from the clover hay to the oat and pea hay and on the same grain ration, most of his cows showed a slight increase in their daily milk yield. Twenty-five of the twenty-nine farmers in the association have silos, but this past year, on account of an early frost, there was not as much silage as usual and the corn crop had to be put into the silo before mature, so corn silage did not show up as well as it probably would have if it had been of a better quality. Every farmer owning a silo had to use some oil meal with his silage in order to make it laxative enough for the good health of his cows. Most of the clover during the winter of 1912-13 was killed by frost, so the dry roughage was mostly timothy hay. When the silage was gone and timothy hay was the sole roughage there was not as much of a drop in milk yield on the same amount of grain as might be expected; that is, not when enough oil meal was put into the grain ration to make the droppings from the timothy ration as loose as they were when silage was fed.

Where the grain ration was kept laxative enough all winter it showed to quite an advantage, both in the health of the cows and in their milk flow. These cows whose bowels were not kept loose were subject to occasional fever: sa udders, indigestion and lower milk yields. The point of keeping a cow's bowels in loose condition both before calving and while in lactation cannot be emphasized too much.

With four or five exceptions the farmers used balanced rations, either of my or their own makeup. These were all computed with the idea in view of cost, bulk, palatability, variety and healthfulness on the cow. Since most of the roughage was timothy hay and corn silage, the proportion of one pound of grain to 3 to 4 pounds of milk was fed, and usually not less than three pounds of grain a day to a cow even when giving less than 10 pounds of milk daily. The following are some of the grain mixtures that produced the best results with silage and timothy hay or timothy hay alone:

No. 1.—200 pounds corn meal, 100 pounds gluten, 100 pounds bran, 100 pounds cottonseed meal and 50 pounds oil meal.

No. 2.—100 pounds corn meal, 400 pounds brewers' grain, 300 pounds gluten, 200 pounds cottonseed meal and 100 pounds oil meal.

No. 3.—100 pounds corn meal, 200 pounds brewers' grain, 200 pounds gluten, 100 pounds cottonseed meal, 100 pounds bran and 50 pounds oil meal.

No. 4.—200 pounds corn meal, 100 pounds bran, 100 pounds distillers' grain, [illegible] pounds oil meal and 100 pounds cottonseed meal.

No. 5.—200 pounds corn meal, 100 pounds brewers' grain, 100 pounds oil meal, [illegible] pounds bran and 100 pounds gluten.

No. [illegible]—300 pounds corn meal, 200 pounds distillers' grain, 100 pounds oil meal and 100 pounds gluten.

No. 8.—200 pounds corn meal, 200 pounds gluten, 200 pounds bran and 60 pounds oil meal.

No. 9.—200 pounds bran, 100 pounds gluten, 100 pounds corn and cob meal, 100 pounds rye, 100 pounds distillers' grains and 100 pounds oil meal.

Besides these there were other good rations consisting mostly of a mixture of the above grains in varying proportions. It will be noticed that some of the above rations make a rather heavy mixture, but most of these were fed on top of the ensilage which, when eaten with it, did not produce any harmful results. Probably the best mixture for dry cows fed during the winter was 100 pounds hominy, 100 pounds oats, 100 pounds bran and 100 pounds oil meal, fed at the rate of from 2 to 8 pounds per day.

Some of the practices among the farmers which go along with good feeding and help increase the milk production are: 1. Regularity in milking. 2. Having the same milker for each cow all the time. 3. Regularity in time of feeding. 4. Keeping the cows well bedded. 5. Keeping the cows curried off. 6. Feeding salt daily or keeping it where the cows can have access to it at all times. 7. Providing clean water at least twice daily and in winter with the icy chill taken off by a tank heater. 8. Kindness to the cows. 9. Allowing a rest of four to eight weeks between lactation periods, and grain fed during this time.

WILSON BUTTER BOY DE KOL PRINCE 119115, WEIGHING 400 LBS. AT 4 MONTHS.
Owned by H. R. Downham, Kent Co., Del

This is the ninth month of testing and almost without exception the dairymen are satisfied. One man, a renter, is having his landlord's herd tested at his own expense. He said "If only I had begun this work eleven years ago when I started renting, I would have an entirely different dairy than you are testing and would likely own my own farm instead of renting all these years." Another young farmer was so doubtful that he did not join the association until the second month. Now he not only expects to join another year but has persuaded his father to do likewise. The owner of a herd of Ayrshires has been breeding purebreds for 30 years but never realized their worth until joining the cow-testing association. Now he is running eight of them in a test for the Advanced Registry and expects to run the remainder of his herd as fast as they come fresh. Three other breeders of purebreds expect to enter their cows in a test for the Advanced Registry of their respective breeds during their next lactation period, besides having them in the Cow-Testing Association also.

Nearly every herd has its surprises. What were thought to be the best cows in the herds are often proving to be only average cows, while some cows that were little thought of are proving to be among the best.

FASHION IN COWS

Hats Off to May Rilma, the Queen of Cows, owned by Captain Cassatt of the State of Pennsylvania. But how soon will she abdicate her throne? How soon will her place be filled by some other cow of royal blood? How soon will her throne be usurped by some Grand Daughter of King Segis, King Hengerveld, King of the Pontiacs, King of St. Lamberts King, Prince Rosendale, King of the May, or Prince Barkley? Pink teas and narrow skirts are the fashion today, but will they be a year hence?

Since May Rilma's wonderful record of 1,073.41 pounds of fat in 365 days was known to the public, all the letters received by the Department of Agricultural Extension of State College requesting names of breeders, have asked for Guernsey cows. For its the fashion. Pennsylvania has the World's Record cow, the world's record Guernsey cow, Ayrshire cow, Shorthorn cow and the world's record 2-year-old Jersey. Three world's records have been broken in the past year by Pennsylvania cows.—L. C. Tomkins, State College, Pa.

How To Use The Babcock Test.—"Before 1890, when the Babcock test was invented, no simple, accurate method was known by which the farmer could measure the richness of the milk or cream which he sold or of the skim milk which remained." So states Circular No. 27 of the Wisconsin Experiment Station, mailed from Madison, Wisconsin, which is an attempt to explain and illustrate the Babcock test in a simple manner. This bulletin goes on to state that "the Babcock test saves many times its cost and at the same time is enabling farmers to select their best cows and improve their herds as rapidly as possible." Every farmer should be acquainted with this test.

Milk Hygiene.—Circular No. 25 of the State Livestock Sanitary Board, issued from Harrisburg has some very valuable pointers in it for the dairyman. It deals with the dairy herd in general and takes up such specific points as grooming, sick cows and their treatment, feed, water, stables, the milk house, the ice house, utensils to be used and the handling of the milk, including straining and cooling. Coming as it does from the State Livestock Board, this bulletin carries with it undisputed authority.

Dairy Feeding And The Home Mixing Of Feeds.—Circular No. 7 of the New Jersey Experiment Station under the above heading has for its purpose a brief explanation of "the basic principles involved in the balancing of feed rations for dairy cows and the illustration of the use of these principles in compounding rations and grain mixtures to be fed. Sample rations and rations to be fed in connection with other products are given in tabular form. Methods for calculating balanced rations are included in this bulletin, which is mailed from New Brunswick, N. J.

BEST BUTTER
30¢ ~~25¢~~
MANY farmers who market their own high grade butter are getting 5c more a pound since using Worcester Salt—for this reason:
Its fine even crystals work in most easily. Their *clean, sweet* flavor brings out the finest flavor in your butter. And the better the flavor—the better the price. Always use—
WORCESTER SALT
The Salt with the Savor
For farm and dairy use Worcester Salt is put up in 14 pound muslin bags and in 28 and 56 pound Irish linen bags. Smaller sizes for table use. Good grocers everywhere sell Worcester Salt. Get a bag
Send us your dealer's name and address and we will mail you free of charge, our booklet, "Butter Making on the Farm."

Live Stock

GETTING COLTS READY FOR MARKET

Right Kind of Colt Rightly Handled

If we make the proper selection of breeding stock and raise the kind of colts that Mr. Geo. Richards, of McKean Co., Pa., does, we need not fear low tariff on live stock so long as the horse market holds up to present conditions. The accompanying cut shows two of Mr. Richards' colts, bred from heavy work mares and a purebred Percheron stallion. Note carefully their fine clean-cut heads and faces, denoting quality; their good backs, shoulders, legs and joints, just the kind that if given a chance will develop into fine individuals and bring long prices. They need very little preparation for market and are very easily sold.

COLTS FROM HEAVY FARM MARES AND PUREBRED STALLION.
Owned and Raised by Mr. George Richards, McKean Co., Pa.

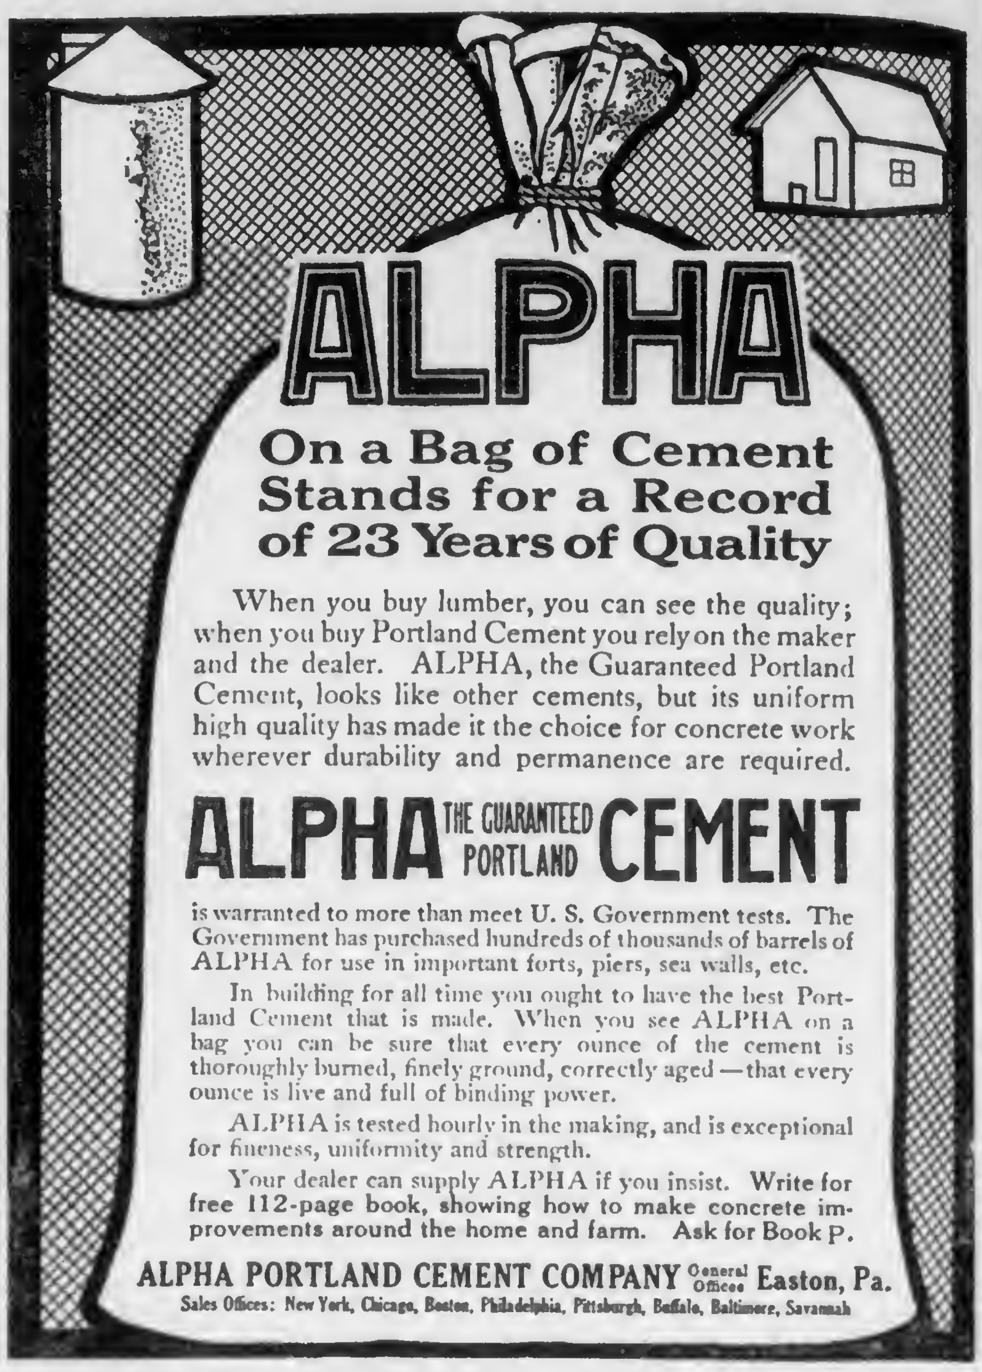
Mr. Richards keeps a very close account on his growing stock, because he knows that if they do not make a steady growth and keep it up right from the start they cannot ever reach their maximum size and weight. And he knows that food eaten by a young animal that is not growing yields no profit. So he weighs his colts at birth and at frequent intervals afterwards, and keeps posted as to just what they are doing much better than he could possibly do by observation. If you have never kept account of the weight of a young colt, just try it with the next one you raise. You will get some surprises. I have done it but did not succeed so well as Mr. Richards in results. But I found it very helpful to know just how they were growing. It will guide one in the feed work and in the care of the mother to the colt's advantage. The scales are accurate; the eye may be influenced by so many surrounding conditions.

A TRIO OF COLTS ON RICHARDS' FARM MAKING STEADY AND PROFITABLE GAINS.

The colt on the left in the illustration weighed 157 pounds at birth, and at 30 days old weighed 287 pounds, showing a gain 4 1-3 pounds daily. At 60 days it weighed 408 pounds, gaining 4 1-5 pounds daily. At 90 days its weight was 515 pounds, making about 4 pounds daily; and at 5 months and 3 days old it weighed 675 pounds, showing an average gain of about 4½ pounds per day from birth, and reaching almost one-half of its probable mature weight in five months.

The colt on the right of picture weighed 153 pounds at birth and at two months old weighed 427½ pounds, showing a daily gain of 4½ pounds. At eight months old it weighed 805 pounds; more than one-half of its mature weight and had averaged 2¾ pounds per day gain from birth. Now these colts were not especially fed or prepared for show, but they are just his regular growing stock and in good growing condition—the way Mr. Richards finds it most profitable to keep them.

The three colts in the lower illustration are from the same sire. The one on the right, 3 years and 4 months old when photographed, weighed 1,450 lbs. at that age, and is a full brother to the one on the extreme left. The other two are 14 months old. Mr. Richards has a good sized farm from which the timber has been taken. He is raising horses, cattle and sheep to clear up the second growth timber and he is incidentally making a good profit on his stock. He has the right kind and makes it good. He is much interested in Ayrshire cattle for his conditions. He is making good on land at which a Lancaster County farmer would throw up his hands in holy horror. And he has a fine family of boys and girls that is sticking to this rough land because it is the best place in the world for them to be, and they like it.—Dr. M. E. Conard, State Farm Adviser.



ALPHA

On a Bag of Cement Stands for a Record of 23 Years of Quality

When you buy lumber, you can see the quality; when you buy Portland Cement you rely on the maker and the dealer. ALPHA, the Guaranteed Portland Cement, looks like other cements, but its uniform high quality has made it the choice for concrete work wherever durability and permanence are required.

ALPHA THE GUARANTEED PORTLAND CEMENT

is warranted to more than meet U. S. Government tests. The Government has purchased hundreds of thousands of barrels of ALPHA for use in important forts, piers, sea walls, etc.

In building for all time you ought to have the best Portland Cement that is made. When you see ALPHA on a bag you can be sure that every ounce of the cement is thoroughly burned, finely ground, correctly aged—that every ounce is live and full of binding power.

ALPHA is tested hourly in the making, and is exceptional for fineness, uniformity and strength.

Your dealer can supply ALPHA if you insist. Write for free 112-page book, showing how to make concrete improvements around the home and farm. Ask for Book P.

NEEDS FOR FARM WOMEN

We have often made the statement that the trouble with farming is a legislative trouble. Not that there was any desire to disapprove or discount the many efforts that are being made to relieve the situation by organization, co-operation, education and more direct dealing. All these things are helpful to relieve the rigor of a bad situation; but are not in the nature of a solution of the problem. They benefit only those who take advantage of them; but with a legislative benefit it is different. If, for instance, a live bunch of people like the grangers make a campaign and defeat a proposition to bond the state, they do not get the benefit themselves, but the whole state gets it. The grange and the progressive dairymen of the state fought the oleo manufacturers until we got a good law in this state, but the whole state, producer and consumer alike, got the benefit. In these legislative victories the strong help the weak and the general welfare is improved.

Give all the farmers equality before the law, which is the right of every citizen; give them a fair field and no favors, and they will not only take care of their own business but will continue to raise, develop and train the brains and brawn to set the pace in very many of the other lines of business and work. It is for this reason that we have so little regard for so many so-called uplifters; refusing to give the farmer his right to equality before the law and trying to make him satisfied with what in his own heart he knows is not a real solution of his trouble.

What is true of the men of the farm is also true of the women of the farm. Representations of a terrible condition of ignorance, unsanitation, isolation and drudgery have been spread far and wide in the press of the country. Dozens of plans and suggestions have been, in the same connection, offered as a remedy for the condition. In many of these plans the idea is put forth either covertly or directly that the meanness and penuriousness of the farmer husband is a large factor as a cause of the difficulty. From my experience in a great many farm homes I never felt that this was a just charge; but that the sense of the resolution here given went really to the heart of the matter. This resolution was sent to secretary Houston in answer to his letter of inquiry into the condition of farm homes, and was published in our National Grange Monthly:

"Resolved, that we of Garden City Grange No. 280, Snohomish, Wash., offer the following for consideration: We respectfully hold that in this broad, fair land of ours, every farm home should be a sanitary abode and in order to free the farmer's wife from the soul-warping drudgery in incessant toil and to secure to her the degree of leisure necessary to develop and cultivate latent and dormant talents and abilities, that every home should be equipped with labor saving devices such as—water under pressure, cold and hot— a sewerage system or sanitary cesspool—power to run washing machine, wringer, churn, etc.,— a light plant—cabinetted kitchen, and the many useful and clever devices for saving time and steps.

"We are also of the opinion that the humdrum existence of the average farmer's wife and the lack of labor-saving devices in the average farm home, are not due, except in rare cases to the penuriousness and selfish conduct of the farmer husband, but are caused by economic and social conditions over which the individual farmer has no control.

"We are also agreed that the economic, social, educational and home forces that can elevate the agricultural pursuit to a higher estate will automatically bring about the betterment of conditions for the farmer's wife."

Then follows a demand for co-operation, direct dealing and a comprehensive legislative program. The presence of machinery outside the house and not inside has been cited as a proof of the assertion that the wife is not getting a square deal. But my observation is that the fact of so much machinery on the farm is one of the great troubles of the farmer today. He realizes that he cannot get the labor that he has to have in order to care for his crops and yet while he is able to get along by the application of machinery, he knows that the extra capital involved together with the repairs and storage is a continuous and serious trouble which he would gladly escape. It must not be forgotten that there is a natural reason for the fact that machinery was not applied in the house as early as it was on many farms, and that is there was no suitable power to apply. Steam was practically impossible. Wind was too uncertain and even the gas engine is far from a pleasant machine for a woman to run.

What will eventually be done and what should be done now is to turn these mill properties that are fast losing their business because of grinding done on the farm, into power houses for the production of electric light and power. Electricity is such a cleanly and convenient power for home use. Here is an opening for splendid community work among the granges to prevent these old mill stands from going into decay by organizing them into power houses. The owners of these properties would hardly feel safe in going to the extra expense of fitting them for this work, but with community organization ready to take the power as soon as installed, it would be an easy and inexpensive change.—John A. McSparran.

LOCATION OF EARTH ROADS

The cost of hauling over country roads is largely determined by the size of the load that can be hauled, the number of trips that can be made in a day and the wear and tear on teams and equipment. Steep grades as well as ruts and mud-holes serve to decrease both speed and the load. On the principle that a chain is no stronger than its weakest link, the maximum load that a team can draw is the load that it can draw up the steepest hill or thru the deepest mud-hole on that road.

The elimination of one or two steep hills on a line of road will frequently enable horses to draw three or four times as much as they could draw on the old road. It takes approximately four times as much power to draw loads up 10 percent grades (10 feet vertical in 100 feet horizontal) as on a level, but on a 4 or 5 percent grade a horse can usually draw (for a short time) as much as he can draw on a level. A 4 percent grade is therefore considered the maximum on roads subject to heavy hauling. Many steep grades may be avoided by locating the road around instead of over the hill,—the handle of the bucket is no longer when held in horizontal position than in a vertical. By going around we avoid two steep hills.

If the road must pass up a hill or mountain sides, the steepness of the grade may be decreased by increasing the length of the road. In other words, eliminate steep grades by locating the road on curved or zigzag lines, and not in a straight line from the bottom to the top of the hill. These curves should be carefully plotted and the straight stretches located with an instrument. In studying the relation of grade to distance the following calculation is interesting: To lift a ton one foot high requires 2,000 foot pounds of energy; on a road the surface of which offers 100 pounds of tractive resistance per ton the same energy would roll the ton a horizontal distance of 20 feet. To save one foot of grade the road may therefore be lengtnened 20 feet.—Office of Public Roads.

Rural Credits Abandoned

Reports from Washington indicate that President Wilson will not force action in rural credit legislation in this session of congress. It is pointed out that the federal reserve bank act will extend credit aggregating $500,000,000 on farm lands and that this will largely cover the ground for which rural credits were designed. There are not likely to be any important protests from farmers against this delay. Opinion seems to have gained ground that the bills introduced were not designed to meet the needs of the farmers in credit requirements. It is doubtful if any special federal law can be made general enough or flexible enough to meet the rural credit needs of the entire country. Recognition of farm property as a basis of credit on the same grounds that other forms of property are recognized is all the farmers ask. Had this been granted there would be no need of special rural credit legislation. Without such recognition, it seems doubtful if any form of credit law will give relief. Communities that are really in need of credit extension would do well to profit by this delay and try the solution of their own problem by the organization of co-operative credit systems or co-operative banks upon the familiar plan of building and loan associations. A few successful experiments of this kind will be a good indication of whether or not there is a real need of a rural credit law.

Labor Requirements

In these days of scarce and high-priced farm labor it is important that farmers study somewhat closely the labor requirement of the various crops grown on their farms. Such study may not influence the character of farming done or bring about any important changes in crop rotations, but it will assist in determining more closely the crops which are costing most in expensive labor. Perhaps the greatest value of such a study will lie in determining the normal labor requirement of each crop common to a locality, from which the farmer who is seeking for highest efficiency in his farm management may gauge his results. From this he can measure the relative advantage of his system and his equipment and measure the efficiency of his working force. The Bureau of Farm Managament, thru its monthly circular, gives figures obtained in such an investigation conducted in Jefferson County, Ky. The figures are of little or no direct value to farmers of northern states, but are interesting as showing comparative labor costs of different crops in the section studied, and suggesting a basis of record in similar studies elsewhere. The figures represent the total labor cost in completing the production per acre of each of thirteen crops expressed in terms of labor units for man and horse. The labor unit for man represents one day's work for one man, and for horse, one day's work for one horse. Figures on the crops grown in this section follow:

Crop	Total Units Man Labor	 Horse Labor
Potatoes, 1st crop	10.2	13.4
Potatoes, 2nd crop	9.5	13.3
Wheat	1.	1.2
Corn	4.3	5.4
Clover hay	1.1	1.0
Timothy hay	3.4	4.5
Soy Beans	3.9	5.3
Onions	21.8	13.7
Sweet Potatoes	12.5	7.6

Bending the Twig

The following statements from Dr. Frank Moore, superintendent of the New Jersey Reformatory, are of interest as indicating the causes of failures in "the best farm crop." He referred to a study he had conducted as to the causes which bring young men into the reformatory. Of course few of these were farm boys, but early impressions and youthful teachings have the same effect upon the young minds of the country as upon those of the city. His records show that of 350 men received at the institution in one year, about 70 percent were from indigent families where poverty was very great and where the first lesson in crime had been given by the parent who had suggested that the son go out and procure fuel. About 60 percent were from illiterate families where the child had even been encouraged by the parents to avoid the truant officer. About 50 percent were from broken families where death or divorce had broken up the home. About 33 percent were feeble minded. In a great many instances these boys, when given training adapted to their individual needs proved themselves valuable members of the community. These figures place the responsibility for the great majority of criminal lives upon the parents, and the training or lack of training given when the child is young. The responsibility which you and I will feel in the condition of the parents and the blighting of young lives depends upon our conception of our duties as citizens and our actual reply to the question of old: "Am I my brother's keeper?"

Trade in Foodstuffs

The Department of Commerce has just made public the figures showing imports and exports of foodstuffs during the first six months under the new tariff duties. It is shown that imports of foodstuffs in their natural condition, including food animals, increased from $117,194,237 in the half year ending with March, 1913, to $143,421,536 in a like period ended with March, 1914; also that imports of foodstuffs partly or wholely prepared for use in the same period advanced from $95,744,241 to $100,967,378. Exports of crude foodstuffs fell from $115,850,453 in the same six-months period in 1913 to $55,483,787 in 1914, and manufactured food products from $180,007,422 to $162,022,620; making a total loss in exports of more than 50 percent. Thus home consumption of domestic foodstuffs has so nearly overtaken home production that we are not only reducing our sales abroad but are greatly increasing our purchases of foreign foods. The balance of trade in foodstuffs is with foreign countries in the six month's period under the new tariff, the total imports being $244,000,000 and total exports $217,000,000. In 1898 the imports of foods for the entire 12 months was $190,000,000 and the exports were $590,000,000. Thus the balance of trade in foods was about 1 to 3 in favor of the United States in 1898; about 1 to 1.24 in our favor in 1913, and in the first six months of the fiscal year 1914 it has shifted to about 1 to 1.12 in favor of foreign countries. The articles showing largest increases in importations in the last six-month period are fresh beef, cattle, corn, wheat, rice, macaroni and fruits.

NORMAL INSTITUTE MEETING

The annual Normal Institute and spring meeting of the State Board of Agriculture was held at Stroudsburg, Pa., May 26-28. The rush of spring work, due to the lateness of the season, interfered seriously with the attendance of local farmers, but there was a good gathering of farmers' institute workers and agents of the state department. The occasion served as a get-together meeting for these workers and it was a real normal school of instruction and discussion of matters of general and mutual interest to institute men. The program was made up largely of speakers from the state staff, and this departure from the custom of previous years appeared to add rather than detract from the general interest of the meeting.

Two sessions were given to the discussion of specific questions of institute management and work. Mr. Martin, director of institutes, reported attendance at institutes constantly increasing. In the season just closed there was an aggregate attendance of 208,000. These were reached by the expenditure of $22,000. At present there are nearly a thousand applications for institutes next year that can not be filled because of lack of funds. The new farm adviser service has been in active operation a little less than one year. In that time the advisers have made 25,055 farm visits and have requests for their services which will keep them busy thruout the summer. The reports of the different advisers indicated a closer grasp of general as well as individual problems than had been possible thru any previous effort in institute work, and corresponding results with the farmers who had important home problems to solve.

One session was given to the discussion of household economies and rural home problems. Club organizations, school hygiene and arrangement of water supply and drainage in the farm home were subjects discussed. Mrs. Jean Kane Foulke, state adviser on home economics outlined the work done in her department in investigation of sanitary and water supply conditions. Her recommendations on water supply and sewage disposal have been published in bulletin form and may be secured free by addressing the State Department of Agriculture, Harrisburg, Pa.

The soil improvement session was perhaps the most spirited and of greatest practical value from the farm standpoint. Differences of opinion indicated that there is still much to learn on the general question of soil improvement and on best methods of building up and maintaining soil fertility. The comparative values of raw rock and acid phosphate came in for much discussion and the consensus of opinion seemed to be that the practical value of raw rock, except under special conditions, has been greatly overestimated and that greater use of acidulated rock would prove more economical for general use. A wise caution urged in this discussion was that value of improvement methods must always be counted by comparative cost of treatment. Certain courses of treatment give quick and striking improvement but are not profitable to the average farmer because of the high cost of treatment.

Interest in the dairy session centered in the cost of production and the cow, the care and the feed necessary to produce maximum yields at lowest cost. One session was given to poultry work, with discussions on maintaining health and vigor of fowls, profitable egg production and an illustrated discussion on how success is achieved in the handling of turkeys. The horticultural session took up production and marketing of apples and gave a particularly timely discussion of truck farming in its various phases.

The troublesome road question came up, as it is bound to do in all farmers' gatherings so long as present conditions exist. Either by accident or to reply to severe criticism of Department methods early in the meeting, Mr. Jones, of the State Highway Department, appeared "to give a complete and definite statement" of what was wrong with our roads. But Mr. Jones was definite on only one point, that of the automobile license fund being held up and not made available for road work. He was extremely indefinite on the amount of money available from other sources and what has been done with it; also as to who is responsible for permitting the roads to get into their present condition where the temporary hold-up of a secondary source of funds can apparently paralyze the entire Department. The Department is going to much pains to advertise the "political animosity" which is responsible for the present tie-up in road matters, but the impression is rapidly growing that the road officials are indebted to their fellow officials in the state house for providing them with a much needed excuse for present road conditions. Mr. Jones was highly successful in confirming that impression.

The people of Stroudsburg proved royal hosts to the visitors, extending every courtesy and making every provision for their comfort and enjoyment. Special features provided were a reception given by the Chamber of Commerce on Wednesday afternoon and a trolley trip to the beautifully picturesque Delaware Water Gap on Thursday afternoon.

STATE CAPITAL NEWS

Millions For Roads.—An appropriation of approximately $10,000,000 for betterment of highways of the commonwealth will probably be recommended to the next legislature by people active in the cause of good roads, this sum to include liberal appropriations to townships for improvement of their highways along approved lines and an amount equal to the automobile license income for purposes of maintenance. Governor Tener has been making a careful study of the whole highway proposition in Pennsylvania and while he has not yet indicated what he will do in the way of an appropriation it is thought that he will be liberal in fixing figures. The defeat of the bond issue showed that the people of the state believed in the pay-as-you-go principle and it is a pretty safe promise that roads will get first consideration next winter. Every candidate for governor is committed to road improvement. Incidentally, the next legislature will end any chance of controversy in the future in regard to the use of income from automobile licenses. The State Board of Agriculture and Farmers Normal Institue at the meeting at Stroudsburg took action pretty well anticipated here and that policy is certain to be carried out, altho it will require a big change in the methods of making appropriations to give Pennsylvania adequate funds for road improvement.

Creamery Wastes.—An important conference, which attracted little attention from the newspapers, was held here during the week just closed between the officials of the State Veterinarian's division and representatives of the creamery interests of western Pennsylvania. It was for the purpose of agreeing upon regulations for the pasteurizing of milk sold by creameries for feeding of cattle. Authority to carry out this provision was given by the last legislature and the state veterinarian will draw up a set of regulations which will be scanned by the creamery people and then put into effect. It was stated that the conference resulted in a valuable exchange of views.

Cutting Down Crossings.—A gratifying rate of progress is being made by the railroads of the state in getting rid of grade crossings. No less than twenty propositions to agree upon steps for abolishing such crossings came before the Public Service commission for approval last month and most of them will be followed by immediate work. The bulk of such improvements are in cities or their immediate neighborhoods. There is a disposition to avoid the risk of accidents along main highways or much traveled roads.

Violated Cattle Laws.—Agents of the State Live Stock Sanitary Board have ended what is believed to have been a source of violation of the cattle quarantine laws in the Western end of the state. Cattle were being driven into this state from Ohio without being inspected.

Seed Law Enforced.—Practical operation of the "pure seed" law of 1913 has resulted in prosecutions for the sale of grass seeds not up to the standards. The law was enacted to keep down noxious weeds and some of the mixtures which are full of nuisances. Samples taken have shown that either goods carried over from last year or some mixtures which were flatly against the percentages set out in the act were being sold.

Oleo In Cities.—Agents of the State are commencing to turn up violations of the oleo law in some of the cities. In several places oleo was palmed off as butter after having been colored and it is thought that some of the people who were arrested two years ago in what was pretty close to an organized illegal traffic are figuring in the sales. Seven arrests have been made in Philadelphia.

Test On Traction Rules.—Dauphin County judges now have under consideration an action to test the right of the highway commission to require owners of traction engines to agree in advance to rules and regulations. The test suit was brought by a Dauphin County man and the point at issue is whether the owner can be bound in advance to repair roads or bridges which may be damaged by his machine. The criticism was made that persons were forced to accept rules not yet promulgated. This action is not affected by the setting aside of certain traction engine rules by the highway commissioner recently.

Agricultural Education.—This year for the first time the examiners in the normal schools will pay particular attention to the qualifications of the graduates as regards preparation for instruction in agriculture. For some years courses in this line have been given, but the state authorities are now making a special effort in the line of preparing men and women to give practical instruction in agricultural education owing to the demand from many country districts. In the course of a few years many teachers will be equipped with a knowledge of practical agriculture. Several officers of the State Board of Education have been working the last year to stimulate the interest in elementary agriculture in many districts of the State. The universal lament has been the lack of specially trained teachers.

Many Attend Meetings.—This week marks the close of the summer orchard demonstration season. The attendance has been equal to or even better than in 1913. The number of questions pouring in on Zoologist Surface from orchard owners is far greater than ever known and indicates the growing interest in fruit growing.—Hamilton. Harrisburg, June 1.

NEW YORK LETTER

Jobs for The Jobless.—The new Bureau of Employment created by the last legislature will be put into operation August 1. The principal office of the Bureau will be in New York City with nine branch offices in Albany, Utica, Syracuse, Rochester, Buffalo, Elmira and either Ogdensburg or Watertown. A director will be in charge of the New York office whose salary will be $4,000 and each branch will have a superintendent at a salary of $2,000. Commissioner Lynch says that the important function of this new bureau will be to investigate the causes for unemployment and then to seek the remedy for the situation. All services rendered by the bureau for those out of work will be free.

The New Bank Law.—The constitutionality of the new Van Tuyl banking revision law is to be tested in the courts. Especially, the provision relative to the transfer from the Comptroller's department to the state banking department of the jurisdiction and supervision of private bankers is to be tested out.

Cold Storage Law.—There have been about 40 prosecutions for violations of the cold storage law since January 1. There have been 13 convictions 11 dismissals, five held for Special Sessions and 10 not returned.

A Cornell Gift.—Announcement has been made of the gift of $100,000 to Cornell university by an unrevealed donor. It is intended to devote it to the building of college dormitories. As the money is available now work will be commenced as soon as bids are received and accepted.

Convicts on Roads.—According to the superintendent of prisons, about 250 miles of road will be built this year by convicts of the state prisons. He is given authority by law and also has an appropriation of $50,000 to experiment with convict labor on the highways and the superintendent proposes to let them make dirt roads instead of macadam, as the appropriation would be sufficient for only about 12 miles of macadam while very much more can be built of dirt.

News Items.—Conferences of cheese instructors have been held this week at Allegany and Varysburg. On June 25, the annual meeting of the state association of county superintendents of highways will be held at Ithaca. Commissioner Carlisle and Senator Murtaugh will be the speakers. The Otsego County Farm Bureau and the superintendent of schools are co-operating in a potato-growing contest for the pupils of the schools. The first prize winner will get a Holstein calf.—D.

MARYLAND NOTES

Strawberry Crop Threatened.—The continued dry weather threatens both yield, size and quality of strawberries. In Anne Arundel County and on the Eastern Shore, the continuous dry weather is having serious effect on the berry, and green pea crops. The pea vines are infested with lice or aphis, and in many places have dried up. Complaints are also made that worms and insects are commencing to attack tomato plants.

Sea Food Abundant.—Ocean City, Md., is becoming an important sea food supply section. On a recent Monday morning the catch of fish was the greatest ever had there. The nets were full and boats were loaded from the water before seines could be hauled on shore. The catch was 1,400 barrels of sea fish which were packed at once and a special train of 16 cars started north with the entire catch the same day.

Preserving Plant Equipement.—The Berlin Preserving Company has a new building 60 by 100 feet to be used for the capping of strawberries alone.

Fruit Predictions.—Fruit growers in Harford County declare there is every evidence of a big yield of all kinds of fruit. May frosts last year ruined the fruit. Even with a heavy June drop of fruit it is concluded the crop will be a "bumper" one.

NEW FORESTRY BUILDING AT CORNELL UNIVERSITY.

FORESTRY BUILDING AT CORNELL UNIVERSITY

On Friday, May 15, the new Forestry Building at the Agricultural College, Cornell University, was opened. New York State, with its many acres of rough land unsuited to agriculture, is becoming thoroly awakened to the practicability of forestry. The opening of this new building can not help but stimulate interest thruout the state. The Department of Forestry was established not only to give instruction and to conduct research, but to give direct help to the owners of forest lands in New York State, which it does by correspondence, lectures, and personal inspection of woodland, or land to be planted.—D.

COUNTY NOTES

Green Co., Pa., (S.W.) May 22.—Weather has been fine during last two weeks. Little live stock changing hands in this community at this time. Corn, $1 bu.; wheat, $1 at mill; eggs, 18c; butter, 22c; chickens, 16 to 17c lb.; oats, 55c bu. Farm work has been rushed during the last two weeks but there is still much corn to be planted. Oats was sowed very late.—C. E. Addleman.

Warren Co., N. J., (N.W.) May 21.—First part May wet and cold; now dry and hot. Stock looks good, being turned on pasture. Cows are high. Pigs $3 to $3.50 apiece. Grain looks good, as does the grass. Oats sowed, potatoes planted. Corn planting in season now. Ground getting dry and hard to plow.—V. R. Loller.

Fayette Co., Pa., (S.W.) May 24.—Has been very warm and dry for the last ten days. The small streams are beginning to show the effects of the dry weather. Most of the livestock wintered nicely and went on pasture in good shape. Pasture stock is in great demand. Pigs are very scarce and high, selling at $10 pair. In spite of the late spring farm work is in pretty good shape. Corn and potatoes all planted and spraying mostly done. Fruit is promising a medium crop.—Samuel A. Harris.

Crawford Co., Pa., (N.W.) May 28.—Warm and dry for ten days. Cows milking well. McJunkin Co., pays $1.30 per cwt. for 4 percent milk. Veals, 8c; eggs, 18@20c; butter, 30c. Wheat looks good. Meadows fair. Lots of fruit blossoms. Farm work very late; wet weather. Oats about all sown. Farmers planting corn and potatoes.—J. F. Seavy.

AMERICAN GUERNSEY CATTLE CLUB MEETING

The annual meeting of the American Guernsey Cattle Club was held in New York City. The report of the work of the Herd Register for the year ending April 30th, showed a remarkable gain for this year. During the last 20 years the number of Guernsey registrations and transfers has increased ten-fold and no small percentage of this is due to this last year. The membership in the Cattle Club has increased from 131 to 591.

The American Guernsey Cattle Club is now in a very prosperous condition. This last year's business showed an income of $76,448.83 with a balance on hand of $4,056.03. This together with the invested funds, office building and invoice of fixtures and Herd Books on hand, makes a present worth of $41,119.76. During the year there were imported 1,150 head of Guernseys.

The work of the Advanced Register showed 1,100 cows, owned by 193 breeders and representing 27 states, were on test. The most remarkable record of the year was that of May Rilma who made a record of 1,073.41 pounds butter fat, which exceeds that of any cow in the world. The 2,957 records in the A. R. show 526 cows with a milk yield of over 10,000 pounds and 25 over 15,000. Four hundred and seventy-three cows have butter fat records better than 500 pounds and 11 exceed 800 lbs. for the year.

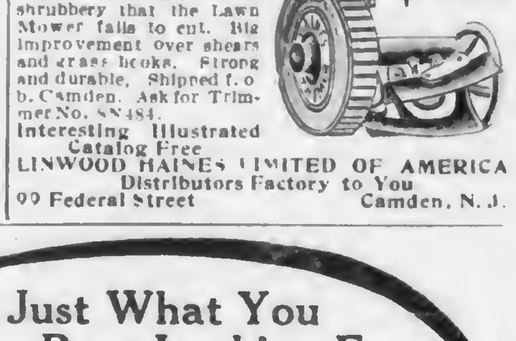
During the year the club has spent $3,205.09 for premiums at fairs and in seeing that the club was personally represented. In this manner a great deal of good has been accomplished in placing the merits of the breed before the public. Estimates for expenses for the coming year include, besides that necessary for the maintenance of the office and printing expenses, $7,500 for the work at the fairs and also for the representation of a herd at the Panama Pacific Exposition.

The following officers were elected.—President Emeritus, James M. Codman, Brookline, Mass.; President, James Logan Fisher, Philadelphia, Pa.; Vice-Presidents, Ex-Gov. W. D. Hoard, Fort Atkinson, Wis., and Ezra Michener Lumberville, Pa.; Sec. and Treas. Wm. H. Caldwell, Peterboro, N. H.

CHANGES IN DEPARTMENT OF AGRICULTURE

Dr. William T. Galloway has resigned his position as assistant secretary in the U. S. Department of Agriculture to accept the deanship of the New York State College of Agriculture in Cornell University. He is succeeded as assistant secretary by William A. Taylor, the present chief of the Bureau of Plant Industry. Mr. Taylor has been in the Department for more than 20 years, entering the service from Michigan where he was a successful fruit grower.

Worms in Pigs and Shotes.—Young and growing pigs are often unthrifty and make slow gains in weight. Often the particular breed or the feed is blamed when the real trouble is stomach or intestinal worms. Some remarkable demonstrations of this fact have followed the use of a good worm destroyer and conditioner like the well-known Sal-Vet. H. H. DeVore, Birchville, Pa., writes: "My shotes were very badly infested with worms. After feeding Sal-Vet a short time, the worms came from them in large bunches until now there are no further signs of them. During the 60 days that I have been feeding Sal-Vet most of my hogs doubled in weight and some more than doubled." Sal-Vet is sold on 60-day free trial and is equally effective on swine, sheep, horses and cattle. For full particulars address The S. R. Feil Co., Cleveland, O., saying you saw this notice in Pennsylvania Farmer.



Haines Lawn Trimmer

Only $2.85

Only free end Lawn Trimmer made. Specially for keeping big lawns in shape cutting all grass close to buildings, fences, shrubbery that the Lawn Mower fails to cut. Big improvement over shears and grass hooks. Strong and durable. Shipped f. o. b. Camden. Ask for Trimmer No. SN484.

Just What You Have Been Looking For

A Practical Concrete Mixer at a Price You Can Afford to Pay.

Whether you are a farmer or contractor the "Simplicity Jr." Concrete Mixer will prove a profitable investment for you. Just the thing for building silos, laying sidewalks, foundations, floors, culverts or any kind of concrete work. Mixes from 35 to 50 yards a day—a perfect mix is always assured with the

Simplicity Jr. CONCRETE MIXER

Simple design—all steel construction—chain drive. It has a low loading hopper and quick, handy discharge—no platform required. Light and easy to handle yet strong and durable. Power furnished by our reliable, well known 2 H. P. "Simplicity" engine.

PRICE—When you learn the price of this complete outfit you will be surprised. Write today for full particulars and prices—just drop us a card.

Something About Strawberries.

Their Dietetic Value.

First, let us inquire a little into the composition of strawberries and the purpose that they serve in human nutrition. They contain 8 to 10 percent of dry matter, which is largely sugar and malic acid. The average composition is about as follows: Water, 90.4 percent; protein, 1 percent (protein is the tissue-building substance of foods); fat, .6 percent, which consists of the essential oils which help to make the flavor; carbohydrates (fuel or energy making substances), 7.4 percent; mineral matter, .6 percent. The carbohydrates consist mainly of sugar (about 5 percent) and malic acid, about 1 percent. The sugar is nearly all what is called fruit sugar, with a very small amount of cane sugar, varying from .1 to .4 percent. Another carbohydrate constituent is "crude fiber," 1.4 percent; this consists of the cellulose or woody fiber forming the walls of the cells that contain the protein, sugar, acid, mineral matter and water.

The nutrients are the protein, comprising only 1 percent of the strawberry; sugar, 5 percent; fat, .6 percent; total 6.6 percent. The fuel value of a pound of strawberries is only 180 calories (a calorie is the amount of heat required to raise one pound of water four degrees). This fuel or energy-making power is insignificant compared with 1,620 calories in a pound of corn meal or rice, 2,840 calories in bacon, 1,576 in a beef roast, 3,555 in salt pork. As a farmer at field work needs about 3,000 calories per day, it would require 3,000 divided by 180 (the number of strawberry calories per pound), which equals 16.6 pounds of fresh strawberries per day to furnish his needed energy—manifestly impracticable.

But strawberries were made for a definite purpose in human nutrition. What is it? The large percent of water which they contain, you may suggest. Partly; it is true that probably we would not drink enough water if it were not served as palatably flavored in fruits and green vegetables, for altho not all of us would avoid water for the reason ascribed by the Southern colonel who remarked, "Watuh is ve'y fine fo' navigation, suh, but a mighty poo' drink," we would likely forget to take enough of it for irrigation of our assimilative system.

But we need the strawberry for other reasons. Its malic acid (the same as that in apples) is one of the most useful acids in human nutrition. It is an organic acid, that is, when it is burned in our bodies to produce heat and energy, just as starch, sugar and fat are burned in us for the same purpose, it is reduced to a pure white ash, all of which is needed for our assimilative processes, and so no clinkers or clogging results, as happens when we eat mineral or fat acids. Malic acid also the other fruit acids, tartaric in grapes and citric in lemons, oranges and grape fruit—is reduced in our bodies entirely to water and carbon dioxide (carbonic acid), then the carbonic acid unites with sodium, one of the mineral elements contained in strawberries, to form the ash referred to, which ash is three-fourths or more alkaline, and which thus preserves the alkalinity of our blood, and so prevents uric acid from forming and causing rheumatism or uremic poisoning. Sodium is the element which unites with chlorine to form sodium chlorid, the common alkaline mineral which we know as salt. There is also a little chlorine in strawberries—about .01 percent. Besides .07 of sodium and .01 pct. of chlorine, they also contain: Lime, .05 percent; magnesium, .03 percent; potash, .18; phosphorus, .064; iron, .0009. We have heard people say that they eat beets because they contain a good deal of iron; as a matter of fact, strawberries analyze out .0009 percent of iron as against .0006 percent for beets.

Strawberry Poisoning.—Some people apparently can not eat strawberries without having large blotches or wheals come out on their skin. Just why strawberries cause this has not been definitely determined, but since the trouble is relieved by usually taking a saline or soda laxative, may it not be suspected that it is due to the effort of the malic acid of the strawberries in combination with the sodium, as previously explained, to alkalize or counteract the overcharge of acid in the blood with the result of violent disturbance. And because the residues of ptomaines of this conflict can not be excreted thru the clogged excretory system the blood throws them out thru the skin. At any rate, correction of the acid condition of the blood and of the constipation frequently enable such people to eat strawberries without this annoyance.

Recipes

(All measurements level full).

Served with Hulls and Stems.—Select large firm berries, and lay them on a crisp crinkly leaf from head lettuce. Serve powdered sugar with them in small individual butter plates or glass salt cellars, the idea being to dip the berries into the powdered sugar.

With Orange or Pineapple.—Small strawberries can be served very attractively as a luncheon first course or as a sauce or dessert by mixing with pieces of orange and pineapple, and pouring over all some juice of the orange or pineapple, either alone or mixed. It is not usually necessary to use sugar unless the fruits are quite tart. Serve in glass sauce dishes or sherbet cups.

Batter Cups.—Mix 1 pint of sugar with 1 qt. of berries, slightly mashed. For the batter, sift ½ teaspoonful salt and 1 teaspoonful baking powder into 1 cup flour; rub well into this a tablespoonful butter, mix in 2 eggs (yolks and whites beaten separately) and ½ cup milk. Place a layer of the batter in buttered cups or molds, then a layer of the berries, and so on until the cups are two-thirds full, leaving room enough for the batter to rise. Steam or bake 45 minutes. Serve with cream (whipped if possible) or with strawberry sauce made as follows:

Strawberry Sauce.—Cream together 1 cup sugar and ½ cup butter add the whipped white of one egg and 1 cup of mashed berries. This is better if kept on ice a few hours before serving.

Muffin Rings.—Line muffin rings with thinly rolled sweetened baking-powder or sour-milk biscuit dough. Bake brown, fill with berries, sprinkle with sugar and serve with whipped or plain cream.

Float.—Bring to boiling point 1 quart of milk containing 1 cup sugar and a pinch of salt; add 1 tablespoonful corn starch dissolved in a little cold milk; cook 3 minutes, add the beaten yolks of 3 eggs, beat together for 2 minutes, then remove from the fire, and let cool. Into the juice from 1 pint of mashed berries gently fold the whipped whites of 2 eggs sweetened with 2 tablespoonfuls powdered sugar. Spread this on top of the cold custard when ready to serve, and drop on this a few prime ripe berries.

Escalloped Strawberries.—You will need ice to chill this dish. Alternate layers of strawberries with whipped cream in a glass dish, and dress with pineapple or strawberry syrup or else with the sweetened uncooked juice of either of these fruits.

Pie.—Why more people do not use fresh strawberries for pie timber is a question. They make beautiful and delicious pies, but strawberry pies need to be eaten warm to be at their best, for if they stand the juice soon soaks the crust. And the crust should be flaky and brown. To make it so, rub 2-3 cup equal parts butter and lard into 2 cups of flour into which you have sifted ½ teaspoonful salt; mix with ½ cup water—ice-cold gives best results, for all pie crust making should be kept as cold as possible. Then roll it about ½ inch thick, and dot with bits of butter, then fold and roll as thin as needed. For the filling allow 1 cup of sugar to 1 quart of berries, and use enough berries to make a "fat" pie. Add no water, for the berries are watery enough; sprinkle with flour, especially near the edges so as to soak up and make a jelly of as much of the juice as possible. Use no spices—it is the pure strawberry flavor that you want. Dot with bits of butter, about 1 level tablespoonful per pie. Turn the crust edge in toward the center and pinch together; thus turning toward the center prevents the juice from boiling out at the joining of the two crusts.

Sherbet.—Is made by adding to partly frozen ice the beaten whites of one or two eggs.

To Can So As To Preserve Plumpness.—Allow 1 quart of sugar to 6 quarts of berries. Crush 1 quart of the berries and strain out the juice, and make a syrup of this and the sugar. Put the rest of the berries into glass cans, fill the cans with the syrup, lay on the rubbers and covers loosely, set the cans in a 2-inch deep water bath in your wash boiler, cover, bring to boil and boil 10 minutes. Then remove from the boiler, tighten the covers, and stand the cans on their tops until next day to make sure that they are tightly sealed.

Strawberry Jelly.—Strawberry juice does not jelly readily alone, because there is not much pectin or jelly-making substance in it, therefore we use a little gelatin or else currant or tart apple juice—in proportion of about one-fifth. Crush the berries to start the juice, and cook until the juice is well extracted, adding no water. Strain thru cheesecloth, or if a very clear jelly is desired thru flannel. One really ought to use a syrup gauge for determining the amount of sugar to use, because the same fruits vary in their sugar content and unvarying success with jellying depends on using the right amount. The syrup gauge should register 25 for jellies. The usual rule is 1 pint of sugar per pint of juice, but sometimes in this way we get our jelly too sugary or not sugared enough. Boiling too long darkens and toughens jelly and boiling too furiously may crystallize it.—Harriet Mason.

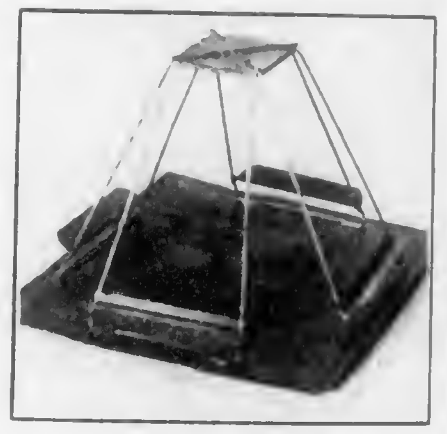
A SANITARY PORTABLE REFRIGERATOR

This sanitary portable refrigerator fills a long felt want in the nursery, sick room, automobile, camp and motor boat, and is useful for light housekeeping. It is absolutely sanitary because it is made entirely of metal, not a bit of wood about it, no dirty pipes, corners or crevices which are hard to keep clean. It is the most economical because it requires but a small amount of ice, and being made entirely of metal and packed thruout with mineral wool, the best known nonconducter of heat, the ice will last longer.

SANITARY PORTABLE REFRIGERATOR.

There is nothing to warp or pull apart or swell up if it gets wet. The outside is covered with an aluminum finish which is both handsome and very durable. The inside is arranged with trays all made of sheet metal, giving space for several dishes. It is small, light weight, making it easy to move about from place to place, well made in every way and is a very practical substitute for a more expensive refrigerator. It costs but a small amount, and for a small family will do the work of a larger refrigerator. There is no waste of ice as in the case of the old-fashioned wooden ice box; in it a small piece of ice will last double the length of time.—Marion Harris Neil.

A COLLAPSIBLE TOASTER



A COLLAPSIBLE TOASTER.

This toaster can be used on any kind of a stove. Four slices of bread can be toasted at one time. The finished toast is positively free from all foreign and disagreeable tastes, as the bread never comes directly in contact with the flame. Tea or coffee may be prepared on the top of the toaster without interfering with the toasting. Four slices of bread can be toasted in two minutes. The outside of the slice is toasted evenly from edge to edge—a delicious golden brown. While the outside is crisp and snappy, the inside of the slice is as soft and palatable as a freshly baked biscuit.—Housekeeper

CLOSETS AND SLEEPING PORCHES

"Let me plan for the closets and you may arrange the rest," remarked a young housekeeper during an animated discussion of the arrangement of a convenient house. They are indispensable conveniences, from the fruit closet or cupboard in the basement to the linen closet opening into the hall on the second floor. How our grandmothers managed with none, or perhaps just one in some out of the way place, and still kept sweet and sunny, is an unsolved mystery.

But there is another feature of the up-to-date home that is fully as important, as regards health and comfort, as the closets, and that is the sleeping porch or room that can be practically thrown open on at least three sides where the pure air is not shut out day or night. American people are becoming impressed with the pure air idea as rapidly as writers, lecturers and instructors can bring its importance before them, or the necessity awakens them to the fact that it is a preventive of disease, and is very often a cure. So it is becoming more and more general to plan for one or more open-air bedrooms when building a new house, or convert verandas and porches of older residences into comfortable and healthful sleeping quarters, to be used the whole year around.

As yet the benefits of sleeping in the open air seem to be appreciated principally by those living in towns or cities, but why should not farmers and their families be equally given to the habit. The great comfort and pleasure derived from sleeping out of doors, especially during the summer, well screened from mosquitoes and flies, where sweet winds may blow at will, bringing dreamless sleep and real rest to the tired muscles, must be experienced to be appreciated. And to be able to go out each morning, strong to meet the battles of the day, instead of being tired out from having tossed half the night because of the heat, will alone be worth many times the actual outlay in dollars and cents that such a porch or room will cost.

The smallness of the house need be no hindrance, as the open gable end of the attic of the tiny cottage is as available for the purpose as is the commodious porch of the more pretentious dwelling. A tent is a fair substitute, but one is apt to discard it and move into the house on the approach of cold weather, and snuggle up in artificially heated rooms and invite colds and all attendant evils.—Glentworth Rubins.

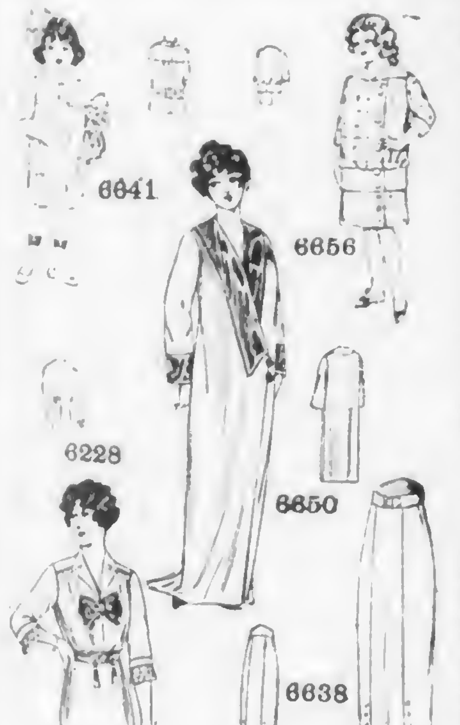
PENNSYLVANIA FARMER PATTERNS

Be sure to give the figures and letters of each pattern exactly as printed at the beginning of each description. We will not be responsible for correct filling of your orders unless you do so. Also give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 214 18 So. 12th St, Philadelphia, Pa.

6641.—Children's Dress.—Cut in sizes 2 to 8 years. Age 4 years requires 1½ yards of 36-inch material and 2 yards of ribbon for belt. Price of pattern, 10 cents.

6656.—Girls' Dress.—Cut in sizes 4 to 11 years. Age 8 years requires 3 yards of 36-inch material. Price, 10 cents.

6650.—Ladies' Kimono.—Cut in sizes small, medium and large. Medium size requires 5½ yards of 40-inch material and 1¼ yards of 27-inch satin to trim. Price, 10 cents.



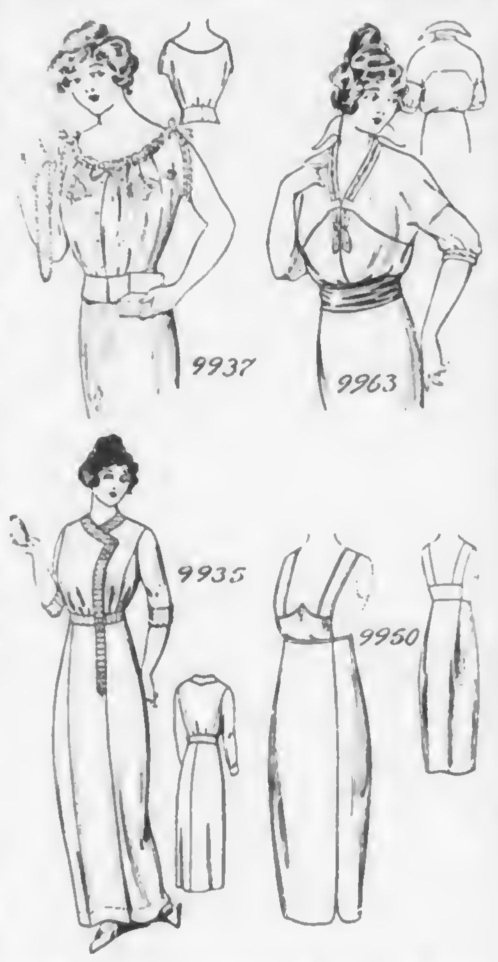
6228.—Ladies' Shirt Waist.—Cut in sizes 34 to 42 inches, bust measure. Size 36 requires 2 yards of 44-inch material and 1½ yards of edging. Price, 10 cents.

6638.—Ladies' Four-Gored Skirt.—Cut in sizes 22 to 32 inches, waist measure. Size 22 requires 2¼ yards of 36, 44 or 54-inch material. Price, 10 cents.

9937.—Ladies' Corset Cover with Peplum.—Cut in 7 sizes: 32, 34, 36, 38, 40, 42 and 44 inches, bust measure. It requires 2 yards of 27-inch material for a 36-inch size. Price of pattern, 10 cents.

9963.—Ladies' Blouse Waist.—Cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches, bust measure. It requires 2¼ yards of 36-inch material for a 38-inch size. Price, 10 cents.

9935.—Ladies' House Dress.—Cut in 7 sizes: 32, 34, 36, 38, 40, 42 and 44 inches, bust measure. It requires 5 yards of 44-inch material for a 36-inch size. The skirt measures about 1¾ yards at the foot. Price, 10 cents.



9950.—Ladies' One Piece Suspender Skirt with Bib Portions.—Cut in sizes: 22, 24, 26, 28, 30 and 32 inches, waist measure. It requires 3 yards of 44-inch material for a 24-inch size, which measures about 1¼ yards at the foot. Price, 10 cents.

Give Comfort to Your Aching Feet

Give your poor, tired, burning feet a chance. Stop the irritation of that constant suffering. Take the sting out of that sore corn. Wear Nurses DeLyte shoes and forget that you have feet. Soft, seamless as easy as a stocking. Made of the famous Duree Kid, with noiseless flexible soles and rubber heels. Adapted to street and house wear.

NURSES DeLyte $3.00

Price, $3 by Mail, Delivered Free

Your choice of button or lace shoes and oxfords, black Duree Kid or white canvas. Fit and comfort guaranteed or your money refunded. State size when ordering. Sizes 1 1-2 to 10, A, B, C, D, E, F. $3.00

SYNOPSIS OF PREVIOUS CHAPTERS

Two New York business men, Van Brunt and Hartley, come to Wellmouth for a vacation. Solomon Pratt, Skipper and village character, finds the ''twins,'' as they are dubbed, interesting but takes them for lunatics and their ''man'' for their ''keeper.'' The ''twins'' after harrowing experiences with cooks, ask Pratt to find them a secluded place of rest and act as their cook. The skipper and Hartley witness a greased pig race, rescue a fresh air youngster hurt in the race, Hartley meets a former friend in a fresh air worker, and the skipper has a troublesome voyage back to Wellmouth in which he is set adrift in a skiff and Van Brunt and his ''man'' in the ''Dora Bassett.''

CHAPTER VI (continued)

So I squared my shoulders and laid to the oars, heading for where, judging by the wind, the land ought to be. 'Twas darker than a black kitten in a nigger's pocket, but I cal'lated to be able to hit the broadside of the United States somewhere. I got aground on the flats five or six times, but along towards midnight I butted ashore at the little end of nowhere where there was nothing but bushes and sand and pines, no sign of civilization. And by this time 'twas pouring rain.

After a couple of years of scratching and swearing and falling down I come out of the scrub into a kind of clearing. Then I discovered a barbed wire fence by hanging up on it like a sheet on a line and located the back of a barn by banging into it with my head. Then a nice talkative dog come out of the barn and located me, and things commenced to liven up.

While me and the dog was conducting our experience meeting a light showed in an upstairs window a little ways off and somebody sticks their head out and wants to know what's the matter.

''Who are you?'' he says.

''My name's Pratt,'' says I.

''Where are you?''

''Well,'' I says, ''judging by the feel and smell I'm on the top of the pigsty. But I ain't real sure. I can tell you where your dog is, if you want to know.''

''What are you doing round here this time of night?'' he says.

I told him as well as I could. The dog was having a conniption fit, trying to bark itself inside out, and I had to say things over three or four times so's a body could hear. But the feller at the window wa'n't satisfied even then. I never see such a wooden-head.

''What Pratt did you say you was?'' he hollers.

I told him my name and where I hailed from.

''Sol Pratt!'' says he. ''Of Wellmouth? What are you doing way over here?''

''Blast it all!'' I yells. ''If I wa'n't half drowned already I should say I was getting wet. Turn out and let a feller into the kitchen or somewheres, won't you? And tie up this everlasting dog.''

That seemed to wake him up some and in ten minutes or so he comes poking out with a lantern. I knew him then. 'Twas Ebenezer Holbrook, Huldy Ann Scudder's sister's husband, who lives over in the woods on the line between South Eastwich and West Ostable. There was another man with him and blest if it didn't turn out to be Nate Scudder himself. Him and Huldy was visiting over there, same as he said they was going to.

Nate had more than a million questions to ask. Ebenezer tied up the dog—the critter pretty nigh broke down and sobbed when he found I wa'n't to be fed to him—and we went into the kitchen. Then Mrs. Holbrook and Huldy Ann rigged up tasty and becoming in curl papers and bedquilts, floated downstairs and there was more questions.

When Nate found out that one of his lodgers was cast adrift in the bay he was almost as worried and upset as I was. But Ebenezer agreed with us that there was a good chance of the sloop's getting ashore safe. He said why didn't I turn in on his setting-room lounge for the few hours between then and sun-up, and in the morning me and Nate could take his yawl dory and cruise alongshore and hunt. So I done it, tho 'twas precious little sleep I got.

About six o'clock we started. I thought first I'd go up to Eastwich village and telegraph to Hartley. Then I thought I'd better not; no use to scare him till I had to. Nate had heard about the pig chase and Hartley's doings over there and he pestered the life out of me with questions about that.

''Queer that boy should turn out to be his brother, wa'n't it?'' he says.

''Whose brother?'' says I, leaning out over the yawl's side and watching for signs of the Dora Bassett.

''Why, Hartley's,'' says he.

''Brother!'' says I. '' 'Twan't his brother. No relation to him.''

''I heard different,'' he says. ''I heard 'twas his brother, name of Oscar Dennis. And that woman from the school was his brother's wife. Some says she ain't living with her husband and some say Hartley's right name is Dennis and that she's his wife and he was down here hiding from her. Seems when that boy first dove into the crowd 'twas because he'd seen Hartley. They say that when that woman and this Hartley [illegible], she sings out, 'My God! my husband!' That's what some says she said, and others says——''

''She never said no such thing,'' I says. ''She wouldn't swear if he was her husband four times over; she ain't that kind. And she ain't his wife nor his sister nor his sister-in-law nor his grandmother's cat's aunt, neither. She's no relation to him and neither's the boy. Who's been giving you all this rigmarole?''

It seems he'd heard it from a feller that lived next door to Ebenezer; and the feller had heard it from somebody else that had got it from somebody else and so on and so on and so on. Nigh's I could find out it had started from Hartley's telling me that the boy was a ''brother outcast.'' Some idiot with poor ears and worse brains had thought he said ''brother Oscar,'' and the whole string of yarns had sprouted from that. Shows you what good soil there is for planting lies down our way. If lies was fetching ten cents a barrel the whole neighborhood would have been rich years ago.

All the time me and Nate was powwowing this way the yawl was sailing up the bay towing my skiff behind her. There was a nice fair wind and a smooth sea and 'twas so clear after the rain, that we could see the hills across the bay. But no sign could we see of the Dora Bassett nor her passengers. I was getting more worried every minute.

We cruised along till we got abreast of the point from where the Old Home pier was in sight. But the sloop wa'n't at the pier. No use going any farther, so we come about and begun to beat back again the way we'd come. Scudder was worried too, but his worriment had caught him in the pocketbook; proves how disease will always get hold of a feller's tenderest place.

''Look here ,Sol,'' says he; ''do you cal'late Hartley'll want to stay to my house if his chum's drowned?''

''Well now, he agreed to take it for a month and there's five days to run yet. Ain't he liable for them days?'' he says.

I was feeling just mean enough to want somebody else to feel that way, so I answers,

''Well, you can't hold a lunatic, 'cording to law. And you and Huldy Ann have agreed that he's crazy.''

He thumped the boat's rail. ''Crazy or not,'' says he, ''I can't afford to lose them days. I shan't give him back none of his money.'' Then he thought a minute and begun to see a speck of comfort. ''Maybe the shock of t'other feller's drowning'll make him sick,'' he says. ''Then he'll have to stay longer than the month.''

Trust Nate Scudder to see a silver lining to any cloud—and then rip out the lining and put it in his pocket.

By this time we was beating in towards where the Neck Road comes down to the beach. And there on the shore was a feller hailing us. And when we got close in it turned out to be Hartley himself.

He was glad enough to see me, but when he found that Van and Lord James had turned up missing he was in a state. He'd been kind of scared when we didn't come back during the night and had walked down to the beach in the morning to see if he could sight us.

We headed off shore again. Nate watched Hartley pretty close and I suppose when he seen that the Twin didn't show any symptoms of getting sick, he begun to worry again. He got out a piece of pencil and an old envelope and commenced to figure.

''Mr. Hartley,'' says he, after awhile; ''about them lady friends of yours over to Eastwich. Do you cal'late they're going to like where they are? Seems to me a place that's as easy to run away from as that ain't the best place for a boy's school. If they was on an island now, the scholars couldn't run off. I know a nice island they could have cheap. Fact is, I own it—that is, Huldy owns it; it's [illegible] her name. That's it over there.''

Hartley didn't answer. I looked where Nate was pointing.

''Oh!'' says I. ''Horsefoot Bar. That's a healthy place for a school. Might do for a reform school maybe, if you wa'n't particular how the reforming was done.''

Horsefoot Bar is a little island about five mile from the Old Home House, a mile and a half from the mainland, and two foot from the jumping off place. By the help of Providence, decent weather, a horse, two whips, and a boat, you can make it from Wellmouth depot in three hours. And when you have made it, you can set in the sand and hang on to your hat and listen to the lonesomeness. I'd forgot that Scudder owned it. When him and I had sailed up that morning we'd passed it on the outside; now we was between it and the beach.

''It's a nice dry place,'' says Nate, arguing, ''and you might live there forever and nobody could run away.''

''Humph!'' says I, thinking of something I'd seen in a newspaper; ''Hell's got all them recommendations.''

Hartley was looking at the Bar now. All to once he grabbed me by the arm and pointed.

''Sol,'' he says, ''what's that sticking up over the point there? There, behind those trees? Isn't it a boat's mast?''

I looked, and looked once more. From where we was you could see a part of Horsefoot Bar that was out of sight from the rest of the bay. As I say, I looked. Then I gave the tiller a shove that brought the boom across with a slat. It took Nate's hat with it and cracked him on the bald spot like thumping a ripe watermelon. Nate grabbed for the hat and I drove the yawl for Horsefoot Bar. I'd spied the Dora Bassett's mast over the sandspit.

In a jiffy we see her plain. She was lying on her side in a little cove, just as the tide had left her. Her canvas was down in a heap, partly on deck and partly overboard, but she didn't seem to be hurt none. I beached the yawl just alongside of her, dropped the sail, chucked over the anchor and jumped over myself. Hartley and Scudder followed. We was yelling like loons.

Up thru the bunch of scrub pines we tore, still hollering. And then, from away off ahead somewheres, come the answer. I was so tickled I could have stood on my head.

In a minute here comes Lord James to meet us. His Lordship looked yellow and faded, like a wilted sunflower, and his whiskers seemed to be running to seed. But his dignity was on deck all right.

''Mr. 'Artley,'' says he, touching what was left of his hat; '' 'ope you 're well, sir.''

''Where's Van?'' asked Hartley brisk.

''Mr. Van Brunt, sir? Up at the 'ouse, waiting for you, sir.''

''The house?'' says Hartley.

''The house?'' says I. Then I remembered.

There is a house on Horsefoot Bar. It was built by old man Marcellus Berry, and in Marcellus's day they built houses, didn't stick 'em together with wall paper and a mortgage, like they do now. Consequence is that, tho the winter weather on Horsefoot made Marcellus lay down a considerable spell ago, his house still stands, as pert and sassy an old gable-ended jail as ever was. The house was there, and Scudder owned it. Likewise he owned the sheds and barn in back, and the sickly bunch of scrub pines, and the beach plum bushes, and the beach grass and the poverty grass, and the world-without-end of sand that all these things was stuck up in. As for the live stock that was seven thousand hop-toads, twenty million sand fleas, and greenheads and mosquitoes forever and ever amen.

We fell into the valet's wake and waded turu the sand hummocks up to the house. And there on the piazza, sitting in a busted cane-seat chair with his feet cocked up on the railing and the regulation cigar in his mouth, was Van Brunt, kind of damp and wrinkled so far as clothes went, but otherwise as serene and chipper a Robinson Crusoe as the average man is likely to strike in one life time.

Wa'n't we glad to see him! And he was just as glad to see us.

''Hello, skipper,'' says he, reaching out his hand. ''So you got ashore all right. Good enough. I was a bit fearful for you after you left us last night.''

''Humph!'' says I. ''I had a notion that 'twas you that did the leaving. Talk about dropping an acquaintance! I never was dropped like that afore. Look here, Mr. Van Brunt, afore you and me go to sea together again we'll have a little lesson in running rigging. I want to learn you what a mainsheet is.''

''Oh,'' he says, careless like, ''I guess I found it, after a while. At any rate if it's a rope I cut it. I cut all the ropes in sight.''

To be continued.

Markets

PHILADELPHIA PRODUCE

Philadelphia, Pa., June 1, 1914.

Butter of fine quality ruled firm with demand equal to the limited offerings. Eggs sold fairly well and ruled steady with supplies of desirable stock well under control. Poultry supplies were rather low and prices ruled firm under the scarcity. Fruit and vegetables were moderately active.

Butter.—Western creamery, 28c; extras, 26c; firsts to seconds, 22@25c; special prints 3[illegible]@35c; near-by prints 29c.

Eggs.—Candled 24@26c dozen; extras, 23c. Current receipts at $6.15 per standard case.

YORK PRODUCE MARKET

York, Pa., June 1, 1914.

Saturday being a holiday the markets were all crowded into four days and this made the crowds immense. Friday's markets were like a vast flower garden, stands piled high with all sorts from the choicest hot-house flowers to the plain blooms found in the wood. County strawberries were in evidence, a few early in the week, and more plentiful on Friday. Very common ones at 10@12c while some sold four and five crates at 18@25c per box. Cherries were on sale in a limited quantity.

Eggs.—19@20c doz.

Butter.—Country, 25@30c, separator, 32@35c. Milk, [illegible] quart. Cream, 10@12c per pint.

Poultry.—Hens, 15@16c, springers, 20c. Dressed poultry 45@90c each.

Vegetables.—Potatoes 10@18c ½-pk; 75c@$1.25 bu; cabbage 3@8c each; lettuce, 2@5c; beets, 3@5c bch; radishes 3@5c bch; onions 2@3c bunch, 15c ½-pk; lima beans, 14@16c qt.; sweet potatoes, 14@16c ½-pk; lard 14@16c lb.; celery 5@10c ea; peppers, 8@12c doz; turnips 10c per ½-pk; sauer kraut 8c qt. apple butter, 20@25c qt. asparagus, 5@8c bch, rhubarb, 3@5c per bunch.

Fruit.—Apples, 25@35c ½-pk; strawberries, County, 12@25c; southern, 6@12c, cherries, 10@12c per box.

Retail Grain Market.—Wheat, $1.06 bu corn, 88c [illegible], 56c; rye, 77c; bran, $1.60 cwt; [illegible], $1.70 cwt.

Wholesale Grain Market.—Wheat, 96c corn, 78c, oats, 40c; rye, 67c.

PHILADELPHIA LIVE STOCK

Philadelphia, Pa., June 1, 1914.

Beef Cattle.—The market closed quiet and steady with the holiday conditions, with demand principally for actual necessities. There was a limited run of cattle, mostly of Pennsylvania and Kentucky brands. Cows and calves sold slowly at the prevailing rates.

	Beef Cattle	Sheep and Lambs	Hogs
Total for week	[illegible]	7,136	4,969
Previous week	[illegible]	12,626	5,245

Best steers	$8.85@9.00
Choice steers	8.60@8.75
Good do	8.25@8.50

Light Western	$8.85@8.90
Heavy to medium	8.60@8.75
Near-by	8.60@8.75
Pigs	8.25@8.75
Roughs	7.00@7.75

Calves.—Receipts for the week were 632 head against 489 head last week. Light supply, market lower at $6.00@9.50.

PITTSBURGH HAY AND GRAIN MARKET

Pittsburgh, Pa., June 1, 1914.

Hay.—The extremely light receipts to this market still continue while billings in transit have fallen off. Inquiries are coming in from the outside districts around Pittsburgh for hay and it looks as if it would be a strong market for the balance of the crop. Shipments should be made at once to take advantage of present conditions.

No. 1 timothy	$18.50@19.00
No. 2 timothy	16.00@17.00
No. 1 light mixed	16.00@17.00
No. 1 clover mixed	15.00@15.50
No. 2 clover mixed	12.00@13.00
No. 1 clover	15.00@15.50
No. 2 clover	10.00@12.00

Straw.—Receipts of straw light with fair demand in evidence, prices ruling steady.

No. 1 Oats	$9.75@10.00
No. 2 Oats	9.50@9.75
No. 1 Wheat	9.75@10.00
No. 2 Wheat	9.25@9.50
No. 1 Rye	10.75@11.00
No. 2 Rye	9.75@10.25

Ear Corn.—The excellent demand which ear corn has had right along has fallen off with receipts normal, market slightly easier.

No. 2 Yellow	82½@83c.
No. 3 Yellow	79@80½c.
No. 1 High mixed	81@82c.
No. 2 Mixed	79@80c.

Oats.—Receipts quite liberal while the demand is only fair.

No. 2 white	44¼@44¾c.
Standard oats	43¾@44¼c.
No. 3 white	42¾@43¼c.
No 1 white	41¾@42¼c.

VISIBLE GRAIN SUUPLY

New York City, June 1, 1914.

Following are the changes in the visible grain supply of grain in the United States:

Wheat decreased 1,[illegible] bushels; in bond increased 428,000 bushels.

Corn increased 323,000 bushels.

Oats decreased 96,000 bushels; in bond decreased 53,000 bushels.

Rye increased 6,000 bushels.

Barley decreased 170,000 bushels; in bond decreased 65,000 bushels.

NEW YORK HAY MARKET

New York City, June 1, 1914.

The market for hay is generally steady in all positions. There is a fair demand for the better grades, receipts Saturday were [illegible]22 tons. Prime timothy $1.15 bale; No. 1, $1.10@1.12½. No. 2 do., $1.05@1.10; No. 3, 95c@$1.00; clover, 82½@$1.05.

The straw market remains steady. Receipts 20 tons. Oats straw 50@60c; rye straw 65c.

NEW YORK MILK MARKET

New York City, June 1, 1914.

Never before at this period of the year has so much milk and cream entered the New York market in the course of a week as did last week. The total shows how the business is growing from year to year. Business was good altho it fell off a little at the end of the week owing to the holidays.

The receipts of milk and cream in 40-quart cans for the week ending May 30, was as follows:

Railroad	Milk	Cream
Erie	52,458	4,664
Susquehanna	8,708	508
West Shore	16,146	2,170
Lackawanna	62,750	3,675
N. Y. Central long haul	91,945	3,972
N. Y. Central short haul	13,750	190
Ontario	17,61[illegible]	5,778
Lehigh Valley	39,393	3,738
Homer Ramsdell Line	2,977	60
New Haven	8,75[illegible]	140
Pennsylvania	8,801	557
Other sources	1,750	30
Totals	355,037	25,177

ELGIN BUTTER QUOTATION

Elgin, Ill., June 1, 1914.

The quotation committee of the Elgin Board of Trade this afternoon declared butter firm at 26¼c.

NEW BULLETINS

Poultry House Construction.—What should prove a very valuable work to poultrymen is Farmer's Bulletin No. 574 of the Department of Agriculture, put out under this heading. The main features in poultry house construction are explained and pictures and plans of satisfactory houses are shown. Every poultryman contemplating the erection of new poultry buildings should secure a copy of this bulletin which is sent free upon application to Washington.

Diversified Poultry Farming.—Under this title the New Jersey Experiment Station at New Brunswick, N. J., puts out its circular No. 32, which is a discussion of poultry possibilities in N. J., with an attempt to give helpful suggestions and cautions. Among other statements we read, ''It is a very easy matter to get a few hens and make a dollar or two or even three dollars a year profit on each hen. To secure these same results with large flocks has been the aim of all anxious beginners. It has never yet been accomplished by trying to do several years' work in one.'' Many practical bits of advice are contained in the bulletin.

The Tuberculin Tests For Tuberculosis In Cattle.—For those interested in a short concise treatise on the Tuberculin Test for Cattle Special Bulletin No. 62 of the Michigan Agricultural College will be of interest. It deals with the preparation of tuberculin, method of injection and interpretation of results. The bulletin is mailed from East Lansing, Michigan.

A System Of Farm Cost Accounting.—Farmers' Bulletin No. 572 of the U. S. Department of Agriculture, Washington, D. C., is an attempt to supply a simple system of farm accounting for those who desire to keep such accounts and have not worked out a system for themselves, and also for those who are not satisfied with the results obtained with present methods. The bulletin outlines the requisites for farm records and then explains different forms which are included in the system in question. It is explained that ''the system outlined is not a theoretical system, but one which for several years with many types of farming and under widely different conditions, has given satisfaction.''

Water Supply, Plumbing And Sewage Disposal For Country Homes.—Any farmer who feels that the sanitary arrangements in his home are not entirely satisfactory is urged to apply for the Department of Agriculture's new free bulletin. With the help of a reliable plumber or sanitary engineer he will be able to work out a simple and economical solution for his problem. The bulletin is No 572 and is mailed from Washington, D. C.

NEW BOOKS RECEIVED

Play and Recreation.—By Henry S. Curtis, former secretary and vice president of the Playgrounds Association of America. 265 pages, 5½x8 inches. Illustrated. Bound in cloth. Published by Ginn and Co., Boston. Price, $1.10.

The truth of the old adage ''All work and no play makes Jack a dull boy'' is so generally recognized that it needs no further demonstration. But even where the need of more and better play is felt, it is often a serious problem how and what to play or how and what to provide for youths of the community to stimulate full and well balanced development. This book is an attempt to show some ways in which the adventure, romance and social co-operation which the country had in the days of the pioneer can be brought back to country life. It suggests ways of organization of recreation in the rural home, in the rural school and in the rural community. Parents, teachers and all others interested in rural life will find it helpful.

Practical Garden Book.—By C. E. Hunn and L. H. Bailey. 250 pages. Illustrated. 5x7½ inches. Bound in cloth. Published by MacMillan Co. For sale thru Pennsylvania Farmer. Price 50 cents.

This is the eighth edition of this popular and useful volume ''containing the simplest direction for the growing of the most common things and for those simple garden operations which most books take for granted.'' The subjects are arranged in alphabetical order the notes being brief and condensed and giving just the advice you want when planning or planting the garden.

The Granger Movement.—By Solon Justus Buck, Research Associate in History in University of Illinois. 384 pages, 6 by 9 inches. Bound in cloth. Published by the Harvard University Press. Price, $2.00.

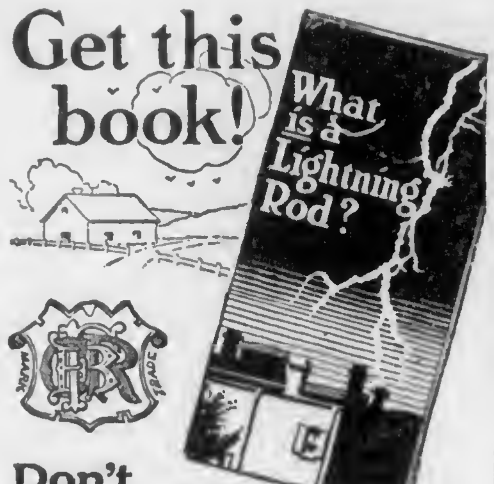
This is a historical discussion of the order of Patrons of Husbandry in its relation to legislation and industrial matters in the period from 1870 to 1880 and was awarded the Toppan prize for the year 1910-11. Of particular interest is the historical and critical treatment of the influence of the grange in relation to co-operative movements, rural social conditions, railroad legislation and rural organization.

Industrial and Commercial Geography.—By J. Russell Smith, professor of industry, Wharton School of Finance, University of Pennsylvania. 914 pages, 6x9 inches. Illustrated. Bound in cloth. Published by Henry Holt and Co. Price, [illegible].

This book teaches geography in a new and intensely interesting and instructive way. As the author explains it ''aims to interpret the earth in terms of its usefulness to humanity.'' Thus ''geography'' is studied from a standpoint of industries and commerce. For example a chapter is given on Cereals, and in this is a study of wheat. The subject wheat is presented under the following sub-divisions: The plant and its climatic requirements, freezing and thawing in open winter, regions with good wheat climate, introduction and breeding of new wheats, effect of process of milling on wheat growing, effect of machinery upon production, yield and production in new countries, effect of cheap wheat upon farm value, wheat growing in foreign countries, manufactured products, future wheat supply. Other products are presented in the same way, thus presenting geographical studies from the standpoint of human activities as affected by the earth rather than by parts of earth as they affect human activities. The book should be of the greatest value to every high school library and every collection of agricultural books.

Suburban Garden Guide.—By Parker Thayer Barnes. 150 pages, 4½x7 inches. Bound in cloth. Published by MacMillan Co. For sale thru Pennsylvania Farmer. Price, 50 cents.

This is one of the Country Life Manual series and, as its name implies, is suited particularly to the suburban garden requirements. Yet it is very complete in notes and tables on garden planting making it useful to all gardeners. It has chapters on best vegetables for the home garden, best flowers, how and when to spray, fertilizing the small garden and an appendix of handy tables of garden rules, planting tables for flowers, vegetables, bulbs, spraying, pruning, etc.



What is a Lightning Rod?

Get this book!

Don't be in doubt!

Get the latest inside facts. Be prepared to *know* the true from the false in any argument.

This new booklet contains facts never before published—instructive information that you've long wanted and never could get until now. (Conducted by W. C. Fair, V. S.)

(Advice thru this department is free to our subscribers. Each communication should state history and symptoms of the case in full, also the name and address of writer. Initials only will be published. We cannot make reply by mail. This is one of the most valuable columns of the paper and we invite readers to make use of it. Clippings from this column, when properly preserved and classified, would make one of the most valuable medical symposiums a farmer-stockman could obtain.)

Periodic Ophthalmia.—We have a 3-year-old colt just nicely broke to harness which seems to have sore eyes. About 2 months ago left eye became sore and remained so for a week or ten days, now the right is affected much the same and I have been bathing it with warm water. So far as I can tell, it is going to get well, but I would like to know if there is any danger of colt going blind? B. J. W., Warren, Pa.—The symptoms are suspicious and I am quite inclined to believe this a typical case of periodic ophthalmia (moon blindness). Nearly all these cases terminate sooner or later in loss of vision in one or both eyes. Dissolve 40 grains borate of soda, 40 grains boracic acid and a teaspoonful fluid extract belladona in 6 oz. water and apply to eyes, 2 or 3 times a day. Give a teaspoonful Donovan's solution of arsenic at a dose, 3 times a day. A bright light always irritates a sore eye, besides, feeding much grain also has a tendency to keep eyes sore.

Collar and Saddle Galls.—For the past few weeks I have had a great deal of trouble with sore shoulders and sore backs on my horses, more than I have had during the past 45 years of farming. Last winter my horses were fed on corn, oats, flaxseed meal, some cotton seed meal, a few potatoes and plenty corn fodder. E. B. M., Lincoln University, Pa.—Give each of your horses a tablespoonful of Donavan's solution at a dose in feed, 3 times a day, and apply the following lotion 4 or 5 times a day. Dissolve ¼ lb. acetate of lead, 3 oz. of sulphate of zinc and 3 oz. of carbolic acid in a gallon of water. The face of collar and saddle pad should be wet with a 2 percent solution of carbolic acid every evening after they are cleaned.

Tetanus—(lock jaw).—Is it possible for a horse to contract lock jaw on account of nails being driven too high or too near sensitive foot. Would it be possible for lock jaw to develop in one or two days after an injury of either kind so that a diagnosis could be made? C. T.—This disease is due to the entrance into the system thru some abrasion, of a tetanus bacillus and this bacillus or tetanus is most frequently found in the dust of roads and in garden earth, or fertile soil or unclean places. It very often follows wounds located low down on the body which are apt to come in contact with the earth. Lock jaw does not develop in a day or two after the germs enter body, but requires several days, usually a week or 10 days. The shoeing could not have caused it in this case.

Vertigo.—We have a small cow, freshened 7 weeks ago, after being dry 6 weeks. This cow, when brought in from pasture last fall, was thin with good appetite and has never gained much in flesh. After eating all her feed last evening she made a sucking noise, with her head down. On releasing her from yoke she pitched around dizzily and fell, kicking as if dying. The spell lasted about two hours. I give her soda and ginger, but this failed to help her and at the end of 4 hours, at the earnest solicitation of a neighbor who said she had lost her cud, we gave her two cuds made of buckwheat flour and the green inner bark of the elder. This morning she is all right, giving nearly her normal flow of milk. Is there such a disease as wolf in the tail? This cow has a soft part in her tail just above the switch. Neighbors claim if it is cut open and salt rubbed in the wound she will improve and get in better flesh. J. G. S., Milbrook, N. J.—There is no such disease as "hollow horn" or "wolf in the tail." Applications made to tail or giving them a few ounces of buckwheat and elder bark could have little bearing on the health of your cow. She suffered from acute indigestion and vertigo, but recovered. What she needed was a large dose of sulphate of magnesia and a few doses of hyposulphite of soda. From one to two pounds of sulphate of magnesia is a dose for a cow. From ½ oz. to an ounce of hypo-sulphite of soda in feed, 3 times a day, is about the right dose.

ATLANTIC
AUTOMOBILE
GASOLINE

Let Our Tank Wagon Service Supply You

Our delivery service of Atlantic Automobile Gasoline is saving money, time and worry for any number of Pennsylvania farmers. Our tank wagons will deliver it right at your door. In this way you are sure of regular supplies of high-grade, uniform fuel.

ATLANTIC AUTOMOBILE GASOLINE will give you freedom from engine troubles and a maximum power per gallon. With it your car starts quickly, and you don't have the bother of frequent carbureter adjustments.

Atlantic Automobile Gasoline is made by a perfected refining process, which equals, though on a much larger scale, the careful accuracy of the chemist's balance.

The result is a uniform fuel, which always acts the same under all conditions. Ask for it by name—"Atlantic Automobile Gasoline."

A County Good Roads Day

By J. M. McKee, Agriculturist, Washington Co., Pa.

"Dig in with us." These are four very small words but when stated as follows: "Dig in with us on Good Roads Day for Washington County" they take a greater significance. And now, after having been emphasized by all manner of means for thirty days, concluded by personal demonstration on the roads thruout the county, these four words mean better roads thru the free efforts of the county citizens.

A country physician who has to drive over the ordinary dirt roads every day in the year finally had it bumped, frozen and mudded into his mind that Washington County ought to have a "Good Roads Day." He got in touch with a number of men at the county seat and won them over to his way of thinking. As the office of our Agricultural Bureau is the common meeting place for country and townspeople alike, Dr. Martin requested us to call together those men whom he had interested. This was done, and after discussing the question fully, we decided on the movement.

We learned early in the movement that the only way to accomplish results was to take the farmer's advice: "If you want a thing done, go ahead and do it." So we went ahead and said that Washington County would have a "Good Road Day" on the 26th of May. This date was chosen with a view to finding a time after the farmers had their spring planting done. Also a day early in the week was selected, so if we had bad weather we could postpone it for a day or two.

The conclusion arrived at from our several meetings was that this movement must be general, embracing all the interests in the county and that to carry on the work we must have an active Central Committee which could meet often. In pursuance of this plan, we had on our central committee, a representative of the pastoral association, a county commissioner, county engineer, state highway engineer, borough engineer, editor of the local paper, a leading political organizer, a leading business man, an attorney, secretary of the local fair board, and the county agriculturist. This committee was then divided into a publicity committee, organization committee and a road districting committee. As a result of the activities of the central board letters were sent out to all the subordinate granges from the Pomona grange master. Letters were sent to the clergymen of the county, many of whom preached a "good roads day" sermon. The judges of our court issued a proclamation calling on all good citizens to work on this day. The supervisors in an annual convention endorsed the work. The school directors at their spring meeting were enthusiastic over it. Boards of trade, town councils, etc., went on record as favoring the movement, and so on thruout the county. Each township or district had its local organization which had active charge of the work and received help from the central committee or suggestions from engineers when requested.

WASHINGTON BUSINESSMEN WORKING ON ROAD.

WASHINGTON AND JEFFERSON COLLEGE FOOTBALL SQUAD FOLLOWING THE SCRAPER IN WASHINGTON COUNTY "GOOD ROADS DAY."

Unlimited publicity was given by all newspapers, thousands of penants and signs were scattered over the county while many automobiles carried banners bearing our slogan "Dig in with us." What was the result of all this? A few extracts taken from newspaper reports tell the story vividly.

At Van Buren

"The old plank road leading thru South Franklin township together with the main highways leading therefrom were placed in excellent condition for travel today when 158 men and 25 teams were at work, together with two engines attached to large scrapers and scarifiers. In addition to the work done by the engines and scrapers, four culvert and two bridges were constructed and 165 perch of stone were hauled and placed on the road. It is believed that the two engines will be secured to go over the old highway from one end to the other as excellent work was accomplished. The road had become hollowed out in the center, leaving several feet on each side. The scarifier attached to the big engine loosened the stone and dirt while the big scraper attached to the engine placed it in the center of the road bed, thus giving a crown to the road, widening the highway and making an excellent opportunity to build side drains. All of the roads in South Franklin township were scraped previous to today and are in fairly good condition. Stones were hauled on the old plank road and all holes filled."

At Centerville

"The women of Centerville borough showed that they are interested in good roads and also that they were capable of doing more than housework. Fourteen of them shouldered their road-making tools and took their places along side of the men for the entire day, raking stone, shoveling dirt and carrying water and making lemonade. In the village of Centerville 49 men and 10 teams were at work the entire day placing the streets in the best of condition. Thruout the borough 145 men and 27 teams were at work and when the day closed the highways of Centerville borough were in better condition than they have been for years. Energy was centered on the worst places in the highways as the other sections are in very good condition."

At Sparta

"Dr. W. D. Martin, the country doctor who was the originator of the "Good Roads Day" in Washington county proved that the citizens of his section backed him up in the movement, as 120 taxpayers of the township were out with all kinds of road tools and 61 teams. In addition there were 45 students from W. & J. College. All the work done was of a permanent nature except the smoothing of the roads and the gathering of stone

Fifteen culverts were built, 80 loads of stone hauled and 50 loads of dirt. The work consisted of stone picking, making fills, widening the roads, dragging them, etc. This township built several drags that it sold to other sections for the cost of making. The roads had been scraped previous to today and the men worked at cleaning out the drains, the under crossings, gathering loose stone and leveling up the highway. Much good was accomplished.''

At Burgettstown

''The worst stretch of road in Washington county was practically made into a boulevard by 53 enthusiastic workers and 16 teams today. The stretch is between Burgettstown and Atlasburg, in Smith township, and is almost two miles in length. Before today even in good weather it was almost impassable because of great ruts. Preachers, physicians, bankers, miners, farmers and citizens of Burgettstown worked hand in hand and by evening the entire thorofare had been gone over and remade. Most of the effort in Smith township was devoted to this road. Teams and men were furnished free of charge for the day by corporations in this vicinity and business men of Burgettstown. Work was done on other roads in Smith township.''

At Hickory

The question of who shall repair the roads taken over by the state highway department kept down the enthusiasm in the good roads movement in Mt. Pleasant township. The road leading from Washington to Hickory was taken over by the state and has been in very bad condition. When volunteers were called for on this highway they were lacking and most of the work on this road in Mt. Pleasant township was done by the college students from W. & J. One squad of students had one lone Mt. Pleasant township citizen with them while another had but three. The superintendents were well pleased with the work of the students and appreciated their efforts where enthusiasm was lacking. On the Westland road, 15 men and one team worked and placed this road in good repair. This highway was also scraped and put in good condition as were many of the other roads of the township previous to today.''

At Scenery Hill

''In the first precinct of West Bethlehem township today 150 men and 15 teams worked on the roads in observance of good roads day. As many men and teams were at work in the second precinct. Two scrapers were used on the roads while other teams were used in hauling stone and filling up bad holes. Several new culverts were made and placed. On the Joseph Wise road, near Dutch Glory, seven new culverts were made and placed.''

At Claysville

''About 50 men, 30 boys, 9 teams, 5 one-horse wagons and one steam roller worked on the streets and alleys of this borough and at quitting time all ugly and mean places as well as tin cans and other rubbish had been entirely removed. Burgess R. R. Holmes declared a holiday and all stores were closed. Forty men, 7 teams and a big steam roller worked on Bell Avenue where four carloads of granulated slag were placed. Ten men worked on Petroleum Avenue and also dragged all alleys. About 30 members of the Boy's Brigade went over the town with five one-horse wagons, gathering and hauling away all rubbish.''

At Lone Pine

'The stretch of highway commonly known as the Lone Pine road, presented a scene of unusual activity. About 35 students comprising the football squad at W. & J. had made some unusually complete preparations for the work. On the Rankin farm, a squad of men had been quarrying and crushing stone for several days, and a huge pile of crushed rock was ready for the volunteers when they arrived this morning. About 50 men in all, with a dozen teams, road scraper and traction engine were in evidence on this road, and the workmen literally 'made the dirt fly'.''

At Houston

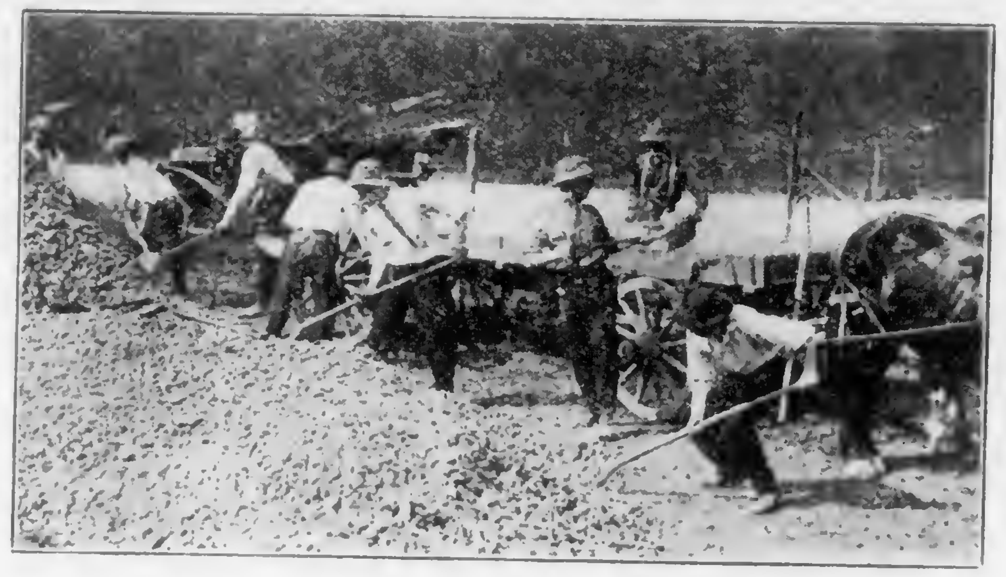
''At Houston the merchants closed their stores and turned out with other citizens and spent the entire day in working the roads.''

At Canonsburg

The work done on the roads in the vicinity of Canonsburg is worth thousands of dollars to the citizens of the community, and cost the taxpayers nothing. Members of the local committee are highly gratified at the success of the county's first Good Roads Day and are anxious to see it repeated at some future time. Already there is talk of effecting a permanent organization whose object shall be to work for better roads and the improvement of highways already constructed.''

At Washington

''In Washington alone fully 1,000 men were identified with the campaign, either by actual work or liberal contributions in one way or another. Automobile transportation for over 500 men was furnished free of charge and on the grounds at 6:30 in the morning. The central committee believed that it was important to the people of the county to have the main highways leading into Washington improved, and accordingly most of their men were placed on such highways, most of which have been taken over by the state and have been allowed to get in very bad condition owing to lack of funds. Certainly, sending men out to all parts of the county within a radius of 15 miles will create the right feeling of fellowship between the townsman and the country man. W. & J. college authorities and students showed themselves abreast of the times by closing college and turning out to a man for work on this day. Many got drags which were built and furnished by the central committee. These were not only worked on the 26th but will be in use thruout the coming year. The Equal Suffrage Association showed their spirit of co-operation by volunteering to furnish lunches for the college students. This offer was accepted and the students were loud in their praises of the lunches furnished.''



W. & J. COLLEGE STUDENTS LOADING CRUSHED STONE. ANOTHER SQUAD QUARRYING AND OPERATING A CRUSHER.

No one can foresee all the results of such a day. The ''Dig In With Us'' call brought out men 80 years of age, glad to give a day's work for the improvement of the general conditions, and one boy four years old worked busily raking stone with his father all day. In brief, it has been stated that this was the greatest general response to any local call that has ever been issued in Washington County. It brought an out-pouring of people from all walks of life, brought them together for a common object; the betterment of the roads in their home community. It served to create enthusiasm for better roads and as a practical demonstration of how much we can do to secure better roads by all pulling together and making our ''kicks'' where the bumps in the road require strenuous action.

Farm Crop Notes

By R. P. KESTER.

Counselor on Soils to the State Department of Agriculture.

Thru this department Mr. Kester will discuss queries from Pennsylvania Farmer readers on soils, field crops and general farm practice. Address all queries to Pennsylvania Farmer, Philadelphia, Pa.

Fads in Farming

Humanity is forever being halved—that is, divided into two parts. I have in mind now one of two divisions. By dividing farmers into ''changers'' and the ''changeless'' we have an unequal division but a very definite one. A great deal is said about the trait of character that is opposed to change and a great part of the cause of the popular topic is charged to the farmers' unwillingness to change the old for the new.

But a conversation with a middle aged man the other day led my mind to the other phase of the question and I have been thinking over ''Fads in Farming'' I have observed. This man came into possession of about $20,000 about the time he was married, fifteen years ago. Today, he is looking for a clerkship or some job for wages. He was a ''faddist'' and was forever changing from one kind of work to another. This man paid $9,000 of his money for a 100-acre farm in a good section. To make the story of fifteen years of fads short, he consecutively tried dairying, hogs, poultry, sheep, fruit growing and trucking. During the last three years he raised general crops, sold everything and has $5,000 left.

While probably this is an extreme case, there are some farmers who are forever changing from one line to another and who do not stay with anyone thing long enough to learn the business. The man who succeeds is the one who can do something well, and the learning takes time. More than that the supply and demand fluctuates, causing periods of high and low prices in every line.

Part of this is due to the natural inclination of some people to change, and part is due to the advice of over enthusiastic speakers and writers. While there are no figures on the subject it is probable that as much money has been lost as has been made on fads. In every prayer should be a petition to be delivered from the faddist, or, as one writer put it, he prayed to be ''delivered from his fool friends.''

There are monumental wrecks in the poultry business, the fruit business, ginseng growing, and the like, to be seen all over the country. When prices are high, men go into pork raising, beef production, potato growing, etc., starting in when prices are high and going out with the first slump, only to try the next fad.

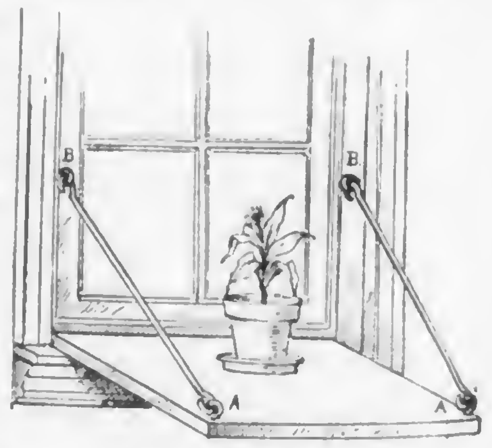
The best advice is, don't. Choose your line, learn it well and stick to it. If you will visit any successful, substantial farmer you will find he has been successful because he stuck to his business, the one he knew, thru thick and thin. Speakers and writers should be careful not to appeal too much to the cupidity of man. The man who is enticed into a line of farming simply for its profits may fail, surely he will if he has not the requisite knowledge. There must be a genuine interest, if not a love, for the business itself. Agriculture is somewhat different in this respect from any other industry. The adaption of crops, the rotation, the building up of a flock or herd all takes time but will bring success to the man who has the knowledge and the continuity of purpose.—R. P. K.

HONEST PACKING

The commission man may be getting nothing more in the way of criticism than is coming to him but while the truth is being told let it all be told. If commission men were saints, they could not return top prices for second class stuff. It does not require an extensive examination of shipments to show that much of it is put up in a careless and unattractive manner, and what is still worse, many times bears evidence of a studied attempt to deceive. Honesty is the best policy, is an old maxim. It is not very good morals but it is a good business motto, and the producer who does not adopt it cannot succeed. No product is so uniform as to be all No. 1, and unless it is graded it will always bring the price of seconds.—R. P. K.

WINDOW SHELF

Here is a good way to make a flower shelf in front of one's windows. Take a piece of board any size desired. Take four staples or screw eyes and fasten two of them in the board at each end as shown at AA. Then put this on your window, and eight inches above this, on both sides of the window, place a staple, or screw eye BB. Then get some wire or chain. Cut it into two pieces so that each piece is one foot long and hook this in the staples. After it has been hooked in, it can be painted any color desired.—Sylvanus Van Aken, Ulster Co., N. Y.



CONVENIENT WINDOW SHELF.

Poultry

A RADICAL TREATMENT FOR GAPES

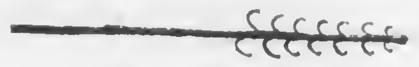
There are a number of so-called remedies for the gapes, but only one of these can I call a ''cure,'' the others being only comparatively efficient. The more efficient remedies involve individual treatment for each bird. When nearly the whole flock has become infected before discovery, as is often the case with farm flocks, these one-bird-at-a-time treatments look to be such a time-consuming task, that the owner usually thinks he cannot afford to adopt them, and casts about for some more ''wholesale'' method. But, in both my experience and my observation of others' use of them, these ''wholesale'' treatments are such uncertain cures, comparatively, that the one-bird-at-a-time treatment is cheapest after all, despite the greater expense in time.

Of all different ''wholesale'' treatment to my knowledge none has been found equally efficient to the well-known one of forcing the affected fowls to breathe dust, thereby inducing such violent coughing, as to throw the gapeworms from the throat. One deficiency of this treatment is that not always does it effect the ejection of all the worms from the throat, and the flock soon becomes infected again. Another objection to it is that in the case of fowls that have been infected for some time before treatment is resorted to, thereby being very run-down and weak, the violent coughing is fatal to a large percentage.

Over a decade ago, in one cold damp spring, ideal for the spread of gapes, nearly my entire flock had become infected before I discovered it, owing to the pressure of catching up weather-delayed field work. When I discovered it I treated them at once by the one-bird-at-a-time method, altho I begrudged the time it took me from field work. Ever since then an occasional gape infection of my own flock, or of several interested neighbors' flocks, has afforded me the opportunity for experimenting. I have been seeking to find something applicable on a larger scale than the single-bird treatment, yet equally effective. So far I have failed in it.

Altho in the single-bird class of treatments there are a dozen of decided effectiveness, all working on the fundamental principle of removing the worm by force, I hit upon a variation of it a few years ago, that so far has a score for effectiveness of 100 percent. I have used it twice in my own flock and on greater or less scale in neighbors' flocks several times. It is this:

An ''instrument'' is made of fishing gut of a large size, such as is used for salmon or lake bass fishing, and at least six inches in length. Soak the gut for 15 minutes in water, when it will be found soft enough for cutting. (It can be cut while dry, but not so perfect an ''instrument'' will result, and the knife soon looses its edge.) Holding the gut in the left hand, take a very sharp knife, (I find a fine-edged surgical one best) and turn back, near one end of the gut 12 to 15 little curls, or forks, being careful not to cut into the gut deeply enough to weaken it. Of course the forks must all point in one direction, and be on the two opposite sides of the gut like this:



GAP WORM EXTRACTOR.

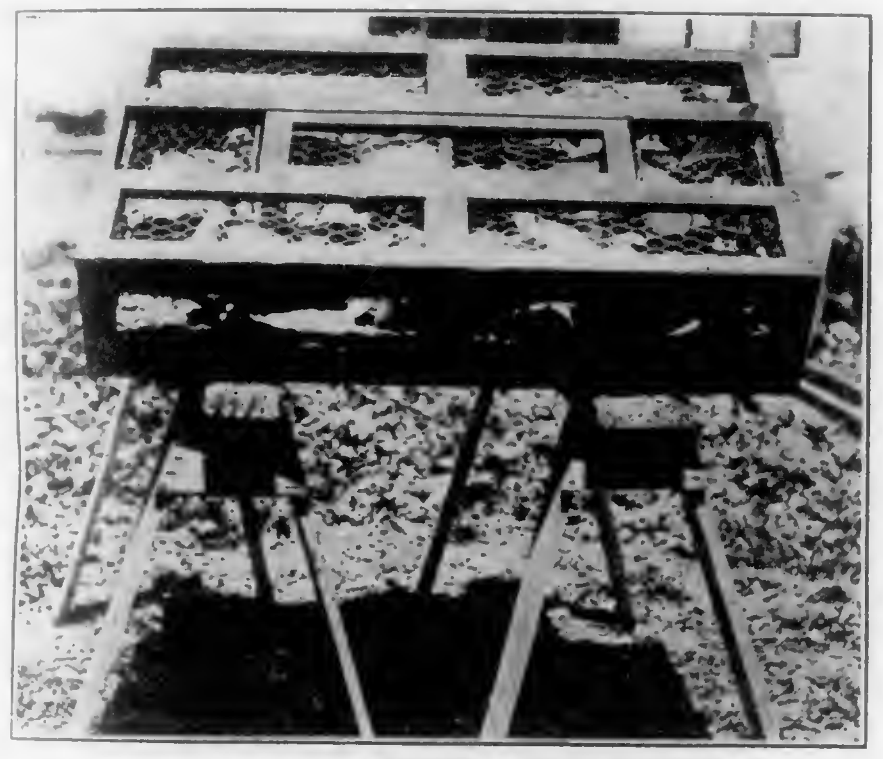
The tip of the gut I make round, or dull, by holding it for a second only, in a candle or match flame. If the forked end is pushed thru any narrow opening or a bit of thin cloth it will be found to pass thru very easily; but when one attempts to draw back every fork catches. To use I proceed thus:

Hold the fowl to be treated lightly against the knees by the head and neck with the left hand, having the back of the fowl's head against the palm of the hand. Hold the bill wide open and the tongue down with the thumb and forefinger of the left hand. (If the bird is quite large it is convenient to have another person hold the bird, instead of knee-gripping it, but an assistant is not really necessary.) In a good light, outdoor sunlight is best, one can look down the fowl's throat and easily see the entrance to the windpipe, which opens and shuts as the patient breathes.

Push the forked end of the gut into this opening from one to four inches, depending somewhat on the age of the bird, of course. Take the free end of the gut between the forefinger and thumb of the right hand and slowly and gently withdraw the gut, at the same time constantly twisting the gut with the finger and thumb so that the forks will come into contact with every part of the windpipe. Two or more red worms about an inch long will usually be found entangled in the forks. If only one worm is caught run a small feather dipped in turpentine down the windpipe, separate the fowl from the rest of the flock and if after a couple of days it still shows gape symptoms, repeat the treatment with the gut. (I have found this second treatment necessary only in a very few cases.)

Usually I have found 2 worms, sometimes 4 or 6 but only occasionally an odd number. In such cases the fowl was given the turpentine-soaked feather swab. The worms generally develop in pairs. They are easily taken off the gut by passing it point foremost clear thru a piece of muslin.

Fishing gut, such as used, can be obtained from any large dealer in fishing tackle. The smaller sizes are too delicate to cut and handle to advantage. With a little practice anyone can make the instrument, being sure the outside ends of the forks are well turned down—each fork forming about two-thirds of a circle. If the forks are left sticking out obliquely they not only are not as effective in entangling the gape-worms, but may injure the windpipe in withdrawing. The forks soon break, or wear out and a new instrument must be made, but the cost of such is inconsiderate. No knife but a very sharp, fine-edged (thin) one will serve to make the instrument properly.—Clark Westford, Schenectady Co., N. Y.



SQUAB RAISING A PROFITABLE SIDE LINE.

A GOOD FARM SIDE LINE

Some farmers think that the regular crops and breeds of stock their fathers raised are all there is to farming. In many instances, the income has been almost doubled by some side line. Some conduct the poultry business as a side line, and a few raise squabs on the side. The experience of I. W. Wood, of California, is worth telling, for he has added $600 to his income each year by raising pigeons.

According to his experience it takes about an hour a day to care for them and they use only about 400 square feet of ground. The pens were inexpensive to build and the feeds are about the same as that for chickens. Every week there are 2 or 3 crates of squabs to sell and they bring a good price. The income is about $2 net per pair per year. He has 300 pair, so the income is $600.

It costs about 10 cents per month to feed each pair, and he raises 7 or 8 pairs of squabs a year. The feeds include kafir corn, egyptian corn, yellow corn, red wheat, hemp seed, screenings, rape, half ground salt, shells, and charcoal.

The squabs are shipped each week and bring an average of about 35 cents each.—J. Y. Beatty, Sonoma Co., Cal.

Light Brahma Year Book.—The 1913 Year Book published by the American Light Brahma Club is a 40-page booklet giving list of members, constitution and by-laws, lists of judges and show notes of interest to Brahma breeders. It also contains a number of valuable articles discussing points of utility of the Brahma breed. This book will be mailed free from the secretary's office to all parties who desire membership in the club. This is a vigorous and progressive club in which all Brahma men should be interested. For full information as to its work address Harvey C. Wood, Assistant Secretary, Bound Brook, N. J.

The big layer is always a big eater, and she pays a good premium on what she eats. The big eater is not always a big layer. Can you tell which of your flock are which?—Kansas Industrialist.

Phases of Management in the Commercial Apple Plantation.

By J. A. RUNK, Huntingdon Co., Pa.

The economical management of a fruit plantation involves a practical working knowledge of much more than simply growing trees. There are problems in starting the plantation which, if worked out satisfactorily, lend much to the later success of the proposition. I refer to such problems as are presented in selecting the site of the orchard, with regard to soil and air drainage, soil composition and organic content, drayage and transportation facilities, and such other fundamentals which should always be carefully considered before the orchard is planted. In these times of enormous interest and resultant large plantings in apple trees, many are ignoring these most important phases which influence the management of the plantation in the future. Frequently I tell the prospective grower that half of the problems in management should be solved before the orchard is planted.

Purchase of Trees

The first subject which I shall take up in detail will be the purchase of trees for the large plantation. Purchase good, strong, well-grown, vigorous, one-year-old trees which are from 3 to 3½ feet in height, either budded or whole-root-grafted. Personally, I prefer good, clean, budded trees, because they have a larger and better developed root system and will therefore withstand the hardships of transplanting better and will push the tree into a more vigorous growth. The whole-root-graft is superior to the piece-root-grafted tree because it has a better root system. Trees, especially one-year-olds, are now mostly graded by height rather than by caliper, because what constitutes a first-class grade caliper in one variety cannot be attained to in another variety; e. g., a one-year Stayman Winesap tree is stocky while Jonathan or York Imperial of the same age is very slender. In height they do not vary so much. In purchasing one-year old trees of best grade one always gets the choice of the nursery, the smaller trees being held over to produce two-year old stock for the retail nursery trade in most instances. The root system of one-year-old trees is not mutilated so much in "cutting loose" with the tree digger which is used in the large commercial nurseries, hence they suffer less shock in transplanting and start into growth very promptly. To my mind however, the most important reason for purchasing one-year-old trees for the commercial plantation is the fact that the owner can head the trees to suit his needs and to satisfy his preference. If he knows the habit of growth of his varieties as he should know them, he can head the tree to suit its growth habit. I am convinced that in order to secure the color and quality of apples which we desire from our eastern plantations, we must grow a more open-headed type of tree.

Later Pruning

Later care and pruning of the trees must be such that a plentiful supply of air and sunlight can reach every branch of the tree. In place of "mowing" off the tops of our trees we must study their habits of growth and thin cut the tops by cutting to side branches and then cutting back as is required to keep the tree within bounds. The production and conservation of fruit spurs is a subject which is terribly neglected. Comparatively few commercial growers seem to realize that apples can be produced only from highly specialized fruit buds which can develop only on the fruit spurs; therefore all pruning must be adapted to the development and protection of these spurs. Very frequently careless or indifferent pickers destroy many fruit spurs which should not be lost. The careful cutting out of canker and rot blights and fire blight when it occurs is a very important phase of orchard management. Good management consists in prolonging the bearing life of the orchard as much as possible and there is nothing which weakens the vitality of the trees and shortens their life more rapidly than the cankers and blight. Careful and consistent spraying is a powerful adjunct to the pruning knife in preventing such ravages in our young orchards.

The Conservation of Moisture

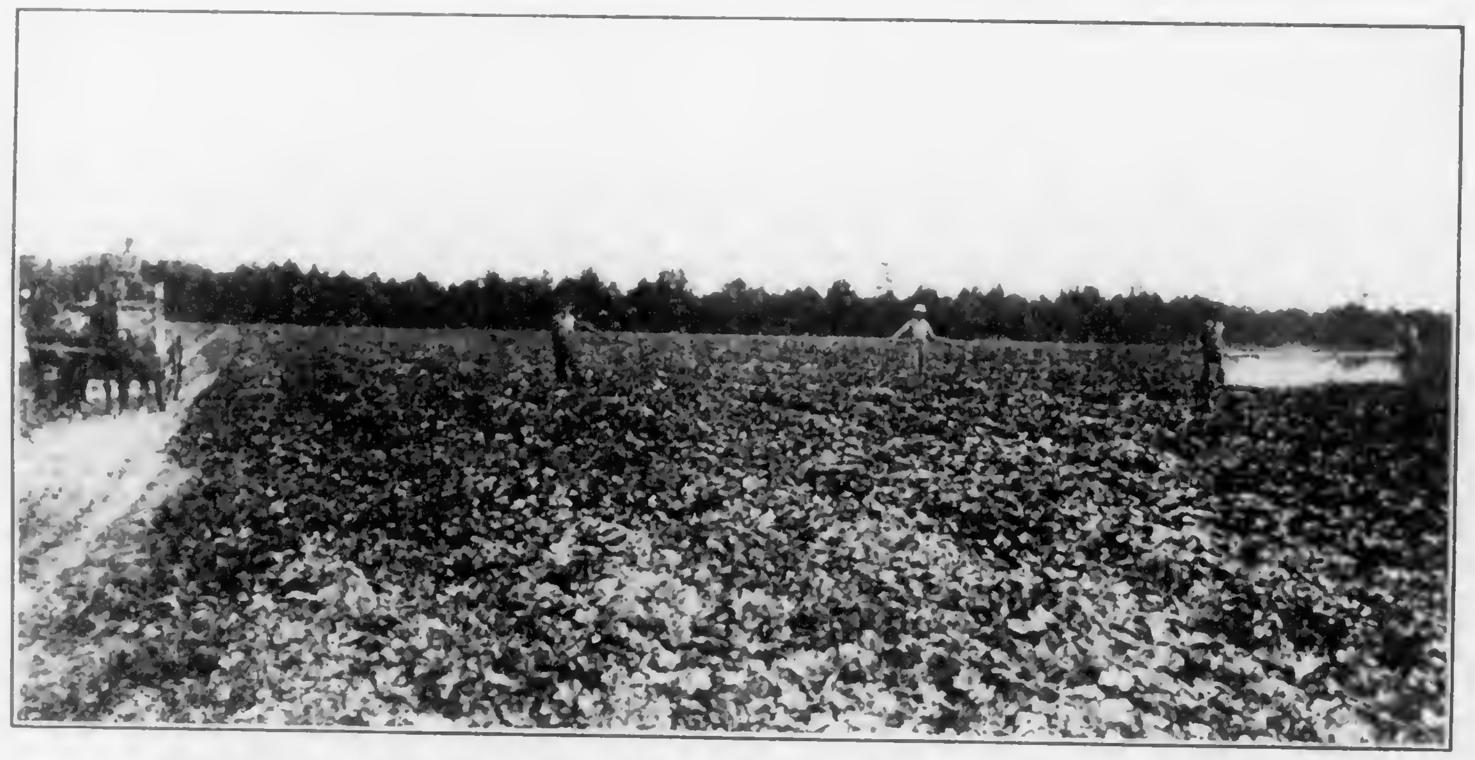
It is my personal observation that the available supply of moisture limits the production of apples in the commercial apple orchard more frequently than any other phase of summer management. It is not my intention to discuss the relative merits of the sod-mulch and clean cultivation methods of managing the bearing orchard but I do note that a good mulch frequently gives a much greater and more regular supply of moisture to the trees while they are maturing crops of fruit than the indifferent cultivation methods which many commercial growers practice. It is mighty important that a good earth mulch of at least 3 inches deep, be maintained in the orchard until the fruit is fully matured if we are to get the greatest returns in bushels of good fruit. I will admit that a cover crop must be grown but I am not ready to admit that the cover crop growth or the lack of cultivation must be permitted to rob the tree roots of a bountiful supply of moisture. Frequently we see bearing orchards lying bare and solid during the months of August, September and October. Under such conditions and with such weather as we frequently incur during those months, the evaporation of moisture may be tremendous. Such loss seriously affects the quantity of fruit which the orchard can produce.

Cultivation, Tools and Methods

It is scarcely the province of this paper to discuss cultivation in all its details. However, there are several important factors which I desire to place before you for careful thought and consideration.

In the first place I want to raise the question as to whether our Pennsylvania fruit growers are using enough up-to-date orchard cultivating machinery. My observation has been that the great majority of our orchard cultivation is being done with only the turning plow and the spike and spring tooth harrow. The general farmer may get along with these few tools, but our most progressive farmers do not attempt to do so, neither should our fruit growers. In the preparation of the orchard for planting, the turning plow has its place, but for the later plowings there are several good makes of light gang plows carrying two or three light steel plows which may be operated by the average two horse or two mule team and with which three to four acres may be turned each day. They have the additional virtue of permitting close plowing to young trees, because of their "extension" construction. Then, too, the ground may be plowed thoroly without leaving the large unworkable finishing furrows between the rows and without ridging the soil so much in the tree rows.

Disc harrows with extension frames should be a part of every orchard's cultivating equipment. These may be had with both single or double gangs of discs. The double-acting tools have a decided advantage for orchard cultivation because they leave the land practically level whereas the single-acting tools leave the land quite irregular. The extension frame permits the driver to keep his team away from the trees far enough to prevent injury while he is cultivating right up to the trunk of the tree. For my own use I find the "cutaway" type of disc very satisfactory for orchard cultivation.



UNIQUE METHOD OF SPRAYING CANTALOUPES USED ON FARM OF REPP BROS., GLOUCESTER CO., N. J.

The Acme harrow equipped with an extension frame has given very good satisfaction in my own orchard. Its cutting blades fine up and pulverize the soil leaving an ideal earth mulch in its wake. It may be equipped with spring teeth, thereby making a very satisfactory extension frame spring-tooth harrow.

No orchard is completely equipped with cultivating tools which does not contain one good orchard cultivator which is light in draft and covers the ground rapidly, forming a good earth mulch. Such a tool conserves both man and horse labor in cultivation work.

What constitutes good cultivation methods in a commercial orchard? The primary object of cultivation in the orchard is the conservation of moisture (see preceding discussion), therefore the plowing or stirring of the soil should take place quite early in the spring and such cultivation should follow with the aid of the tools discussed above, as will maintain an "earth mulch" three or four inches deep thru out the growing season. The character of the soil and the manner of the rainfall will largely determine the number of cultivations which will be necessary each season.

Spraying

We need to do more intelligent spraying in Pennsylvania. We must study to know what we are spraying for and then we will know what spray material to use and when to do the spraying. Whether we have scale insects or not, there should be one dormant spraying made with concentrate lime and sulphur solution, either commercial or home-boiled. This helps to keep the bark of the tree healthy and vigorous. When "Black Leaf 40" or some similar tobacco product which is injurious to aphis, is used with lime and sulphur and the spraying is done in the spring just before the buds begin to open, the winter forms of the aphis may be destroyed and the insects thus largely controlled.

Careful and persistent spraying with arsenate of lead is the only means for controlling the codling moth. In many of our fruit sections there are yet sufficient old and neglected orchards to make the codling moth an ever present enemy. The new angle nozzles, the spray rod and the spray tower are splendid auxiliaries for fighting the codling moth. For the second brood spraying the arsenate of lead should be mixed with summer strength or self-boiled lime and sulphur.

The curculio is doing a great deal of damage in many of our isolated orchards. A second spraying with arsenate of lead should follow the first codling moth spraying by about two weeks so as to keep the small fruits covered with the arsenical spraying to combat the feeding of the curculio.

I have found by personal experience that it is an exceedingly difficult proposition to rid old trees of San Jose scale with lime and sulphur, especially when they are badly infested. In such cases I have resorted to the use of a miscible oil with success. The miscible oil spray spreads over the entire tree when it has been well sprayed. With the lime and sulphur spray, the entire surface area must be covered.

In connection with spraying, I should like to emphasize the fact that bordeaux mixture should be used on all old trees to control the cankers and the bitter rot. I saw a good crop of Grime's Golden apples from eight year old trees go down with bitter rot two years ago. It could have been saved with bordeaux. There are too many old, neglected orchards in most sections of our State for us to abandon the use of copper sprays. Personally I think that at least two sprayings with bordeaux should be given, one in the early spring and one during the late summer season.

Thinning of Apples

There is no question but that the eastern grower should aim to grow a maximum amount of well colored fruit of the first grade. To do this systematic thinning is very necessary. It is true that even picking of the malformed and infected fruit will help greatly but we must practice an actual thinning out of the fruit to secure the results we need. Thinning to eight inches is not too much for the most of our varieties, in fact such thinning usually pays well. If we keep our trees headed low and the tops well opened by pruning, the thinning work may be greatly facilitated. Thinning should be done in our territory in June as far as possible to secure the greatest results.

Storage Problems

In the future, gluts in the apple market are sure to occur. With the present rate of planting it cannot be otherwise. The commercial grower who is to make a success of his work and reap the profits which are due him must be prepared to control a large percentage of his product when such gluts occur. Then too, the commercial grower must be independent of the unscrupulous dealer who tries to force down prices during the fall selling season in order that he may secure great profits.

There are two means of avoiding the above conditions. One is to provide temporary storage for your apples and place them in cold storage as soon as possible; the other is to build storage plants on the fruit plantation and store large quantities of fruit there. Local and home storage plants are working successfully in other sections and they may be worked successfully in Pennsylvania. The Gravity Brine System of storage seems to me to be admirably suited to this class of storage. It is economical to build, also to operate. Suitable cave or cellar storage may be worked out for several thousand bushels of apples on almost every plantation. I know of several such storage cellars which are netting good money for their owners every year because they are enabling them to dispose of practically all of their fruit on their home markets at a good net profit.

SPRAYING CANTALOUPES

A neat and labor saving spraying device is in use on the Repp Fruit Farm in New Jersey. The illustration shows the method of spraying cantaloupes. The spraying machine used employs a compressed air system by which compressed air is passed thru the spraying liquid, agitating it freely and is then separated from the liquid and passed up thru a separate quarter-inch tube of the double hose and thru the extension rod, mixing with and atomizing the liquid as it emerges from the nozzle.

In spraying cantaloupes on the Repp Farm a hose about 45 feet long is used, with a perforated extension rod at the end, sufficient to deliver the spray over ten feet of plants. Men are placed at fifteen foot distances on the hose to keep it from dragging and damaging plants. The spraying machine moves along with the men handling the hose. The saving over the knapsack method is in the larger area sprayed at one time and in the comparatively short time necessary to get over these areas.

"For the land's sake, use Bowker's Fertilizers; they enrich the earth and those who till it."—Adv.

More Wheat Per Acre
We cannot control the price of a bushel of wheat, because too many countries raise wheat. But we can increase the profit from an acre of wheat by reducing the cost of production per bushel. There is not much profit in 13 bushels of wheat per acre, which is the American average. There is good money in yields of 25 to 35 bushels. These can be obtained, if one prepares the land right, uses good seed and **good fertilization.**
POTASH
Good fertilization means enough fertilizer of the right kind. With a good rotation 400 to 600 pounds per acre is enough, provided a reasonably high-grade formula such as 2-8-6 or 0-10-6 is used. Some of the most progressive farmers are using 2-8-10 for wheat followed by clover. The low-grade 1-7-1, 2-8-2 and 0-10-2 formulas are out of date and out of balance, and the plant food in them costs too much per unit. Urge your dealer to carry high-grade formulas or if he is stocked up with low-grade stuff get him to buy some potash salts with which to bring up the *potash content* to a *high grade.* One bag of muriate of potash added to a ton of fertilizer will do it.
If you prefer real bone or basic slag in place of acid phosphate try 300 to 400 pounds per acre of a mixture of 1600 pounds of either with 400 pounds of muriate of potash. You will find that **Potash Pays.**
These high-potash mixtures produce better wheat, clover, heavy grain and stiff straw
We sell Potash salts in any quantity from 200 pounds up. If your dealer will not get potash for you, write us for prices and for our FREE booklet on Fall fertilizers.

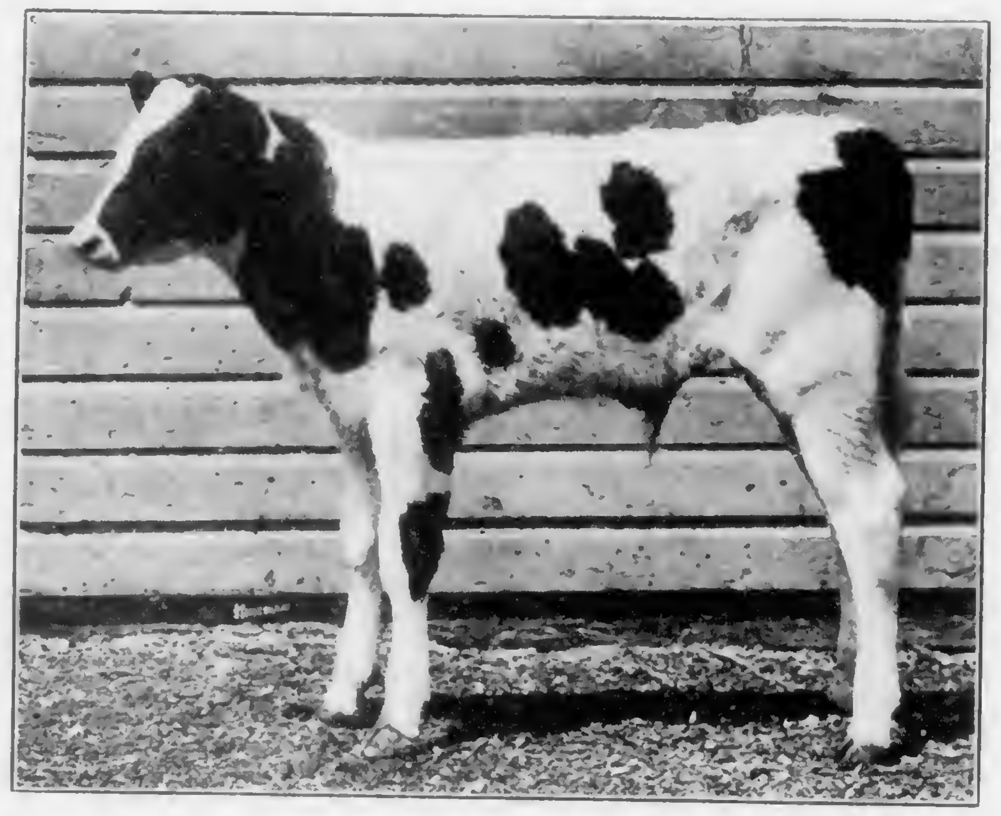
The Dairy

EFFECT OF RATIONS ON COST AND QUALITY OF MILK

The United States Department of Agriculture has recently concluded a series of interesting experiments to determine the effect on the flavor of milk of feeding different kinds of rations to cows. The experiments were conducted to ascertain the correctness of the theory of some dairymen that the feeding of crushed oats to cows would improve the flavor of milk. Six cows were used in the experiment and the various kinds of rations were fed to them. In all, fifty opinions were passed on the various samples of milk from these cows. Of these, sixteen showed a preference for the milk from cows fed on crushed oats, twenty-five preferred that from the bran and corn ration, while nine expressed no choice. The government experts express the opinion that in these rations, not only were there no marked differences in favor of the crushed oats as a fed to improve flavor, but if anything, the ration containing bran and corn was more successful in producing a fine flavored milk.



KING SEGIS PONTIAC CHICAGO, HOLSTEIN BULL CALF, SOLD JUNE 5, 1914 FOR $20,000.

At the New Jersey experimental farm, some very practical experiments with the dairy herd have been conducted for several years, in order to throw some light on this question of feeding. These cows are managed as a commercial herd rather than as an experimental one, and are used to produce milk for a milk route. In connection with these experiments the effect of so called "good" and "poor" rations have been tried. The good ration consisted of 4 pounds of wheat bran, 4 pounds of dried brewers' grains, and 2 pounds of linseed meal, together with 5 pounds of timothy hay and 30 pounds of silage, and had a nutritive ratio of about 1 to 5.3. The poor ration consisted of 4 pounds of corn meal with 8 pounds of timothy hay and 12 pounds of corn stalks, and had a nutritive ratio of about 1 to 13.5. The latter ration, I have found is quite common in many districts. In a period of 30 days 4 cows produced on the good ration 2,701 pounds of milk and 131.04 pounds of butter; and in a similar period on the poor ration, 2,014.2 pounds of milk and 94.32 pounds of butter. The good ration therefore gave 687.5 pounds more milk and 36.7 pounds more butter, equivalent to 34 percent more milk and 39 percent more butter on the ration containing the larger amount of grain. At local prices for feeding stuffs the cost of producing 100 pounds of milk and 1 pound of butter was practically the same for the two rations, but it is pointed out that 20 cows fed the good ration would produce as much milk and butter as 30 cows fed the poorer ration. To quote the report: "It has been claimed that, other things being equal, a small herd well fed will prove more profitable than a large herd poorly fed, and the facts brought out by this study seem to emphasize the correctness of this claim and point to the importance of good feeding in the economical production of butter."

Experiments were also made in feeding different amounts of the grain making up the good ration. Rations of 10, 15 and 20 pounds per head were fed to the cows in full flow of milk. The indications were that while a healthy animal may consume large quantities or grain, the rate of increased yield is not in proportion to the increased amount of grain used after a certain point is passed. Rations containing more than 10 pounds of grain a day while profitable were less so than those containing this amount.

Cost of Producing Milk.—Another interesting matter which has been solved quite satisfactorily by our New Jersey Station, is the cost of market milk. The results of such experiments show that the average cost of feed per quart of milk was 3.04 cents, and the total cost of milk, including labor, was 4.16 cents per quart, when the figures were based on the cost of growing the feed consumed. When the cost per quart was based on the market price of feed, the total cost was 4.8 cents per quart. By comparing these figures with those of the New York, Massachusetts and Canadian stations, I am convinced that it costs a trifle more to produce good milk in New Jersey than elsewhere. I ascribe this fact to slightly higher price of hay and mill feeds, as well as the greater wages paid to farm hands. It is an interesting field for study, this determining the cost of producing milk, and one to which every producer should give greater attention.—D. T. Hendrickson, Monmouth County, N. J.

DAIRY RATION

"I have been feeding a bran mixture to my dairy herd during the winter season. I want to drop the bran out during the summer because of the high price. I am feeding 25 pounds ensilage a day and some corn fodder, along with meadow hay. I will have clover hay later in the season. Will you kindly give me a balanced ration of good yellow dent and cob meal, linseed meal, cottonseed meal and a good stock food if you advise the latter." H. R. D., Bechtelsville, Pa.

Twenty-five pounds of silage is a very satisfactory amount to feed. I would not feed over four pounds of the corn fodder and as much of the meadow hay or of the clover hay as the cows will eat up clean. Feed one pound of the following grain mixture for each three pounds of milk which the cow gives: 150 pounds corn and cob meal, 25 pounds linseed meal, 75 pounds cottonseed meal.

As a rule I would not practise the feeding of dairy mixed grains because in general you can buy the well-known grain and compound a ration of your own at less cost. There are cases when a man does not care to take the time to mix feeds. Then commercial feeds undoubtedly have a place. Of course the price of grains determines what you feed largely and if you are offered the stock feed at a low enough figure and if the analysis shows that you are getting the ingredients cheaper than you are in the grains, it is all right to buy them.—F. S. Putney, Ass't Professor of Dairy Husbandry, Pennsylvania State College.

NOTABLE HOLSTEIN PURCHASE

The illustration on this page shows King Segis Pontiac Chicago, a Holstein bull calf sold recently at Chicago for $20,000. The purchasers were Spencer Otis, H. Stillson Hart, George E. Van Hoegen and Spencer Otis, Jr., all of Barrington, Ill. This calf carries the combined blood of some of the most noted Holstein families, and the purchase price indicates the faith which his new owners have in his ability to transmit the valuable characteristics to his offspring. Is the purchase of so young an animal at such a price a gamble? Most of us would consider it so, but if the animal shows a happy combination of the dairy characteristics of his ancestors he will be worth many times the price paid.

ALFALFA AS A SOILING CROP

How to Cure and Handle It

In all sections of the country farmers have been experimenting with alfalfa, and in nearly every township a few have studied the plant and by conforming with its requirements have successfully grown an acre or two. Having this crop, which is almost as valuable when rightly cured as an equal weight of grain, or as a bank account, for it saves drawing from it to buy grain for live stock, one may not realize its full value unless he knows how to handle it rightly.

First, when deciding to cut the alfalfa, pay little attention to the blossoms, altho they are usually partly out when it is ready to cut. Look rather at the roots of the plants. When the next crop is sprouting from the roots, the present one is at its best and cannot be left longer without injury to the one that has begun to grow. It is the nature of the plant to start four crops a year from the roots, and we aid it in making a maximum amount of forage during the summer by getting each crop out of the way as soon as it has made its growth. We also increase the vitality of the stand of plants and the length of time they can be profitably maintained.

I will assume that the small acreage is on the dairy farm, and will be used to supplant failing pastures or balance ensilage in the summer silo. As far as it can be used, alfalfa is the best soiling crop on earth for the dairy cow, yet there are some reasons why, as it will be generally handled for this purpose, dairymen will not get the most out of it. Some may try to mow and feed the green alfalfa every day, and the unwilted alfalfa may cause bloat in animals. Again, during rainy weather it is very disagreeable to cut and feed the the green alfalfa and the danger of bloat is still greater.

Another reason why feeding fresh-cut alfalfa will not be satisfactory is that it cannot be well cut continuously. Altho there is a crop growing all summer and the first crop can be cut early in June and the fourth the last of October, there are two or three weeks between each harvest when the alfalfa should not be cut as the crop is only partly grown and of course all the alfalfa matures for cutting at the same time.

In the following way we avoid the difficulties and get all its feeding value: When we have decided the alfalfa is ready for cutting we wait for a time when we can expect two or three days sunshine. If it is to be used for soiling cattle at the time, we mow what is needed for perhaps a week and let it wilt considerably in the swath. It may need some tedding if there is a large growth. Then we put up rather high, narrow heaps and cover with hay caps and let it remain until fed. If the alfalfa is to be made into hay to be stored in the barn, it should be wilted more before heaping, and then left in the heaps until it is so thoroly cured that there is no danger of excess heating in the mow.

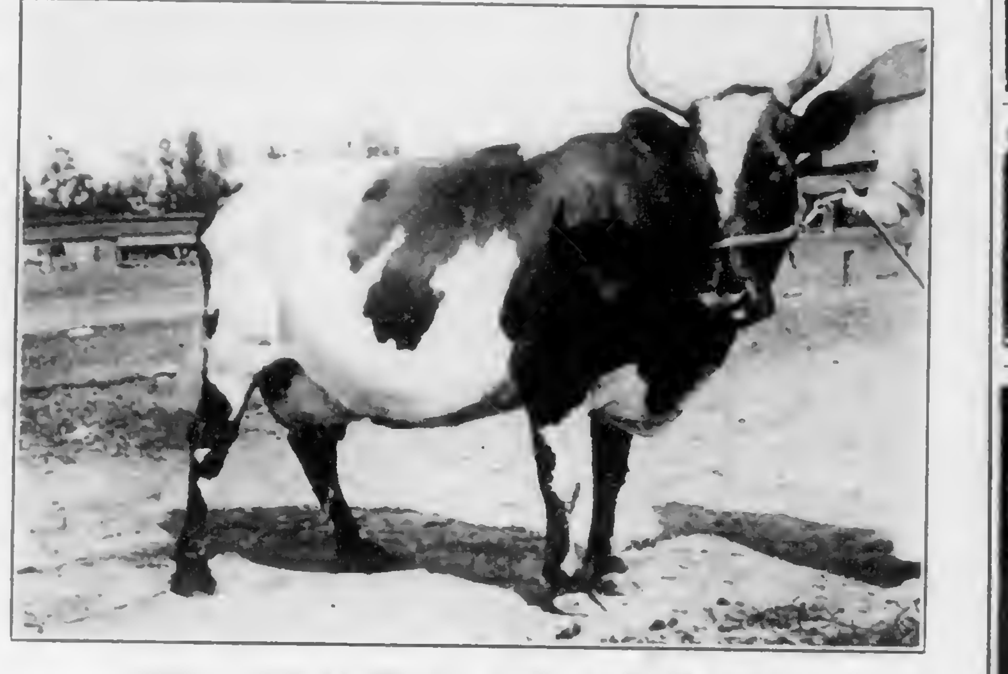
Forage next best to wilted alfalfa is new alfalfa hay cured just enough so it will keep over two weeks or more. This may be stored in the barn and fed in the manger, which probably is the best way. If one wishes to save labor a considerable quantity can be put in large covered, slatted racks in a yard where cattle can be allowed to go at will. Cattle on pasture will always eat more or less of this alfalfa placed in racks if allowed to go to them any time. When the pasture is abundant and is too succulent, or when it is drying up and perhaps corn silage is fed, the new alfalfa is almost equally valuable.

As farmers learn better how to grow good crops of alfalfa more will be put in the barn for winter to balance the corn silage. Mastering the difficulties in the way of growing it will solve the farmers' problems of economical feeding of animals and restoring soil fertility.—J.

A GOOD HERD IN COMFORTABLE QUARTERS

Many farmers are confronted with the problem of remodeling old-style buildings to make them comfortable for the dairy herd. Mr. J. Henry Stewart, Steuben Co., has such a remodeled stable which is giving excellent satisfaction. Three things about this stable impressed me. There was good light, good ventilation and warmth. Entering on a cold day last winter the good temperature, devoid of stuffiness, was very manifest. The building, in the basement of which the cows are housed, is an old barn, about 25 by 35 feet in size, which has been newly walled and lighted, the cows occupying the whole basement. They stand in two rows facing, with a feed alley between. The mangers are perhaps six inches deep and about 18 inches in width. The stanchions swing, as well as have a small movement ahead as the cows rise and lie down. A gutter behind the cows receives the excretions, which are not allowed to remain longer than the first chance to remove them to a wagon standing outside. Manure is never allowed to accumulate inside or outside the stable. The cows do not bear the usual stable marks but show good care.

This dairy consists of sixteen cows now giving milk. There are also ten young heifers coming on—a beautiful herd. The bull shows fine dairy points. The entire herd is in fine condition, and ten giving milk at the time of my visit were producing 100 quarts daily, which went to the Rochester market at 4½ cents a quart. The monthly milk checks have ranged from $128 to $152 since April 1, 1913, when he began selling milk in this way.



AYRSHIRE COW, BONNIE REG. GIVING 64 LBS. MILK DAILY.
Owned by J. Henry Stewart, Stueben Co., N. Y.

All forage for the herd is supposed to be produced on the 100-acre farm, but most of the grain feed is purchased. During the winter the cows received shocked corn fodder and mixed hay alternately, and a grain ration of bran gluten and hominy meal, equal parts by weight. Of this the cows received one pound to each three pounds of milk. Later in the season he fed buckwheat middlings and corn meal, equal parts, with no noticeable falling off in production. The cost of the grain feed was about $1.35 per day for the entire dairy herd, while the income ranged around $4.50 daily. The net income would not be far from $3.00 daily after deducting cost of feed, freight, etc. The fertility added yearly to the farm, is no inconsiderable item, which comes from adding a load of manure daily during much of the year. The manure is enriched by tons of purchased feeds. The farm which was formerly given to potato growing is showing great improvement.—Clarke M. Drake, Steuben Co., N. Y.

Some Faults In Formaldehyde Disinfection Of Potatoes.—Popular edition of bulletins 369 and 370 of the New York Experiment Station at Geneva, N. Y., is a discussion of the above topic, which may prove of interest as a comparison with discussions which advocate the formaldehyde treatment unreservedly.

FINISHING OFF ON SOY BEANS

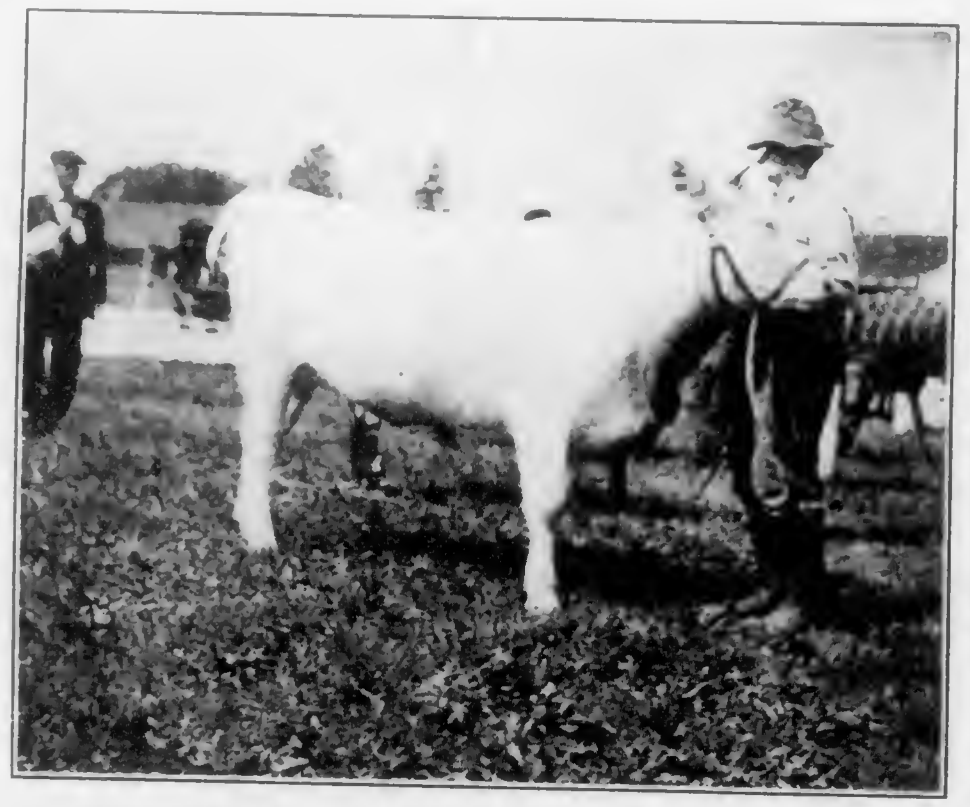
Several years ago the Tennessee Experiment Station carried on a comparative test in finishing steers, using corn silage as the roughage with each lot, but finishing off separate lots on soy beans, on cowpeas and on corn. The experiment was continued for two years, and with two lots of steers. Aside from the fact that the steers fed on soy beans made nearly three times as much flesh on the product of an acre as did those finished on corn, there was the question of quality of the meat. All the steers were butchered by one of the large packing houses, and the meat passed on by an expert. In every instance the soy bean-fed steers produced meat of higher quality than those finished off on corn; meat that brought a higher price in the market.

We are hearing a good deal about hogs finished off on peanuts. There is no question of the quality of the meat, nor that it is really bringing fancy prices in the market in competition with corn-fed pork. Talk to a Canadian farmer and he will tell you that hogs fed on field peas make a much better quality of pork than the corn-fed product. He will admit that the pork is not as firm, but says it has a finer flavor.

By a succession of plantings it is possible to keep hogs on soy beans until very late in the fall. Certain varieties hold their seed splendidly after ripening, notably the Wilson, Haberlandt and Swan; and the Hollybrook is late in maturing and holds its seed quite well enough for the purpose in view. The gains in weight on such feeding are heavy, and the pork is of a very desirable type, rather lean, as the soy beans go to make flesh rather than fat.

This type of hog feeding is desirable because the hogs do the harvesting, and because they undoubtedly make greater gains from a given area of soy beans than they would from the same area of corn. But I can not get away from the fact that, in addition to the larger gains and greater income per acre, there should be the same distinctive quality of meat in soy bean-fed hogs as has been found in the case of the steer, and that a market could be built up for the product at better than common prices.

Of course, under such conditions, the ground could not be used for wheat in most districts of the north; but it could be used for rye and the nitrogen and humus from the soy beans will make a bumper crop of rye. For such work the soy beans should be drilled in thru every feed using the oats and barley feed, or broadcast. If planted in this way the root system will keep the ground in shape so as to make the late fall plowing more certain as well as easier.—Abram Bunn, Bedford Co., Pa.



THE TYPE OF SHORTHORN FROM WHICH BABY BEEF IS PROFITABLY PRODUCED.

ECONOMICAL GAIN MADE ON BABY BEEVES

The farmer who is feeding calves will be gratified to learn the results of a recent experiment carried at the Iowa Experiment Station. It was demonstrated that gains could be made on "baby beeves" with about 50 percent corn and cob meal, cost of which would not exceed in any case, over $6.50 per hundred pounds. This cost of gain compared with cost of gain of 2 year-old feeders, shows why young calves are so popular for feeding. It costs from $9 to $11 or $12 per hundred to put weight on the 2 year-olds.

Three groups of calves were used. They weighed 385 lbs at the start and were fed for 203 days at which time they weighed somewhere around 903 pounds. Those fed on a ration of corn and cob meal, cottonseed meal, clover hay and corn silage, made an average daily gain of 2.26 pounds and weighed at the end of the experiment 843 pounds, having made the gain at a cost of $6.04 per 100 pounds. The daily rations fed were: Corn and cob meal, 11.66 pounds; cottonseed meal, 0.84 pounds; clover hay, 203 pounds; corn silage, 5.16 pounds.

The group fed daily on 13.40 pounds corn and cob meal, 1.84 pounds cottonseed meal and 2.06 pounds clover hay, silage omitted, made an average daily gain of 2.18 pounds and weighed 829 pounds at the end of the experiment; having made their gains at a cost of $6.46 per hundred pounds.

The group fed corn and cob meal, 13.70 pounds daily; oil meal, 1.84 pounds daily, and clover hay 2.04 pounds daily, no silage, made a daily gain of 2.31 pounds, weighing 854 pounds at the end of the experiment and made gains at a cost of $6.23 per hundred pounds.

Corn and cob meal sold for 53 cents per hundred pounds when the experiment was conducted, oil meal at $30, clover hay at $12 per ton and silage at $3.25. This did not take in the profit on the hogs which ran with the steers. The baby beeves made a net finishing profit of $20.13 per head, as against a profit of $14.01 per head on yearlings and 2 year-olds. It is quite interesting to note that the bunch fed on silage made the most economical gains.—S.

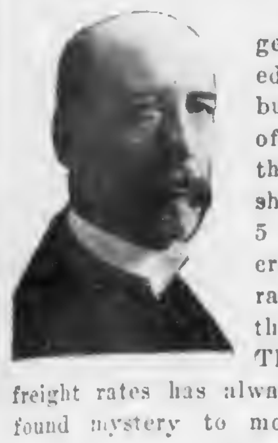
Looking Over The Fence.

By THE COUNTRY PARSON.

Waste in Railroad Transportation



It seems to be generally conceded by the larger business interests of the country that the railroads should have the 5 percent increase in freight rates for which they are pleading. This question of freight rates has always been a profound mystery to most laymen. I am inclined to think that the rate makers themselves do not understand it. I fear that the rate situation, like some of their terminal freight yards, is the result of a haphazard growth. As their needs expanded, they added spur track and switch to spur track and switch until they got things in such labyrinthine shape that they often lose their own cars. The only thing to do is to replan and rebuild the entire yard—an annoying and expensive, but nevertheless a most necessary undertaking.

In a like manner, as their business grew they seem to have added classifications to preferentials and preferentials to classifications, without definite plan or regard for sound economic principles, until this whole rate-making business is in a frightful tangle. I do not know that we can blame them particularly for this is the general tendency of all human affairs, which every now and then need more or less radical readjustment. While it may not always be possible for an outsider to say how, it is seldom difficult to say when such readjustment should be made.

Feeling that their first duty was to their stockholders, the early rate makers unhesitatingly put on all the "traffic would bear." While the outcome showed this to have been a shortsighted policy on their part, it was nevertheless an entirely human and excusable one. In their place, we would have undoubtedly done the same thing. Nor is it clear to me that the watering of their stocks is alone responsible for their present troubles. They did other things, as shortsighted and reprehensible as stockwatering.

For one thing, they largely succeeded in destroying the first efforts of this country toward the development of a system of inland waterways. In some instances they actually laid their tracks in the beds of canals constructed by the toil of former generations. While pleading for the maintenance of the competitive system, their efforts to check competition destroyed a means of communication, which, had it been used for heavy freight, would have permitted the use of the railroads for passenger and fast freight service, thus preventing the periodical recurrence of freight congestions whenever they are called upon to move a crop. They failed to forsee the demands which the business development of this country would make upon them. Had it not been for the saving sense of the people of the State of New York, they would have destroyed even the Erie Canal. We are as much to blame as the railroads, for we not only permitted, but encouraged them to do these things.

By giving them outright immense tracts of the richest agricultural lands of this country, we made it to their interest to encourage the depletion of these soils. The railroads had a threefold interest in moving the immigrant as far west as possible. They sold him his tickets; they sold him his lands and they moved his crops. That they were separating producer and consumer and that the disadvantage of distance must be met by rate adjustments which enable a Texas farmer to ship turkeys to New York in competition with the man who can haul them to the city market is apparent. The decline of agriculture in the East and the exploitation of the West was an inevitable consequence. Like the people who denuded the watersheds of the Allegheny and Monongahela of their forests for mine timber and called it development, these rate makers boast of having developed the West. Now they are calling upon the government which means the people of the United States, to save them from the fatal consequences of their own shortsightedness.

This plan of rate making has tended to build up a few great cities and industrial centers at the expense of the country at large with this result: While the farmers find it impossible to get labor, 65 percent of our present immigration goes to Pennsylvania, New York, New Jersey, Connecticut and Massachusetts. The one state in the Middle West receiving any considerable immigration is Illinois, which gets about half as much as Pennsylvania. The centralization of our immigrant population in a few sections of our country is one of the gravest problems of our national life—a problem for which the railroads are largely responsible.

A long haul may be temporarily profitable to them but its economic wastefulness and social harmfulness are immediately apparent to any person who will stop to give the matter a moment's thought. I can understand why citrus fruits should be cheaply transported from Florida or California to sections of the country which cannot grow them. I cannot understand why Boston should get its milk from Canada or why Texas should ship turkeys to New York.

The railroads may need this 5 percent increase. At most, it will be a mere temporary expedient, like adding a switch and a spur track to an overloaded freightyard. What we need is a national rate policy for our whole system of transportation, including railroads, canals, trolley lines and coastwise steamers, shaped not merely by a regard for the rights of the stockholders, but by a statesmanship sufficiently broad to take into consideration the general welfare of the entire nation. Perhaps, the proposed physical valuation of railroad properties will lead to the adoption of such a policy. Perhaps the railroads may be sufficiently broad minded to co-operate with the government in formulating such a policy? If they are wise, they will do so. If not, they will have only themselves to blame, when the government some day takes hold of their business with the same gentle firmness now being so painfully felt by the express companies.

THE PROPER FARM BANK

Building Association Plan

Financiers have been coming to understand of late that one handicap that the farmers of the nation labor under is difficulty of getting cash funds at reasonable rates at the needful times to handle their business affairs promptly and economically. They state that the farmers are compelled in some regions to pay as high as 18 percent for working funds. A foundry company can start business, for instance, on a paid-up capital sufficient to erect its plant and turn out some product. It can then go to bank and borrow enough money to keep busy with during the producing season, and when its selling season comes around it cashes up and pays off its note at the bank. The life of these notes is perhaps four months, and the banks are glad to get them. In different lines of manufacturing the working and the selling seasons range thru the entire year, so that as fast as one concern pays off its notes another is ready to take up that money on its own notes. No going enterprise under close competition can afford to do business entirely on its own capital, turning it into product during part of the year and having it lie idle the rest. By the aid of banks several concerns can keep busy the year round on the same identical money.

With the farmer the case is different. For one thing, he turns his working capital over only once a year. Then, his product is more or less perishable unless properly watched over and cared for. He needs capital in the spring to put in his crops, and in the summer and fall to get them harvested and housed. But altho he may have many thousands of perfectly safe dollars invested in his plant—that is, his farm—he can not get a dollar credit on that plant at a national bank. He must get his working capital where he can then, outside regular business channels, or get along without. When he has grain or stock to market he can not borrow money to hold them for a proper price; and yet the buyer can command unlimited cash to take them in. So the farmer is in a sense forced to sell at once, and every fall the banks are called on for a heavy total of ready cash "to move the crops."

Now a legitimate part of the price of farm products to the consumer is the expense of taking care of them until he is ready to use them. The farmer should have the equal opportunity to earn that money if he cares to. Yet unless he has accumulated money enough to hold it on his own funds he is forced to sell just when every other farmer is selling; and the peculiarity of the case is that the very product that was worthless in the farmer's hands as security for borrowed money becomes first-class security in the buyer's hands. Therefore it is the buyer who bides his time for a rise.

For the most part, in Pennsylvania, conditions are not oppressive; but the evil exists, and in the solid grain-growing regions further west the strain is often acute. In looking about for a remedy the financiers have been taking notice of two German methods of co-operative money lending; the Landschaft and the Raffheisen system. Expensive commissions have been sent to Germany to study each of these in detail. The general conclusion seems to be that neither of them is exactly fitted for adoption as such in the United States, partly from their nature, partly because they are not in accord with the American temperament.

But we have an institution in this country that has been working smoothly and successfully for many years that with a little modification to meet the special conditions would solve the whole difficulty. I refer to the Building Association. Nowhere—not even in Massachusetts, its native home—has it done more efficient work than here in Pennsylvania; and thousands of wage workers own their homes in the towns and cities who could never have done so except for its aid.

The principles are simple. A hundred men form an association and subscribe for one share each. Once a month they meet for an hour or more, and each pays in one dollar toward his share. Other corporations begin with paid-up stock in order to do business. This one has for its whole purpose the paying up of the stock. When there is $200 in cash on hand for each share of stock it winds up and divides.

The first night they meet they have a hundred dollars on hand. This might be laid away awaiting more; but the practice is to turn it over to one of the members on satisfactory security, the member agreeing to pay interest on the part of his share that is so paid off until the others get their money also. The security is in fact not for the return of the $100 later, but for the continued and regular payment of the monthly dues and interest. If that payment is kept up there comes a day when the others have received theirs also, and the security is cancelled without any further payment of any kind, and returned to the giver.

If there were no interest, and maturity depended wholly on the dollar a month paid in by each, obviously it would take sixteen and one-third years to pay up all the shares. But interest is paid in monthly on all that has been collected and paid out; and so virtually is compounded twelve times a year. When working rightly the treasury should be emptied by the close of each meeting, the interest being loaned out along with the payments. This interest accumulation shortens the time to maturity, and lessens the number of payments; so that the association winds up usually in 8 to 12 years, the "borrower" having paid about $200 and the non-borrower getting his $200 by the payment of some $60 or $70 less.

Now one peculiarity of the case is that whereas this association may be made up of members no one of whom could go to a National bank and borrow a dollar on his farm, the association itself could get funds there at need. Again, there are many people with regular incomes who very much like this form of investment but who have no intention of borrowing. They put their money in for others to use, and are satisfied with the savings fund feature and the percent of interest. A building association then, in addition to its own funds could command other money at a pinch, and help needy members over their tight places.

As stated above, some modifications of the laws would be necessary in order to adapt the system to farm requirements. To be practicable for poorer men the payment of dues and interest monthly might have to be changed. Monthly payments might be no hardship to the milk shipper, and an unsuperable obstacle to the grain grower. It might be needful for the association to establish a warehouse or elevator for the proper care of produce under its own eye before even temporary loans could be made on that class of products. Other things will occur to the thoughtful. But the essence of the system is just what the farmer needs, and it should be worked out into practical shape.

The safety of its investments depends, and the laws of this state require, that such an association be a purely local affair. The members should have every opportunity to know each other and each other's circumstances; and the investments are intended to be practically under the eye and judgment of all the members all the time. By pooling their little contributions they help each other, and the association as a whole can command bank loans on which it will make no profit but which may save the farm life of some members; and each member is the final judge of the sufficiency of the security pledged to the association.—C. H. Darlington, Chester Co., Pa.

Good Roads Day The story of the inauguration and results of the Washington County Good Roads Day, told on the first page of this issue, should be used as the basis of a similar movement in every county of the state. There is no single feature of county or community development of more general interest and value than the public roads. There is no one asset of a community on which all citizens are more mutually dependent than the roads. Any effort at their improvement is working for the common good. It may be urged that a spasmodic effort, lasting but a single day in the year, is a waste of time and energy. But a county that is thoroly aroused by a one-day campaign is not going to be indifferent to the condition of its roads during the rest of the year. There is an influence in such campaigns that is bound to make itself felt not only on the roads but on the public officials who have the roads in charge thruout the entire year. Best of all, such road days enable the farmers to press the importance of improvement of all the roads, the earth roads in which they are vitally interested as well as the main-line roads which receive greatest attention from the town and city travelers. The big road problem in this state, so far as farmers are concerned, is in the earth roads, and every movement looking to the improvement of these roads is worth while. Let there be more Road Days.

Automobile License Fund The Dauphin County Court on June 8 handed down a decision releasing to the state highway department the automobile license fund now amounting to approximately one million dollars. This should end the controversy long existing between the state auditor and state treasurer on the one side and the "administration" on the other as to the disposal of this fund. The entire controversy has been a case of playing politics, made possible by the carelessness of the last session of legislature in so wording the appropriation clause as to leave question of conflict with the specific appropriation act of 1909. There was never a doubt of the intent of the legislature to appropriate the license fund to the use of the state highway department. The hitch came on a technical point involving the legal right of the auditor and treasurer to honor and cash the requisitions drawn by the highway department under the loose wording of the appropriation law of 1913. This legal point should be satisfactorily removed by the late court decision. There is talk of an appeal from the decision by the auditor. There can be little excuse for such action at this time. It is only fair to state that because of general dissatisfaction with the administration of the highway department, public opinion in the state has tended to support the claim of the auditor and treasurer in withholding these funds. At least there has been little general criticism of a parley, admitted to be for political effect, which interfered with placing additional money in the hands of a department which has shown little ability in making good use of its appropriations. But there is a limit to public patience which is as apt to be felt by the warring officials as by the road department. An appeal of the case will be carrying politics a step too far. The highway department has been urging the retention of this fund as an excuse for its inefficiency for months. It has served well as an excuse, but the condition of the state roads demands immediate attention, and responsibility for further delay will be placed where it belongs.

High Priced Breeding Stock The sale of a Holstein bull calf for $20,000, as noted on page 7 of this issue, probably establishes a record in price for a young breeding animal in this country. Records of production and records of prices in dairy cattle are following each other so rapidly in recent years that nothing surprises. The payment of $20,000 for an immature and untried sire is an indication of the value which progressive breeders place upon a sire of promise. It also indicates the chances which breeders with money are willing to take in the hope of securing an animal of especial merit. In the sense of buying actual, demonstrated value, this recent purchase is a gamble. The purchasers are risking their money on the chance that a law of breeding will hold true in the case of the animal purchased—that like will produce like, and that the youngster combining the richest blood in the Holstein breed will be able to transmit the valuable characteristics of his ancestors to his offspring. It is such a chance as men of means are taking every day in other lines of business, and if King Segis Pontiac Chicago carries the qualities of the illustrious families represented in his breeding to his offspring, he will be well worth the money and the risk. But the purchase is nevertheless a gamble, a chance, and the practical dairymen and breeders of modest means can not afford to take chances. The time of purchasing herd sires on breeding alone is largely past for the practical dairyman. The combination of rich producing blood in an animal is a promise but by no means a quarantee of value in the individual, and the breeder or producer who wants to buy on safe ground will purchase the sire of mature years and proven worth. The promise of ancestry is sufficient for the big breeder, but the proof of offspring is much safer for the man who must get full value from every dollar invested.

DEDICATION OF HORTICULTURAL BUILDING AT STATE COLLEGE

Fifty-fourth Commencement

The new $120,000 Horticultural building was dedicated at State College, Pa., June 10th, with appropriate ceremonies. In a brief sketch, Dean R. L. Watts called attention to the importance of the various horticultural products of the state as reported in the 1910 census. It was a matter of surprise to many of the audience to learn that the vegetable interests represent a value of approximately the same as all the fruit crops put together. The figures show that vegetables that year had a total of $10,013,920 and the fruit $10,691,679. Flowers, plants, nursery products had a total of $4,344,450. The total value of horticultural products of the State, therefore, is $25,050,049 as reported by the census. On the basis of the value of the horticultural industries of the State, the investment in the horticultural building at the College is thus seen to be less than one two-hundredth.

PROF. M. G. KAINS ADDRESSING GATHERING AT DEDICATION OF NEW HORTICULTURAL BUILDING, PENN. STATE COLLEGE.

Mr. C. J. Tyson, President of the Horticultural Society of Pennsylvania, discussed the development of horticulture at the College and pointed more particularly to the wonderful growth made in accession of students. The total enrollment of students in the School of Agriculture during the past decade has increased fifteen times and that of students enrolled in the various courses of horticulture more than twenty times.

A beautiful pastel portrait of Gabriel Heister, a graduate and a former trustee of the institution and formerly president of the State Horticultural Society was presented to the College as a gift of the Crab Apple Club. D. H. Stewart, the president made the presentation. Mr. Bruce W. Bell presented, in behalf of the Landscape Gardening Department, a portrait of Frederick Law Olmsted, the greatest American landscape gardener.

In a brief address the new Head of the Department, Professor M. G. Kains, sketched the potentialities of Horticulture in Pennsylvania. He pointed to the development of the industry from nothing at all a century ago to the present commercial valuation referred to by Dean Watts. Based upon the fact that the native small fruits have been developed in this period from the wild state to their present prominent position, and that a century ago practically all of our tree fruits were chance seedlings, showed that the potentiality, with respect to literally hundreds of other species are as yet untouched. In closing he pointed to the fact that the underlying laws, whereby present development has been reached, will apply without limit to all of our present list of cultivated fruits and to hundreds of wild species worthy in importance, demand alone being the governing factor.

Professor F. A. Waugh of the Massachusetts Agricultural College delivered the address of the day, "The Arts of Peace." He drew a pen picture of war, its horrors and frightful expense, not merely in money, but in destruction of human lives and of business. Then he contrasted agricultural industries, showing the constructive nature of all lines of agricultural effort.

The college this year graduated the largest class ever turned out at the institution. There were 332 graduates from the various departments. Governor John K. Tener made the commencement address.

U. S. CROP REPORT---June.

The U. S. Crop Reporting Bureau in reporting crop conditions on June 1 indicates prospects for bumper crops of grains and hay. Winter wheat shows a condition indicated as 92.7 percent as compared with 83.5 percent last year and 80.3 percent, the 10-year average. Oats condition is rated at 89.5 as against 87 percent a year ago; rye, 93.6 against 90.9 last year; hay, 88.7 compared with 87.5 a year ago and pastures 89.8 compared with 89.2 on the same date last year. Basing estimates of yields upon present indicated condition, all of these crops should make record yields. With an acreage of winter wheat 11.6 percent in excess of last year, it is estimated that the total production in 1914 will be close to 638,000,000 bushels as compared with 523,000,000 bushels last year and a 5-year average of 441,000,000 bushels. The oats crop is estimated at about 1,216,000,000 bushels as against 1,122,000,000 a year ago. General crop conditions on June 1 in the Middle Eastern states, 100 representing the 10-year average, are given as follows: Pennsylvania, 105; New York, 100.6; New Jersey, 102.9; Delaware, 103.9; Maryland, 106.4; United States, 102.2. The condition of the various crops on June 1, expressed in percentage of their 10-year average (not normal) and the average producers' price for the country on June 1, are as follows:

Crop	Condition	Farm Price
Wheat	114.7	$ .844
Apples	110.8	.....
Alfalfa	108.6	....
Rye	104.3	644
Peaches	104.2	....
Hay	101.5	12.34
Oats	101.	.40
Pastures	99.8	
Clover	95.	

STATE CAPITAL NEWS

Cultivation Statistics. — Work has been started by the new Bureau of Statistics of the Department of Agriculture to ascertain what percentage of owners are tilling their own farms and the general run of sizes of the farms which are tenanted as well to gain information concerning the character of leases. This bureau is just closing up a census of run-down or disused farms. It has been demonstrated by a canvass of each county that every owner of a farm, no matter how run down it may be has very clear ideas about its value and that there are none without owners. In some counties a dozen or so have been turned up whose owners have given up cultivation or have failed to get a tenant. These farms, with buildings going to rack and ruin and fields being overgrown with weeds and noxious plants, are not uncommon in some sections of the state and just what a nuisance a farm of that character may be is well known. The object of the listing is to show where agriculture can be taken up again in this state. The study of ownership and tenanting is being carried on as a supplement to this first investigation because it will show how in some parts of Pennsylvania farms have become garden spots and what can be done to improve conditions in other portions.

Listing Creameries, etc.—State officials are making an effort to supplement the list of farmers of the state by obtaining first hand information about creameries, condensers and canners. One of the greatest complaints about the state government's work for agriculture has been that there was a dearth of reliable information about farms, farmers and the various lines in which they are interested. The division of horse breeding has for some time past been publishing lists of stallions and their owners' addresses together with registered stock and the division of zoology is working out a card index of every orchard in the state and specialty. Now there is to be provided a directory of creameries and canneries which will furnish information as to the easiest way of reaching these consumers of farm products. Statistical information about milling and cheese making enterprises has already been collated.

Leeway On Butter.—Within a short time the state authorities will publish a schedule of what are known as tolerances on various commodities. This schedule will show how much leeway is to be given on various things such as butter, which are liable to shrink.

Awaiting Decision.—State Game authorities are waiting to see the outcome of the automobile license fee controversy as the basic principle in appropriation of this income is about the same. The Dauphin County court held that the motor vehicle license act provided for using the automobile license money for road repair and the auditor general and state treasurer will decide whether to contest the case in the supreme court. Meanwhile the Highway department is preparing to begin repair work and if an appeal is taken efforts will be made to make it of such a character that the use of the money can be had for road repairs while the court is acting on the question. The State Game authorities, who are held up in reimbursing counties for scalps of wild animals and in carrying on their game propagation, are eagerly awaiting determination of the question inasmuch as counties have been informed that they must pay for scalps and look to the state for reimbursement.

The Growth Of Automobiles.—As an indication of the manner in which the use of motor vehicles is spreading it may be stated that up to date 84,500 pneumatic tired vehicles have been licensed and 7,300 with solid tires, the latter including trucks. Motorcycles now number over 11,500. It would be interesting if it could be learned how many of these cars are owned by farmers.

Prison Labor.—A conference is to be held here later in the summer to draft a proposed act to permit use of prisoners in county jails on roads. The work would be under direction of road authorities and the men would work for the public and not for contractors.

NEW JERSEY FARM NEWS

Grain And Grass.—Corn came up fine. A bumper crop is predicted. Wheat and rye are almost normal. Because of the early drouth hay will be short. except upon these fields where nitrate of soda was used. Recent rains have produced abundant pasturage, insuring, for a time at least, a good flow of milk.

The Tomato Outlook.—The outlook for a bumper tomato crop in the central and southern portions of the state is said to be fine. This is remarkable in view of the fact that a considerable part of the acreage had to be re-planted because of unfavorable weather conditions and also the havoc wrought by cut worms. The report comes from the South that the crop there will be late, owing to cold nights which may bring both crops on the market at once, altho some farmers say that the acreage North is below the average. The large profits of a tomato crop come when the product is marketed early, when as high as $2 to $3 per basket is secured. There is good money in tomatoes at $1 per basket and it is a paying crop at 50 cents a basket, and even at 25 cents a grower would not go bankrupt. The demand for tomato products seems to be steadily increasing, and every year canners demand more of this vegetable.

A Great Project.—The Campbell Soup Company of Camden, has purchased a tract of 2,000 acres of land on and around the site of Washington Park, which will involve the expenditure of millions, including a model town, equipped with homes of the most sanitary type and facilities for the moral, mental and physical uplift of 4,000 or more employees of the company. On July 1, ground will be broken for the erection of a four-story re-inforced concrete factory, which will cost approximately $2,000,000. The plant will have 34 acres of floor space and will be the largest canning factory in the world. As contracts will be made with New Jersey farmers, insofar as it may consistently be done, for the supply of vegetables, great impetus should be given to the production of such crops.

The Irrigation Question.—Last year the New Jersey experiments with irrigation were encouraging, as a result of which irrigation systems are being operated this spring on nearly twice as large an acreage. Farmers who have irrigation plants in operation declare they have proved so successful that the outlook is for still greater extension of this system of crop saving next year.

MARYLAND NOTES

Strawberries Abundant. — One Wicomico County grower recently gathered from one acre over 2,000 quarts of strawberries at one picking. May 27 there were 27 car loads of berries shipped from Pittsville. The yield has been good, altho the second picking was affected by the drought.

Crop Prospects.—The apple prospect is unusually good, but the peach crop is not so promising. The crop of crimson clover has been harvested and is the best ever had in the county. Farmers are talking about increasing their number of cows owing to the fine hay yield. Some farmers have housed from 75 to 150 tons. Much of this clover land has been plowed and corn planting on it has commenced. This will produce an abundance of fodder as well as a corn crop. The farmers are progressing and find out cattle help crops as well as crops help cattle. There is evidence of increasing fertility of many farms in the county.

Saved The Cantaloupes.—In Kent County a number of cantaloupe growers this season used ordinary paper drinking cups for covering the plants nights when there was danger of frost. This it is claimed will permit them to have a crop ready for shipping ahead of the regular way.

Alfalfa in Harford Co.—Harford County is waking up on alfalfa. One grower has alfalfa that measures 4 feet in height. He has for several years gradually mixed some alfalfa seed with other seed sowing and has his land now well inoculated.

Fruit Prediction.—Orlando Harrison recently stated that the yield of apples, peaches and other fruits in this state this year will exceed any other recent year. The only danger he said is twig blight.—G. O. B.

COUNTY NOTES

Bedford Co., Pa., (S.C.) June 9.—Hot and dry, with occasional showers. Demand for horses and cattle light. Wheat selling at 90 to 95c bu. Fruit prospects good for apples and plums. Strawberry crop fair, selling at from 12 to 15c qt. Corn and oats are looking good, but several weeks late, on account of wet spring.—N. F. Richards.

Venango Co., Pa., (N.W.) June 8.—First part of May cold, balance of month dry and warm. Live stock doing well. Spring planting about done. Apples, wheat, rye, and grass looking fair. Acreage of oats and corn below normal. Potato acreage above normal. Butter, 25c; eggs, 25c; potatoes, $1 bu. Farm work still behind. Haying will be here before the farmers are ready for it. General conditions fairly good. —W. J. Pringle.

Lancaster Co., Pa., (S.E.) June 8.—Warm and dry. Some sections have been visited by thunder showers. Most sections too dry for growing crops. Live stock is in good condition. Cows are doing well on pasture. Fat cattle are being put on the market at good prices. Wheat has made a good growth of straw and is well headed but some fields are badly damaged by Hessian fly. Clover fields are doing well but timothy will be short unless we have a soaking rain soon. Potatoes and oats are doing fairly well. Corn came up well, but much damage was done by wire worms. Some fields were replanted. Tobacco farmers have begun planting. Farmers are busy harrowing corn and potatoes and getting things ready for haymaking and harvest.—J. Henry Haverstick.

Harford Co., Md., (N.E) June 5.—Dry and dusty; very little rain fall. Live stock continues high. Fat cattle, 7½@8½c lb.; fresh cows $75@100 each; calves 9c lb. Wheat looking very good. Clover hay fairly good but timothy will be short unless it rains soon. Corn up and growing good. Farmers working corn and setting tomatoes. Some using water; others waiting for rain.—D. G. Harry.

Chester Co., Pa., (S.E.) June 2.—Clear and dry. Corn high; horses not so high. Wheat affected by fly. Timothy and clover short and not so promising as at first expected. Potatoes and corn are growing nicely. Much corn was planted later than usual. Ground becoming dry which may affect hay crop.—Hayes C. Taylor.

Chautauqua Co., N. Y., (S.W.) June 4.—Weather generally fair and warm; been quite dry, raining now. Live stock in good condition. Horses quite high, $125 to 250; cows, $50 to $75 for common, $75 to $100 for extras; dressed pigs, 10½c; fowls, live, 15c; eggs, 19@20c; asparagus, 75c dozen bunches; strawberries, 12c; butter, 22 to 24c. Farm work a little behind on account of being wet early and then very dry. Crops looking well. Apples, cherries and berries promise well.—J. L. Barber.

Steuben Co., N. Y., (S.W.) June 1.—Weather hot, with frequent showers. Live stock of all kinds is scarce and high in price. Pastures are good. Sowing over. Most all corn planted. Preparing for ensilage corn and potatoes. Farmers are very busy. Farm work is much behind on account of wet weather in April and May. Butter, 28c lb.; eggs, 19c dozen.—Geo. W. Rowley.

ATLANTIC
AUTOMOBILE
GASOLINE

Gasoline C. P.

The chemist asks for no guarantee upon his supplies other than the letters C. P., meaning "chemically pure." For gasoline, the symbol C. P. is not used, but the name *"Atlantic"* on Gasoline affords the motorist, and the farmer who owns a gas engine, just the same grounds for confidence that "C. P." does the chemist.

Forty-eighty years of experience and manufacturing resources have combined to set a distinctive quality standard for ATLANTIC AUTOMOBILE GASOLINE.

Our distribution service is the best in the State. Our tank wagons will deliver regular supplies of first quality engine fuel right to your door. Ask for it by name at any first class garage—"Atlantic Automobile Gasoline."

The Atlantic Refining Co.
Everywhere in Pennsylvania

Modern Interest in Housekeeping.

Modern housekeeping is confronted with some problems that are like those in modern farming, notably so in labor and machinery. The housekeeper must reach a decision in regard to the degree in which it is possible and desirable to supplement or replace manual labor with improved implements. She must decide whether or not she will adopt scientific methods in home management. The housekeeper is confronted with the difficulty, almost the impossibility, of securing help in carrying on her housekeeping routine, even in emergencies. When serious illness comes to the farm home it often happens that the only way in which the added labor can be met is by securing a nurse to take care of the sick person while the house mother continues in the routine work; even when she is fully competent to manage the sick room she finds it impossible to do so because she cannot hire a housekeeper's helper, while she can hire a nurse.

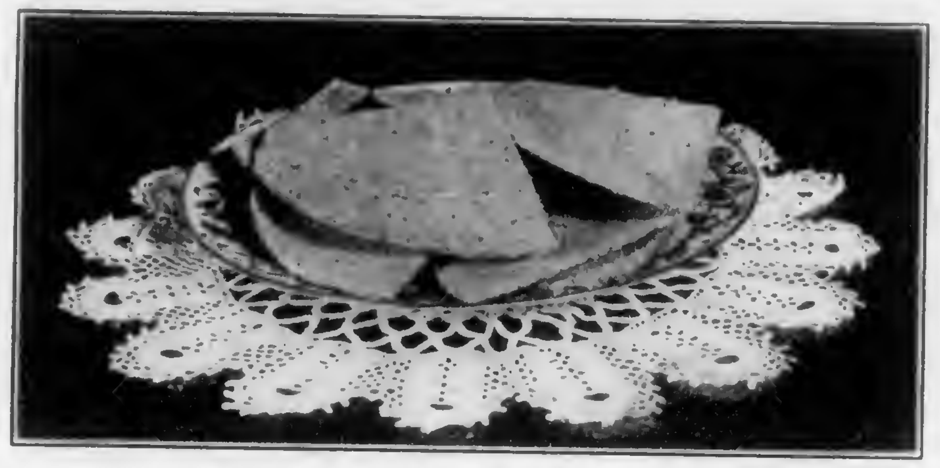
When everything is going well with home affairs, no illness nor any stress of circumstances, many women find something distasteful about having an alien personality in the home; they greatly prefer having just their "own," and it is they who welcome the new housekeeping which enables them to get along comfortably without extra help. Also they find that the new system and the new devices which reduce labor will at the same time create a demand for sustained mental energy that in turn begets a new and lively interest in the business of housekeeping.

Every device that lightens labor costs a double price. In addition to an expenditure of money to buy it, there is required also an expenditure of intelligence in order to use the device properly. It is the latter that explains the increasing interest in housekeeping which is in plain evidence among the better class of home makers. The new housekeeping recognizes two plans of advance; the first is the plan of putting out of the house whatever work can be as well or better done by an organized commercial agency; the second plan is that of securing the best equipment, using the best formulas or recipes and practicing the best system suited to the particular household.

In line with putting work out of the home, in many sections the making of butter at home is practically abandoned. While undoubtedly the best home-made butter is far better in quality than any creamery butter can possibly be, yet the facilities present and the labor available in most cases are such that the sale of the milk or cream and the purchase of butter is in practice satisfactory. In the same way the home butchering of hogs, the rendering of lard, the curing of meat, has given place to the plan of selling the hog on foot, and buying whatever form of fat or meat is desired. The steam laundry takes excellent care of the heavy portion of the family washing and will return the flat pieces clean and smooth at a cost of about 5 cents per pound. Putting bread making out of the home is a debatable point. Certainly the old 24-hour process that began with the troublesome potato sponge and ended with uncertain results often made bakery bread preferable. Many progressive housekeepers, however, are now quite willing to give the 20 minutes of labor required for the making of four or five loaves of bread in order that the family may have palatable and nutritious home-made bread; they are willing to do this and can do it regularly all the time because dependable yeast can now be had, we have ovens that can be controlled, and a dependable short process formula for making bread is available. Consequently it may be desirable sometimes that the plan of putting work out of the house should give way to the plan of having good equipment and using the best methods.

Putting work out of the home has been coincident with selling produce outright and of independent buying. The housekeeper no longer exchanges eggs and butter as she formerly did, the farmer no longer exchanges wheat for flour. Independent buying gives the opportunity for making a wider selection of foods without in any degree adding to the cost of living. The housekeeper now generally buys the standard flour and in addition pastry flour, graham flour, buckwheat and corn meal, each of which, when handled properly, contributes to variety in palatable and nutritious forms of food. Variety is an essential factor not only in the matter of promoting health but also in promoting an increase of interest in planning and preparing meals. Monotonous repetition is avoided and while there is no increased price there is an increased value when the housekeeper seeks knowledge of how to use a wide list of foods. By the way a new device for saving time and labor is found in a late bulletin issued by the Department of Agriculture on "Corn Meal and Its Use." Mush, which is so very good in its first state and much better in its second, as browned in fat, may be made without stirring by using cold water and corn meal in the proportions of 3½ cups of water to 1 cup of meal, and heating very gradually, then cooking in a double boiler or fireless cooker for 3 hours. Having made mush without lumps by the directions given in this bulletin we consider it a real contribution to the list of labor-saving directions.

The alert and interested housekeeper uses the help which now is so generously offered in the bulletins issued by the Department of Agriculture and the State Universities that have Departments of Home Economics. There is found encouragement and inspiration in the work of others who, with training in research and experiment, are now offering the demonstration of what science has to contribute to efficiency in the business of housekeeping. It is deeply gratifying to witness the building of a great body of literature around the science and art of useful, everyday, household cookery. — Mrs. Virginia C. Meredith, Wayne Co., Ind.



WHOLESOME AND APPETIZING OATMEAL CAKES.

OATMEAL CAKES.—Put 1½ cups of fine oatmeal into a bowl, add 1 tablespoon dripping and ¼ teaspoonful of salt. Pour on a little boiling water, and stir with a knife until the dripping melts, then stir into the meal until all is moistened, but it must not feel soft. Turn out on to a baking board, roll out until a nice thin cake is formed; then divide into four, and bake on a hot griddle. Toast the top side over the fire or in the oven.—Marion Harris Neil.

ONE FARM WOMAN'S GARDEN PROFITS

Most farm women can find use for money they can earn themselves for there's always some article or perhaps several articles they are longing for. It may be rugs or curtains, a piece of furniture, clothes for themselves or for their children.

This article will tell how one farmer's wife met this problem. She is as busy as any farm woman but manages to get the time to care for the crops which supply her some needed money.

She has a small garden 19 feet wide and 22½ feet long, from which last summer she sold $8.50 worth of lettuce and $20 worth of endive. The lettuce was planted as early as possible in the spring and sold for 40 cents a dozen bunches. A bunch is as big a handful as one can hold in one hand and tie without assistance. This makes an extra large bunch, much larger than the bunches made in trucking centers, but it is the size demanded in this locality.

As soon as this lettuce crop was off the ground was worked up with hand cultivators, and a second crop sowed. Had this matured it would have brought thirty or forty cents a dozen bunches as the main crop of lettuce was gone, for there is a limited local demand for lettuce in July and August. The main crop of lettuce comes into market here in June, then the bottom simply drops out of the prices, and 15 cents a dozen is a very good price then. But as her crop is marketed before the 31st of May she is never forced to take such a low price. But by July no one has lettuce and that's the time to rush the second crop to market. That was what the second crop was planted for but the goslings found it when it was nicely up, and in a short time there was no lettuce visible. After putting the goslings where they couldn't reach the garden, it was again worked up, and endive was planted, but one day the young chickens got in and made short work of it. However, this woman determined that she just would get another crop from that garden, so it was prepared for planting right away and made secure from the chickens.

Endive was sown again and matured in a surprisingly short time. It was planted in August, and by the middle of October the endive had all been sold but it is also a quick money crop, for in six weeks some of it is fit to sell. And it also pays better than lettuce. The price of endive is the same as that for lettuce, 40 cents a dozen bunches in the local towns. There is a big demand for endive from Germans and Italians, the latter at all seasons.

As to growing endive, this is the way it is done. After giving the ground thoro preparation sow the seed thinly in drills 12 inches apart. As soon as the crop appears, commence cultivating. When the plants are large enough thin to a plant every 8 inches. With this method it is necessary to blanch either by boarding as for celery, or by tying the leaves up. Set 4 inches apart the plants will blanch without trouble but the heads do not get as large as they should. Frequent cultivation makes it grow fast.

The bugbear of weeding is overcome with lettuce or endive. There are few Americans, even among truckers, who know what endive is, and there are still fewer who know how to grow it. The first year over $20 worth of endive was sold, and this year, with the help of a crop of onions over $100 was realized from this little garden. This woman has had this garden for years, but the first time she ever got a decent sum from it was three years ago, when she raised celery after an early crop of lettuce. And it was just because she had not looked over the demands of the region, and then fitted her capacity to the opportunity.—M. A. Herold, Luzerne Co., Pa.

PEANUT BUTTER USES

I use a great deal of peanut butter in my family, as we are very fond of it, and find it a valuable article of food. As a rule I make it myself, making a small quantity at a time, so as to have it always fresh. It keeps well however, in cool weather, or on ice in summer, but any food containing so large an amount of oil should not be kept near other food unless closely covered, for it absorbs odors readily. I always buy the salted peanuts to make into butter, for several reasons: First, the cost is little if any more, as we can buy the finest salted peanuts for 15 cents by the single pound, or less in quantity. Second, it saves the trouble of shelling them, and the extra cooking received in the salting process improves them greatly for making the butter. The salt in them is usually the right amount to salt the butter properly. All the loose skins should be thrown out, but some should remain to add to the rich color of the butter.

I have a peanut butter attachment to my food chopper, which makes a very fine-grained, smooth butter which I pack solidly in glasses which can be closely covered.

For ordinary use I add nothing to the butter, but if it does not spread well, I thin it with a little milk or melted butter as I use it. Many people add a generous proportion of butter or olive oil, but it seems rich enough for most purposes as it is. High pressure in grinding the nuts brings out more oil, so those who have a regular grinder will find the finished product much more oily than when prepared with a food chopper. If the nuts are very fresh, they will make a much smoother butter, so it is well to heat them gently before beginning the work.

Sandwiches.—I use the peanut butter, thinned with a little milk on bread or delicate crackers, for plain sandwiches, or spread one slice of bread with the butter and the other with finely minced figs or dates and put them together. Suit other fruits to taste.

Peanut Butter Milk.—Invalids or those who think they cannot drink milk will enjoy this substitute: Thin peanut butter with boiling water till of the consistency of milk or part milk can be used. Drink while hot. This is as good a remedy for insomnia as the glass of hot milk so often recommended.

Toasted Peanut Sandwiches.—For breakfast toasted peanut butter sandwiches are very good. Cut bread very thin, spread with peanut butter, and after placing two slices together, toast on both sides in the usual way. A more elaborate meal can be prepared in this way: After the sandwiches are all made, roll them in beaten egg, then in bread crumbs, and fry to a delicate brown on both sides. This can be done either in deep fat or they can be sauted in a little fat in the frying pan. For this use spread the peanut butter thickly, using an ordinary glass for a dozen slices of bread.

Peanut Butter Gravy.—This is a good substitute for meat gravy, and is made in this way: Add 1 rounding tablespoonful of the butter to 1 pint of boiling water, rubbing until the butter is dissolved. Thicken with browned flour made into a smooth paste with water. If onion is liked, a little can be added to the gravy.

Peanut Butter Pie Crust.—When making pie crust, try using part peanut butter instead of all lard. I find one-fourth about the right amount. It makes a delicious crust of nutty flavor, and is especially suited to apple pie.

Peanut Soup.—Use one pint each of milk and water, and when boiling add 1 heaping tablespoonful of peanut butter dissolved in a little warm water. Season well with celery salt, a little onion or tomato to suit the taste, and rice may be added if liked. The amount of peanut butter used in the soup should be varied to suit one's taste. We often prefer more than these directions call for.

Peanut Butter Potato Puffs.—These are good for supper. Use 1 heaping tablespoonful of the butter dissolved in a little warm water, add 1 beaten egg, 1 pint of mashed potato, and salt and pepper to taste. Bake in well-greased gem tins until nicely browned and serve hot.

Peanut Trifles.—Mix smooth, 2 rounding tablespoonfuls of peanut butter, 1 cup sugar and 1 cup flour; then add 2 beaten eggs and ½ teaspoonful baking powder, drop by small spoonfuls into greased baking tins, and bake golden brown.

When stuffing dates, use peanut butter for part of them, mixing 2 tablespoonfuls of it with 1 of powdered sugar. If too stiff, add a little milk, roll to the size and shape of the date kernel, and stuff into the date, afterward rolling in powdered sugar.—Mrs. H. M. Woodward, Winnebago Co., Ill.

The New Belts.

By Our New York Correspondent.)

Belts are certainly "different" this year. Any neat, narrow one you may have left over from last year may as well be discarded with the trim linen shirt waist to which it belongs. This year women care nothing at all about having figures, only so they do not have too much of them.

The "vestette" (No. 1) is the new summer belt. It is usually made of very rich brocade, in strong colors. The buttons and imitation pockets are usually black or at least the color of the background of the brocade.

No. 2 is still wider, and comes well down over the hips. It is frequently of pique or heavy linen, and the pockets and buttons are the real thing.

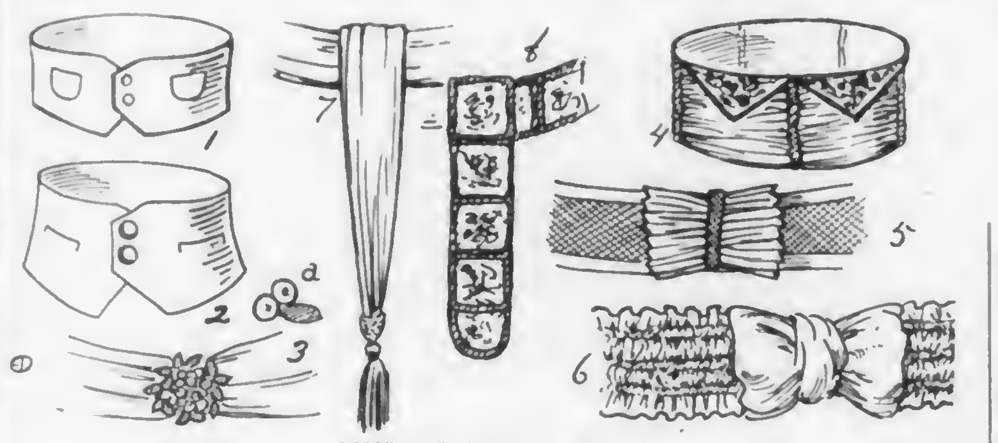
A soft crushed-silk girdle, four or five inches wide, intended for dressy occasions, is shown in No. 3. The beauty of the cluster of silk buds and leaves that finished it was more than three-fourths of the whole effect. The girdle was a soft pink, and the buds were several shades of blue and dull green, with now and then a soft dull red, all contrasting agreeably with the silk of the girdle. The detail (a) shows the method of making the buds. Small balls of cotton are covered with silk, then a black cross stitch of silk thread is placed in the center of each bud. For directions for making rose buds with petals see our issue of May 2.

A wide soft girdle, supported by several lengths of featherbone, over which it is shirred, is shown in No. 4. The beauty of this girdle is in the point of striking embroidery dropping over its top edge. These may be scraps of oriental [illegible], and may be limited to the two in front, or they may go all around the girdle, and be embroidered in the colors of the costume to which they belong. They are pretty conceits for using bits of handsome embroidery or lace that one may own.

A pretty belt, five or six inches wide, was made of plaided and plain silk, as indicated at (5). If preferred the arrangement of materials could be exactly reversed.

A charming girdle for a slender waist is shown at (6). It was made of soft silk, and shirred over three bands of rubber tape, leaving a 1½-inch ruffle on either side for a finish. A large soft crushed bow of the material was used to cover the fastening in the back.

Long ends are very popular, or rather one long end. No. 8 shows a very effective girdle of silk embroidered heavily in squares, giving the effect of squares of oriental work set together. The long end shown at (7), finished with a tassel, while not so distinctive, would be much simpler to reproduce. The tassels, with crocheted caps to fit over the end of the ribbon, can be had in any store, but they are not hard to make by one who can crochet, for the tassel could be very cheaply made from a few inches of fringe.—Ellen Den.



SOME IDEAS FOR BELTS.

PROFITABLE SHADE

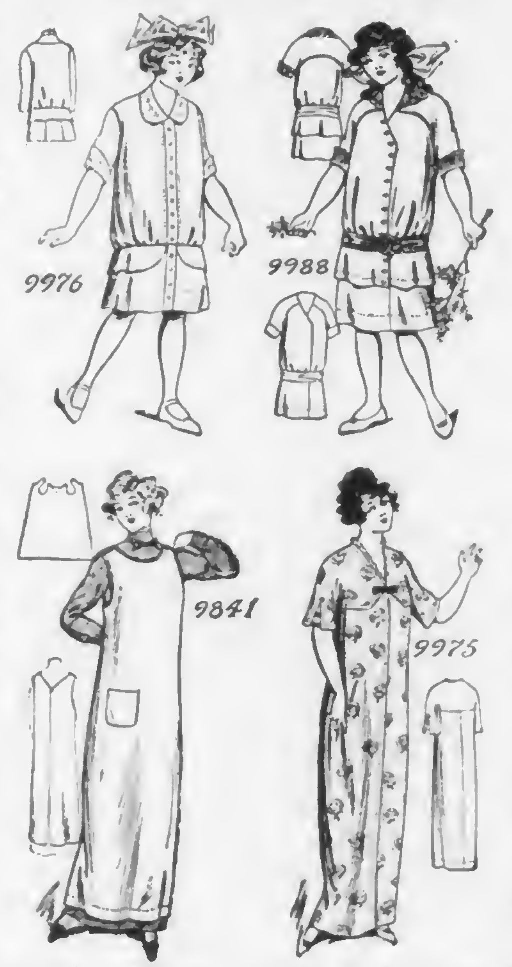
That perplexing question of shade to protect the kitchen windows from the intense sun rays comes to every housewife's mind with the warm spring days. What to plant, what variety of vine, is what concerns her most. A canvas awning is efficient, but it prevents the free circulation of air while vines to a great extent do not.

Last summer I decided to plant a vine that would give both shade and profit. I soaked a few ordinary soup beans in water over night and planted them under the kitchen windows. When they began to run I trained them to the top of the sash. Those vines were profitable in beans which we ate with relish and the vines kept out the sun. Later in the season, I built a square frame arbor a few feet outside the kitchen door; ten feet high, ten wide and twenty long. I sowed lima beans and soup beans on the sides and soon we had a fine vine-covered outside kitchen where the women worked or sat to sew on the hot, sultry days. I'm sure if each housekeeper will try either the arbor or growing the vines up the wall, she will be delighted and the family will enjoy the fruit of the profitable shade.—The Country Doctor.

PENNSYLVANIA FARMER PATTERNS

Be sure to give the figures and letters of each pattern exactly as printed at the beginning of each description. We will not be responsible for correct filling of your orders unless you do so. Also give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 214-18 So 12th St., Philadelphia, Pa.

9976.—Girls' Dress with or without Chemisette.—Cut in 4 sizes: 6, 8, 10 and 12 years. It requires 3½ yards of 44-inch material for an 8-year size. Price of pattern, 10 cents.



9988.—Girls' Dress with or without Tunic.—Cut in 4 sizes: 8, 10, 12 and 14 years. It requires 3¼ yards of 40-inch material for an 8-year size. Price, 10 cents.

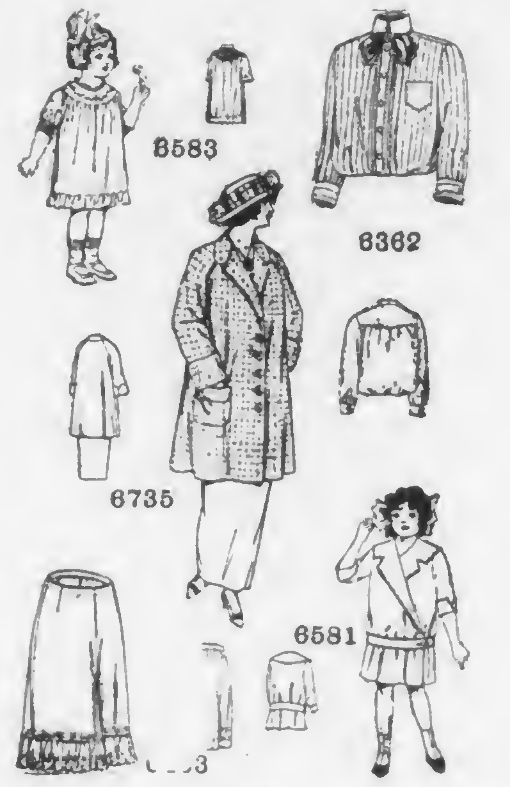
9841.—Ladies' Apron.—Cut in 3 sizes: Small, medium and large. It requires 3⅜ yards of 36-inch material for a medium size. Price, 10 cents.

9975.—Ladies' Kimono or Lounging Robe.—Cut in 3 sizes: Small, medium and large. It requires 4⅜ yards of 36-inch material for a medium size. Price, 10 cents.

6583.—Children's Dress.—Cut in sizes ½ to 5 years. Age 4 years requires 2¼ yards of 27-inch material and 1½ yards of edging. Price of pattern, 10 cents.

6362.—Boys' Blouse.—Cut in sizes 4 to 16 years. Age 8 years requires 1⅞ yards of 36-inch material. Price, 10 cents.

6735.—Ladies' Coat.—Cut in sizes 14 to 20 years. Age 16 years requires 2½ yards of 54-inch material. Price, 10 cents.



6463.—Ladies' Closed Drawers.—Cut in sizes 22 to 30 inches, waist measure. Size 22 requires 2¼ yards of 36-inch material. Price, 10 cents.

6581.—Children's Dress.—Cut in sizes 2, 4 and 6 years. Age 4 years requires 2¼ yards of 36-inch material. Price, 10 cents.

DAISY FLY KILLER placed anywhere, attracts and kills all flies. Neat, clean, ornamental, convenient, cheap. Lasts all season. Made of metal, can't spill or tip over; will not soil or injure anything. Guaranteed effective. Sold by dealers, or 6 sent by express prepaid for $1.
HAROLD SOMERS, 150 DeKalb Ave., Brooklyn, N. Y.

YOUR NEEDLE WORRIES SOLVED FOREVER
This Handy NEEDLE CASE
CONTAINS A NEEDLE FOR EVERY USE
Here Is What It Contains:
75 Gold-eyed Sewing Needles, 15 Art Work Needles, viz.: 15 Silk and Cotton Darners, 15 Milliner's Needles, 15 Crewel or Embroidery, 3 Rug or Tapestry, 3 Chenille Needles, 1 Bone Stiletto, 1 Bone Crochet, 1 Steel Crochet, 1 Steel Bodkin or Tape, 1 Punch Work, 2 Medium Wool Darners, 2 Fine Wool Darners, 2 Medium Darners, 2 Fine Cotton Darners, 2 Medium Cotton Darners.
HOW TO GET THIS NEEDLE BOOK
Send us 2 subscriptions to Pennsylvania Farmer for Balance of year at 25c each and we will send Needle Case by return mail postpaid.
Positively not given for less than 2 subscriptions.
We have only a limited supply of these needle books so send your order at once.

SYNOPSIS OF PREVIOUS CHAPTERS

Two New York business men, Van Brunt and Hartley, come to Wellmouth for a vacation. Solomon Pratt, Skipper and village character finds the "twins," as they are dubbed, interesting. The "twins" ask Pratt to find them a secluded place of rest and act as their cook. After a period during which Pratt has some experiences with the "twins" including, helping to rescue a fresh air youngster, in whose protectress Hartley finds an old sweetheart; and a hair-raising voyage back to Wellmouth in which Van Brunt and his "man" are set adrift in the Dora Bassett and Pratt in the dory, accident brings the twins to Horsefoot Bar Island, which they decide is Paradise and for the rent of which they make a "bargain" with Nate Scudder. The present instalment continues the tale of the moving operations to the island.

CHAPTER VII (Concluded.

I carted dunnage all the forenoon. Then I cooked dinner and washed dishes. James was going to help me wipe 'em but Van's clothes had got wet when he was adrift in Dora Bassett and they had to be pressed. So I wiped and cleaned up and carted more dunnage, including stove pipe and blankets and flour and quilts and nails and pork and pillows and a rake and sugar, and the land knows what. Then I cooked supper. And how them Paradise tenants did eat!

"By gad, you know!" busts out Van Brunt with his mouth full; "this is what we've been looking for, Martin. This is getting back to nature."

Hartley grunted, being too busy with a fried mackerel to talk with comfort. But it was easy to see he was satisfied.

They went on bragging about how good it was to cut loose from the fight and worry of the Street. At last, according to Van, they realized that life was worth living.

"No more speculation for me," he says, joyful. "No more fretting about margins. I don't give a continental if the bottom drops out of the market and carries the sides with it. I hereby solemnly swear for the fifth time never to buy another share of stock."

Then he reaches after another half-acre slab of my johnny-cake.

Lord James was upstairs in the sleeping vaults sorting out bed clothes. The sheets and blankets and things was more or less mixed up with the hardware and groceries. I was out in the kitchen getting ready a second relay of mackerel. The dining-room door was open, so I could see and hear everything.

"By the way, Martin," says Van, buttering the johnny-cake, "how did Agnes look? Well?"

"Yes," says Hartley, short.

"She must have been surprised to see you. Did you tell her we were naturalized citizens, or on the road to it?"

"No."

"No? Why not? She probably thinks that we're down here organizing another syndicate. For a girl whose mother is of the world worldly, Agnes has developed queer ideas. I suppose I ought to go over to see her," he went on. "You said she had another girl with her. Who is it?"

"Margaret Talford."

"Talford—Talford? One of the Newport Talfords? Oh, I know. Pretty little girl, dark hair and brown eyes, and—and a way with her?"

"I guess so. Very likely. I haven't seen her."

Van seemed to be thinking. "I'll go over tomorrow," he says.

Then he commenced to whoop for more mackerel and 'twas time for me to load up the platter. I thought I'd cooked supper enough for six men, but when the Twins got thru I had to fry another ration for me and Lord James. Eat! I never see such sharks in my life.

When they'd finished everything on the table except the knives and forks and the dishes, the Heavenlies went outside to smoke cigars and promenade up and down the beach. His Lordship and I set down to have a bite ourselves.

"Say," says I, "that Page girl is a good looker, ain't she?"

He was horrified, same as he always was when you mentioned the New York big bugs without getting up and bowing.

"Miss Page," says he, "is a member of one of our first families."

"Want to know," says I. "First in what?"

"First in everything," he says. "Her father was one of our oldest residents."

"So?" says I. "Oldest inhabitant, hey? I suppose he could remember way back afore the town hall was built, and the hard winter of '38, and how his ma's cousin used to do chores for George Washington."

I knew pretty well what he meant, but, you see, I liked to stir him up. He was such an innocent critter: always swallowed hook, line and sinker. It done me good to see him stare at me after I said things like this.

All he said now tho was "'Orrors!"

"How about your boss, this Van Brunt?" says I. "He's another first rater, hey?"

The Van Brunts was even more "first families" than the Pages, so the valet said. They'd been there ever since New York was built. 'Twas their ancestors that got up the first barn-raising, or words to that effect.

"And Hartley?" says I.

That was different. The Hartleys was another breed of cats. Martin's dad was born in Chicago or somewheres outside of New York. He'd repented of it, of course, and tried to live it down, but he never had been quite the big apples on the top layer, like the Van Brunts. He was dead now, old man Hartley was; been dead three or four years.

"How about ma?" says I.

She was dead, too; died a year or more ago. Martin was an orphan.

And then I cal'lated it was about time to heave out the question that I'd been leading up to all along.

"What made the Page girl cut loose from him and take up with Van?" I says. "She don't look like the kind that would be too hard on a chap just because his dad made the mistake of being borne out of township limits."

Lord James fidgeted some over that. First he said he didn't know.

"Well," says I, "let's guess then. Guessing's a good Yankee trick and you'd ought to have picked it up by this time. You guess first."

He didn't want to guess, but I kept at him throwing out all sorts of foolish maybes and perhapses. Finally he got tired of saying "No."

"Oh, I don't know," says he. "I 'eard as 'ow 'twas because 'e was too mercenary. 'E was an awful chap in the Street after 'is old man died. 'E was there night and day. 'Ardly came 'ome at all."

"Humph!" says I. "I'd never suspicioned it to look at him. Wa'n't he doing well at his job?"

Lord James said it wa'n't that. Said he was doing mighty well. Folks was calling him a "born financier" and all sorts of names.

"So?" says I. "Then I don't see that Miss Page had any complaints. 'Tain't usual for a young woman to kick because her steady company is making too much money. There's something else. Out with it. I'll keep my mouth shut."

So then he told me a little—much as he knew, I guess likely. Seems that he was acquainted with the feller they call the butler—sort of a steward, I judged he was—over at the Page girl's house. And this butler was sweet on the "maid"—the young woman valet who took care of Agnes's duds and spare rigging. And one night this maid happened to be in the "conservatory"—which I presumed likely was the high-toned name for the preserve closet—and Miss Page and Hartley was in the setting room. Agnes was laying into Martin for staying down town and neglecting her.

The maid said she could hear only part of the talk, but 'twas more than average sharp and vinegarry. Agnes told Martin he was getting more mercenary every day he lived. That all be thought of was the office and making money. She detested a mercenary, hard, money-grasping man. Said money-loving was the worst vice there was, and she thanked God she had none of it, meaning vice, of course—she had money enough to sink a ship.

Then Martin he speaks up proud and short and says he has been working hard and had been trying to make money. Said he had a good reason for it, and some day he would tell her what it was. She said he could tell her now or hang his May-baskets on somebody else's door—or words to that effect. He says "Very well," and she says something else, but the maid didn't hear it because just then old lady Page come in and give her her walking papers for listening.

"And so," says Lord James, "the engagement was broke off. And a good thing too, I say. W'at's the use of 'er lowering 'erself to marry a man whose father got 'is money in trade?"

"How did Van's dad get his money?"

"By in'eritance," says he. "Of course Mr. Edward dabbles in shares, but, Lord love you, only for the fun of it."

"How was the inheritance come by in the first place?" says I. He didn't know, but I found out afterwards. Grandpa Van Brunt was an alderman.

The Twins come back into the house then. They come in slapping and jawing. I judged that the mosquitoes was living the Natural Life too. The Heavenlies set down on each side of the fireplace—I had a wood fire going, just for sociableness—and smoked and talked.

By and by Van rummages out that Natural book and spreads it open.

"Martin," says he, "hark to the voice of the oracle. Come in here, skipper, and improve your mind."

But me and his Lordship was improving the dishes just then, and, when that was done, he had beds to make and I had bread to mix and fires to lay and wood to chop and couple of million other chores to do. The Twins read and talked until they got sleepy, which was about half past nine or so; earlier than usual, but neither of 'em had rested well the night afore, I guess. Anyhow they went upstairs to turn in and I kept on with my work. Lord James turned in too. He had the back bedroom, the one over the kitchen.

'Twas still as still could be. The door and windows was open and there wa'n't a sound except the mosquitoes humming glad and thankful, and the breeze whining in the pines outside and the waves moaning along the bay shore of the island. Once in awhile I'd hear his Lordship thrash over in bed and fetch a grunt or a groan in his sleep. He had one of the late Marcellus's cornhusk mattresses and I wouldn't wonder if there was a cob end or two in with the husks. A rake across the back from a corn cob ain't the most comforting thing in the world even when a feller is used to it, and Lord James had been brought up tender.

Pretty soon I went to the back door to throw out some fish-bones and things and then I heard somebody tramping thru the sand up to the house. Neighbors are scarcer than snake's finger nails 'round Horsefoot Ozone and I couldn't think who was coming at this time of night. I ain't a nervous chap, generally speaking, but I remembered how old Marcellus had died in this very house all sole alone, and the short hairs at the back of my neck begun to bristle up. I cal'lated if anything would fetch a sot old codger like Marcellus out of his grave, the doings of the Heavenlies was that thing.

But in a minute more the walker got into the light from the door and I could see him. And I was 'most as much surprised as if he had been Marcellus himself. 'Twas Nate Scudder, with his arms full of bundles.

"What in the nation?" says I.

"Hello, Sol," says he. "Where's the folks?"

"Turned in," says I. "What's up?"

He seemed real disappointed. Set the bundles down on the kitchen table and puffed. That sand is hard walking and nobody knows it better than I do.

"Turned in so early, have they?" he says. "That's too bad. I wanted to see 'em."

"Want me to roust 'em out?" he asks.

"No, I guess not. But they're nice folks as ever I see and I've fetched 'em a few presents."

I flopped into a chair. I was getting used to surprises, but Nate's giving anybody a present was the biggest wonder yet. I figured that lunacy was catching and we was all going crazy together.

"Yes," says he. "Me and Huldy Ann's been talking it over. They've hired this house and—and—all the rest of it and we want 'em to like it. Don't want 'em to get tired and leave, you see."

I see all right. When the melon's getting ripe that's the time to water it.

"Yes," he says. "I like them young feller's well's anybody I ever see; so does Huldy. We got to thinking of 'em over here in this big house and we wanted 'em to feel at home; just as if 'twas home. Now there's nothing like pictures and such on the walls to make a place homey. So Huldy and me has sent 'em these few things to hang up 'round."

He commenced to undo the bundles.

"'Twas Huldy Ann's notion," he went on. "When she bought this place at auction there was the furniture and fixtures in it that belonged to Marcellus. Some of 'em we left here, beds and chairs and the like of that, and some we took over to our house. There was more than we needed and these is some we had in the attic."

To be continued.

Lettuce, 8@10c bunch. Beets new 12c bunch; string beans, 20c ¼-pk; peas, 25c ¼-pk; spinach 10c ¼-pk; asparagus, 35@40c bunch; tomatoes, 15@20c qt; squash, 10c each; kale, 8c ¼-pk; parsnips, 5c bunch; cucumbers, 10@12c each; turnips, 5c ¼-pk; radishes, 5c bunch.

Fruit.—Apples, 15@25c ¼-pk. Pineapples 20@25c apiece. Oranges, California 20@30c doz. Florida, 35@40c doz. Bananas, 10@15c doz. Grapefruit, 7@10c each; strawberries 40@50c box; lemons 12@15c doz.

YORK PRODUCE MARKET

York, Pa., June 15, 1914.

The past week witnessed the heaviest buying of any week in the year 1914. Thousands of crates of strawberries were hauled to the city from the surrounding country, while many were disposed of in the near-by towns and villages. The bloom promised one of the heaviest crops York Co., has ever seen, but the excessive drought and the burning sun caused the entire crop, medium early and late, to come on the market in about a week's time. At this time our late berries should be just ripening, and they are practically over. Cherries, apples, and peaches are falling off rapidly thru the effect of the dry weather.

Eggs.—19@20c doz.

Butter.—Country, 25@30c; separator, 32@35c. Milk, 5@6c per quart.

Poultry.—Hens, 15@16c; springers, dressed, 50@85c each.

Vegetables.—Potatoes 10@18c ½-pk; 75c@$1.00 bu; cabbage 3@6c each; lettuce, 2@6c; beets, 3@5c bch; radishes 3@5c bch; onions 3@4c bunch, 15c ½-pk; lima beans, 15c per quart; sweet potatoes, 15c ½-pk; lard 14@16c lb.; celery 5@10c ea; peppers, 10@12c doz; turnips 10c per ½ pk; sauer kraut 8c qt; apple butter, 20@25c qt.; asparagus, 5@8c buch; rhubarb, 3@5c per bunch; peas, 15@24c per ½ pk.

Fruit.—Apples, 25@35c ½-pk; strawberries, county 5@8c per box; cherries, 6@10c per box; huckleberries, 15c per box.

Retail Grain Market.—Wheat, $1.06 bu, corn, 88c; oats, 56c; rye, 77c; bran, $1.60 cwt.; middlings, $1.60 cwt.

Wholesale Grain Market. — Wheat, 96c; corn, 78c; oats, 45c; rye, 67c.

PHILADELPHIA LIVE STOCK

Philadelphia, Pa., June 15, 1914.

Beef Cattle.—The local condition developed a slow but rather steady feeling as to trading with a moderate supply of Pennsylvania and Chicago cattle making up the current shipments. Cows as well as calves were in ordinary demand at former values.

	Beef Cattle	Sheep and Lambs	Hogs
Total for week	2,984	10,669	6,269
Previous week	2,608	8,011	5,079

Best steers	$8.87@9.00
Choice steers	8.65@8.75
Good do	8.45@8.55
Medium steers	8.00@8.25
Common steers	7.75@7.87
Bulls	6.00@7.50
Fat cows	5.00@6.75
Thin cows	2.75@4.50
Milk cows	45.00@85.00

Veal calves higher.

Best calves	$11.00@11.50
Good to choice do	10.00@11.00
Medium	8.00@9.00
Common do	6.00@7.00

Sheep and Lambs.—There was a noticeable increase in the offerings of stock and a good absorption of all desirable grades at fairly steady prices.

Choice wethers	$5.75@6.00
Good do	5.25@5.50
Common to medium	4.00@5.00
Ewes fat	4.25@4.50
Extra lambs	8.25@8.50
Good to choice do	7.50@8.00
Common to medium	5.00@7.00
Early spring lambs	9.50@9.75

Hogs.—Conditions were fairly steady and demand was seasonable. Western, $11.50@11.75.

City Dressed Stock.—Every variety of choice and prime meat was held in a steady to firm manner, inquiry being about normal. Steers 12@14c; heifers, 10½@13c; cows, 9@12c. Veal calves, 13@14c; country dressed calves 13@14c; extra do., 14½c. Sheep, 11@12c; extra wethers, 13c. Spring lambs 18c. Hogs, 11¾@12c.

PITTSBURGH LIVE STOCK

Pittsburgh, Pa., June 15, 1914.

Cattle.—With a liberal supply of 110 loads compared with 80 loads the week before the market ruled fairly active at prices generally 10 to 15 cents lower. A few choice cattle on sale sold higher than the week before but the quality was the best that has been here for some time. Cows in liberal supply and sold lower, generally 25 cents off. Heifers in fair supply and sold about steady. Bulls in liberal supply and lower. Best fresh cows steady. Other grades and springers slow. Today's receipts were 60 cars. With the demand only moderate, the market ruled slow.

Good to choice	$8.80@9.00
Good 1,300-1,400 lb.	8.50@8.75
Medium to good 1,200-1,300 lb	8.10@8.60
Tidy 1,050-1,150 lb.	8.20@8.50
Fair to medium, 900-1,100 lb.	7.50@8.10
Rough, half-fat, 1,000-1,300 lb.	5.00@7.00
Common, 700 to 900 lbs	5.75@7.00
Common to good fat oxen	4.50@7.00
Common to good fat bulls	5.50@7.75
Common to good fat cows	4.25@7.00
Heifers	5.50@8.25
Bologna cows	3.50@4.25
Fresh cows and springers	25.00@90.00

Calves.—Today's receipts were 1,100 head. Choice sold slow, others steady.

Heavy and thin calves	$6.00@ 7.50
Veal calves	8.00@10.25

Hogs.—The supply of hogs has been liberal all week and the market ruled fairly active at about steady prices, while the close on the light and medium weights was 5 to10 cents per cwt. higher. Today's receipts were 65 double-deck loads. The market ruled 5 to 7½ cents lower.

Prime heavy	$8.30@
Heavy mixed	8.35@
Prime medium weights	8.37½@
Best heavy Yorkers	8.40@
Light Yorkers	8.40@
Pigs	8.10@8.25
Common to good roughs	7.00@7.35
Stags	6.25@6.75

Sheep and Lambs.—Sheep and lambs in fair supply but with a good demand for sheep they closed 30 cents per cwt. above Monday's prices, while the springer and yearling lambs were only steady. Today's receipts were 25 double-deck loads. With only a fair demand the market ruled slow and 15 to 25 cents lower on sheep and lambs. Spring lambs were in fair supply and 25 cents lower.

Prime wethers	$5.90@6.10
Good mixed	5.60@6.00
Fair mixed ewes and wethers	5.00@5.50
Culls to common	2.50@4.00
Culls to choice lambs	4.50@7.50
Spring lambs	6.00@9.50

BUFFALO LIVE STOCK

Buffalo, N. Y., June 15, 1914

Cattle.—With a firmer Monday market the trade was fair; dry-fed grassy cattle easy, the warm weather making a light demand for this kind. The close was slow on common grades and steady on good. Today's receipts were 4,000 head. Best, sold steady, others 10 to 15 cents lower.

Choice heavy steers	$9.00@9.30
Fair to good	8.25@8.75
Yearlings	7.75@8.65
Handy butchers	7.25@8.60
Good to choice fat cows	5.00@7.25
Good to choice heifers	7.00@8.25
Butcher bulls	6.25@7.60
Feeders	7.00@8.00
Cows and springers	30.00@90.00

Calves.—There was very little change from the Monday's basis of $10.50@10.75. The close was half a dollar higher, the basis being $11@11.25. Today's receipts were 1,700 head.

Choice veals	$10.50@10.75
Lights and thin	6.00@ 8.75

Sheep and Lambs.—The light supply Monday made a higher basis for the week and prices ruled firmer for yearlings and choice lambs. Sheep were in good demand. Heavy lambs light demand. The market on the closing days was good and prices generally higher. Spring lambs were in good demand and higher. The whole trade was good. Today's receipts of sheep and lambs were 3,000 head and they sold steady.

Choice lambs	$9.50@10.00
Yearlings	8.00@8.60
Wethers	6.50@6.75
Ewes	4.50@5.50
Mixed sheep	5.75@6.00

Hogs.—The liberal supply Monday lowered the basis of prices, but there was a good clearance. The bulk of the Yorkers brought $8.55. Heavy hogs, $8.50@8.55. On the close the trade ruled 5 to 10 cents higher. Mixed and heavier hogs stronger. Roughs were firm. Today's receipts were 18,000 head.

Heavies	$8.40@8.45
Mixed and medium	8.40@8.45
Yorkers	8.40@8.45
Light Yorkers	8.40@8.45
Pigs	8.10@8.25
Roughs	7.10@7.25
Stags	6.50@7.00

Horses.—Offerings 350; fair demand at unchanged values. Basis on best teams, $700@750.—S.

BALTIMORE LIVE STOCK

Baltimore, Md., June 15, 1914

Cattle.—Receipts for the week were 1,535 head against 1,697 last week.

Steers	$6.25@8.50
Heifers	5.50@7.50
Cows	3.00@6.25
Bulls	5.25@7.00
Fresh cows	32.50@70.00

Sheep and Lambs.—Receipts for the week were 12,247 head against 8,366 last week. Heavy supply; market lower.

Sheep	$2.05@
Spring lambs	7.00@9.25

Hogs.—Receipts for the week were 9,008 head against 11,221 last week.

Light Western	$8.75@8.80
Heavy to medium	8.65@8.75
Near by	8.60@8.70
Pigs	8.00@8.65
Roughs	6.50@7.75

Calves.—Receipts for the week were 406 head against 358 head last week. Light supply, market higher at $6.50@11.00.

NEW YORK LIVE STOCK

New York City, June 15, 1914.

Beef Cattle.—Receipts today, 2,700 head Market steady.

Steers	$6.75@9.00
Bulls	5.75@7.75

Choice	$8.00@11.50
Culls	5.75@ 6.75

Sheep and lamb receipts 20,700 head Market lower.

Sheep	$3.50@5.25
Spring lambs	8.50@9.75

Hog receipts 6,924 head. Market steady.

Choice	$8.40@8.60
Roughs	7.00@7.25

PITTSBURGH HAY AND GRAIN MARKET

Pittsburgh, Pa., June 15, 1914.

Hay.—Receipts during the beginning of the week were rather heavy but the demand so far managed to take care of same with only slight concessions. At the present writing the market is fairly good considering the season of the year. It may be if receipts continue heavy market will decline further but at present, indications do not point that way.

No. 1 timothy	$17.50@17.75
No. 2 timothy	14.50@15.50
No. 1 light mixed	14.50@15.50
No. 1 clover mixed	13.00@13.50
No. 2 clover mixed	10.00@11.00
No. 1 clover	12.50@13.00
No. 2 clover	10.00@12.00

There is a good demand for oat straw but the other grades are dull and slow.

No. 1 Oats	$9.25@ 9.50
No. 2 Oats	9.00@ 9.25
No. 1 Wheat	9.25@ 9.50
No. 2 Wheat	8.75@ 9.00
No. 1 Rye	10.25@10.50
No. 2 Rye	9.25@ 9.75

Ear Corn.—Receipts of ear corn quite liberal while the demand is very limited; market dull.

No. 2 Yellow	77 @78c.
No. 3 Yellow	73½@75c.
No. 1 High mixed	75½@77c.
No. 2 Mixed	73½@74½c.

Oats.—Receipts quite liberal while the demand is slow; market lower.

No. 2 white	44¾@45c.
Standard oats	44 @44½c.
No. 3 white	43 @44c.
No. 4 white	41½@42½c.

NEW YORK HAY MARKET

New York City, June 15, 1914.

Hay prices maintain quite a steady tone with a good demand. Receipts Saturday were 968 tons. Prime timothy $1.15 bale; No. 1, $1.10@1.10½; No. 2 do., $1.05@1.07½; No. 3, 95c@$1.00; clover, 82½@$1.05.

The straw market remains steady. Receipts 10 tons. Oats straw, 50c; rye straw, 77½@85c.

GRASS SEED MARKET

Toledo, O., June 15, 1914.

Cloverseed.—Prime cash, $8.10; October and December, $8.67½.

Timothy.—Prime, cash, $2.65; September, $2.75.

NEW YORK MILK MARKET

New York City, June 15, 1914.

The dealers were very well pleased with last week's business. The goods went well and the demand for cream stiffened up at the end of the week. The market conditions have so far not changed the probability that many of the dealers will pay the Borden rate for June. Last year the Borden company paid a bonus in addition to the regular rate. If this is done this year, these other dealers will do the same. Upwards of 70 percent of the market's supply will follow this rate.

The receipts of milk and cream in 40-quart cans for the week ending June 13, were as follows:

Railroad	Milk	Cream
Erie	49,584	3,906
Susquehanna	7,763	392
West Shore	13,867	1,783
Lackawanna	62,950	3,850
N. Y. Central (long haul)	93,491	3,993
N. Y. Central (short haul)	15,125	49
Ontario	43,703	5,691
Lehigh Valley	38,857	2,603
Homer Ramsdell Line	3,025	67
New Haven	9,220	70
Pennsylvania	9,195	504
Other sources	1,780	33
Totals	348,360	22,940

ELGIN BUTTER QUOTATION

Elgin, Ill., June 15, 1914

The quotation committee of the Elgin Board of Trade this afternoon declared butter firm at 27½c.

TOBACCO MARKET

The greater part of the crop has now been transplanted and a very few days will find practically the entire acreage in the field. The acreage will be smaller than last year but just how much smaller cannot as yet be determined. The crop is going out at a timely season and under favorable conditions with the exception of drouth. Rain is much needed and until it comes the transplanted tobacco seedlings will make little headway. Very little of the old crop remains unsold, the few remaining crops being of rather inferior quality and selling at a correspondingly low price. It was reported that one grower refused $11.50 per cwt for a crop of good quality. The cigar industry continues slow which is the most potent cause of easy conditions all along the line.

In New York the main feature is the tendency to specialization in varieties and methods. Climatic conditions there were favorable and transplanting is under way. Wisconsin has not recovered from its recent storms and climatic conditions are still changeable and uncertain, in sharp contrast with Pennsylvania and Ohio. In Wisconsin transplanting has progressed under favorable conditions and the acreage will be considerably in excess of an average. Some growers there are preparing for irrigation.—H. F. Tweed, June 15, 1914.

STEEL Shingles or Wood???

Will you buy wood shingles, which burn and rot, or Edwards Steel Shingles, which are absolutely rot-proof and fire-proof?

Will you buy wood shingles, that have to be nailed on, one at a time, or Edwards Steel Shingles, that go on in clusters of 100 or more?

Will you buy wood shingles at a big price or Edwards Steel Shingles at low prices, direct from the maker?

The time to decide is now—before you have invested your good money.

Edwards Steel Shingles

Factory Prices—Freight Paid

Don't judge Edwards Steel Shingles by common galvanized roofing—which always rusts. We have a method that absolutely prevents rust from getting a foot-hold, as 125,000 people have found. It's the famous Edwards Tightcote Process.

No painting, no extras, no tools, no expert workmen needed. Hired man can do it with hammer and nails. Put 'em on right over old roof or on sheathing. Outlast four ordinary roofs. No dealer's profit to pay. Sold direct from factory to user. And we now pay the freight!

WRITE Get off a postal tonight and our Special Price Offer and Roof Book No. 691 will come by return mail. Then judge. Then decide "which is which"—Edwards Steel Shingles or wood shingles. Give size of roof, if you can. (132)

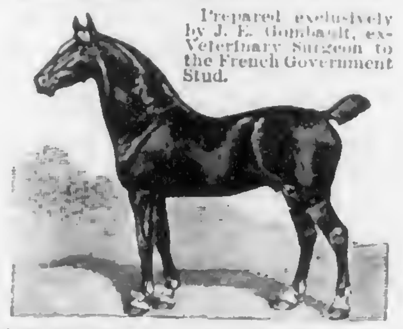
Horse Owners Should Use

GOMBAULT'S CAUSTIC BALSAM

The Great French Veterinary Remedy.
A SAFE, SPEEDY & POSITIVE CURE.

Prepared exclusively by J. E. Gombault, ex-Veterinary Surgeon to the French Government Stud.



SUPERSEDES ALL CAUTERY OR FIRING.

Impossible to produce any scar or blemish. The safest best Blister ever used. Takes the place of all liniments for mild or severe action. Removes all Bunches or Blemishes from Horses or Cattle.

As a **HUMAN REMEDY** for Rheumatism, Sprains, Sore Throat, etc., it is invaluable.

WE GUARANTEE that one tablespoonful of **Caustic Balsam** will produce more actual results than a whole bottle of any liniment or spavin cure mixture ever made.

Every bottle of **Caustic Balsam** sold is Warranted to give satisfaction. Price **$1.50** per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

THE LAWRENCE-WILLIAMS COMPANY, Cleveland, Ohio.

ROOFING

A FREE BOOK that will interest every building owner. It pictures, lists and fully describes roofing and roofing material of every kind. Our guaranteed roofing not only saves you money on the first cost but on its wearing qualities. We return money if not satisfactory. Save money by sending for Book No. E. S 41

HORSE LAME? Use KINDIG'S Famous OINTMENT. A sure cure for bone, bog, and blood spavin, ringbone, curb, soft bunches, splint, etc. 50 cents, post paid. S. Kindig, Jr., Remedy Co., 4525 Woodland Ave., Phila.

Veterinary

(Conducted by W. C. Fair, V. S.)

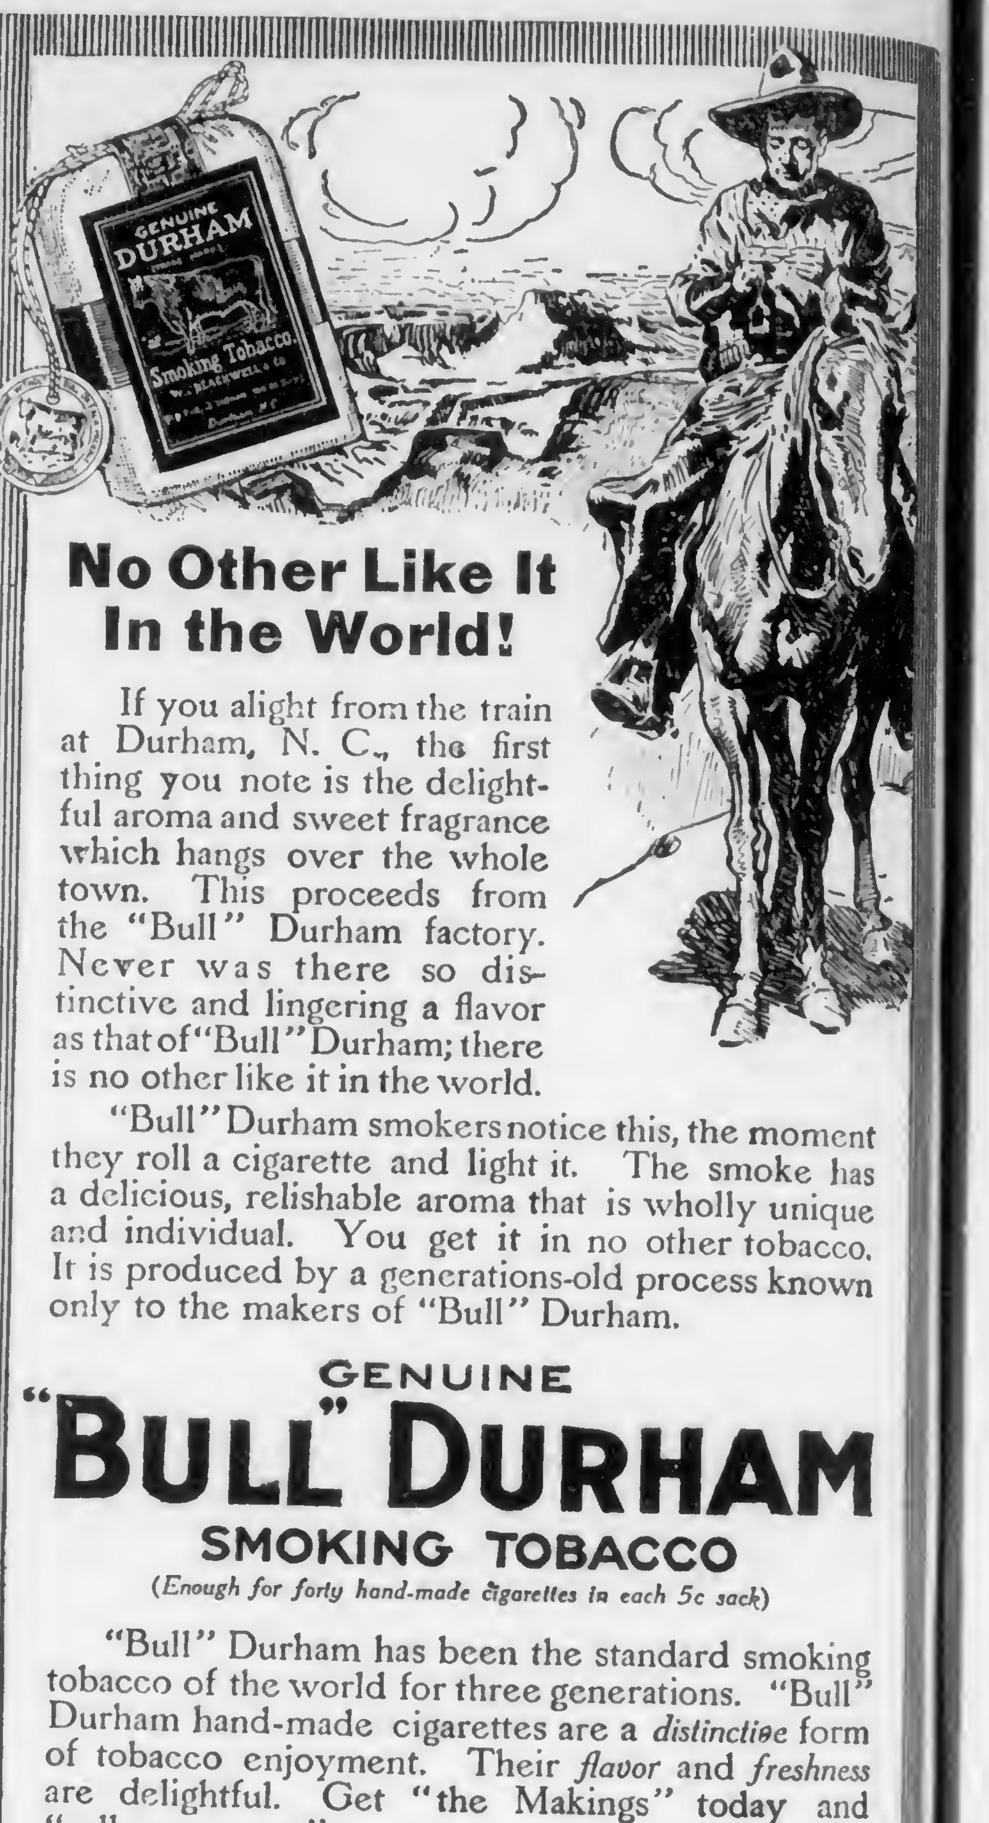
(Advice thru this department is free to our subscribers. Each communication should state history and symptoms of the case in full; also the name and address of writer. Initials only will be published. We cannot make reply by mail. This is one of the most valuable columns of the paper and we invite readers to make use of it. Clippings from this column, when properly preserved and classified, would make one of the most valuable medical symposiums a farmer-stockman could obtain.)

Side-bone.—I have a horse, 8 years old, which has a side-bone. I am anxious to have it removed. T. C. A., Espyville Station, Pa.—Apply 1 part red iodide mercury and 4 parts lard every week or 10 days. Perhaps it is needless for me to say that in some cases the side-bones should be removed by surgical operation. Unless this is done, horse will never fully recover. Furthermore, it always relieves a horse lame from side-bone to lower heels. Give her rest and if worked she should travel on soft footing.

Bloody Milk.—Occasionally my cow gives bloody milk. I would like to know what can be done to correct this trouble. B. J. E., Durand Pa.—Careful milking, plenty of bedding and keeping her away from other stock will perhaps remedy trouble. Over-feeding has a tendency to cause congestion of udder which is sometimes followed by hemorrhage. Apply extract witch hazel to udder twice a day.

Judging Soundness in Horse.—I expect to engage in business buying and selling horses, but have not had much experience and would like suggestions in judging soundness of horses. M. E. T., Jamestown, N. Y.—First of all get experience with a dealer. Practical experience is worth more than a theoretical knowledge gained from books or by correspondence. In examining a horse as to soundness many things should be considered, because unsoundness depreciates value. First, examine the mouth carefully and ascertain if it is normal, notice if notrils and nasal passages are free from polypus or obstructions. See that the lips are not paralized, that the glands of throat are not swollen, that the ears are normal and that his hearing is good. Pass the hand up on poll to ascertain if he has poll-evil; also examine neck under mane for warts or tumors. Examine the shoulders, upper part of neck and withers for bunches or sores, notice carefully if there is any swelling of withers or sweeny in shoulder. Examine the back under saddle for galls or bunches; look carefully under abdomen for hernia or abnormal bunches. The sheath or udder should be examined carefully, then examine the rectum for bunches. Then examine both fore and hind limbs by passing hand over them carefully to ascertain if there are any splint, wind puffs, ringbones or side-bones. Bend the knee to ascertain if there is any mechanical stiffness, then examine hip, stifle, hock, shin, fetlock and pasterns carefully for bunches. Be especially particular in your examination of hock. The opposite side should be gone over in like manner. The eye should then be carefully examined by leading the horse into a dark stall or stable facing a reasonably bright light. When in this position eye imperfections are readily discovered. The animal should then be walked, also backed, then trotted both straight away and in a circle, obliging him to go both to the right and left. In some cases of lameness the horse shows lameness only when traveling in a circle. In order to test his wind, put some one on his back and give him a brisk gallop; this will tell you whether he is a roarer or has heaves. Stand him in the stable where you can watch him to ascertain whether he is a crib-biter or weaver, or stall kicker. Also observe if he stands up squarely on all four feet, or rests one or more. Be sure and see him driven and also in pull of a heavy load. The writer has had a great deal of experience both in breeding and dealing in horses and knows that it is profitable to see for himself rather than to take statements from people who have horses to sell. You usually pay full price for their talk.

Wart on Neck.—One of our two-year-old colts has a wart on neck under mane which is about the size of a small hen's egg. What can I apply that will take it off? B. J. A., Warren, Pa.—Warts are only skin deep, therefore, you had better cut it out and raw spot will soon heal. Apply equal parts boracic acid and tannic acid to wound, 3 times a week.



No Other Like It In the World!

If you alight from the train at Durham, N. C., the first thing you note is the delightful aroma and sweet fragrance which hangs over the whole town. This proceeds from the "Bull" Durham factory. Never was there so distinctive and lingering a flavor as that of "Bull" Durham; there is no other like it in the world.

"Bull" Durham smokers notice this, the moment they roll a cigarette and light it. The smoke has a delicious, relishable aroma that is wholly unique and individual. You get it in no other tobacco. It is produced by a generations-old process known only to the makers of "Bull" Durham.

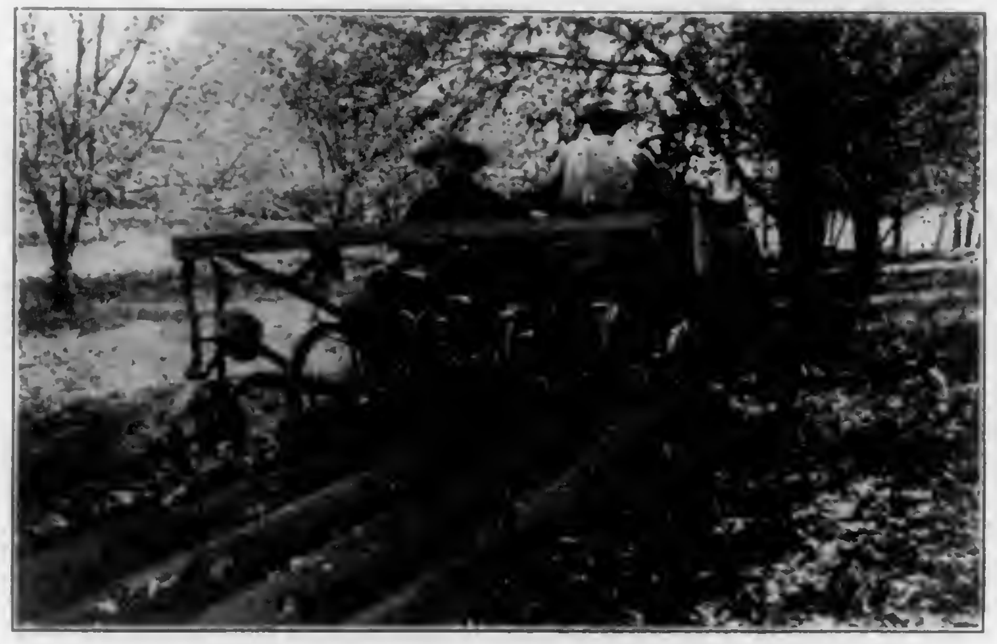
Tractor Power On The Small Farm.

Most of us are inclined to associate the idea of tractor power for farm work with immense areas, clear fields and much but rather poor quality of work done. When the farm tractor is mentioned we call up mental pictures of an immense engine drawing a 12- to 20-bottom plow across a prairie farm where there is not a stone, stump, tree or even a fence in sight. To such a mind, a farm tractor on 50 acres of land and used to perform the exacting work in orchard cultivation suggests the proverbial bull in the china shop. Yet Eli P. Garrettson, one of the most skillful and successful orchardists in Adams County, Pa., (and there are some mighty skillful orchardists in Adams County) is demonstrating the economic advantages of the farm tractor in just such work.

Mr. Garrettson has a farm of 50 acres, 30 of which are in apple orchard with the remaining 20 in preparation for planting in the near future. The motive equipment on the farm consists of a gasoline engine, a farm tractor, a motor truck and a mule team. The tractor and truck are meeting the needs of the farm so well and so completely that the only annoyance now experienced is that the mules are left with little to do but kick the stalls to pieces. In cultivation of the orchards and in seeding and harvesting of the farm crops, as well as in moving the crops to market, the tractor and truck are meeting every requirement.

It was while trying to cover the orchard area with teams and work as close to the trees as good cultivation demands that the small tractor suggested itself to Mr. Garrettson. Investigation seemed to prove that the tractor would do just the work required. Accordingly he purchased a tractor that was rated to develop five horse power on draft and ten horse power on the belt. He also purchased a four-bottom gang plow. With this outfit the problem of getting over the orchard with plow or harrows when conditions are just right to make such work most effective, and in getting so close to the trees with all cultivating implements, has been solved. With two men, one to drive the tractor and one to operate the plow, he gets perfect work. The steering wheel is the highest point on the tractor and the driver is in position to raise low-hanging branches and prevent injury to tree or fruit. And as the machine is under perfect control at all times, the plow or harrow can be brought as close to the trees as desired without danger of barking or jarring them. The accompanying illustrations show the perfection of the outfit in this respect.

The second great advantage found in the tractor outfit is in increasing the amount of work which can be done in spells of irregular weather or when conditions demand rapid work. The bulk of Mr. Garrettson's orchard has now reached the point where deep plowing is no longer necessary. With plows running three inches deep, five acres is about an average day's work, and seven acres have been covered in a day of 12 hours. In plowing for corn or other field crops, the tractor handles the four-bottom gang when plowing at a depth of five inches. Much of this farm is hilly and the tractor has been put to very severe tests in operation of tillage machinery on steep grades. It is used on from 25 to 30 percent grades without difficulty, but has to run on low gear under such conditions. On low gear it travels at a pace somewhat slower than the average farm team.



TRACTOR AND FOUR-BOTTOM PLOW DOING CLOSE WORK IN GARRETTSON ORCHARD, ADAMS COUNTY, PA.

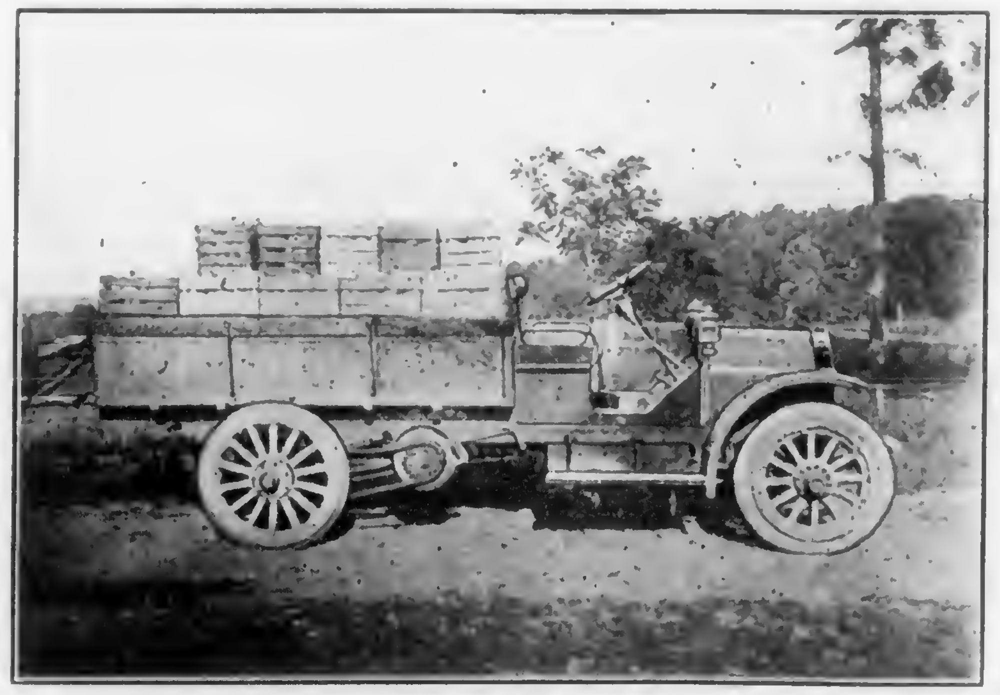
The tractor is used on a 25-disk cutaway harrow in orchard work and covers from eight to ten acres per day of nine hours, depending upon soil conditions.

It is also used in other farm work. During the past two years it has drawn the grain binder in cutting wheat over very uneven ground. The average for the two seasons was about five acres in four hours. The grain acreage is small on this farm, but the tractor has proved its adaptability in such work. It was found advisable to put a short tongue on the binder to facilitate easy handling, and have a boy operate the adjusting levers. The tractor engine has also been used in operating the ensilage cutter, wood saw, feed chopper, etc.

The cost of operating the tractor varies to a large degree with the nature of the work, condition of the soil and skill of the operator. The maximum fuel consumption, when the tractor is working at full capacity, is about 12 gallons of gasoline per day. This was the amount used in plowing the seven acres of orchard in 12 hours. The fuel bill and a slight expense for lubricating oil about cover the cost of operation. Repairs have been nominal so far under good care.

Mr. Garrettson is, if possible, even more enthusiastic over the efficiency and all-around service of the motor truck in his work. The truck has practically taken the place of the team in all road hauling and in much of the miscellaneous hauling on the farm. It is of 35 horse power, guaranteed to carry 1,500 pounds, and actually able to carry much more. It is equipped with solid tires on the hind wheels, and has a carrying body eight feet long and four feet wide. It was found advisable to remove the covered body and equip the car with a platform rack.

The use made of the truck in the apple harvest last fall is an example of its adaptability to farm requirements. Mr. Garrettson handles apples in the orchard in bushel crates. The apples are packed in barrels at the barn and drawn immediately to a storage house one and one-quarter miles from the farm. The regular routine during the rush of the packing season last fall was to bring a truck-load of 40 crates from the orchard to the barn at the close of each day. In the morning the truck would first take its load of 12 barrels to the storage house while the packers were barreling the load brought in the evening before. The truck regularly made the 2½-mile trip to the storage house, returned, brought in a load of 40 more crates from the orchard and was ready for its second load of barreled apples by the time they were packed. Thus the picking force, the packers and the hauling crew were kept busy and the apples were moved away to storage without loss of time or waste of storage space. In a test of time the truck was loaded at the barn, was driven to the storage plant, was unloaded and returned to the barn in 24 minutes.



35-HORSE POWER MOTOR TRUCK USED ON E. P. GARRETTSON FARM, ADAMS COUNTY, PA.

For this work the truck is not only more efficient than teams in speed of work and amount of load handled in a day, but is also more economical in cost of maintenance. During the heaviest and steadiest work, the fuel cost does not exceed five gallons of gasoline per day. The truck has traveled over a thousand miles, frequently heavily loaded, and the tires show little wear. Another advantage over a team is its greater carrying capacity when required. It has drawn 1,500 pounds of lime at full speed and 2,780 pounds over loose ground at a more moderate speed. To increase capacity for rush season work, Mr. Garrettson plans to buy a trailer to couple on behind the truck. A heavy spring trailer, capable of carrying from 10 to 12 barrels of apples, can be purchased for about $100, and Mr. Garrettson believes that such an outfit will serve his needs better and cheaper than a larger or heavier truck. As the traction capacity of the truck will easily handle the trailer, this outfit should meet the requirements for many years to come.

Mr. Garrettson has something like $2,000 invested in traction and power equipment on his farm. This would buy considerable high-quality horse or mule flesh; but with the care he is giving his equipment, he expects it to show a very favorable comparison with teams in time of service, and his records of cost of maintenance and operation to date show it to be more economical. Again, the power equipment has the advantages of doing faster work than is possible with teams, better work where care is necessary, will handle bigger and heavier loads and costs nothing for maintenance except storage room when not in use. An additional advantage, the value of which it is impossible to estimate, is that it is tying two growing sons to the farm. The boy likes to see things "move." A big day's work at the harrow appeals more to his desire for accomplishment if it is done back of a traction engine rather than a team of mules, and if it covers from 10 to 12 acres rather than 5 to 7.

Mr. Garrettson has given both tractor and truck a thoro test, and is enthusiastic over both. He has demonstrated to his own satisfaction that both are more profitable to him than horses or mules for his character and quality of work; and he has demonstrated that both are applicable to the labor requirements of the small farm. Arthur J. Anderson.

LIGHTNING ROD FACTS

I think it is an established fact that a good copper cable lightning rod system is a great protection to property from lightning. Scientists, insurance companies, reading and thinking people generally verify this statement. Many farmers have protected their buildings and contents from lightning the past few seasons who for a time had regarded the lightning rod proposition as a sort of fake.

It is claimed that over 50 percent of the losses paid by Farmers' Mutual Fire Insurance Companies are caused by lightning. A few insurance companies known as Farmers' Mutual Lightning Protected Fire Insurance Companies have taken advantage of this fact, and are insuring only buildings properly rodded. The rates of insurance are only a fraction of that paid by the majority of farmers who are insured by other companies covering both rodded and unrodded buildings, at a uniform rate; a practice which is very unfair. It is a pity that there are not more companies insuring rodded buildings only, or that insurance companies generally do not lower rates on protected buildings. Why should we who have invested money in rods to protect our property from lightning, pay the same rate of insurance as the man who does not protect his property?

A recent statement of a farmers' mutual lightning protected insurance company of Michigan is interesting. This company insures only buildings of over $200 valuation, when properly rodded with first-class copper cable lightning rods. The company is quoted as carrying at present a risk of over $35,000,000 worth of property, with the loss of only one building by lightning in five years, and the loss of this building was traced to defective lightning cable. While this company appears to have very strict rules for rodding buildings, this statement of losses is conclusive of results.

For the policy and survey fee this company charges $1.50; premium 10 cents on each $100, or fraction thereof insured. Their assessment in 1911 was $1.30 per $1,000; in 1912, $1.20 per $1,000 and in 1913, $2 per $1,000. I am at present carrying insurance on farm property in three different insurance companies. The rates I am paying average about $5 per $1,000 of insurance annually. About $2 would pay the highest assessment of the above company in three years. I figure the other $3 per $1,000, which in my case amounts to nearly $20 annually, goes toward paying heavy losses caused by lightning on unrodded buildings. This is not a "trick in the trade" but is "unfair treatment."

The above company will not insure buildings rodded with steel or iron wire cable. They must be rodded with copper cable rods and these are not to be less than 5-16, nor smaller than 18 gauge wire. Glass or earthen insulators must not be used. All rods must have at least two ground rods, connected by the main rod, making a continuous rod circuit from ground to ground. Points must not be placed farther than 25 feet apart, and not to exceed three points to each ground rod. The points must be especially manufactured for the purpose. Gas pipes must not be used for groundings, but the copper cable itself must be put down at least 8 feet, and in light soils still deeper.

Cheap lightning rod systems do not necessarily mean inefficient ones. On the other hand, first-class jobs, and using first-class material, is possible at very moderate cost. There is nothing complicated in rodding buildings and any farmer with good common sense can rod his buildings himself. If he is not climber enough to do the roof part of the work he can well afford to hire someone by the day to do this under his instructions. When rodding my buildings I purchased 7-16 pure copper cable and pure copper points from a manufacturer at wholesale prices, getting it at a fraction of what most agents charge for rodding buildings.

I required considerable rodding material which enabled me to get wholesale rates, but two or three farmers can order their material together. I found it worth money to write several firms before purchasing my material. I figured I saved nearly $100 by buying direct. I was very particular about the groundings of the rods, sinking them 10 feet in the ground to insure their being in moist soil at all times. Two and three groundings were used according to the size of building rodded. The cable was run along the ridge of roof, then down the facing board from gable to eave, and then down the siding and grounded. The tops were placed about 15 feet apart, and fastened to the cable by special clamps. All eave spouting was connected with the lightning rod cable, which is essential.

The work of putting up rods was not difficult, except punching holes the desired depth for the groundings. All necessary clamps, galvanized nails and staples for constructing the rods were purchased with the material. The manufacturers also guaranteed that should any of the buildings rodded be burnt by lightning with the rods in good repair, they would return the purchase price of the rods, with 6 percent interest. When the opportunity comes to insure my buildings in a lightning protected insurance company, I am ready to consider business.—Farmer, Erie Co., Pa.

TRACTOR ENGINE ON CUTAWAY HARROW IN ORCHARD WORK ON FARM OF E. P. GARRETTSON, ADAMS CO., PA.

CAUSES OF HOLES IN POTATOES

"Last year my potatoes were very badly eaten on the surface, and I could find no cause of same. I noticed that the fish-worms were very thick in the potato patch. Could that be the cause?"—A. J. C., Grove City, Pa.

I think the injury described may have been done by the white grub, which is the larva of the May beetle or June bug. It may have been caused by other species of insects, such as wire worms, or by the disease known as the potato scab. Most persons make the mistake of calling scabby potatoes "worm eaten." They do not realize that the disease known as potato scab causes pits in the tubers, as tho they were eaten by worms or grubs. However, these pits vary in diameter and in shape, but are generally about the same depth. Holes made by the white grub are much larger and deeper than those made by the scab germ, while those made by the wire worms are often small in diameter, but deep.

While it is important to recognize the trouble by the marks left behind, it is more important to prevent such damage in the future. Therefore, I can say that the standard method of preventing damage by the white grub is to plant potatoes on ground that has been in a cultivated crop for the last two years. However, this present summer is to be a year of the mature June bugs or May beetles, which are the parents of the white grubs, and you were safe in planting potatoes in sod ground this year, if preferable to do so; 1915 will be a white grub year, and potatoes then should not be planted where there was sod during the fall of 1914. Of course, in all cases the enemies of the May beetles and their larvae should be preserved. Among these the skunk is one of the most useful creatures.

To prevent damage by scab, always dip seed potatoes in a solution of formalin or corrosive sublimate. Use one-half pint of formalin in 15 gallons of water. Put the potatoes into a sack and dip them into a barrel of this solution, letting them stand one-half hour. Then drain them, spread and let them dry, and keep them clean until planted.—Prof. H. A. Surface, State Zoologist.

A TRIP WORTH WHILE

A trip worth while is one going by trolley from Reading to Kutztown to Allentown, Bethlehem, Nazareth, Bangor, Portland and Stroudsburg, thru the most fertile section of Berks, Lehigh and Northampton counties where nature provided soils unexcelled for all crops of cereals, fruits and potatoes. The iron, cement, slate and manufacturing industries of vast extent give employment to armies of employes; affording ready market for the products of the soil.

In the vicinity of Stroudsburg, the Delaware Water Gap and the bank of the river for a long distance is lined with cottages, bungalows and boarding houses, and extensive hotels afford accommodations for a large population of guests and temporary residents from the cities during the summer months. The Delaware Water Gap is worth a visit and a trip on the scenic trolley line winding its way over the mountains affords a grand view of the surroundings. The heaps of sand, gravel and boulders over a part of Northampton and much of Monroe Counties prove the existence at a remote period of a glacial age extending from ocean to ocean, covering valleys, dales, hills and mountain summits with drift brought from the far north and near by points, all mingled in confused masses of granite, sand stone, lime stone, etc, in places scattered over the surface, in mounds and terraces. Some sections are so covered with boulders that the land is not tillable; in some places swamps are formed, together with lakes of various dimensions, while in other places a fine fertile soil was formed of excellent quality.

One of the neglected opportunities afforded agriculture along the Delaware Valley appears to be trucking and fruit growing; the demand for vegetables, berries, etc., among the hotels and boarding places is largely shipped from a distance. Mentioning this to a farmer having a cottage and a farm along the river suited to producing garden crops, the answer was that with a team and carriage, keeping a few boarders and earning five to seven dollars a day in taking visitors out on trips around was easier money than digging in the ground. He said also that those who came to spend their vacations in the country were usually well supplied with cash and it was a part of the business of the citizens to separate their guests from some of it.

Stroudsburg was the mecca where assembled members of the State Board of Agriculture, institute lecturers, experts, specialists and plain and fancy farmers from various counties, but the farmers from the vicinity were conspicuous by their absence. W. H. Stout, Schuylkill Co., Pa.

Farm Crop Notes

By R. P. KESTER.

Counselor on Soils to the State Department of Agriculture.

Thru this department Mr. Kester will discuss queries from Pennsylvania Farmer readers on soils, field crops and general farm practice. Address all queries to Pennsylvania Farmer, Philadelphia, Pa.

Notes by the Way

If he who spends his time in traveling in the interests of agriculture were privileged to photograph and describe all the good and the bad in agricultural practice that he sees, it would, if well done, make a most interesting and useful book, one that would teach more helpful lessons to farmers than any technical books on the subject.

One of the most noticeable things is that good crops and success depend more on the man than the land. In some sections, you will see only here and there a prosperous looking farm, standing out like an oasis in the desert, an example of what might be done thruout the neighborhood.

Again, we see whole communities that seem to be prosperous, happy and contented. In such places we find a progressive community spirit. In such places the people meet and talk and work together for their common betterment. Whatever may be said in addition, the basal need of agriculture and agricultural communities is personal efficiency and social co-operation.

The Legislative Way

They who, for partisan purposes or from a desire to further their own ambitious ends, try to befog the farmers' minds as to their needs and duties should be distrusted, no matter what label they wear. The demagogue should find no welcome among farmers. He may be recognized by his speech, his style and his spirit, not by his business, place or party name. The farmer has too long been playing the part of the ball in the foot-ball game of politics. Agitators have declared this law and that law, the success of this party or that party, to be the panacea for the ills that exist in the agricultural world. Laws have been passed and other laws repealed; parties have triumphed and have been defeated and the millennium is not yet—nor will it ever be brought by legislation alone. Better laws will succeed, not precede the time of greater intelligence and personal efficiency and a more general willingness to work with and for each other.

Fassett's Fruit Farm

Situated on up-land, a few rods back from the Susquehanna river in Wyoming Co., is the properous fruit farm and hospitable home of F. H. Fassett. Mr. Fassett is well known thruout Pennsylvania as an institute lecturer on fruit growing. A visit to his farm will show the visitor that he does and has just what he tells of on the platform. Dropping in on him the other day, I found him up a tree. He was pruning some ten-year-old Northern Spy trees to hasten full bearing.

One can see in this orchard the effects of the different methods of treatment and fertilization. The sod mulch, sod and manure, culture and cover-crop, etc. Also the effects of different fertilizing materials, singly and in combination. Exact records of growth and production are kept as well as the cost of the different treatments. Mr. Fassett is conducting this experimental work in connection with the state experiment station. However, the orchard is first and last a business proposition, and Mr. Fassett and his sons are making it pay.

Summer Forage

How soon the dairymen or other stock-keepers run against a snag when a dry spell hits them if they are depending entirely upon pasture for summer feed! The increasing price of land, the uncertainty of sufficient rain, the passing of fences, etc., all indicates a greater need to provide something to help out in the feed of herds in summer. Silage, alfalfa, oats and peas, early corn are easily provided and may be allowed to ripen and be stored for winter if not needed. Anyway, their provision allows the farmer's head to lie more easily when the summer showers fail to come regularly.—R. P. K.

HESSIAN FLY THREATENS

The Hessian fly has returned to the wheat producing counties of North New Jersey and threatens the destruction of the 1914 wheat crop. Recent warm weather revealed the presence of the pest and confirmed the suspicions of the farmers that the bugs had returned. Grain fields, which gave promise earlier in the season are now showing the yellow streak indicating that the flies are at work. Concerning the growing wheat crop, there is nothing that can be done now to check the ravages of the fly. The problem now is to cut off the fly by preventing its propagation, and the consequent menace to the wheat that will be sowed this fall.

THIS OUTFIT HAS COVERED THE GARRETT

The danger to next winter's wheat crop lies in the fact that if the Jersey farmers follow their usual practice of planting the crop early in September, the flies will have opportunity to lay their eggs in the tender "tillers." Safety lies in planting after Sep. 25. If this is done, the early shoots will appear after the fly has gone, and the next crop—the winter wheat to be harvested in the summer of 1915—will be immune from the fly. As to late planting, experience teaches that farmers are reluctant to give it due attention. The farmers have asserted repeatedly, despite the certainty of a tainted field, that unless their fields be sown early in September, the wheat will lack the virility to live thru the winter. The answer to this statement would seem to be that we should be able by careful preparation of the soil and the use of a speedy fertilizer to bring our fields to proper maturity for wintering, despite the lateness of planting. By such a course, and only by that course, can the fly be successfully checked.

Thus, instead of planting the first week in September, we should plow and thoroly work our fields, so as to produce a finely pulverized, compac

MUTILATED TEXT

by the wood from the vinegar be detrimental? R. G. L. Newcastle, Pa.

An old vinegar barrel is suitable for storing concentrated lime-sulphur solution. I have used them many times for this purpose, and am using one-half dozen of them now with good results. I make all my lime-sulphur solution during bad weather, and store it in any open-headed barrel until I want to use it, thus saving time. I, of course, store it in the concentrated manner, and do not dilute it until I am ready to use it. I also use oil barrels.—Prof. H. A. Surface, State Zoologist.

SOME "BUG BEARS"

The farmer, the market gardener or even the village resident with only a small plot of ground at his disposal starts out on the first approach of spring to plow, prepare and plant his garden or acres, as the case may be, with high hopes of success. The soil may be ideal, he may prepare in the best manner, use the best plants or seeds obtainable, use scientific methods of manuring and fertilization, climatic conditions may be good too; and seeds may be planted at just the right time. If the grower is setting plants equal care may have been observed in preparing and planting. all may start to grow, not a plant be missing. The future looks bright but troubles in the form of insect pests sooner or later begin.

Asparagus Beetle

There are two bugs that infect the asparagus plant and while they have distinct names and can be easily told by their looks their deviltry is about the same and the remedy for both is similar. One of these is the ordinary asparagus beetle while the other is the twelve-spotted asparagus beetle. While they do not do a vast amount of damage to cutting beds except where entire green grass is cut they do a vast amount of damage to young planted beds. They begin feeding on the young and tender parts of the plants. Later one can observe the stalk all speckled with eggs. In a few days, if the weather is warm, these eggs hatch and the young begin operations at once, seeking the more tender parts of the plant on which to feed.

If these insects are allowed to go unmolested the vegetable part of the plant will soon be destroyed. On young planted asparagus beds this is dangerous. The life and future usefulness of an asparagus bed depends almost wholly on its care and management before cutting begins. If allowed to become stunted from any cause its future usefulness is impaired and if badly damaged by bug depredations it will die; hence the grower must see to it that these insects and their young are destroyed. If the planting is small and poultry are allowed to roam at will thru it they will keep it clean until it gets quite tall; otherwise the grower must resort to poisons and now is the time to use them.

These insects are chewing insects, hence poisons kill; the only question being the effectiveness of the poison used. The asparagus plant has a peculiar fern-like foliage that is hard to penetrate and upon which it is hard to make applications of spray mixture stick. I have used paris green with fair success but it does not stick in case of a rain, neither does dry arsenate of lead. The most successful material I know of is 6 pounds of arsenate of lead paste to 50 gallons of soft water. Use plenty of the mixture and drive it into the foliage with high pressure. If this mixture can be applied 24 hours without any rain it will stick from 10 days to 2 weeks; in fact, it will be new growth that will have

to be sprayed next time. No definite advice can be given as to amount or number of sprayings. Spray when bugs are on the plants in sufficient numbers to do damage. One season one spraying may do the work; another might require three, but in any case keep the insects killed or disaster will follow.

The Squash Bug

There is another bug that attacks squashes, cucumbers, cantaloupes and allied plants, commonly known as the squash bug and it is far more troublesome than the asparagus bugs. A perfect stand of any of the above named plants may be ruined by the squash bug in a full day's time. Poisons do no good. The insects work early in the morning on the under side of the leaf and the only remedy is a repellant. Almost anything with an offensive odor will drive them away; also anything of a floury nature, such as air-slaked lime or very fine land plaster. Mix with this a sufficient amount of crude carbolic acid to give an odor and dust on the young plants and on the soil under the plants just as soon as bugs appear. One can not be too quick. He may be compelled to apply this remedy to cantaloupes even on Sunday morning knowing that failure to do so will mean that the planting will be lost by the next morning. I have also used with success fine dry ground fish scrap. Where this is available it is desirable to use it because nothing is lost but the time in applying it; it is a good fertilizer and the plants will later utilize it. A close watch on the young plants and quick action must be the watchword. One or at most two applications are all that is needed for these insects.

The Cutworm

The cutworm is very troublesome under certain conditions and in some sections particularly. When the cutworm is discovered or suspected at a point where hay or legume crop has been plowed down the grower should mix together 1½ pounds of Paris green and 50 pounds of good sweet wheat bran, mixing and applying it dry, as it lasts longer and does better work. Apply in the field before the crop is growing. The worms being hungry at this time will devour it and die. Do not wait until damage is done. These pests are too lazy to move when their stomachs are full and once they are located among plants poisons do but little good.

The Potato Bug

Last but not least there is the potato bug and when plants like the tomato and eggplant are planted where numbers of these hard shell bugs can get at them, considerable damage is soon done. Poisoning may help but they will not entirely eliminate the trouble, especially when the bugs occur in large numbers. There are so many working at one time that by the time the poison kills all a sufficient amount of chewing has been done to kill the plant [illegible]. The grower must resort to hand picking where these pests appear in quantity. Hand picking of potato bugs has been practiced by tomato and eggplant growers in this section on large acreages with success.—C. C. Hulsart, Monmouth Co., N. J.

BUSH FRUITS

Raspberries.—In planting raspberries set plants in well prepared soil as early as possible in the spring, 3 or 4 inches deep, leaving the short cane above the surface. Planting distance should be 4 by 6 feet, or 5 by 5 feet if cross cultivation is desired. The first year the young canes will not grow very high, and should be pinched off about 2½ feet from the ground and but 3 or 4 allowed to grow. The second season will be a partial crop. Prune back in the spring with the hand pruners, leaving the branches about 6 to 8 inches long. As soon as the new canes, which come from the roots, reach a height of 3 feet pinch off the tips and allow only 4 to grow, but if the soil is light, thin to two or three. These canes will then branch, forming the fruiting wood for the next season. Prune back in the spring as before.

It is important that the number of canes be limited, because the plant will naturally throw out more than the roots can stand sapping the vitality of the plant and resulting in poor quality of berries. As soon as the canes have borne fruit they die and the sooner they are cut out and burned the better.

Red raspberries take the same treatmen as black caps and it is well to plant some of them. They do not bear as heavily as black caps, but they usually sell at a higher price. The purple berry is a very prolific bearer and is considered superior to either when canned. Its appearance is against it and does not sell well on the market.

For the raspberries, good varieties are: Black raspberries—Gregg, Plum Farmer, Kansas Black and Cumberland. Purple raspberries: Columbian Purple. Red raspberries: Cuthbert and London.

Blackberries.—Blackberries are a paying crop but are hard to manage, as the sprouts come up all over the ground. They are propagated by root shoots. The canes should be cut out between the rows and kept thinned in the rows. The best planting distance is 5 by 8 feet.

Dewberries.—The dewberry is a species of vining blackberry native to Pennsylvania. It is not grown much commercially because of the difficulty of keeping the vines within bounds and in picking the fruit. The best way to grow them is on an arbor about 18 inches high, but this is too expensive for commercial purposes. The only variety that is worth planting is the Lucretia.

Currants.—Currants are not grown as much as an intercrop as they should be. There is not as much difficulty in harvesting currants as with other small fruits inasmuch as they remain on the bush two weeks after ripening without damage. Good prices are always obtained, because the supply never equals the demand. Plant in rows 5 feet apart and 4 feet apart in the rows. Keep thinned to 4 or 5 canes, cutting out one-half the number each year.

Good varieties are: Cherry, Fays Prolific, Wilder, Red Cross and Perfection.

Diseases of Small Fruits.—The essential things to keep in mind are preventative measures. Spray before the disease gets started, keep the plants growing and never allow them to become anemic, as this is the ideal condition in which to allow disease to get a start.

Anthracnose is one of the worst diseases of raspberries. Avoid getting plants from fields infected and cut out and burn all infected canes. Practice frequent rotation. Anthracnose also affects currants. It is controlled by using 5-5-50 bordeaux mixture applied thoroly. This will also control leaf spot.—H. G. Fassett, Wyoming Co., Pa.

Potato Diseases in New Jersey. Circular No. 33 of the New Jersey Experiment Station at New Brunswick, N. J., is a discussion of potato diseases in New Jersey, with suggestions as to their control, and contains some detailed discussion of the potato seed problem as it exists in Pennsylvania. Illustrations of the appearance of the different diseases on the tubers and also of types of fumigating houses, make the bulletin complete.

Getting at Cost of Production.

By W. M. KELLY, New York.

It is difficult to get at the exact cost of producing milk. There are so many factors like soil fertility and the intrinsic value of various improvements in stock and equipment that evade appraisement. Many a dairyman appears to be making a profit from his cows, when in reality a missing link in the summary of his annual operations may conceal a source of loss that heavily taps the proceeds of his other farm operations. Viewed by the difference between the size of the milk checks and the cost of purchased grain feeds, the business may appear to pay, while actually it is consuming the profits from some of the other branches of farming during the term of years.

If we figure the cost of producing milk on an exact basis, and charge the feed and labor against the cows at current prices, but few milk producers could show a profit at the end of the year. The best test of the wisdom of feeding dairy cows, and their value as a factor in increasing the fertility of the farm, is found in the gain in the productivity and value of the property in a decade or more, if the income has been largely invested in the business.

While it is important on the farm that we should know what milk, potatoes and other products actually cost to produce, yet, we should take a broad view of the situation from the standpoint of the fertility of the farm, which comes in a greater or less degree from the presence of the cows. In this way we can look the situation squarely in the face, know what it costs to produce milk under normal conditions, and give the cows due credit for the fertility utilized by the crops produced on the farm.

PRODUCTS	Cash Paid Out For			Depreciation of Stock	Taxes, Insurance and General Repairs, Etc.	Total Cash Paid Out	Interest on the Investment	Produced and Used on the Farm in making Other Products				Total Cost of Production

COST SHEET—MARCH 1, 1912 TO FEBRUARY 28, 1913.

Is there any way by which the producer of milk can ascertain with a reasonable expenditure of time whether or not his cows or his crops are profitable? I think there is, and the plan I submit is one which separates the cost of production of the various products of the farm. I recommend this plan because it practically compels the owner to consider the exact distribution, in making up the cost of various products, of the indirect expenditures which are too often neglected. Some of these expenditures must be arbitrarily apportioned it is true and, altho some error may exist by this arbitrary apportionment, nevertheless the proposed method will get at the approximate cost of any product. Experience and observation have convinced me that the man who knows just what it costs to produce farm crops and finished products is always master of the situation.

For example, I submit a cost sheet I made in figuring the cost of producing milk and other products for a farmer who employed me in the capacity of farm adviser. This sheet was made up from his books for the past year and will give a very good idea of the actual cost of producing milk, potatoes, apples, wheat, corn and hay here in western New York. On this farm we find that the potato crop actually made the most net profit, but it was in a measure dependant upon the manure from the cows and the supply of organic matter from the roots and stubble of the hay crop, yet the liberal use of purchased plant food for the potato crop more than made good this dependence, because the fertilizer that was not utilized by the potato crop helped out every other crop in rotation.

The gradual addition of more plant food to the soil than is removed by the crop helped to balance up the supply for succeeding crops in the rotation. If the potato crop is omitted from the rotation the cost of producing milk would be greatly increased, and the net profits of the farm materially reduced. This is due to the fact that the potato crop affords a better distribution of labor and fertility, and that the use of larger quantities of the mineral elements of plant food tends toward a more economical use of the available supply of nitrogen, thus encouraging a better growth of wheat, clover and mixed hay. The growth of several crops on the farm and their reciprocal effect upon the soil and the net income from the farm can not be thoroly understood unless we keep a cost sheet and know what it actually costs to produce each crop.

In getting at the profits of farming I can not agree with a large number of economists who persist in distinguishing the business profits from earnings. This method only complicates the problem and makes it difficult to understand. Looked at from any standpoint the varied earnings are better understood if we regard them all as the returns from labor; returns marked by many peculiarities, among which the most striking are the risks and uncertainties, the wide range of market and weather conditions and the high gains from good management.

In most cases farming profits are separated from wages by considering as wages that amount which the individual would receive if hired by some one else. An efficient farmer's earnings are likely to exceed that sum; the excess is profits. Here emphasis should be put on the element of risk. Profits differ from labor because they are the result of the assumption of risk and are the reward for that assumption. To know exactly what you are really entitled to draw from the business it is necessary to study the facts carefully, avoid all fallacies, count in every expense, and get the price that will pay the profit. This is no small order, but if you have the courage to study the cost of each product and get at the real facts, you will be able, thru good management, to materially reduce the cost of each product on your farm.

SALES SHEET

March 1, 1912 to February 28, 1913.

80 gallons of milk per day for 365 days at 15c per gal.	$4380.00
14 veal calves	134.00
6 cows sold from herd	196.00
3640 bushels of potatoes	2548.00
243 bbl. of apples at $2.00	486.00
170 cwt. of apples at 50c	85.00
Poultry and eggs	318.00
Wheat 640 bushels at $1.10 per bushel	704.00
Wool, lambs & breeding rams	214.00
Small fruit, truck, etc.	72.00
Total products sold from farm	9137.00
Total sales as per sales sheet	$9137.00
Total cost of production as per Cost shee	8809.00
Leaving a profit of	328.00

This profit of $328 is found after deducting the total cost of production from the amount of the total sales. This comes after allowing the owner the difference between total cost of labor as per cost sheet and the amount he actually hired or $1,240 minus $760, leaving $480; interest on his investment, $680; pay for manure, $650; pay for hay, seed, pasture, silage, etc.,$2,140; and $290 worth of food for his family, or $5,093. So long as each crop and product is made to practically pay its cost of production we are on a safe basis, and good management can make a good showing for the year's business. When each crop and product is compelled to stand strickly on its own merits, we can trace every loss to its source.

The farm from which I have submitted the above cost sheet consists of 156 acres of land, about 43 acres in pasture, 10 acres in bearing apple orchard, the rest of the land being devoted principally to the growing of potatoes, corn, hay and wheat, a five-year rotation of crops being practiced. About two-thirds of the manure is applied to the sod ground in preparation for the potato crop, the balance is used to patch up the thin spots in the clover and grass seedings. The livestock consists of from 26 to 34 dairy cows, the number required to maintain a minimum production of 80 gallons of milk a day which goes to the city trade, 6 work horses, 24 sheep and about 300 hens.

In making up this cost sheet I have not attempted to get at the exact cost of producing each crop and product on this farm, but I have charged each crop and product what the owner and myself thought a fair amount, providing they were compelled to stand on their own merits. At first glance many would say that I am not charging enough labor against milk production, but further study will show that the labor is charged against the corn and hay crops, which are consumed by the cows, sheep and horses. It has been my aim to charge each crop and product maximum prices for labor, seed and fertilizer, so that thru good management the owner could materially reduce the cost of growing each crop and producing each product.

For example, I have charged the potato crop $1,445 for labor, seed, manure, horse keep, fertilizer and a part of the taxes and interest on the farm, while actually the larger part of this ost is being credited to the farm and the other lines of production. The oint I wish to make clear is that any times a crop or product that apears to be paying a fair profit may be apping the other lines of production heavily that it conceals a source of ss. Some crops and some products hat appear to be produced at a loss may more than make good this apparent loss thru their direct benefits upon the other crops or products which depend in a large measure upon them for their most profitable production.

In the case of milk production on he above described farm, the cows ave left a by-product, in the form f manure, worth at least $600 for use n preparing the ground for succeeding rops. The cows have stood on their wn merits and paid full price for their eedstuffs; therefore, it is only fair at we charge the crops which profit rom the use of the manure a reasonble sum for its use. This enables us o get more nearly at the exact cost f production so that we may know hich branches of our farming are aying the most profit. It also goes o show to what extent the crops proluced on the farm are dependent upon he presence of the cows. The feeding f livestock and the growing of the everal crops in rotation and the reciprocal effect of each kind of livestock and each crop upon the profits and fertility of the farm affords an interesting and profitable field for study and investigation.

Meridale Jerseys

Meridale Jerseys are increasingly attracting the attention of discriminating breeders —the men who like good-looking cows, but who also put emphasis on production. The Meridale herd comprises several families of just such cows.

A new issue of our little booklet, entitled "Meridale Jerseys," describes them and their progeny quite fully. It will be sent on request. Address
AYER & McKINNEY, 300 Chestnut St., Philadelphia, Pa.

ADVANCING PRICES OF COWS

The eastern dairyman has a lot of things to guess about of late. I do not know but we have always been just as much uncertain about the future of our business as we are now, but it does not seem so. We have the high price of cows now to look after as well as the high price of feeds and labor. In addition, we have the possible imports of dairy products, or rather the probable importation of such products. Speaking of the price of cows, will say that they are high and it seems likely that they will remain so for some time. Possibly not so high as just at present, but we are not looking for cheap cows very soon.

The other day a dealer came along looking for cows. He stopped at a neighbor's and offered him $80 a head for what he had. My neighbor priced the cows at $100. The dealer said he had been out all day and those were the first cows he had found that he could buy at any price. He said that if he could find enough others to make out a car load he would be back as he believed the owner would reduce the price somewhat. One does not have to hark back many years to find cows offered at less than half the sum offered for these. All last winter stock was being shipped out by the car load. That was because of the dry season and the consequent shortage of feed. Now grass is looking fine, and that has much to do with the advance in prices.

There are more calves being raised than for some years, and it will not be surprising if there should be a surplus of stock in a few years again. At $75 to $100 for good cows there is not so much money in raising them after all. If one could be sure of getting good cows at that price he might about as well buy as to raise. Of this he can not be sure, and it stands us in hand to keep a purebred bull of the right stamp and raise what cows we need for our use at any rate. I know of some men who have started out to raise up cows to sell. That does not seem to me the part of wisdom unless, as in one such case, milking is practically out of the question, and something is needed to work up the roughage that is produced on the farm.—H. H. Lyon, Chenango Co., N. Y.

HOLSTEIN FRIESIAN MEETING

The 29th annual meeting of the Holstein Friesian Association of America was held at Chicago, Illinois, June 2 and 3. Members present represented 19 states, Wisconsin leading with 97, Illinois being second with 72 and Michigan third with 59. President A. A. Hartshorn, in annual address pointed out the growth of the association and presented promising conditions of breed affairs. There were 938 applications for membership in the past year. The association is now recording production of 55,000 cattle per year; total income from this source, $109 968.75. Total receipts during the past year were $172,775.97 and disbursements $175,723.30, of which $52,651.25 was invested in bonds. Cash on hand amounted to $153,012.11 and total cash in banks and in bonds, $205,663.36.

During the past year 9,722 cows were under test, 423 being for yearly records. For the 9,116 ordinary records, the average production was 402.8 pounds of milk, 16.68 pounds butter; average per cent fat, 3.55. Appropriations made for the year include $7,500 for special prizes at fairs and dairy shows; $15,000 for prizes for records made under the advance registry system; $25,000 for the work of the literary committee, $400 for scholarship in students' judging contest at National Dairy Show and $5,000 for representation at the Panama Pacific Exposition.

The following officers were elected for the coming year: President, D. D. Aitken, Flint, Mich.; treasurer, Wing R. Smith, Syracuse, N. Y.; supt. of Advanced Registry, Malcolm H. Gardner, Delavan, Wis.; secretary, Frederick L. Houghton, Brattleboro, Vt. The next annual meeting will be held at Syracuse, N. Y. A number of matters of especial interest to members was discussed. Full report, giving reports of various officers and complete minutes of session will be published and distributed from office of the Secretary.

You need a new DE LAVAL SEPARATOR NOW

1st If you are still using some gravity or setting process of creaming---

BECAUSE YOUR WASTE IS greatest and quality of product poorest in mid-summer, when the milk supply is greatest.

BECAUSE TIME IS OF greatest value on the farm at this season and the time and labor saving of the good separator counts for most.

BECAUSE THE SKIM-MILK IS poorest without a separator in hot weather and often more harmful than helpful to calves.

BECAUSE THE WORK OF AN improved De Laval Cream Separator is as perfect and its product as superior with one kind of weather as with another.

2nd If you have a very old De Laval or an inferior separator of any kind---

BECAUSE THE LOSSES OF the poor separator from incomplete skimming and the tainted product of the hard-to-clean and unsanitary separator are greatest at this season.

BECAUSE OF THE GREAT economy of time at this season in having a separator of ample capacity to do the work so much more quickly.

BECAUSE AN IMPROVED De Laval is so much simpler and more easily handled and cared for than any other, and you cannot afford to waste time these busy days "fussing" with a machine that ought to have been thrown on the junk-pile long ago.

BECAUSE THE DE LAVAL Separator of today is just as superior to other separators as the best of other separators to gravity setting, and every feature of De Laval superiority counts for most during the hot summer months.

These are all facts every De Laval local agent is glad of the opportunity to prove to any prospective buyer. If you don't know the nearest De Laval agency simply write the nearest main office, as below.

Poultry

KEEPING LARGE FLOCKS

I have recently seen nearly 300 hens in one flock, that returned the owner over $2.00 per hen. First he divided his poultry house into rooms for 40 hens, and had a separate yard outside for each flock. This man has business in the village close by that requires about 10 hours of his time every day. He found that feeding and caring for his hens when kept in so many divisions was too much work for him, so he experimented by keeping two flocks together, with the result that he had less work and got just as many eggs. Later he opened the division doors, and kept almost 300 birds in a flock, with no reduction in egg production. He now has 1,000 hens, kept in units of 500, and the labor of feeding them is reduced to a minimum by filling modern self-feeding hoppers with dry mash constituting a balanced ration, once a week. In the summer scratch feed of a mixture of grains, provides exercise.

There can be no possible benefit in separating hens by division walls or fences provided they are kept busy working for their feed; in fact, the healthy, vigorous hen that scratches all day apparently thrives better when there are many others around her, necessitating competition.

AN EXAMPLE OF SLIP-SHOD, BACKYARD POULTRY RAISING TO BE SHUNNED.

The poultry man I have mentioned did what every one can do, covered the scratch feed with the most convenient material and kept the hens a little hungry in the first part of the day so they would naturally be looking for something to satisfy hunger. Another has this litter for the floor very convenient by providing straw ventilation. Straw is stored in the loft over the henhouse. There are openings at the gables to let the air thru the straw to the hens. Fresh straw is easily pulled down to the floor any time when needed for the litter to cover scratch feeds.

We use alfalfa hay. We want to get the surplus hay fine enough to use as a fertilizer for our crops in the cheapest way, and know of no more economical method than to cover the henhouse floor deep with alfalfa hay and let the hens scratch it until it is broken into small pieces. In the morning we throw down a small quantity of grain and pitch the alfalfa in a big pile over it. A big flock of hens will work the hay over and over for a long time to find every kernel of grain. In a few days the alfalfa will be sufficiently broken up into bits and with the hen manure mixed thru it, is stored away for a fertilizer or spread on the land, and more alfalfa is placed on the floor. Alfalfa which has been used thus makes a very good mulch for the strawberry bed. It is all that can be desired as a fertilizer as it contains no weed seeds and retains moisture quite well. All poultry keepers should grow alfalfa. It is excellent poultry food, rightly used, and it is hardly possible to get maximum egg production without it; also it involves little cash outlay.

Briefly then it has been demonstrated that a division fence or partition is not an aid to increasing egg production, if each hen is kept busy. The point in the whole proposition of increasing the flock without reducing egg production, is to work out successfully the problem of compelling the hen to scratch for her living winter and summer.—W. H. Jenkins, Delaware County, N. Y.

PUTTING ON SUPERS

Beekeeping is such a mystery that one can hardly ever be sure that he has learned one of its secrets. What may seem to work in one locality may not work in another. And what may work with one colony will not work with another, each colony like each dairy cow apparently having its own individuality.

In the matter of putting on supers, the common practice is to study the flora of one's locality and then put on the supers just at the time when the honey flow comes on. This may be true for some colonies, but on the other hand, it may be altogether wrong for some other one. It seems to me that the number of bees in the colony is a better index to the time to put on the supers than is the time of the beginning of the main honey flow; for, if the brood chamber is not full of bees there is no use of giving additional room by putting on the super; they will not go up into it any way. Then again, if a colony is strong in the spring, has abundant stores, and weather conditions are favorable for brood rearing and the supers are not put on it is apt to get the swarming fever and give much trouble during the season.

I think that the proper time to put on supers is just at the time when the brood-chamber gets full of bees, even if it is in fruit bloom. This condition of any colony can be observed readily by simply lifting the cover and looking down between the frames. If there are several bait sections in the super and there is even a light flow of honey coming in, the young bees will go up in the super as the brood-chamber becomes crowded below, and when the main honey flow comes on, everything will be ready to receive it.

Then I think it is a good practice to put on another super after work has started nicely in the first one. This one should be put on the top and when the first super is about half or three-quarters full reverse the supers and usually this will put new vigor into the colony. One can tell whether a colony needs attention by observing closely at all times the activity at the entrance.—V. Ross Nicodemus, Bedford Co., Pa.

BROILERS FOR PROFIT

Women are especially adapted to raising broilers for the market according to Professor David F. Warner, of the department of poultry husbandry at State College. At the conference of women who are interested in agriculture and horticulture held at Ambler, Pa., Professor Warner said "Women are willing to take more pains and are more careful to look after details which are essentials to success in raising broilers for profit."

Women who were planning to take up this business were advised to begin on a small scale and learn the business before branching out. Care must be taken in selecting the breeding stock so as to get best results in shape, size and quality. There are three sizes of broilers sold in market. The squab size weighing ¾ of a pound, the small broiler from 1 to 1½ pounds and the large broiler at 1½ to 2 pounds. In special trade such as club rooms and wealthy people the average price is from 60 cents to $1 per pound, picked and 35 to 50 cents live weight. It costs 14 to 18 cents to produce a broiler weighing 1½ pounds not counting labor.

Incubators should be started early and the eggs collected often to prevent chilling and thus lower the rate of fertility. Sour skim milk is recommended as an excellent feed for chicks in the brooder. A good scratch food is cracked wheat 25 pounds, pin head oats 15 pounds, cracked corn 25 pounds. An excellent mash is made from the following formula: 6 pounds corn meal, 4 pounds wheat middlings, 2 pounds beef scrap wet with sour milk or sweet milk.—N. D. Hitchcock.

PRESERVING EGGS FOR WINTER USE

Many farmers find that it is good economy to pack down eggs for winter home use while they are cheap. The water glass system of keeping these is well known and very successfully used. Another system which seems to have some advantages over the water glass and is certainly much cheaper is to take one-half cup of quick-lime, mix it with water until it has come to what is known as a lime cream and pour it in one gallon of boiled, cooled water and store the eggs in this in the cellar, making sure of course that the solution covers all the eggs. Do not use more lime than is in the prescription as it is likely to give a flavor to the eggs. Recently I have found several city people who have made a practice for many years of buying eggs during this season and storing them for their own winter use for cooking and ordinary eating purposes. These little economies on the farm are worth while.—Prof. F. L. Stevens, in Lehigh Valley R. R. Bulletin.

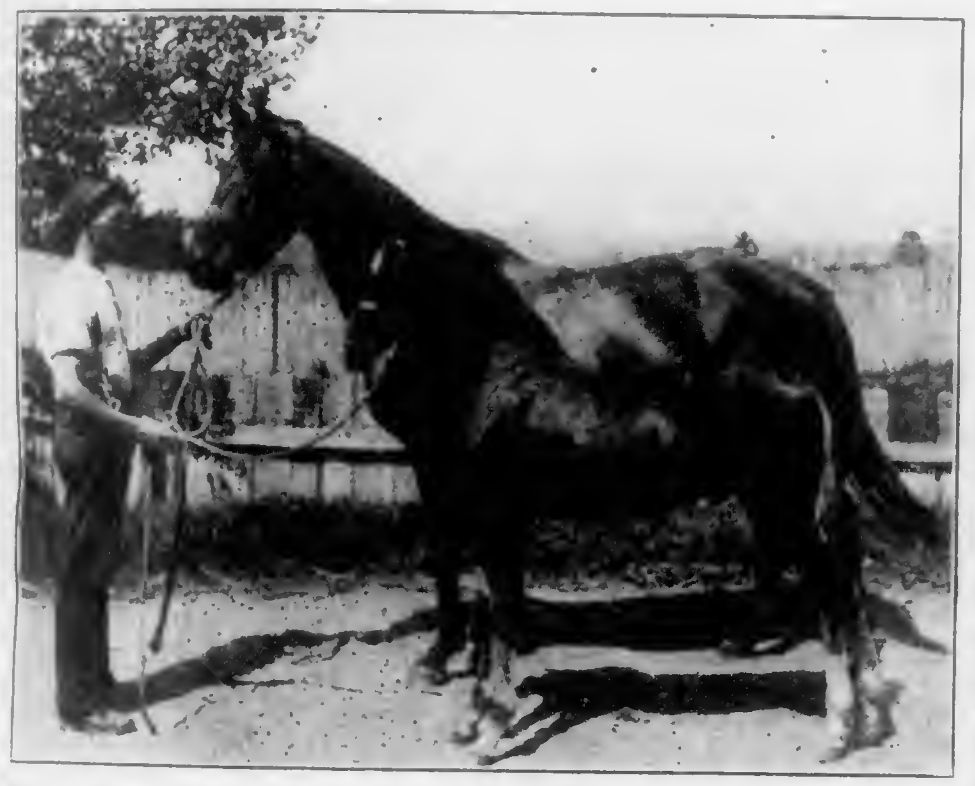
TRAINING THE COLT

Little Hints and Great Results

Every man who attempts any line of breeding wants to win out. Usually if there is failure it is charged to luck, but somehow I cannot shake off the impression that when I stumble and fall my eyes were not on their rightful job. In several years' horse breeding some simple lessons were forced home thru my failures, and therefore they cannot be forgotten. I want to pass them on to others as worthy of a test.

We found that it was useless to breed a mare doing little work for the winter and when grain fed until, with cooling mashes and reduced rations, and some work, we had cooled out the system and gotten rid of surplus fat. Then too, we found better success if mares were bred the very last of the period when they began to be cross and even kick some.

It was the rule with the stable that the care taker should be with every mare when she dropped her foal, and this paid in dollars and cents. In several instances we, in this way, saved a valuable colt. Before the colt was a half day old it was the duty of the man in charge of that stall to gently place his right arm under the quarter and the left under the shoulder and raise the colt off its feet. There would be a momentary struggle and as soon as all was quiet the colt was as gently lowered until well on his feet, and then given full liberty. By that one act the best of friendly relations were established and next to its mother, the colt would follow the caretaker. Instead of taking time it saved time, for never was there a shadow of fear after this one step, and, whether in the paddock or pasture, the man could go directly to his colt at any time.



STYLE AND INTELLIGENCE ARE TWO VALUABLE QUALITIES IN THE YOUNG ROADSTER

Seventy five percent of all the trials and troubles of the horse breeder are preventable. The trouble is that far too many leave their colts, as they do their children, until they are "old enough to have judgment" and then wonder why they are self-willed, obstinate, headstrong and ill tempered. If you would incline the tree you must bend the twig. When the time comes to halter-break, say when three weeks old, do not do it. Just slip on a nose halter, buckled just tight so it will not shake off, and let the colt run until thoroly used to it. Then, some morning, when you feel good natured, snap a rope halter into the ring under the chin. Standing off ten feet gently tighten the rope. As the colt feels it, he will probably attempt to jump back, rear, leap sideways and try to get away. Stand firm, hold a steady hand but do not pull, and when the colt moves up enough to slacken the rope unsnap and let him go. If you attempt to do more you will accomplish nothing except to aggravate him. Do not let him get the idea at anytime that you are not a friend. In a few days try the second lesson and probably you will, without much opposition, bring the colt to your side. It is then an easy matter to complete the work and have a colt that you can halter anywhere, at any time, and lead where you please.

Never force a colt to keep his mother company all day. She should be put to work when the colt is three or four days old, but not on heavy loads. Leave the colt in a safe, darkened stall, where he cannot injure himself and let the mare in to feed him once during the forenoon and afternoon, at noon and over night. It is easy to injure a young colt by forcing it to follow its mother all day on the road or at work.

The secret of success is never to teach a colt anything you do not want it to remember thru life. Never say "whoa" unless you intend your horse, or colt shall stop; and having said it, see to it that they do stop. If we would but spend moments doing what we want done we could save days undoing what we should not have done. If we want a safe horse make him so by first getting his confidence and then holding it by honest treatment. I have seen men teach their babies to make up faces, laugh with their friends and call it cunning and later seen the same father horsewhip his boy for making up faces in school. I have seen men tickle their colt's heels and laugh as "it just kicked" and later heard the same men curse their kicking horse and "it must have inherited it from some way back ancestor."

We are not half honest with our animals. If we were we would remember that they, like us, were first a bundle of susceptibilities and as we received impressions they grew into tendencies and these into habits and finally habits settled into characters. No man can tell how far he may go in correcting a bad tendency in a colt, but this much is certain: If we commence early and move slowly, teaching only what we want them to remember, there is little question but nine-tenths of our colts would develop into sound, safe horses and we profit immensely by this humane line of education. If the majority of us had been treated when young as so many treat their colts we would be known as mulish, stubborn, kicking, contrary fools.

One thing more, when you leave that colt in the stall, be sure there is a little sweet clover hay there, and a little box containing a few crushed oats and bran. These never hurt a young animal and the earlier the colt gets its nose into these the better for its growth. We want size, substance, courage, kindness, good disposition and style with an alert, snappy action, whether it be draft or driving stock, and all these depend as much on training, care and feeding as on breeding. If you want a good horse commence early to educate and feed and never forget the a, b, c period thru which some patient soul bore with you and helped you on to solid ground.

I like to see colts like the one shown herewith, and this colt, with others, was reared along the lines I have indicated. From the time he was six hours old he would follow the man who was with him at birth anywhere and never know a trick because not one was taught him. If you want large horses, commence early to feed them. If you want safe horses, commence early to educate them, and be careful to give only short lessons along the best line of future development. Never think of breaking a colt but always of educating.—Dr. G. M. Twitchell, Androscoggin County, Me.

1913 RECORD Magnificent Crops in all Western Canada
All parts of the Provinces of Manitoba, Saskatchewan and Alberta, have produced wonderful yields of Wheat, Oats, Barley and Flax. Wheat graded from Contract to No. 1 Hard, weighed heavy and yielded from 20 to 45 bushels per acre; 22 bushels was about the total average. Mixed Farming may be considered fully as profitable an industry as grain raising. The excellent grasses full of nutrition, are the only food required either for beef or dairy purposes. In 1912, at Chicago, Western Canada carried off the Championship for beef steer. Good schools, markets convenient, climate excellent. For the homesteader, the man who wishes to farm extensively, or the investor, Canada offers the biggest opportunity of any place on the continent.
Apply for descriptive literature and reduced railway rates to Superintendent of Immigration, Ottawa, Canada, or to Canadian Government Agent.

Berkshire Pigs. REG. STOCK FOR SALE. Not the biggest, but the best, Berkshire herd in the State. D. Buckley, Broad Axe, Pa.

Registered Chester White Pigs and Jersey Bull Calves FOR SALE. J. A. BOAK, R. D. 4. New Castle, Pa.

Fancy Poland-Chinas. Big and smooth. This is the place to get them. Pigs for sale. Write me.
G. S. HALL, Farmdale, Ohio.

Poland China and Cheshire Pigs bred from excellent stock. Write for Cheshire booklet and further information. Prices right. C. O. Carman, R. 33, Trumansburg, N.Y.

Hillcrest O. I. C.'s—Bred Sows, Spring Pigs. Pairs no akin. Registered free. F. S. Murdoch, Hartstown, Crawford Co., Pa.

O. I. C. GILTS BRED FOR JUNE AND JULY Farrow. Also spring pigs.
G. P. ANDREWS, Dansville, Ingham Co., Mich.

Choice Registered O. I. C. Pigs. Prices reasonable. Write. SWICKARD BROS., Jefferson, Ohio.

Duroc Pigs—Spring Pigs, $16 a Pair.
Write S. O. WICKS, DeGraff, Ohio.

Duroc Jersey Sows. Choice lot Fall pigs mated; no akin. Prices reasonable.
L. C. McLaughlin, Box B, Pleasantville, Ohio.

SWINE Large English Yorkshires Bred sows, lusty fall pigs—pairs no akin. Service boars. Prices right. R. D. Eddy, Cattaraugus, N. Y.

Maple Stock Farm Durocs BRED BY CHAMPIONS
E. D. HOWARD, Powell, Ohio

MULEFOOT HOGS
Oldest breeder in the State. Pedigreed stock for sale
SAMUEL JOHNS, - Wilmington, Ohio. Sec. D.

BIG TYPE MULEFOOT HOGS—A few choice animals from America's Champ. Herd. Write for particulars. J. H. Dunlap, Bx 414, Williamsport, O.

Cheshires The pig that is so human, so much like yourself.
Fred W. Card, Sylvania, Pa.

SHEEP

Pinehurst Shropshires
Best Breeding flock in America. Foundation stock for sale. Send for illustrated catalogue to
H. L. WARDWELL
Box Z Springfield Center, N. Y.

IT PAYS TO BUY PURE BRED SHEEP OF PARSONS, "the sheep man of the east." "Oxfords, Shropshires, Rambouillet, Polled Delaines. Parsons, R. 3, Grand Ledge, Mich.

Scotch Collie Pups, the intelligent kind. Also Ferrets, great rat destroyers.
Write NELSON BROS., GROVE CITY, PA.

Philadelphia, Pa., June 27, 1914.

Fourth of July Next week the Nation will observe the annual celebration of the Fourth of July. The appropriateness of the celebration will depend largely upon the temper and customs of the various communities. These customs are undergoing constant changes, the most important of which is the safeguarding of the little folks from criminal carelessness in the handling of dangerous explosives. It is frequently charged that the modern Independence Day is lacking in the observation of the real significance of the day. Perhaps it is too much to expect that the lessons in patriotic devotion given us in the stirring days of '76 be appropriately impressed upon the succeeding generations and fittingly moulded into the young lives of today. But is not too much to expect that the day be saved from the reckless indulgences of a few years ago. The most convincing argument on how not to celebrate that we know of is the appended record of accidents in the United States due to the use of explosives in celebration of the Fourth of July. These figures are taken from the records kept by the Journal of the American Medical Association, as follows:

Year	Killed	Injured	Total
1904	183	3,986	4,169
1905	182	4,994	5,176
1906	158	5,308	5,466
1907	164	4,249	4,413
1908	163	5,460	5,623
1909	215	5,092	5,307
1910	131	2,792	2,923
1911	57	1,546	1,603
1912	41	947	988
1913	32	1,131	1,163
Total ..	1,326 ...	35,505 ...	36,831

A decrease from 166 deaths in 1903 to 32 in 1913 is due to more intelligent methods of celebration, the most marked decrease being in states where "safe and sane" celebrations have been enforced.

College Extension The enforcement of the Lever law, appropriating federal money to agricultural extension work in states, is raising a question of federal supervision of such funds. The state agricultural colleges have long been drawing money from the federal government under the provisions of the Morril act. This money has been definitely appropriated and there has been little occasion for supervision of its expenditure by the colleges. The support of the county agent system, however, is divided between states and the federal government, and it is reasonable to expect that the federal department must exercise a reasonable control over its share of such appropriations. A memorandum of agreement proposed for the acceptance of state institutions proposes that all extension work in agriculture shall be planned and executed under the joint direction and general supervision of the state directors and the federal officer in charge of demonstration work in the district in which the state is located, subject to the approval of the federal secretary of agriculture. This broad interpretation of the rights of supervision by the federal authorities over all extension money, even that appropriated by state authority, is borne out in all clauses of the agreement. However, the federal appropriation is the basis or original source of support, and state appropriations are supplementary to the fund designed for a specific purpose defined by federal law. Therefore, a limited federal participation in control of the fund is not only just but necessary for uniform management. It is understood that the federal department does not desire to have any part in planning the expenditure of purely state funds except as it feels compelled by the act to make sure that such funds supplementing the Lever funds are used in true extension work.

Borrowing Money The protracted discussion of the need of a rural credit system has tended to create the impression that all farmers are chronic borrowers. We have frequently expressed the opinion that the credit needs of the rural communities are too varied to be met by one general, nation-wide banking system. The need of lower interest rates in sections of the South and West, and the serious handicap which such rates place upon agricultural development in those sections are not to be minimized; but this need is solely for lower rates and the acceptance of various forms of farm property as security for loans. The agitation for easier credits has created the impression that the farmers are clamoring for easier methods of borrowing money and mortgaging their farms. There is as much fallacy in this impression as in some of the systems that are being proposed for the farmers' relief. A recent Farmers' Bulletin issued by the Department of Agriculture presents a number of rules to be observed in borrowing money which are applicable at all times and which should be borne in mind under all systems of credit. Five rules for borrowing money are laid down. The three most important are: "Make sure that the purpose for which the borrowed money is to be used will produce return greater than needed to pay the debt. The length of time the debt is to run should have a close relation to the productive life of the improvement for which the money is borrowed. Provision should be made in long-time loans for the gradual reduction of the principal." The business principles underlying these three rules will be found to conform closely to the three-C rule of the banking profession. This rule to which all applications for loans are supposed to be subjected gives consideration of the capital, credit and character of the applicant. The capacity of the applicant to make profitable use of the borrowed money is the surest guarantee that he will meet interest payments and the principal. From the standpoint of the borrower the safest guide to the safety of the loan is the assurance that the earnings of the money borrowed will repay the loan. The late Pierpont Morgan, when testifying before a Congressional investigating committee, declared that the value of a security did not depend so much upon capital and credit as upon the character of the security holder, and this applies to farm credits as well as to railroad finance.

Sugar Cane Quarantine The U. S. Department of Agriculture announces a quarantine prohibition against the importation of living sugar canes, cuttings or parts of cane from foreign countries, Hawaii and Porto Rico. This action is declared necessary by the discovery that these canes are likely to be infected with insect pests and fungous diseases. The vigilance of the Department officials in preventing the importation of insect and fungous pests has been of great service to the agricultural industry of this country, but in this case the precaution taken would seem to be a bit superfluous. It would be difficult to convince the American cane growers that any foreign fungus would be more destructive of their industry than the free sugar clause of the recent tariff law. The sugar beet growers of the North might prefer the insects and fungus to the legislative blight. Farmers frequently win in a fight against bugs and bacteria.

STATE CAPITAL NEWS

Status Of Auto Fee Suit.—The state's fiscal officers will appeal to the state supreme court from the decision of the Dauphin County court holding that the act appropriating the revenue from automobile licenses to the highway department for road maintenance is constitutional. The officers who took the appeal declare that their action is forced because of the importance of the question involved and this is the excuse given for action which may result in prolonging the repair of roads which are in such condition that they are in many places a public menace. Under the rules of the supreme court the appeal must be filed by June 29. There does not seem to be any disposition to file the appeal before the last day and as the supreme court will meet within a few days after the time expires there will be no opportunity to get the printing and other details arranged so as to proceed to immediate argument. Then court will not sit again until October. The highway commissioner has apportioned money to each district, engineers and superintendents have been told how much each is to spend and in some districts men have actually been told to be ready to go to work and stakes set for repairs. If the Tener administration can develop a man big enough to sweep aside the attorneyisms it will do much to rehabilitate itself in the minds of dwellers in rural districts.

For An Agricultural Exhibit.—The removal of the battle flags from the State Museum to the rotunda of the Capitol, which took place a week or so ago, leaves space in the Museum building available for some display of interest to the agricultural interests of the state. The museum contains much of historical, industrial and educational value. Models of agricultural implements, growths of fruits and grains and even samples of soils and results of scientific cultivation might be added to the collection with profit to visitors. In any event some regard for the great agricultural interests would be fitting and exhibits might well replace some of the junk which has been dumped on the state and given space under the mistaken idea that it must be displayed.

Less Rural Typhoid.—Statistics gathered by the State Department of Health in the last year show that there has been a marked decrease in the number of cases of typhoid fever in rural districts and that people are now complying with regulations prescribed by physicians in the treatment of such cases. Some of the reports show that precautions unknown ten years ago are now being taken and that the cases resulting fatally are also declining.

State Aid Contracts.—The contracts let a few days ago by the State Highway Department for construction of roads were on the state aid plan, this being the only object for which the Highway Department has any money at present. It is probable that several additional contracts will be let within a month, estimates having been approved by county commissioners in over a dozen counties.

Fires In Hay Fields.—Inquiries as to what redress farmers have against railroads for hay destroyed thru sparks falling in fields have been coming in at the office of the Public Service commission, but thus far nothing has been worked out along that line and the letter writers are referred to the railroad claim agents. It is probable that next session when bills are presented to provide for damages from forest fires caused by engines that the agricultural interests will demand some protection. Some of the letters sent in declare that people can not grow hay in fields along railroads because of the danger from sparks while it lies on the ground and that stubble frequently catches fire and endangers fences and buildings.

Hessian Fly Ravages.—State Inspectors who have visited eastern counties where the hessian fly and other wheat pests have been reported say that in a number of cases the fly has ruined fields of wheat and that steps will be taken immediately to give instruction to farmers in the districts so that they will be given the benefit of the state's experts.

Hunters' Licenses.—The 1914 hunters' license blanks are being issued by the state to county treasurers. They are effective September 1.—Hamilton, Harrisburg, June 22.

NEW JERSEY FARM NEWS

Horse Notes.—The Monmouth County farm bureau has inaugurated the plan of having school boys study the judging of horses of the draft type. Most of the horses studied were taken to school by the boys. Thousands of Western farm horses are sold every year to New Jersey farmers, and, it is hoped to train these boys to become intelligent purchasers. A number of farmers already have horses from New York, Philadelphia and other large cities turned out to pasture. They have found this a profitable business, and, at the same time, the fertility of their farms is greatly increased. The dates for the Monmouth County horse show at Long Branch this summer have been fixed for July 22-25. A committee has been appointed to prepare the prize list and select judges for the various classes. Over $6,000 will be offered in prizes.

Scarcity Of Menhaden.—Menhaden, which has been used as a fertilizer ever since the aborigines taught our forefathers how to use them, have suddenly become very scarce in our coast waters. Whereas they formerly came in schools by the millions, they are running in such small quantities that the fish factories have been obliged to close. In their stead, the farmers have resorted to the use of nitrate of soda, several carloads of which have been disposed of at each distributing center.

The Potato Crop.—Potatoes, altho planted a little late, came up well and never looked better at this season of the year. This year, there has been no frost damage as there was last. About 6,600 bags of seed potatoes were shipped into Elmer from Maine this spring costing the farmers around $20,000. It is estimated that about 1,000 bags of these have been put in cold storage for planting in August to grow second crop seed. It is probable that more home grown second croppers have been planted this spring than ever before. Salem, Cumberland and Gloucester county tuber growers, alone, expended at least $100,000 for northern grown seed potatoes.

Another College Farm.—About 25 acres of the farm of Nathaniel [illegible] near Madison, have been leased by the agricultural department of Columbia University for the purpose of demonstrating scientific farming. Dr. O. S. Morgan, professor of agriculture at Columbia, who originated the idea, made arrangements for the use of the tract, in order that Columbia students who have taken his course might try their hands at actual scientific farming. It is the idea to do plain farm work, nothing of the experimental station idea being contemplated. The University will establish in Madison a summer school of agriculture for the convenience of students taking the regular agricultural course in the university.

Crop Prospects Good.—Prospects are good for the largest crop of tree fruits that has occurred in New Jersey for a number of years says Professor M. A. Blake, of the State Experiment Station at New Brunswick. He states that the quality of this crop, however, will be largely determined by the efforts of the fruit growers. The orchard should have been plowed and well harrowed before this. Keep the soil free from weeds and in a mellow condition by frequent cultivation until August 1, and then sow a clover crop. If trees do not show a vigorous dark green foliage, apply 150 to 200 pounds of nitrate of soda to the acre, in addition to 200 pounds of muriate of potash and 400 to 500 pounds of a good mixed fertilizer, and if they still lack vigor, give an additional application. About June 15th to 20th, thin peaches to 5 or 6 inches apart, and pears and apples one fruit to a spur. Spraying for the control of codling moth, curculio and other enemies should have been done already, and upon fall and winter varieties of apples and pears, don't forget to spray again the last week in June. The second brood of codling moth may cause much damage otherwise.

Potato Warning.—Powdery scab, a serious European disease of the potato, which has attracted attention during the past year, probably has been introduced into New Jersey. Potato growers have been advised in a bulletin to examine their crop from time to time and report indications of the disease to Dr. Mel T. Cook, plant pathologist, New Jersey Agricultural Experiment Station at New Brunswick. The United States department has established a quarantine on the Maine potatoes to take effect August 1. After that date all Maine potatoes will be sold under United States inspection.

No Gypsy Moth.—Dr. Thomas J. Headlee, State Entomologist, declares that the alarm felt over an invasion of the Gypsy Moth into New Jersey is unwarranted. "This office has investigated conditions at Westwood, Hillsdale, Wool Cliff Lake, Allendale and other points from which complaints had come regarding the Gypsy Moth," he states. "We find that the insect is the tent caterpillar, which this year is very common in a wide district and numerous in wild cherry trees."

State Accepts Extension Money.—The provisions of the act recently passed by Congress which makes available an appropriation of $10,000 for New Jersey for co-operative agricultural extension work have been accepted by Governor Fielder. The first appropriation under the law is for the fiscal year beginning July 1, 1914, and amounts to $10,000. Each year thereafter $10,000 is again appropriated for the several states, provided it is accepted by the legislatures. After the first year an additional sum of $600,000 is again appropriated, which sum is increased each year for seven years, until it reaches the amount of $4,100,000. The additional appropriation is not available to the states however, unless their respective legislatures appropriate a sum equal to that received from the Federal Government. The apportionment of the additional appropriation will be based upon the proportion which the rural population of the state bears to the entire rural population of all the states. This work is to be carried on in such a manner as may be agreed upon by the Secretary of Agriculture and the state agricultural colleges.

New State Federation.—The objects of the State Board of Trade and Commerce are to take concerted action on state wide problems, to make the federation a clearing house for the latest thought and experience in civic and commercial work, to analyze and take constructive steps in regard to such matters as agricultural and industrial development, civic and social conditions, waterways, city planning, good roads, municipal research, community publicity, vocational education, retail credits and many other lines of activity; to advance the prosperity and prestige of New Jersey thru the increased efficiency of its several communities, and to build up public opinion that truly reflects sound economic principles. It is understood that steps will be taken at once to investigate such rural problems as consolidation of schools, transportation of pupils, purchase of school supplies, salaries and cost of living of country school teachers, marketing and transporting of farm produce, co-operative purchasing of fertilizers, seeds and farming utensils, farm and domestic help, libraries at convenient local centers, etc. This work of investigating will be done by trained experts.

Road Commissioner Makes Statement.—Accepting the full responsibility for any apparent delay in approving contracts for road building, Colonel Edwin A. Stevens, state road commissioner, has made a statement answering the charge that road money is being held up. In accordance with instructions received from Governor Fielder and the state controller's offices, Colonel Stevens admitted that the practice of approving contracts before the appropriation therefor becomes available, would be discontinued. In the past it has been customary to approve contracts for roads to be built with the appropriations becoming available at the beginning of the fiscal year, November 1. Governor Fielder and the state controller concluded that this practice, which is contrary to that pursued in state departments generally, was contrary to the spirit, if not the letter, of the law. A recent report shows that in 5 states having a large mileage of improved roads, the average attendance of enrolled pupils in 1908-09 was 80 percent, while in 5 other states without improved roads the attendance during the same period was 64 percent. The difference may not be wholly attributable to the roads, but poor roads undoubtedly keep the children, especially the smaller ones, from attending school.

Cattle Inspector's Report.—"Tuberculosis in meat animals has decreased from 19 to 11 percent since last year," declared Charles McNabb, who is in direct charge of the work for the department of agriculture. "Since the first of January, we have been killing what will run into probably 1,900 cases this year. This will show you the great number that were killed, when the percentage was up to 19."

State Game Farm.—The fame of the State Game Farm at Forked River, Ocean County, has spread to the United States Government and to several other states of the Union. Charles E. Brewster, game law expert, of the United States Department of Agriculture, Bureau of Biological Survey; Dr. Joseph Kalvfus, Game Commissioner of Pennsylvania, and J. Quincy Ward, Fish and Game Commissioner of Kentucky, were guests a few days ago of President Ernest Napier, of the New Jersey Fish and Game Commission, at the State Game Farm. As a result of his visit to the farm, Mr. Brewster has written President Napier as follows: "During my visit to the State Game Farm at Forked River, I saw many evidences indicating success along lines or hertofore doubtful possibility that I have decided to write a report of the matter to the Chief, in order that the information obtained there may be filed for future reference in the office record of this bureau."

Fewer Forest Fires.—Effective work on the part of the New Jersey State Board of Forestry has decreased the number of forest fires in this state to a considerable extent, only two serious fires having occurred this year. One of these destroyed about 1,000 acres of woodland, while the other wiped out about 2,000 acres. With 260 fire wardens scattered thru New Jersey and with the assistance of the citizens, forest fires are on the decrease. While the department has a line on most of the sources from which the fires spring, they lay most of the blame to the railroads and automobile parties.

Monmouth Poultry News.—Dr. Robert Dickson, of Fair Haven, has been appointed superintendent of the pet stock department of the annual exhibition of the Monmouth poultry club, which will be held Thanksgiving week at the Asbury Park Casino. William B. Patterson, of Red Bank, was appointed judge and handler of the pet stock. Wellington W. Kennedy, of Red Bank, was appointed superintendent of the pigeon department of the show. William Stanton, of New York, will judge the pigeons. Elmer Carr, of New Egypt, state bee inspector, will be superintendent of the bee department and he will be assisted by Charles H. Root, of Red Bank. The club decided to start the show on Wednesday, November 25th, and it will be continued until the following Sunday night if the Asbury Park officials will permit them to hold it on Sunday. If not the show will close Saturday night. The annual banquet of the club will be held on Tuesday night, December 1st, at the Globe hotel, at Red Bank. Charles E. Hendrickson, Jr., will be assistant superintendent. Frank Hodges will be secretary and Howard A. Rogers will be assistant secretary.—D. T. H.

NEW YORK LETTER

Brick To Be Made At Elmira.—Tests have been made of the shale on state lands at Elmira reformatory, as to its availability in making vitrified brick for road construction, and the reports are favorable. Commissioner Carlisle is at work on the plans for the brick-making plant and it is said that it will be ready for operation by next fall. The plant will be capable of turning out 15,000 brick a day.

The State Fair.—It looks as if there would be some "big guns" as speakers at the state fair this fall if present plans materialize. It is the purpose of the commission to invite President Wilson, Secretary Bryan, ex-president Roosevelt, Charles S. Whitman, Gov. Glynn and other lesser lights. The fair will be open evenings and fireworks, with an illuminated chariot race, will be the attractions.

After The Farmers.—The town superintendents of highways are finding fault with the farmers in some sections who, in plowing their fields adjacent to the roadways, often plow across ditches at the sides of the roads, and thus prevent proper drainage. It has become necessary for the state highway department to issue a warning to farmers against this practice. It is believed that calling attention to the matter will be sufficient.

The Farm Brokers.—At the annual meeting of the Farm Brokers' association of the state held at Ithaca recently, it was voted to discourage dishonest representations of farms and a strictly brokerage commission was agreed on instead of opposition methods. The following officers were elected: President, E. J. Webb, Beacon; vice-president, W. H. Hazard, Salamanca; secretary, J. H. Fort, Oneida; treasurer, F. C. McCarty, Auburn. The association will meet in New York City next year.

Farm Train.—In order to educate the fruit growers of the western part of the state in the methods of packing and grading apples as required by law, a demonstration train will be run over the lines of the New York Central, the state department of agriculture co-operating. One of the cars will be adapted to lectures and another to the demonstration of correct methods in packing fruit.

The Forestry Faculty.—Owing to the demands of the college of forestry at Syracuse and the expansion of its work, three new members will be added to the faculty at the opening of the fall term. These are Dr. C. C. Adams, of the University of Illinois, Prof. J. Fred Baker, who is now studying at the University of Munich, Germany, and R. P. Prichard who has been at the head of the Rangers' school at Wanakena. The student body now consists of 218 young men.

Active Farm Bureau.—The Jefferson County Farm Bureau, the Pomona grange, the County school superintendents and the U. S. Department of Agriculture are co-operating in the corn and potato contest in which over 200 boys and girls are enrolled. There have been registered 40 boys who will each grow one acre of corn and 98 boys and girls who will each grow a quarter acre of potatoes. There are 35 boys who will grow and exhibit ten ears of corn and 30 boys and girls who will grow and exhibit a plate of 10 potatoes each. Moneys to finance operations are being raised by subscriptions by the Pomona and subordinate granges. The round up will be held in December at the meeting of the Pomona grange.

Co-operation Bureau.—There are now 31 co-operative societies in the state organized under the Cole act, and these organizations, together with other such organizations having a common purpose, will meet in Albany sometime next month. "The work of organization of these co-operative societies is going on conservatively, in accordance with the consensus of opinion of those present at the conference held early this month. There is a constant and growing demand on the Bureau for speakers to take up the subject of co-operation in its phases, particularly in the granges of the state.

The Fairs Get Money.—Most of the county and town fair treasurers have by this time received the moneys due them by the state for premiums paid. There was a legislative appropriation of $250,000 for this purpose and checks have this week been forwarded to the 88 associations that are entitled to share in the state moneys.

Fruit Growers' Excursion.—A somewhat elaborate plan has been laid out for the enjoyment of the members of the State fruit growers' association and their friends in late July, on the occasion of the annual summer meeting. A special train will convey the members and others from Rochester, starting on the afternoon of July 28. The itinerary to be as follows: Rochester to Saratoga Springs, to Lake George (excursion on lake) to Ausable Chasm; to Lake Champlain (excursion on lake) and across to the Vermont side with a side trip thru the Champlain orchard section, thence to the Thousand Islands with an excursion thru the islands, thence to Rochester. The trip will cover three days. In the evenings there will be talks on timely subjects pertaining to horticultural interests.

Milk Experts.—The annual meeting of the American Association of Medical Milk commissions was held in Rochester June 20. Dr. John W. Kerr, assistant surgeon general in the U. S. Public Health Service, is president of the association. There were addresses by national authorities on the medical milk question. The certified and market milk contests were features of interest. There were certified milk entries from 12 states. Among the entries was a sample from El Paso, Tex., which contained but 1,000 bacteria to the cubic centimeter. A government expert has been in the city for several days testing the milk.

Short Notes.—The fifth annual convention of the New York State Waterways association will be held in Rochester in September, beginning the 24th and continuing three days. The third annual meeting of the Farm Brokers' association of the state was held in Ithaca this week. Prof. Warren, of Cornell, Hon. Marc Cole, of Albany, Col. C. A. Simmons, of Ithaca, Prof. Martha VanRensselaer, of the Department of Home Economics of Cornell and Prof. Mann, of the Agricultural college, gave addresses. Early indications are that the grape crop will exceed last year's in the grape belt. The crop may run 4,500 cars. There are 45,000 acres in vineyards in the belt.—D.

MARYLAND NOTES

Liquor Law Violated.—The new law which allows only one gallon of liquor to be shipped to an individual a month in some of the Eastern Shore counties it is claimed is being violated. Persons have been arrested for bringing in a supply, not shipped, and the validity of the law in consequence is questioned.

Crop Indications.—The protracted dry spell continues. One or two very light rains occurred during the past 10 days. The weather is cool, especially the nights, and corn and other crops are growing slowly. The hay crop thruout the state is mainly harvested and has been secured in excellent condition, ideal weather prevailing for hay making. Wheat seems to be unusually good, but straw somewhat short. In Kent, Washington, Frederick and Carroll Counties the farmers are bragging about their wheat crops. In Cecil County the dry spell has been disastrous to the hay and oat crops, and the huckleberry and blackberry crops threaten failure. The strawberry season has been only a moderately fair one, bugs and drouth seriously affecting the second ripening of the fruit. In Caroline County the pea canneries are running full time and even at night, as the hulling machinery was inadequate to keep pace with the huge loads delivered. The crop was better than expected.

New Creamery Projected.—Arrangements are being made to establish a creamery in Princess Anne. Goldsboro milk station is developing bigger business than was anticipated, notwithstanding unfavorable weather conditions.

Gardeners' Club.—The Gardeners' Club of Harford County has been organized with Mrs. Bertram Stump as president. The object of the Club is to encourage garden planning and planting, and to increase the interest of its members in all horticultural pursuits. It starts off with a large membership of the leading women of the county.

Chestnut Blight Ravages.—The blight of the chestnut trees in Frederick county is becoming serious. At Braddock Park many chestnut trees have been ruined and have been cut down.

National Institution Buys Land.—The National Vaccine and Antitoxin Institute of Washington, D. C., has purchased a 54-acre tract in Montgomery Co., and will expend $25,000 in buildings and other operations.—G. O. B.

A Boys' Fourth of July Party.

By JESSIE K. BURCHARD.

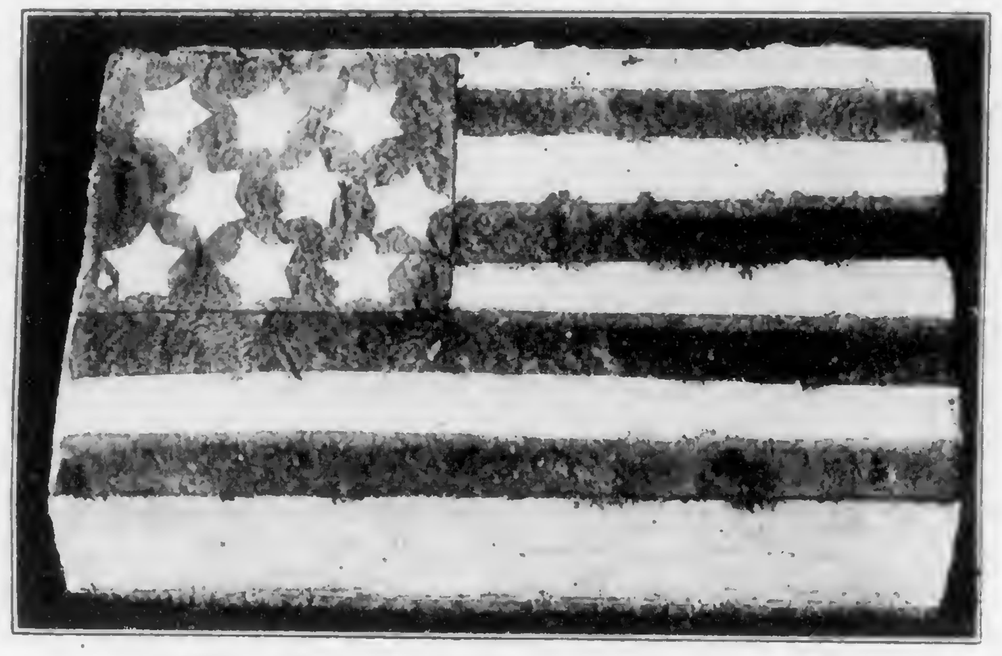
Eleven small boys were invited to help celebrate a playmate's birthday which fell upon July fourth. The invitations read "James Brown invites you to take part in an athletic meet in his back yard, on Wednesday, July Fourth, at three o'clock."

On the appointed afternoon the yard was gay with flags, the fences were draped with red, white and blue bunting, and the "events" were set forth on a large piece of wrapping paper, which was tacked to the side of the house. A similar sheet blank, was tacked beside it to record the winners.

The first event was the standing broad jump. A big neighbor boy measured the distances carefully, and the winner's name and the length of his jump were written aloft with great ceremony. The big boy was invaluable also in keeping the peace when excitement waxed too high for comfort.

The next event was rolling a big indoor baseball over the short clipped grass. No throwing was permitted.

After this came an old fashioned potato race, a row of twelve potatoes, two feet apart, being alloted to each boy, who was provided with a teaspoon, with which he had to carry the potatoes, one at a time, to a pan which stood at the end of his row. This is always productive of lots of fun, and the winner finished in fifteen minutes, while the last boy took nearly half an hour.



SPONGE CAKE FLAG FOR BOYS' FOURTH OF JULY PARTY.

Then came the running jump contest, and after that a few boys succeeded in walking on their hands a few steps. For all these events prizes were awarded, these being of boxes of candy, tied up with red, white and blue ribbons.

Then there were relay races, and a tug of war, after which the young athletes were invited to wash their hands and repair to the dining room. The room presented a very patriotic appearance, with streamers of red, white and blue extending from the ceiling to the corners of the table. The centerpiece was a fort built of blocks, and surrounded by tiny cannon, which were given as souvenirs at the end of the feast.

Cannon crackers filled with candy were at each place, also a bunch of little chocolate fire crackers, wrapped in red. Peanut butter sandwiches were rolled, and tied with patriotic colors. Plain ham and tongue sandwiches had a tiny flag stuck in each. The beverage was a lemonade, colored red with red raspberry juice, and cool, but not iced.

The ice cream was vanilla molded into blocks with red raspberry ice, and was served with a flag flying from each block. With this came the greatly admired cake, shown herewith, that looked like a great flag. To make it a sponge cake batter was baked in a sheet, iced with a plain boiled icing, and the stripes laid on with red vegetable coloring, while the square for the stars was of violet, no blue vegetable color being obtainable, and the stars were cut out of white paper, and applied with a drop of soft icing. As it seemed impracticable to get all the red and white bars, and all the forty-eight stars onto the cake, we used only eight bars an nine stars. The red color ran into the white so annoyingly that to make the bars any narrower, would prevent having the white stripes clearly defined, so we decided to sacrifice fact for effect.

ALL KINDS OF CURRANTS

Their Use In The System

Black, white and red currants will soon hang in clusters awaiting gathering—at least they ought to be thus ripening in all farmers' gardens. A good row of currants means more than appetizing jellies, jams, conserves, pie-timber and juices for syrups and refreshing beverages. It means better health for the families which use the dietetic virtues of the currant in their food. In our June 6 issue we told you how the characteristic acids of fruits are organic acids, which burn to a pure white alkaline soda ash in the system, and thus prevent that accumulation of acid which causes a whole lot of aches and systematic derangements.

The acid of the strawberry, you may remember that we told you, is malic. That of the currant is tartaric, which is also the characteristic acid of the grape. Currants contain about 5.8 percent of acid and 1.96 percent of sugar, as compared with 1.2 to 5 percent of acid, and 10 to 16 percent of sugar in grapes. The sugar in currants consists of what chemists call "reducing sugars," because they are the forms of sugar to which cane and beet sugar and all starches have to be reduced before they can be assimilated. These reducing sugars are mainly grape sugar and fruit sugar. So we see that the sugar in currants is practically all ready to be taken into the system directly. And as sugar is a food because it is an energy or fuel maker, currants thus have some real food value as well as the dietetic or medicinal value afforded by their acid and mineral content.

The fuel or carbohydrate content of fresh red currants (which consists mainly of sugar) is about 12.8 percent. The tissue-repairing or protein content is 1.5 percent. The mineral or ash content is .7 percent, and comprises, in the order of their amounts, potash, phosphorus, lime, magnesium, sodium, chlorine, sulphur, and just a trace of iron. There is no fat, but there is a lot of water, about 85 percent. These minerals, particularly potash, phosphorus and sodium, are very necessary factors in the chemical conversion of all kinds of food into blood and tissue and heat and energy in our bodies, and the lime is mostly needed for our bones. Hence, we see that the minerals so readily available in currants and all other fruits are important reasons why fruits should form a liberal portion of our diet.

Black currants are a little richer in food material than red or white because they have a little less water (79 percent), and they also have 13.1 percent of sugar, 1 percent of mineral matter, a little fat (.3 percent), but less protein (only .5 percent). Of the mineral ash, there is a little more potash, phosphorus and lime than in red currants.—Harriet Mason.

Some Ways to Serve Them

(By Marion Harris Neil)

Black currant jelly well set, with perhaps a little gelatin added to its juice in making, is the finest substitute for voice lozenges. This juice is actually added to medicinal lozenges for voice clearing. It can be made at home quite well, in this way, to act precisely as expensive medicinal stuffs do. Sufferers from rheumatism will benefit by taking this black currant conserve freely.

The white currant is an off-shoot of the red only. Both make pretty fruit decorations for the table, being pretty to look at and good to eat afterwards. Home-made wine made from both red and black currants is delicious. It is medicinal and far more wholesome than purchased wines.

At this season, mothers will do well to make some boiled puddings of black or red currants. They are not only dainty and palatable but good medicine.

Red Currant Jelly.—For every 2 lbs. of red currants take 1 lb. white ones all just ripe and very juicy, and very carefully stripped from their stalks. Over ripe currants have lost much of their pectin or jelly principle. Place the currants in a granite kettle, and keep them well stirred over the fire, to make them render their juice freely. As soon as they have done so, pour it off, weigh it, and for each quart of juice take 1½ lbs of lump sugar, broken into fairly large pieces; dip these in cold water, and throw them well drenched, into a pan and boil them to a thick syrup, stirring it all well together until it drops from the skimmer in thick strings. Now pour in the juice at once, stir it all well together, and when well blended, let it all boil together quickly for 10 minutes; then skim carefully, and pour it into glasses which have been previously scalded and dried. When set, seal with melted paraffin, and put on the jelly glass covers.

Black Currant Vinegar.—Put in your kettle 1 quart of good ripe black currants, add 1 pint of the young currant leaves, and stir over the fire with a new wooden spoon till the currants begin to boil, then pour it all into a jelly bag, and strain, squeezing out every drop of juice you can. Return this juice to the pan with 1½ lbs. of lump sugar to each quart of juice, stir it well until the sugar melts, then skim very carefully, putting the skimmings on a sieve, and returning the juice that strains thru to the preserving kettle. Let this stand till cold, then for each quart of this syrup allow 1½ pints of the best white wine vinegar, adding, if it is to keep, from ½ pint to 1 pint of brandy to each gallon of vinegar.

Red Currant Jelly Sauce.—Two tablespoonfuls butter, 2 tablespoonfuls flour, ¼ cupful red currant jelly, 1 teaspoonful lemon juice, a few drops of onion juice, 1 cupful milk, a few grains of pepper, and ¼ teaspoonful salt. Blend together the butter and the flour; when smooth, add the milk and stir till boiling, then add the red currant jelly, lemon juice, onion juice, pepper, and salt. Boil 8 minutes, stirring all the time, strain and serve with meat.

Currant Punch.—Five cupfuls of currant juice, 4 cupfuls sugar, 12 cupfuls water, 2 cupfuls tea, 6 lemons, 6 oranges, and a large piece of ice. Boil the sugar and water for 10 minutes; add the currant juice, tea, sliced oranges and lemons, and the ice.

Mrs. Caustic—"Yesterday Annie asked me if I believed any girl ever died for love, and I said, 'Yes, lots. They marry and then work themselves to death for their husbands.'"

Anty Drudge—"Well, they needn't. And I don't believe any woman does, any more, since Fels Naptha Soap was made. It does the work and leaves women time for rest and pleasure."

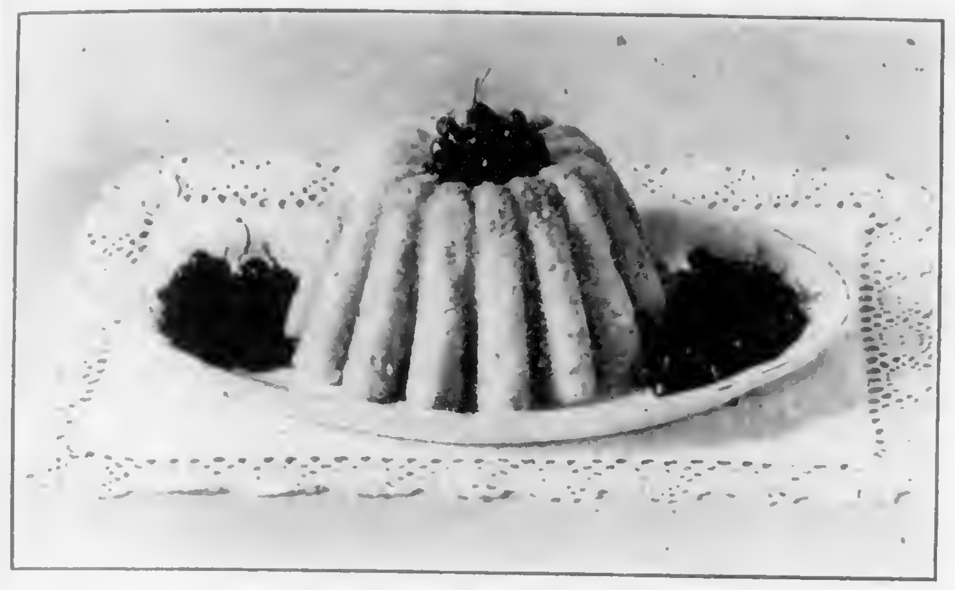
Don't make yourself sick doing work the hard way when there's a better way to do the same work and it's easy.

Fels-Naptha Soap in cool or lukewarm water does the *hard* part of your work *for* you. Clothes are sweeter, cleaner and whiter in less than half the time, and don't have to be hard-rubbed nor boiled. And for washing dishes and all kinds of cleaning, it has no equal.

Fels-Naptha saves your strength. Buy it by the carton or box and follow the easy directions on the Red and Green Wrapper.

Fels & Co., Philadelphia

FELS-NAPTHA



RED GRITS PUDDING WITH CURRANTS.

[illegible] Currants.—Wash, stem and cover 5 lbs. currants with 5 lbs. sugar; let stand in a basin over night, then [illegible] agate kettle and cook very slowly until the boiling point is reached. Skim, fill sterilized jars full, and seal.

Spiced Currants.—Five pounds of currants, 1 cupful vinegar, 1 level teaspoonful salt, 2 lbs. lump sugar, 2 tablespoonfuls ground cloves, 2 tablespoonfuls ground cinnamon, and 1 tablespoonful allspice. Remove the stems and wash currants, add remaining ingredients, and boil for half an hour. Keep in earthenware jar.

Red Grits Pudding.—One pound of red currants, 2 cupfuls water, grated rind and strained juice of ½ lemon, ½ cupful ground rice or sago, and ½ cupful sugar. Boil the red currants with the water until they are quite soft; [illegible]. Return the liquid to the saucepan, add the sugar, lemon juice and grated rind; allow to boil, then sprinkle in the ground rice or sago, and boil [illegible] minutes, stirring all the time. Pour into a wet mold, and turn out when cold. Serve with cream, and garnish with fine stems of currants, as illustrated.

Red and White Currant and Raspberry Salad.—Pick 1 lb. of white currants and [illegible] lb. of red currants off their stalks. Place the red currants in the center of the dish on which the salad is to be served; then arrange around them in alternate bunches the white currants and raspberries. Sweeten and freeze. Serve whipped cream and send to table separately.

Currant Compote.—Fresh currants, ½ lb. lump sugar, and ½ cupful of water. Dissolve the sugar in the water, boil until well reduced, skimming meanwhile. Put in the currants and simmer until tender but not broken. The compote may be served separately, or as an accompaniment to custards.

Currant Mold.—Put 2 heaping tablespoonfuls of gelatin into a clean saucepan, add the grated rind and strained juice of 1 lemon, ½ cup boiling water, and 1½ cups sugar, then dissolve. When beginning to set, add 1 cup of currants. Pour into a wet mold. Turn out when firm. Serve with cream or milk.

Currant Pie.—Line a buttered pie tin with good pastry. Mix 1 cup of sugar with ¼ cup of cornstarch, add the yolks of 3 eggs beaten with 1 tablespoonful water. Wash 1½ cups of white, red or black currants, drain, remove stems; add to first mixture and turn into the prepared crust. Bake in moderate oven until firm. Cool and cover with meringue made from the whites of the eggs. Set in a slow oven until delicately browned.

Currant Souffle.—Thickly butter a plain round mold, tie a band of buttered paper round the outside, wide enough to come two inches above it. Blend together 2 tablespoonfuls butter with 4 tablespoonfuls flour in a saucepan over the fire; add 1 cup milk, stir until boiling, and cook 5 minutes, stirring all the time, then add 1 cup stemmed currants, 3 tablespoonfuls sugar, the yolks of 3 eggs, one by one, and the stiffly beaten whites of 4 eggs. Pour mixture into the prepared mold and steam gently for one hour. Turn it carefully onto a hot dish, and pour sweet sauce around it.

Currant Tarts.—Line some gem pans thinly with pastry. Fill them with raw rice to preserve their shape during baking; bake quickly until they are a delicate brown, then turn out all the rice (This rice should be saved to use again for a similar purpose.) Wash and stalk 3 cups of red or black currants. Boil 1 cup lump sugar and ½ cup water 5 minutes, put in the currants, and simmer 10 minutes. Strain off the syrup, and put it back into the pan, add 1 tablespoonful butter, and boil until thick. Pour it into 1 teaspoonful cornstarch mixed smooth with a little cold water. Reboil the syrup for 5 minutes, stirring all the time. Fill the pastry cases with the currants, filling up with syrup. If desired cold, do not add the syrup until it is nearly cold.

PENNSYLVANIA FARMER PATTERNS

Be sure to give the figures and letters of each pattern exactly as printed at the beginning of each description. We will not be responsible for correct filling of your orders unless you do so. Also give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 214-18 So 12th St., Philadelphia, Pa.

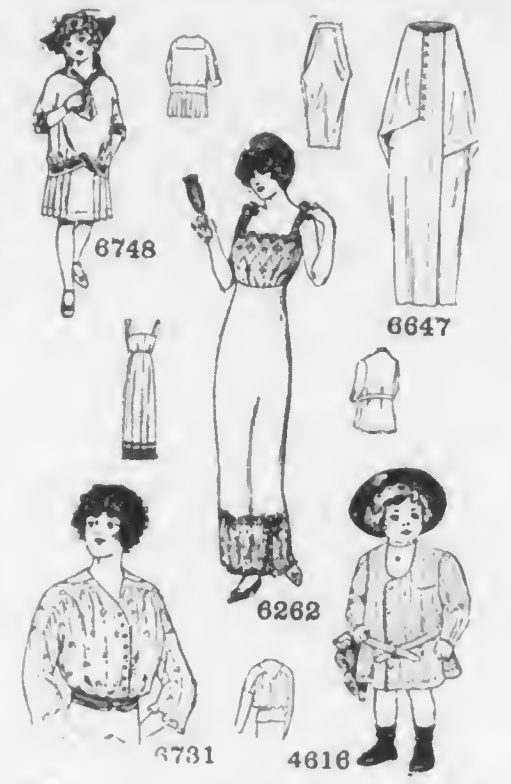
6748.—Girls' Dress.—Cut in sizes 6 to 14 years. Age 8 years requires 2⅜ yards of 36-inch material and ¾ yard of 27-inch contrasting goods. Price of pattern 10 cents.

6647.—Ladies' One-Piece Skirt.—Cut in sizes 22 to 32 inches, waist measure. Size 22 requires 2¼ yards of 36-inch material. Price, 10 cents.

6262.—Ladies' Semi-Princesse Slip.—Cut in sizes 34 to 42 inches, bust measure. Size 36 requires 3⅜ yards of 27-inch material, 3¼ yards of edging and 3½ yards of insertion. Price, 10 cents.

6731.—Ladies' Waist.—Cut in sizes 34 to 44 inches, bust measure. Size 36 requires 2¼ yards of 36 inch material. Price, 10 cents.

4616.—Boys' Russian Dress.—Cut in

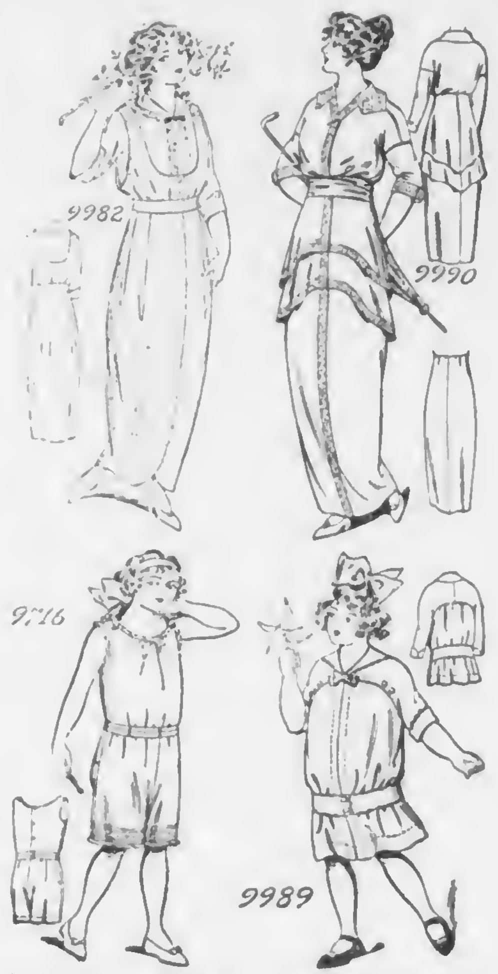


sizes 1, 2 and 3 years. Size 3 requires 1⅞ yards of 44-inch material. Price, 10 cents.

9982.—Dress with Over Blouse for Misses and Small Women.—Cut in 4 sizes: 14, 16, 17 and 18 years. It requires 5½ yards of 27-inch material with 2¼ yards for the underwaist, for a 16 year size. The skirt measures about 1¾ yards at the lower edge. Price of pattern, 10 cents.

9990.—Ladies' Dress with or without Flounce or Tunic.—Cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches, bust measure. It requires 6⅞ yards of 44-inch material for the dress in a 36-inch size. If tunic and flounce are omitted it will require 4⅞ yards. The skirt measures about 1⅞ yards at the foot. Price, 10 cents.

9716.—Girls' Under Waist and Drawers.—Cut in 5 sizes: 4, 6, 8, 10 and 12 years. It requires ⅞ yard of 36-inch material for the waist and 1 yard for



the drawers for a 6-year size. Price, 10 cents.

9989.—Girls' Dress.—Cut in 4 sizes: 4, 6, 8 and 10 years. It requires 2⅜ yards of 44-inch material for a 6-year size. Price, 10 cents.

DAISY FLY KILLER placed anywhere, attracts and kills all flies. Neat, clean, ornamental, convenient, cheap. Lasts all season. Made of metal, can't spill or tip over; will not soil or injure anything. Guaranteed effective. Sold by dealers, or 6 sent by express prepaid for $1.

HAROLD SOMERS, 150 DeKalb Ave., Brooklyn, N. Y.

PIANOS Rebuilt Instruments of Famous Makes $75.00

Sales of Pianola-Pianos bring us many good uprights; all standard makes. We rebuild them to sell at $75, $85, $100, $125, etc.

We have others, our own three sounding-board pianos, reduced from $50 to $100 below regular value, also several player pianos, different makes, prices far below real values, also several piano players at $75 to $150, 25 rolls of music free.

Victrolas, complete line, from $15 to $200, also several talking machine outfits at half price (No Victors included.)

Write for large illustrated catalogues, with special plans of payments.

AGENTS WANTED EVERYWHERE. Fine chance for workers. Write for information for Agents.

MR. PRATT

By JOSEPH C. LINCOLN

Copyrighted by A. L. Burt Company.

SYNOPSIS OF PPREVIOUS CHAPTERS

Two New York business men, Van Brunt and Hartley, come to Wellmouth for a vacation. Solomon Pratt, skipper and village character, finds the "twins," as they are dubbed, interesting. After a period, during which Pratt has some experiences with the "twins" including helping to rescue a fresh air youngster, in whose protectress Hartley finds an old sweetheart; and a hair-raising voyage from Eastwich to Wellmouth, accident brings the twins to Horsefoot Bar Island, which they rent at a "bargain" from Nate Scudder and to which they move. Scudder has just brought over some "presents" for the "twins."

CHAPTER VII (Concluded)

He'd got the newspapers and strings off by this time and he spread the presents out on the floor. There was a wax wreath, from old Mrs. Berry's funeral, in a round case; and a crayon enlargement of a daguerreotype of Marcellus when he was thirty or so; he had a fancy vest on and a choker and a fringed-end necktie, and looked like he was freezing to death fast and knew it. Likewise there was a shell work basket in a shell frame with about a third of the shells missing; and two silver coffin plates on black velvet; and a worsted motto thing with "What is Home Without a Mother" on it.

"There!" says Nate, happy and generous. "We'll give 'em them things, Huldy and me. Leastways they can have 'em to look at while they're here. Have 'em strung around on the setting-room walls and it kind of takes off the bare look. Gives 'em something to think about too, don't it?"

"Yes," says I; "I should think 't would. I wouldn't think of much else, seems to me."

"Yes," says he. "Well, I hoped they could have 'em tonight afore they went to bed. But you explain about 'em in the morning. Tell 'em they're from me and Huldy. I'll be around after breakfast to fetch some more things from the store and see if there ain't something else I can do. Good night."

"Good night," says I, absent minded. I couldn't get my mind off them coffin plates.

He kind of hesitated.

"Oh say," he says. "Did you eat all of them mackerel you had? If you didn't, and they're likely to spoil, why, I'll take a couple along home with me. Huldy's dreadful fond of mackerel."

"There ain't but one left," says I, "and——"

"Oh well," says he; "one'll be enough for us. We're awful small eaters."

So I trotted out the mackerel and he done it up in a newspaper and went away to his dory. I lugged in the presents and laid 'em away in the old chest of drawers in the dining room. Felt like an undertaker, too, I did, all the time I was doing it. I didn't want the Heavenlies to see them relics till they'd ate a good breakfast—they was too much for an empty stomach. Then I locked up and took the lamp and went to my room.

After I got undressed I opened the window and leaned on the sill and thought. I thought about my new job and what I could see was coming to me in the way of work, and about Lord James and Nate and all. And then I thought of Hartley and that Page girl. Martin didn't act to me like a money-grabber. I couldn't understand it. One thing I was sure of, them two was meant for each other and it seemed to me that they still liked each other. But there was Van Brunt—I liked him too.

Just then a thundering big greenhead bit me on the back of the neck and I slammed down the sash and turned in on my bale of corncobs. Tired! don't talk!

CHAPTER VIII

Mr. Scudder's Presents

I was up the next morning about five and pitched in making biscuit and lugging water and so on. Lord James comes poking down after a while. He looked pretty well used up.

"See 'ere, Pratt," says he. "W'at they got in them blooming beds—bricks?"

"Why?" says I. "Was yours hard?"

"'Ard? Upon me word I'm all full of 'oles, like a grater. My back is that sore you wouldn't believe it. And w'at makes 'em so noisy?"

"That's the husks," says I. "They do rustle when a feller ain't used to 'em."

"Rustle! When I'd go to roll over, upon me word the sounds was 'orrifying. Like the water washing around that boat of yours, it was. I dreamed about being adrift in that awful boat all night. About that and ghosts."

"Ghosts, hey? Did you dream of ghosts?"

"That I did. I could 'ear 'em groaning."

"'Twas yourself that was groaning," says I. "A feller that took aboard the cargo of supper that you did hadn't ought to sleep on cornhusks."

"I didn't sleep; not a 'ealthy Christian sleep, I didn't. I say, Pratt, did you ever 'ear that this old 'ouse was 'aunted?"

"Well," says I, "I don't know as I ever heard that exactly. But old Mrs. Berry died in it and then Marcellus lived here alone till he died. Seems to me he died in that room of yours, come to think of it," says I, cheering him up.

He turned pale, instead of the yellow he'd been lately.

"'Oly Moses!" says he. "You can't mean it."

"I can mean more than that without half trying," I says. "Yes, I remember now. He did die there and they say he died hard. Maybe that was on account of the bed tho."

He was mighty upset. Commenced to tell about a friend of his over in "the old country" who had been butler at a place that was haunted. I asked if his friend had ever seen any of the spooks.

"No," says he, "'e never saw 'em 'imself, but it was a tradition in the family. Everybody knew it. It was a white lady, and she used to trip about the 'ouse and over the lawns nights," he says.

"White, was she?" says I. "Well, I suppose if she'd been black they wouldn't have been able to see her in the night. Never heard of a colored ghost anyway, did you?"

"I mean she was all dressed in white," he says, scornful. "And they say 'twas 'orrid to see her a-gliding around the grass."

"Want to know!" says I. "Well, if you see old Marcellus gliding around the hummocks out-side, call me, will you? I'd like to see how he manages to navigate thru the sand. That's a job for a strong, healthy man, let alone a dead one."

I guess he see I didn't take much stock in his ghost yarns, so he quit and went to getting the things on the breakfast table. But he was nervous and broke a dish and sprinkled forks and spoons over the floor like he was sowing 'm. Pretty soon he had to stop and hustle upstairs, for the Twins was shouting for their duds. For grown men they was the most helpless critters; His Lordship was a sort of nurse to 'em, as you might say.

After a while he had 'em dressed and ready and they come down to breakfast. Nate had brought over feather beds for them, so they had slept pretty well. Van Brunt was rigged up special because he was going to Eastwich that forenoon to see his girl.

I'd cooked a whopping big breakfast but 'twas only just enough. Van was a regular famine breeder and Hartley wa'n't far astern of him. The Natural Life was agreeing with both of 'em fine so far. Martin's cheeks was filling out and him and his chum was sun-burned to brick red.

After breakfast they went out for their usual promenade. By and by I heard 'em hailing me from the back of the house. When I reached 'em they was standing by the barn, with their hands in their pockets, and looking as if they'd discovered America.

"Come here, skipper," says Van. "Do you see this?"

He was pointing at a kind of flat place in the lee of the pig sties. 'Twas a sort of small desert, as you might say: a bunch or two of beachgrass in the middle of it and the rest poverty grass and sand.

"I don't see much," says I. "What do you mean?"

"I mean the location," says he. "Here's where we'll have our garden."

I looked to see if he was joking. But it appeared he wa'n't.

"Garden?" says I.

"Sure," he says. "It's an ideal spot. Sun all day long."

"You could make a garden here, couldn't you, Sol?" asks Hartley.

"Maybe I could," says I, "if I dug thru to Chiny and hit loam on t'other side. Otherwise you couldn't raise nothing in this sand but blisters."

"Scudder could bring us loam," says Van. "We've thought of that."

"Starting a garden in July!" says I. "What do you cal'late to raise—Christmas trees?"

"Late vegetables, of course," says Van. "Martin and I intend to stay all thru September. Think of it, Martin; green corn from our own plantation. And cucumbers in the morning, with the dew on 'em."

"And tomatters already baked in the sun," I says, disgusted. "You take my advice and buy your green stuff off Scudder."

But they wouldn't hear of it. Called me a Jeremiah and so on.

"All right," says I, finally. "Have it your own way. But who's going to work this cucumber and dew farm?"

"Why, we are, of course," says Van. "That's part of the game, isn't it, Martin? Nothing so healthful as outdoor work for caged birds like us. Maybe we'll have two gardens, one apiece. Then we'll see who raises the first crop."

I could see 'em doing it! But there was no use arguing then. I put my trust in Scudder's not being able to fetch the loam.

Pretty soon Nate heaves in sight in the dory with a cargo of skim milk and store eggs and butter. Van Brunt and I went down to meet him. Van didn't give him a chance to talk; just as soon as the stuff was put on shore he announces that Scudder must go right back and drive him over to Eastwich. Nate backed and filled, as usual, telling how busy he was, and how he hadn't ought to leave, and so on. But Van corks him right up with a five-dollar bill and off they went.

I lugged the milk and butter and the rest of the truck up to the house and started in on another stretch of work. I'd had a vacation of ten minutes or so; now 'twas time to begin again. After I'd cleared up round the kitchen and the like of that, I went off down to the Dora Bassett and tackled her. Van Brunt had cut away about everything but the mast, and I had to rig new halliards and sheets and downhauls and land knows what. Drat that Heavenly! 'twas a two days' job.

While I was making a start on it Hartley comes loafing down from the house.

"Skipper," he says, "let's have another one of your chowders for lunch, will you? They're the real thing."

"Well, I tell you, Mr. Hartley," says I, "if we have chowder I'd ought to go and dig the clams right now, on account of the tide. And, honest, I hate to leave this work I'm on. Still, of course, if you say so, why—"

"What's the matter with my digging 'em?" he says.

I grinned. "Why, nothing," I says, "so far as I know, except that it's something of a job."

"Job!" he says. "It'll be fun. Tell me where to go—and what to dig 'em with, and—and how to do it."

I told him to take the skiff and a clam hoe and a couple of buckets and row across to the mainland. There was clams all alongshore there, I knew.

"You go along till you see a lot of little holes in the sand," I says, "then you dig. Want to look out that they ain't sand-worm holes, nor razor fish. And when you begin to dig," I says, "you want to lay right into it, 'cause the clams are likely to be [illegible] and they get under fast. So—"

"Hold on a minute," says he. "How am I going to tell a worm-hole from a clam hole, or a clam-hole from a—what was it?—barber fish hole?"

"Razor fish," says I. "Not barber. Well, I don't know how to tell you, exactly. If it's a sand-worm there's likely to be a little tiny hole alongside the regular one; that is, there is sometimes and sometimes there ain't. And if it's razor fish—well, I can't tell 'em, but I cal'late you'll have to use your own judgment."

He said all right, he guessed he'd get along. So off he went, and pretty soon him and Lord James comes down and gets aboard the skiff. His Lordship was loaded with no less than four buckets, besides a clam hoe and the garden hoe and the stove shovel. 'Twas the most imposing clam hunt outfit ever I see. If I'd been a clam and see that battery coming my way I'd have took to tall timber.

"Sure you've got hoes and buckets enough?" I asks, sarcastic.

"I guess so," says he, looking around at the weapons. "We might need another pail perhaps, but if we do I'll send James after it."

His Lordship started rowing, taking strokes with one hand and then with the other, and the fleet got under way and waltzed, as you might say, zigzag across to the main. 'Twas as calm as a millpond and they hit land up towards the point by the Neck Road. Then the clam slaughterers got out and disappeared round behind the point. I went on with my rigging.

(To be continued.)

Markets

PHILADELPHIA PRODUCE

Philadelphia, Pa., June 22, 1914.

There was little trading in butter and the market was unchanged. Strictly fine [illegible] sold fairly and were well cleaned up at full figures. Poultry offerings were only moderate and the market ruled steady with trade quiet. Fruits and vegetables fluctuating.

Butter.—Western creamery, 29½c extras, 27½c, firsts to seconds, 22@26½c; special prints 35@37c; near-by prints 31c.

Eggs.—Candled 25c per dozen; extras, 25c. Current receipts at $6.15 per standard case.

Poultry.—Fowls, 16½@17½c; old roosters 11@12c; chickens 30@32c; pigeons, [illegible] 18@22c.

Dressed Poultry.—Western fowls, 10@18c; roosters, 12c; squabs, $2.00@4.50 per doz.

Poultry.—Hens, 14@16c; springers 18c per pound; dressed, 40@85c each.

Vegetables.—Potatoes 10@16c ½-pk; 75c@$1.00 bu; cabbage 5@8c each; lettuce, 3@6c; beets, 3@5c bch; radishes 3@5c bch; onions 3@4c bunch, 15c ½-pk; lima beans, 15c per quart; sweet potatoes, 15c ½ pk; lard 14@16c lb.; celery 5@10c ea; peppers, 10@12c doz; turnips 10c per ½ pk; sauer kraut 8c qt; apple butter, 20@25c qt.; asparagus, 1@8c bunch; rhubarb, 3@5c per bunch; peas, 10@18c per ½-pk.

Fruit.—Apples, 25@35c ½-pk; strawberries, county 4@10c per box; cherries, 3@8c per box; huckleberries, 12@15c per box.

Retail Grain Market.—Wheat, $1.07 bu; corn, 88c; oats, 56c; rye, 77c; bran, $1.60 cwt., middlings, $1.65 cwt.

Wholesale Grain Market.—Wheat, 97c; corn, 78c; oats, 45c; rye, 67c.

PHILADELPHIA LIVE STOCK

Philadelphia, Pa., June 22, 1914.

Beef Cattle.—The market was reasonably steady all along the line with a moderately fair trade. Pennsylvania cattle were principally in evidence. Cows, as well as calves, commanded former rates under conservative inquiry.

	Beef Cattle	Sheep and Lambs	Hogs
Total for week	2,987	8,656	5,750
Previous week	2,981	10,669	6,269

Best steers	$8.87@9.00
Choice steers	8.65@8.75
Good do	8.45@8.55
Medium steers	8.00@8.25
Common steers	7.75@7.87
Bulls	6.00@7.50
Fat cows	5.00@6.75
Thin cows	2.75@4.50
Milk cows	45.00@80.00

Veal calves steady.

Best calves	$11.00@11.50
Good to choice do	10.00@11.00
Medium	8.00@9.00
Common do	6.00@7.00

Sheep and Lambs.—Offerings of the better class were well absorbed at unchanged prices and current arrivals were not so liberal. Winter lambs are about exhausted.

Extra wethers	$6.25@6.50
Choice do	5.25@5.50
Common to [illegible]	4.00@5.00
Ewes fat	4.25@4.50
Extra lambs	8.25@8.50
Good to choice do	7.50@7.00
Common to medium	5.00@7.00
Early spring lambs	9.50@9.75

Hogs.—Conditions were fairly steady and demand was seasonable. Western, $11.50@11.75.

City Dressed Stock.—Every variety of choice and prime meat was held in a steady to firm manner, inquiry being about normal. Steers 12@14c; heifers, 10½@13c; cows, 9@12c. Veal calves, 13@14c; country dressed calves 13@14c; extra do., 14½c. Sheep, 11@12c; extra wethers, 13c. Spring lambs 18c. Hogs, 11¾@12c.

PITTSBURGH LIVE STOCK

Pittsburgh, Pa., June 22, 1914.

Cattle.—While the supply was only 60 loads compared with 110 the Monday before, the market ruled slow and generally 10 to 15 cents lower. Very few desirable cattle were on sale, the bulk running to the common and grassy grades. Fat cows were in liberal supply and sold lower. Quite a number of bulls were on sale and they sold generally 25c lower. Fresh cows were in liberal supply and barely steady on best, while medium and springer grades were lower. Today's supply was 65 loads. The market ruled active and higher on all grades.

Good to choice	$8.85@9.10
Good 1,300-1,400 lb	8.60@8.85
Medium to good 1,200-1,300 lb	8.10@8.60
Tidy 1,050-1,150 lb	8.20@8.50
Fair to medium, 900-1,100 lb	7.50@8.10
Rough half fat, 1,000-1,300 lb	5.00@7.00
Common, 700 to 900 lbs	5.75@7.00
Common to good fat oxen	4.50@7.00
Common to good fat bulls	5.50@7.75
Common to good fat cows	4.42@7.00
Heifers	5.50@8.00
Bologna cows	3.50@4.25
Fresh cows and springers	25.00@85.00

Calves.—Veal calves were in fair supply and the market closed 50 cents above Monday's prices. Today's receipts were 900 head. Market was active and steady.

Heavy and thin calves	$6.00@7.50
Veal calves	8.00@10.50

Hogs.—The supply for the past week has been the largest that has been on sale for some time and with a good demand, the market ruled stronger each day after Monday and the close for the week was 15 to 20 cents per cwt. above Monday's price. Today's receipts were 65 double-deck loads. The market was 5@10 cents higher than last week's closing prices on best weights.

Prime heavy	$8.55@
Heavy mixed	8.55@
Prime medium weights	8.60@
Best heavy Yorkers	8.60@
Light Yorkers	8.55@
Pigs	8.20@8.30
Common to good roughs	7.00@7.40
Stags	6.25@6.75

Sheep and Lambs.—Sheep and lambs were in liberal supply all week and with only a fair demand, sheep ruled lower. Lambs were only steady, while spring lambs were higher. Today's receipts were 25 double-deck loads. The market was stronger on choice sheep but other grades sold steady. Yearlings were slow at about steady prices. The supply of spring lambs was liberal and the market lower, top being $9.50 with bulk of sales at $9.35.

Prime wethers	$5.80@6.00
Good mixed	5.50@5.70
Fair mixed ewes and wethers	4.50@5.25
Culls to common	2.50@4.00
Culls to choice lambs	4.50@7.25
Spring lambs	6.50@9.50

BUFFALO LIVE STOCK

Buffalo, N. Y., June 22, 1914.

Cattle.—The demand was fair for choice butcher cattle thruout the week. The supply was light. The market after Monday was quiet and the close about steady at unchanged prices. With 4,000 head on sale this morning the market was strong and 10c higher on all grades.

Choice heavy steers	$9.00@9.30
Fair to good	8.25@8.35
Yearlings	7.75@8.65
Handy butchers	7.25@8.60
Good to choice fat cows	5.00@7.25
Good to choice heifers	7.00@8.25
Butcher bulls	6.25@7.25
Feeders	7.00@7.75
Stockers	6.00@7.75
Cows and springers	30.00@85.00

Calves.—There was no particular change in the market during the week, the basis on choice veals being $10.50@10.75. Arrivals today numbered 1,600 head.

Choice veals	$10.50@10.75
Lights and thin	6.00@8.75

Sheep and Lambs.—The trade opened fair for good lambs but was lower on spring lambs. Yearlings were in fair demand and lower. Sheep and wethers were in fair demand. On the close, the trade was good with an active demand for yearlings, and with wethers higher. Sheep and lambs were steady today with 3,000 head on sale.

Choice lambs	$9.50@10.00
Yearlings	7.50@8.50
Wethers	6.50@6.75
Ewes	4.25@5.50
Mixed sheep	5.75@6.00

Hogs.—Notwithstanding the heavy receipts Monday the trade was good but the basis lower on the opening. The trade after Monday was fair on desirable grades. On the close, the demand was good and the market firm on desirable grades. Yorkers sold at $8.55@8.60. Dairy and common hogs were slow. Hog arrivals today numbered 1,600 head.

Heavies	$8.55@8.60
Mixed and medium	8.55@8.60
Yorkers	8.55@8.60
Light Yorkers	8.55@8.60
Pigs	8.40@
Roughs	7.15@7.25
Stags	6.00@6.75

Horses.—Offerings today numbered 350. There was a fair demand for workers, while drivers were slow. Best teams, $700@750; medium $600@700. S.

BALTIMORE LIVESTOCK

Baltimore, Md., June 22, 1914.

Cattle.—Receipts for the week were 1,919 head against 1,575 last week.

Steers	$6.25@8.35
Heifers	5.50@7.50
Cows	3.00@6.25
Bulls	5.25@7.00
Fresh cows	32.50@70.00

Sheep and Lambs.—Receipts for the week were 9,322 head. Fair supply; market strong on good stock.

Sheep	$2.25@5.25
Spring lambs	7.50@9.40

Hogs.—Receipts for the week were 10,701 head against 9,908 last week.

Light Western	$8.85@8.95
Heavy to medium	8.85@8.90
Near-by	8.75@8.85
Pigs	8.00@8.70
Roughs	7.00@7.75

Calves.—Receipts for the week were 350 head against 406 head last week. Light supply, market lower at $6.50@11.00.

NEW YORK LIVE STOCK

New York City, June 22, 1914.

Beef Cattle.—Receipts today, 3,000 head. Market irregular.

Steers	$7.00@8.40
Bulls	5.35@7.75
Cows	3.75@7.00

Calf receipts 7,000 head. Market firm.

Choice	$8.50@11.25
Culls	6.50@8.00

Sheep and lamb receipts 15,000 head. Market steady.

Sheep	$3.50@5.37
Spring lambs	8.50@9.75

Hog receipts 7,000 head. Market steady.

Choice	$8.50@8.75
Roughs	7.25@7.50

PITTSBURGH HAY AND GRAIN MARKET

Pittsburgh, Pa., June 22, 1914.

Hay.—Heavy receipts of poor stock shipped into this market within the last week has had a depressing effect on all grades. Hay of poor quality is hard to dispose of, there being quite an accumulation on track, and can only be placed after concessions are granted. No. 1 and No. 2 timothy hay can be placed at quotations but the lower grades are hard to dispose of as are also clover and prairie hay.

No. 1 timothy	$17.00@17.25
No. 2 timothy	14.00@15.00
No. 1 light mixed	14.50@15.00
No. 1 clover mixed	13.00@13.50
No. 2 clover mixed	10.00@11.00
No. 1 clover	12.50@13.00
No. 2 clover	9.00@11.00

Straw.—Receipts continue liberal with only a slight demand; market dull and slow sale.

No. 1 Oats	$9.00@9.25
No. 2 Oats	8.50@8.75
No. 1 Wheat	8.75@9.00
No. 2 Wheat	8.25@8.50
No. 1 Rye	9.75@10.00
No. 2 Rye	8.75@9.25

Ear Corn.—Receipts of ear corn quite liberal while the demand is very limited; market lower.

No. 2 Yellow	75@76c.
No. 3 Yellow	71½@73c.
No. 1 High mixed	73½@75c.
No. 2 Mixed	71½@72½c.

Oats.—Receipts quite liberal while the demand is only fair; market dull and draggy.

No. 2 white	44¾@45c.
Standard oats	44@44½c.
No. 3 white	43@43½c.
No. 4 white	41½@42½c.

GRASS SEED MARKET

Toledo, O., June 22, 1914.

Cloverseed.—Prime cash, $8.20; October and December, $8.75.

Timothy.—Prime, cash, $2.62½; December, $2.70.

NEW YORK MILK MARKET

New York City, June 22, 1914.

The market suffered a slump last week owing to the comparatively cool weather. The dealers estimate that the surplus, which increased rapidly, is now about 20,000 cans a day. All of this is being manufactured. It is expected that the Borden rate will serve as a basis of payment for 70 percent of the June milk. Whether the producers in the 26 cent zone receive approximately 2½ cents or 2¾ cents depends upon whether or not the Borden company decides to pay a premium as it did for June of last year.

The receipts of milk and cream in 40-quart cans for the week ending June 20 were as follows:

Railroad	Milk	Cream
Erie	50,085	3,765
Susquehanna	7,750	305
West Shore	14,796	1,982
Lackawanna	68,250	3,875
N. Y. Central (long haul)	95,011	4,496
N. Y. Central (short haul)	15,175	50
Ontario	46,751	4,646
Lehigh Valley	18,560	2,854
Homer Ramsdell Line	3,050	68
New Haven	8,787	280
Pennsylvania	8,539	241
Other sources	1,785	34
Totals	354,539	22,596

ELGIN BUTTER QUOTATION

Elgin, Ill., June 22, 1914.

The quotation committee of the Elgin Board of Trade this afternoon declared butter firm at 27½c.

TOBACCO MARKET

Transplanting is well underway but in many localities this is of little use owing to the presence of millions of hungry cutworms. In one instance 65 worms were found devouring a row of 130 plants. Another grower lost one half of all the plants transplanted. Fortunately there is an abundance of plants to replace those thus lost, but this means much additional hand labor and precludes the possibility of first-class results. Growers should not overlook the practicability of Paris green as a destroyer of these pests. Mixed with some 20 times as much air-slaked lime and applied with some sort of sifter or blower results are at once favorable.

A very small part of the 1913 crop remains in growers' hands and this seems to be marketable at an even lower price than existed during past weeks. A slight improvement was noted in the cigar industry which raised hope all along the line. In the general market there was an increased demand for Pennsylvania and similar types but the transactions were of limited volume.

In New York crop conditions are favorable and tobacco plants are ready to transplant even before growers are prepared to do so. Connecticut has experienced a favorable season and the crop is going out under favorable conditions. A large product is predicted there. Transplanting is under way in Wisconsin, being abundant and even too forward to suit the convenience of growers. H. E. Tweed, June 22, 1914.

Veterinary

(Conducted by W. C. Fair, V. S.)

(Advice thru this department is free to our subscribers. Each communication should state history and symptoms of the case in full; also the name and address of writer. Initials only will be published. We cannot make reply by mail. This is one of the most valuable columns of the paper and we invite readers to make use of it. Clippings from this column, when properly preserved and classified, would make one of the most valuable medical symposiums a farmer-stockman could obtain.)

Thoroughpin.—I have a yearling colt that has a soft, puffy swelling on each side of hock. What should I apply? T. B. H., Burgettstown, Pa.—Apply 1 part powdered cantharides and 6 parts lard every 10 days. Or apply equal parts tincture iodine and spirits of camphor, 2 or 3 times a week.

Mange.—The neck and shoulder of three of my steers are diseased and my neighbor tells me they have mange. I. W. R., Oil City, Pa.—Apply 1 part sulphur, ½ part carbonate of potash and 3 parts lard to mangy parts of body, twice a week.

Sore Ears.—Several of my hogs are troubled with sore ears and the home remedies that I have applied fail to heal the sores. I am not able to tell what caused this trouble, but am inclined to believe it caused by wallowing in water that is none too clein. B. T. I., Navarre, Pa.—First of all, if this chapping of the skin is caused by wet and filth, keep the hogs out of it and their ears will soon heal. Apply 1 part carbolic acid and 7 parts vaseline to sores daily.

Sweeny.—I have a 4-year-old colt that stepped on a stone which in some way affected his shoulder so that flesh has fallen away nearly the whole length of back part of shoulder blade. He was lame for a short time after accident and before sweeny set in. The hide is perfectly loose and the wasted parts will not measure more than four inches in width. This accident happened five weeks ago. E. T., Cameron, N. Y.—Clip hair off atrophied muscles and apply 1 part powdered cantharides and 6 parts fresh lard every 10 days and he will gradually get well.

Sprained Back.—I have a horse that has been working in woods hauling heavy logs and today chain broke, horse fell and since then has had poor use of hind quarters. G. W. D., Tillmore, N. Y.—Give him 1 dr. of ground nux vomica at a dose in feed, 3 times a day; also give him a dessert spoonful of powdered nitrate of potash, once a day. Also apply 1 part turpentine, 1 part aqua ammonia and 3 parts olive oil to back, once a day.

Fistula of Withers.—For more than a year our local veterinarian has been treating one of my horses for fistula of withers, but he has not succeeded very well. H. H. B., Califon, N. J.—You had better ask your veterinary to apply serum treatment and he will doubtless obtain good results. There are several commercial brands on the market that are reliable and which he no doubt knows of.

Out of Condition.—Have a colt that perspires very freely and has a rough coat, but his appetite is good and he seems healthy otherways. Can you suggest a remedy? M. E. T., Herman, Pa.—Groom your colt twice a day and give him a teaspoonful powdered sulphate iron, a tablespoonful ground gentian and a teaspoonful of powdered nitrate of potash in feed, 2 or 3 times a day. Be sure and ventilate your stable thoroly.

Tapeworm.—Have a pet dog that I am positive suffers from a tapeworm. Can a drug be given that will rid him of it? B. I. W., Gettysburg, Pa.—Give 1½ grains of powdered areca nut for every pound the dog weighs, every day for a few days until tape worm is dislodged. It may be necessary to give him castor oil, 2 hours after giving areca nut.

Hoof Ointment.—For the past three months I have been watching the columns of the Pennsylvania Farmer for a formula for a good hoof ointment, but so far have not seen it recommended. M. Y. O., Punxsawtawney, Pa.—Lanolin, (wool fat) is rather expensive, but it makes a nice ointment to soften dry hoofs. One part kerosene and 9 parts vaseline make another very good ointment; also 1 part coal-tar disinfectant and 9 parts vaseline; or mix 4 oz. of melted beeswax in ½ lb. of melted tallow and 1 lb of archangel tar, stirring this mixture until cool, then apply to hoofs every day or two. This will keep them soft and stimulate growth of horn.

ATLANTIC
AUTOMOBILE
GASOLINE

Let Our Tank Wagon Service Supply You

Our delivery service of Atlantic Automobile Gasoline is saving money, time and worry for any number of Pennsylvania farmers. Our tank wagons will deliver it right at your door. In this way you are sure of regular supplies of high-grade, uniform fuel.

ATLANTIC AUTOMOBILE GASOLINE will give you freedom from engine troubles and a maximum power per gallon. With it your car starts quickly, and you don't have the bother of frequent carbureter adjustments.

Atlantic Automobile Gasoline is made by a perfected refining process, which equals, though on a much larger scale, the careful accuracy of the chemist's balance.

The result is a uniform fuel, which always acts the same under all conditions. Ask for it by name—"Atlantic Automobile Gasoline."
